Elongation	0 to 10%, excl	0.5%
	10% and above	1%
Reduction of Area	0 to 10%, excl	0.5%
	10% and above	1%
Impact Energy	0 to 240 ft • lbf (or 0 to 325 J)	1 ft • lbf (or 1 J) (B)
Brinell Hardness	all values	tabular value (C)
Rockwell Hardness	all scales	1 Rockwell Number

NOTES:

- (A) Round test data to the nearest integral multiple of the values in this column. If the data value is exactly midway between two rounded values, round in accordance with A8.1.1.2.
- (B) These units are not equivalent but the rounding occurs in the same numerical ranges for each. (1 ft • lbf = 1.356 J.)
- (C) Round the mean diameter of the Brinell impression to the nearest 0.05 mm and report the corresponding Brinell hardness number read from the table without further rounding.

SPECIFICATION FOR CARBON AND ALLOY STEEL FORGINGS FOR THIN-WALLED PRESSURE VESSELS

SA-372/SA-372M

[Identical with ASTM Specification A 372/A 372M-03(R08).]

1. Scope

1.1 This specification covers relatively thin-walled forgings (including gas bottles) for pressure vessel use. Three types of carbon steel and six types of alloy steel are included. Provision is made for integrally forging the ends of vessel bodies made from seamless pipe or tubing.

NOTE 1 — When working to the chemical and tensile requirements of this specification, the influence of wall thickness and cooling rate will necessarily eliminate certain forging sizes in each class.

NOTE 2 — Designations have been changed as follows:

Current	Formerly
Grade A	Type I
Grade B	Type II
Grade C	Type III
Grade D	Type IV
Grade E Class 55	Type V Grade 1 Class 55
Grade E Class 65	Type V Grade 1 Class 65
Grade E Class 70	Type V Grade 1 Class 70
Grade F Class 55	Type V Grade 2 Class 55
Grade F Class 65	Type V Grade 2 Class 65
Grade F Class 70	Type V Grade 2 Class 70
Grade G Class 55	Type V Grade 3 Class 55
Grade G Class 65	Type V Grade 3 Class 65
Grade G Class 70	Type V Grade 3 Class 70
Grade H Class 55	Type V Grade 4 Class 55
Grade H Class 65	Type V Grade 4 Class 65
Grade H Class 70	Type V Grade 4 Class 70
Grade J Class 55	Type V Grade 5 Class 55
Grade J Class 65	Type V Grade 5 Class 65
Grade J Class 70	Type V Grade 5 Class 70
Grade K	Type VI
Grade L	Type VII
Grade J Class 110	Type VIII
Grade M Class 85	Type IX Class A
Grade M Class 100	Type IX Class B

1.2 The values stated in either inch-pound or SI [metric] units are to be regarded separately as the standard. Within the text and the tables, the SI units are shown in brackets. The values stated in each system are not exact equivalents;

therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification.

1.3 Unless the order specifies the applicable “M” specification designation (SI units), the material shall be furnished to inch-pound units.

- E 165 Practice for Liquid Penetrant Examination
- E 290 Test Method for Semi-Guided Bend Test for Ductility of Metallic Materials
- E 433 Reference Photographs for Liquid Penetrant Inspection

3. Ordering Information and General Requirements

3.1 In addition to the ordering information required by Specification A 788, the purchaser shall include with the inquiry and order a detailed drawing, sketch, or written description of the forging and the areas of significant loading in the forging when required (see 6.4.2.2).

3.2 Material supplied to this specification shall conform to the requirements of Specification A 788, which outlines additional ordering information, manufacturing requirements, testing and retesting methods and procedures, marking, certification, product analysis variations, and additional supplementary requirements.

3.3 If the requirements of this specification are in conflict with the requirements of Specification A 788, the requirements of this specification shall prevail.

4. Materials and Manufacture

4.1 Melting Practice:

4.1.1 The steel melting procedures of Specification A 788 shall apply except that for Grade M forgings, only steel that has been vacuum treated prior to or during the pouring of the ingot, in order to remove objectionable gases, particularly hydrogen, shall be used.

4.2 Production Methods:

4.2.1 Methods for the production of gas bottles and similar vessels shall include the cupping of slabs or plates, the piercing of billets or plates, and the subsequent drawing of cups so produced. Such semifinished forgings or seamless steel pipe or tubing shall be closed by spinning, swedging, or pressing. In all cases there shall be sufficient discard to ensure soundness in the completed forging.

4.3 Heat Treatment:

4.3.1 At the option of the manufacturer, Grades A, B, C, D and Classes 55, 65, 70 of Grades E, F, G, H, and J forgings shall be normalized, normalized and tempered, or liquid-quenched and tempered.

4.3.2 Grades K, L, M, and Class 110 of Grade J forgings shall be liquid-quenched and tempered.

4.3.3 When normalized forgings are to be tempered, or when forgings have been quenched, they shall be reheated to a subcritical temperature and held for at least $\frac{1}{2}$ h/in. [25 mm] of maximum cross section.

4.3.3.1 Minimum tempering temperatures shall be as follows:

Grades E, F, G, H, J in Classes 55, 65, 70	1100°F [595°C]
Grade K	1100°F [595°C]
Grade L	1000°F [540°C]
Grade J Class 110	1000°F [540°C]
Grade M	1100°F [595°C]

4.3.3.2 If an attachment is welded onto a previously quenched and tempered pressure vessel, the post weld heat treatment temperature of a weldment shall not exceed the prior tempering temperature of the pressure vessel. Fabrication welding of pressure shell is not permitted.

Attachment welding prior to heat treatment is not permitted.

4.3.4 All quenched and tempered forgings shall be subject to magnetic particle examination in accordance with Section 7.

4.3.5 Heat treatment is to be performed after all forming operations.

5. Chemical Composition

5.1 Heat Analysis — The heat analysis obtained from sampling in accordance with Specification A 788 shall comply with Table 1.

5.2 Product Analysis — The purchaser may use the product analysis provision of Specification A 788 to obtain a product analysis from a forging representing each heat or multiple heat.

5.3 Starting material produced to a specification that specifically requires the addition of any element beyond those listed in Table 1 for the applicable grade of material is not permitted. This does not preclude use of deoxidation or inclusion control additions. Supplementary Requirements S1 and S2 of Specification A 788 shall apply.

6. Mechanical Properties

6.1 Mechanical tests for acceptance shall be made after the final heat treatment of the forgings.

6.2 Tension Test — When tested in accordance with Test Methods and Definitions A 370, the material shall conform to the requirements of Table 2. The yield strength shall be determined by the 0.2% offset method.

6.3 Bending Properties — Depending upon the outside diameter, D , and the wall thickness, T , of hollow or bored forgings, a bend test or flattening test will be required.

6.3.1 For bored or hollow forgings with outside diameters of 14 in. [355 mm] or less and with a D/T ratio of more than 10.0, a flattening test is required. This shall be carried out in accordance with Specification A 530/A 530M and Table 3. No breaks or cracks in the test ring are acceptable until the distance between the plates is less than that shown in Table 3.

6.3.2 For bored or hollow forgings with outside diameters over 14 in. [355 mm], or where the D/T ratio is 10.0 or less at the manufacturer's option, the flattening test specified in 6.3.1, or a transverse bend test in accordance with Arrangement C of Test Method E 290 is required. The bend test pin diameter shall be as specified in Table 4. No cracks or ruptures in the test piece are allowable when the test piece is bent through the required angle.

6.4 Orientation and Location of Test Specimens:

6.4.1 Test specimens representing vessel bodies or shells shall be taken from a prolongation of a forging, from test rings that have been heat treated with the forgings they represent, or from a representative forging after heat treatment in accordance with 4.3.

6.4.1.1 Test specimens representing vessel bodies or shells shall be located at a position corresponding to the mid-wall location of the parallel side wall of the heat-treated forging and shall be oriented parallel to the longitudinal axis of the vessel.

6.4.1.2 A test ring shall be in the shape of a right circular cylinder having the same diameter and wall thickness as the cylinders it represents. In addition, the test ring shall be from the same heat of steel and be subjected to the same heat treatment as the cylinders it represents. The method of quenching the test ring must duplicate that of the cylinders; if the cylinders are quenched from the outside only, then the test ring must have its ends closed. The length of test rings that will be liquid quenched must be at least 24 in. [610 mm]. The ends of such test rings may be vented to prevent pressure buildup during heat treating.

6.4.2 Test specimens representing vessel covers or similar components may be taken from a full section prolongation of the cover, from a representative forging, or from an integral prolongation when the part is contour-machined prior to heat treatment.

6.4.2.1 Test specimens taken from full size prolongations or representative forgings shall be located at a position midway between the center and the surface.

6.4.2.2 When forgings are contour-machined prior to heat treatment so that highly stressed surfaces are exposed, the test specimens may be taken at an equal distance (t) from the nearest quenched surface as the highly stressed area, but not less than $\frac{3}{4}$ in. [20 mm]. The location of the specimens from a second surface shall be at least the greater of $1\frac{1}{2}$ in. [40 mm] or $2t$.

6.5 Number of Tests:

6.5.1 Up to 200 like forgings, each with a heat-treated weight of less than 1000 lb [510 kg] when heat treated in a single batch furnace charge, shall have one tension test taken in accordance with 6.4.1 or 6.4.2 to represent each heat. In addition, for hollow or bored forgings, one bend or flattening test shall be taken in accordance with 6.3.

6.5.2 Like forgings, weighing less than 1000 lb [450 kg] each when heat treated in a continuous furnace, shall have one tensile test taken to represent each heat and not more than 200 forgings in any continuous period up to 4 h duration. In addition, bored or hollow forgings shall have one bend or flattening test taken per heat per 200

forgings in any continuous period up to 4 h duration in accordance with 6.3.

6.5.3 For heat-treated forgings weighing 1000 lb [450 kg] or more, one tension test shall be taken in accordance with 6.4.1 or 6.4.2 to represent each heat and not more than ten forgings in a heat-treat lot. In addition, hollow or bored forgings shall have one bend or flattening test, taken in accordance with 6.3, to represent each ten or fewer forgings from the same heat and heat-treatment lot.

6.6 Hardness Testing:

6.6.1 Forgings under 1000 lb [450 kgm] in weight, heat treated in a batch lot of up to 200 pieces (6.5.1) or in a continuous furnace run covering up to 200 pieces in up to four hours production (6.5.2) shall be subject to a uniformity check by Brinell hardness testing, or an equivalent method. For this purpose, 10% of the furnace production shall be sampled and shall meet the minimum hardness specified in Table 2 for the type and shall also be within 20 Brinell points of the hardness of the forging from which the tensile test was taken.

6.6.2 In the event that the test sample does not meet these criteria, the remainder of that production group shall be hardness tested and all of those forgings that fall outside these limits shall be retempered or reheat-treated at the manufacturer's option and retested.

7. Magnetic Particle Examination

7.1 All quenched and tempered forgings shall be subject to magnetic particle examination after heat treatment. The methods used shall be in accordance with Test Method A 275/A 275M.

7.2 Only direct current or rectified alternating (full or half wave) current shall be used as the electric power source for any of the magnetizing methods.

7.3 The forgings shall be free from linear indications indicative of cracks. In case of doubt as to the type of condition giving rise to linear magnetic particle indications, they may be inspected for Type II indications referenced in Reference Photographs E 433 when inspected by the liquid penetrant method in accordance with Practice E 165. Alternatively, some other suitable method for classifying the indications may be used as agreed upon between the manufacturer and the purchaser.

8. Workmanship

8.1 If the thickness of a portion of the wall of a forging is less than that specified, the forgings may be accepted by the purchaser, provided that such irregularity will not require lowering the allowable working pressure below that for which the forging was designed.

9. Repair Welding

9.1 Repair welding shall be permitted when mutually agreed upon between the purchaser and the manufacturer and shall be performed in accordance with all the requirements of the applicable code or rules of construction.

SUPPLEMENTARY REQUIREMENTS

One or more of the following supplementary requirements shall apply only when specified by the purchaser on the inquiry, contract, or order. Details of these supplementary requirements shall be agreed upon by the manufacturer and the purchaser.

S1. Grain Size

S1.1 When a grain size range is required, it shall be specified in the ordering information, and shall be determined by an agreed-upon method from Test Methods E 112.

S1.2 Samples for grain size estimation shall be taken from the tension test specimen location.

S2. Rough Machining

S2.1 Rough machining shall be performed in the sequence and manner as specified.

S3. Impact Testing

S3.1 Charpy V-notch test specimens shall be taken from the same location and in the same orientation as tension test specimens. The number of specimens, minimum energy values, and test temperature(s) shall be as specified.

S4. Fracture Toughness

S4.1 Specific fracture toughness requirements are levied by certain sections of the ASME Boiler and Pressure Vessel Code. Forgings in the permitted types shall comply with the applicable code sections.

S4.2 The necessary code references toughness criteria and test temperature data shall be included in the ordering information.

S5. Ultrasonic Examination

S5.1 Ultrasonic examination of forgings shall be carried out in accordance with Practice A 388/A 388M.

S5.2 Acceptance criteria shall be specified and shall be in accordance with the applicable Code or purchaser's specification and shall be included as part of the ordering information.

SPECIFICATION FOR SEAMLESS AUSTENITIC STEEL PIPE FOR HIGH-TEMPERATURE CENTRAL-STATION SERVICE

SA-376/SA-376M

(Identical with ASTM Specification A 376/A 376M-06, except for the deletion of HT-O option from 6.2 and 14.1 and clarification of heat treatment requirements in 6.2.)

1. Scope

1.1 This specification covers seamless austenitic steel pipe intended for high-temperature central-station service. Among the grades covered are five H grades and two nitrogen grades (304N and 316N) that are specifically intended for high-temperature service.

1.2 Optional supplementary requirements (S1 through S10) are provided. These supplementary requirements specify additional tests that will be made only when stated in the order, together with the number of such tests required.

1.3 Grades TP321 and TP321H have lower strength requirements for nominal wall thicknesses greater than $\frac{3}{8}$ in. [9.5 mm].

1.4 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification. The inch-pound units shall apply unless the “M” designation of this specification is specified in the order.

NOTE 1 — The dimensionless designator NPS (nominal pipe size) has been substituted in this standard for such traditional terms as “nominal diameter,” “size,” and “nominal size.”

2. Referenced Documents

2.2 Other Standards:

SNT-TC-1A Personnel Qualification and Certification in Nondestructive Testing

3. Terminology

3.1 Definitions — For definitions of terms used in this specification, refer to Terminology A 941.

4. Ordering Information

4.1 Orders for material to this specification should include the following, as required to describe the desired material adequately:

4.1.1 Quantity (feet, centimetres, or number of lengths),

4.1.2 Name of material (seamless austenitic steel pipe),

4.1.3 Grade (Table 1),

4.1.4 Size (nominal size, or outside diameter and schedule number or average wall thickness),

4.1.5 Lengths (specific or random), (Permissible Variations in Length Section of Specification A 999/A 999M),

4.1.6 End finish (Ends Section of Specification A 999/A 999M),

4.1.7 Optional requirements (Section 9) (see Hydrostatic Test Requirements Section and the Permissible Variation in Weight for Seamless Pipe Section for weighing individual lengths, of Specification A 999/A 999M), (see 10.6, repairing by welding; 14.3, die stamping),

4.1.8 Test report required (Certification Section of Specification A 999/A 999M),

4.1.9 Specification designation, and

4.1.10 Special requirements or any supplementary requirements selected, or both.

5. General Requirements

5.1 Material furnished to this specification shall conform to the applicable requirements of the current edition of Specification A 999/A 999M unless otherwise provided herein.

6. Materials and Manufacture

6.1 *Manufacture* — At the manufacturer's option, pipe may be either hot finished or cold finished, with a suitable finishing treatment, where necessary.

6.2 Heat Treatment:

6.2.1 All pipe shall be furnished in the heat-treated condition. For H grades, separate solution treatments are required for solution annealing; in process heat treatments are not permitted as a substitute for the separate solution annealing treatments.

6.2.2 As an alternate to final heat treatment in a continuous furnace or batch-type furnace, immediately following hot forming while the temperature of the pipes is not less than the specified minimum solution treatment temperature, pipes may be individually quenched in water or rapidly cooled by other means.

6.2.3 *Grades TP304, TP304N, TP304LN, TP316, TP316N, TP316LN, TP321, TP347, TP348, 16-8-2H, S31725, and S31726* — Unless otherwise stated in the order, heat treatment shall consist of heating to a minimum temperature of 1900°F [1040°C] and quenching in water or rapidly cooling by other means.

6.2.3.1 The purchaser may specify controlled structural or special service characteristics which shall be used as a guide for the most suitable heat treatment. If the final heat treatment is at a temperature under 1900°F [1040°C], each pipe shall be stenciled with the final heat treatment temperature in degrees Fahrenheit or Celsius after the suffix "HT."

6.2.4 *Grades TP304H, TP316H, TP321H, TP347H, TP348H, and 16-8-2H* — If cold working is involved in

processing, the minimum solution-treating temperature for Grades TP321H, TP347H, and TP348H shall be 2000°F [1100°C], for Grades TP304H and TP316H, 1900°F [1040°C], and for Grade 16-8-2H, 1800°F [980°C]. If the material is hot-rolled, the minimum solution-treating temperatures for Grades TP321H, TP347H, and TP348H shall be 1925°F [1050°C], for Grades TP304H and TP316H, 1900°F [1040°C], and for Grade 16-8-2H, 1800°F [980°C].

6.2.5 *Grade S34565* — Heat treatment shall consist of heating to a temperature in the range of 2050°F [1120°C] minimum and 2140°F [1170°C] maximum, and quenching in water or rapidly cooling by other means.

6.3 A solution annealing temperature above 1950°F [1065°C] may impair the resistance to intergranular corrosion after subsequent exposure to sensitizing conditions in TP321, TP321H, TP347, TP347H, TP348, and TP348H. When specified by the purchaser, a lower temperature stabilization or re-solution anneal shall be used subsequent to the initial high temperature solution anneal (see Supplementary Requirement S9).

6.4 The grain size of grades 304H, 316H, 321H, 347H, and 348H as determined in accordance with Test Methods E 112, shall be No. 7 or coarser.

7. Chemical Composition

7.1 The steel shall conform to the requirements as to chemical composition prescribed in Table 1.

8. Product Analysis

8.1 At the request of the purchaser, an analysis of one billet from each heat or two pipes from each lot (Note 2) shall be made by the manufacturer. A lot of pipe shall consist of the following:

NPS Designator	Lengths of Pipe in Lot
Under NPS 2	400 or fraction thereof
NPS 2 to NPS 5, incl	200 or fraction thereof
Over NPS 5	100 or fraction thereof

NOTE 2 — A lot shall consist of the number of lengths specified in 8.1 of the same size and wall thickness from any one heat of steel.

8.2 The results of these analyses shall be reported to the purchaser or the purchaser's representative, and shall conform to the requirements specified in Table 1.

8.3 If the analysis of one of the tests specified in Section 9 does not conform to the requirements specified in Section 7, an analysis of each billet or pipe from the same heat or lot may be made, and all billets or pipe conforming to the requirements shall be accepted.

9. Tensile Requirements

9.1 The material shall conform to the requirements as to tensile properties prescribed in Table 2.

10. Workmanship, Finish, and Appearance

10.1 The pipe manufacturer shall explore a sufficient number of visual surface imperfections to provide reasonable assurance that they have been properly evaluated with respect to depth. Exploration of all surface imperfections is not required but may be necessary to assure compliance with 10.2.

10.2 Surface imperfections that penetrate more than $12\frac{1}{2}\%$ of the nominal wall thickness or encroach on the minimum wall thickness shall be considered defects. Pipe with such defects shall be given one of the following dispositions:

10.2.1 The defect may be removed by grinding provided that the remaining wall thickness is within specified limits.

10.2.2 Repaired in accordance with the repair welding provisions of 10.6.

10.2.3 The section of pipe containing the defect may be cut off within the limits of requirements on length.

10.2.4 Rejected.

10.3 To provide a workmanlike finish and basis for evaluating conformance with 10.2, the pipe manufacturer shall remove by grinding the following:

10.3.1 Mechanical marks, abrasions (see Note 3), and pits, any of which imperfections are deeper than $\frac{1}{16}$ in. [1.6 mm].

NOTE 3 — Marks and abrasions are defined as cable marks, dinges, guide marks, roll marks, ball scratches, scores, die marks, and so forth.

10.3.2 Visual imperfections commonly referred to as scabs, seams, laps, tears, or slivers found by exploration in accordance with 10.1 to be deeper than 5% of the nominal wall thickness.

10.4 At the purchaser's discretion, pipe shall be subject to rejection if surface imperfections acceptable under 10.2 are not scattered, but appear over a large area in excess of what is considered a workmanlike finish. Disposition of such pipe shall be a matter of agreement between the manufacturer and the purchaser.

10.5 When imperfections or defects are removed by grinding, a smooth curved surface shall be maintained, and the wall thickness shall not be decreased below that permitted by this specification. The outside diameter at the point of grinding may be reduced by the amount so removed.

10.5.1 Wall thickness measurements shall be made with a mechanical caliper or with a properly calibrated

nondestructive testing device of appropriate accuracy. In case of dispute, the measurement determined by use of the mechanical caliper shall govern.

10.6 Weld repair shall be permitted only subject to the approval of the purchaser and in accordance with Specification A 999/A 999M.

10.7 The finished pipe shall be reasonably straight.

10.8 The pipe shall be free of scale and contaminating iron particles. Pickling, blasting, or surface finishing is not mandatory when pipe is bright annealed. The purchaser may request that a passivating treatment be applied.

11. Hydrostatic or Nondestructive Electric Test

11.1 Each pipe shall be subjected to the Nondestructive Electric Test or the Hydrostatic Test. Unless specified by the purchaser, either test may be used at the option of the producer.

11.2 Hydrostatic Test — Each length of finished pipe shall be subjected to the hydrostatic test in accordance with Specification A 999/A 999M, unless specifically exempted under the provisions of 11.3 and 11.4.

11.3 For pipe sizes NPS 24 and over, the purchaser, with the agreement of the manufacturer, may complete the hydrostatic test requirement with the system pressure test, which may be lower or higher than the specification test pressure, but in no case shall the test pressure be lower than the system design pressure. Each length of pipe furnished without the completed manufacturer's hydrostatic test shall include with the mandatory marking the letters "NH."

11.4 Nondestructive Examination — Each pipe shall be examined with a nondestructive test in accordance with Practice E 213 or Practice E 426. Unless specifically called out by the purchaser, the selection of the nondestructive electric test will be at the option of the manufacturer. The range of pipe sizes that may be examined by each method shall be subject to the limitations in the scope of the respective practices.

11.4.1 The following information is for the benefit of the user of this specification:

11.4.1.1 The reference standards defined in 11.10.1 through 11.10.4 are convenient standards for calibration of nondestructive testing equipment. The dimensions of these standards should not be construed as the minimum size imperfection detectable by such equipment.

11.4.1.2 The ultrasonic testing (UT) can be performed to detect both longitudinally and circumferentially oriented defects. It should be recognized that different techniques should be employed to detect differently oriented imperfections. The examination may not detect short, deep, defects.

11.4.1.3 The eddy-current testing (ET) referenced in Practice E 426 has the capability of detecting significant discontinuities, especially the short abrupt type.

11.4.1.4 A purchaser interested in ascertaining the nature (type, size, location, and orientation) of discontinuities that can be detected in the specific application of these examinations should discuss this with the manufacturer of the tubular product.

11.5 Time of Examination — Nondestructive testing for specification acceptance shall be performed after all mechanical processing, heat treatments, and straightening operations. This requirement does not preclude additional testing at earlier stages in the processing.

11.6 Surface Condition:

11.6.1 All surfaces shall be free of scale, dirt, grease, paint, or other foreign material that could interfere with interpretation of test results. The methods used for cleaning and preparing the surfaces for examination shall not be detrimental to the base metal or the surface finish.

11.6.2 Excessive surface roughness or deep scratches can produce signals that interfere with the test.

11.7 Extent of Examination:

11.7.1 The relative motion of the pipe and the transducer(s), coil(s), or sensor(s) shall be such that the entire pipe surface is scanned, except as in 6.2.

11.7.2 The existence of end effects is recognized, and the extent of such effects shall be determined by the manufacturer, and, if requested, shall be reported to the purchaser. Other nondestructive tests may be applied to the end areas, subject to agreement between the purchaser and the manufacturer.

11.8 Operator Qualifications — The test unit operator shall be certified in accordance with SNT-TC-1A, or an equivalent recognized and documented standard.

11.9 Test Conditions:

11.9.1 For eddy-current testing, the excitation coil frequency shall be chosen to ensure adequate penetration yet provide good signal-to-noise ratio.

11.9.2 The maximum eddy-current coil frequency used shall be as follows:

On specified walls up to 0.050 in.—100 KHz max
On specified walls up to 0.150 in.—50 KHz max
On specified walls up to 0.150 in.—10 KHz max

11.9.3 Ultrasonic — For examination by the ultrasonic method, the minimum nominal transducer frequency shall be 2.00 MHz and the maximum nominal transducer size shall be 1.5 in.

11.9.3.1 If the equipment contains a reject notice filter setting, this shall remain off during calibration and testing unless linearity can be demonstrated at that setting.

11.10 Reference Standards:

11.10.1 Reference standards of convenient length shall be prepared from a length of pipe of the same grade, size (NPS, or outside diameter and schedule or wall thickness), surface finish, and heat treatment condition as the pipe to be examined.

11.10.2 For Ultrasonic Testing, the reference ID and OD notches shall be any one of the three common notch shapes shown in Practice E 213, at the option of the manufacturer. The depth of each notch shall not exceed $12\frac{1}{2}\%$ of the specified nominal wall thickness of the pipe or 0.004 in., whichever is greater. The width of the notch shall not exceed twice the depth. Notches shall be placed on both the OD and ID surfaces.

11.10.3 For Eddy-Current Testing, the reference standard shall contain, at the option of the manufacturer, any one of the following discontinuities:

11.10.3.1 Drilled Hole — The reference standard shall contain three or more holes, equally spaced circumferentially around the pipe and longitudinally separated by a sufficient distance to allow distinct identification of the signal from each hole. The holes shall be drilled radially and completely through the pipe wall, with care being taken to avoid distortion of the pipe while drilling. One hole shall be drilled in the weld, if visible. Alternately, the producer of welded pipe may choose to drill one hole in the weld and run the calibration standard through the test coils three times with the weld turned at 120° on each pass. The hole diameter shall vary with NPS as follows:

NPS Designator	Hole Diameter
	0.039 in. (1 mm)
above $\frac{1}{2}$ to $1\frac{1}{4}$	0.055 in. (1.4 mm)
above $1\frac{1}{4}$ to 2	0.071 in. (1.8 mm)
above 2 to 5	0.087 in. (2.2 mm)
above 5	0.106 in. (2.7 mm)

11.10.3.2 Transverse Tangential Notch — Using a round tool or file with a $\frac{1}{4}$ in. (6.4 mm) diameter, a notch shall be filed or milled tangential to the surface and transverse to the longitudinal axis of the pipe. Said notch shall have a depth not exceeding $12\frac{1}{2}\%$ of the specified nominal wall thickness of the pipe or 0.004 in. (0.102 mm), whichever is greater.

11.10.3.3 Longitudinal Notch — A notch 0.031 in. or less in width shall be machined in a radial plane parallel to the tube axis on the outside surface of the pipe, to have a depth not exceeding $12\frac{1}{2}\%$ of the specified wall thickness of the pipe or 0.004 in., whichever is greater. The length of the notch shall be compatible with the testing method.

11.10.3.4 More or smaller reference discontinuities, or both, may be used by agreement between the purchaser and the manufacturer.

11.11 Standardization Procedure:

11.11.1 The test apparatus shall be standardized at the beginning and end of each series of pipes of the same size (NPS or diameter and schedule or wall thickness), grade and heat treatment condition, and at intervals not exceeding 4 h. More frequent standardization may be performed at the manufacturer's option or may be required upon agreement between the purchaser and the manufacturer.

11.11.2 The test apparatus shall also be standardized after any change in test system settings; change of operator; equipment repair; or interruption due to power loss, process shutdown, or when a problem is suspected.

11.11.3 The reference standard shall be passed through the test apparatus at the same speed and test system settings as the pipe to be tested.

11.11.4 The signal-to-noise ratio for the reference standard shall be $2\frac{1}{2}$ to 1 or greater. Extraneous signals caused by identifiable causes such as dings, scratches, dents, straightener marks, and so forth, shall not be considered noise. The rejection amplitude shall be adjusted to be at least 50% of full scale of the readout display.

11.11.5 If upon any standardization, the rejection amplitude has decreased by 29% (3 dB) of peak height from the last standardization, the pipe since the last calibration shall be rejected. The test system settings may be changed, or the transducer(s), coil(s) or sensor(s) adjusted, and the unit restandardized, but all pipe tested since the last acceptable standardization must be retested for acceptance.

11.12 Evaluation of Imperfections:

11.12.1 Pipes producing a signal equal to or greater than the lowest signal produced by the reference standard(s) shall be identified and separated from the acceptable pipes. The area producing the signal may be reexamined.

11.12.2 Such pipes shall be rejected if the test signal was produced by imperfections that cannot be identified or was produced by cracks or crack-like imperfections. These pipes may be repaired in accordance with Sections 13 and 14. To be accepted, a repaired pipe must pass the same nondestructive test by which it was rejected, and it must meet the minimum wall thickness requirements of this specification.

11.12.3 If the test signals were produced by visual imperfections such as:

- (1) Scratches,
- (2) Surface roughness,
- (3) Dings,
- (4) Straightener marks,
- (5) Cutting chips,
- (6) Steel die stamps,
- (7) Stop marks, or
- (8) Pipe reducer ripple.

The pipe may be accepted based on visual examination provided the imperfection is less than 0.004 in. (0.1 mm) or $12\frac{1}{2}\%$ of the specified wall thickness (whichever is greater).

11.12.4 Rejected pipe may be reconditioned and retested providing the wall thickness is not decreased to less than that required by this or the product specification. The outside diameter at the point of grinding may be reduced by the amount so removed. To be accepted, retested pipe shall meet the test requirement.

11.12.5 If the imperfection is explored to the extent that it can be identified as non-rejectable, the pipe may be accepted without further test providing the imperfection does not encroach on the minimum wall thickness.

12. Mechanical Tests Required

12.1 Transverse or Longitudinal Tension Test — The tension test shall be performed on 1% of the pipe from each lot.

NOTE 4 — The term "lot" applies to all pipe of the same nominal size and wall thickness (or schedule) which is produced from the same heat of steel and subjected to the same finishing treatment in a continuous furnace or by directly obtaining the heat treated condition by quenching after hot forming. When final heat treatment is in a batch-type furnace, the lot shall include only that pipe which is heat treated in the same furnace charge.

12.2 Flattening Test — For pipe heat treated in a batch-type furnace, the flattening test shall be made on 5% of the pipe from each heat-treated lot (see Note 4). When heat treated by the continuous process or when treated condition is obtained directly by quenching after hot forming, this test shall be made on a sufficient number of pipe to constitute 5% of the lot (Note 4) but in no case less than two pipes.

13. Certification

13.1 In addition to the certification required by Specification A 999/A 999M, the certification for pipe furnished to this specification shall identify each length of pipe which is furnished without the manufacturer's completed hydrostatic test, in accordance with 11.3.

14. Product Marking

14.1 In addition to the marking prescribed in Specification A 999/A 999M, the marking shall include the ANSI schedule number, the heat number or manufacturer's number by which the heat can be identified, and, if applicable,

NH when hydrotesting is not performed and ET when eddy-current testing is performed, or UT when ultrasonic testing is performed.

14.2 If the pipe conforms to any of the supplementary requirements specified in S1 through S10, compliance shall be so indicated by adding the symbol “S” directly followed by the number of the applicable supplementary requirement to the marking prescribed in 14.1.

14.3 No steel indentation stamping shall be done without the purchaser’s consent.

15. Keywords

15.1 austenitic stainless steel; feedwater heater tubes; stainless steel tube; steel tube; welded steel tube

TABLE 1 CHEMICAL REQUIREMENTS

Grade	UNS Designation	Composition, %										Tan- talum	Nitrogen (A)	Others

NOTES:

- (A) The method of analysis for nitrogen shall be a matter of agreement between the purchaser and manufacturer.
 (B) The titanium content shall be not less than five times the carbon content and not more than 0.70%.
 (C) The titanium content shall be not less than four times the carbon content and not more than 0.70%.
 (D) The columbium content shall be not less than ten times the carbon content and not more than 1.10%.
 (E) The columbium content shall be not less than eight times the carbon content and not more than 1.10%.
 (F) This grade is intended for special purpose applications.

TABLE 2 TENSILE REQUIREMENTS

Grade	Tensile (A) Strength, min, ksi [MPa]	Yield Strength, min, ksi [MPa]	Elongation in 2 in. or 50 mm (or 4D) min, %	
			Longitudinal	Transverse
TP304, TP304H, TP304LN, TP316, TP316H, TP316LN, TP347, TP347H, TP348, TP348H, 16-8-2H, S31725	75 [515]	30 [205]	35	25
TP304N, TP316N, S31726	80 [550]	35 [240]	35	25
S34565	115 [790]	60 [415]	35	30
TP321, TP321H				
≤ $\frac{3}{8}$ "	75 [515]	30 [205]	35	25
> $\frac{3}{8}$ " (B)	70 [480]	25 [170]	35	25

NOTES:

(A) For grade TP304, NPS 8 or larger, and in schedules 140 and heavier, the required minimum tensile strength shall be 70 ksi [480 MPa].

(B) Prior to the issuance of A 376/A 376M — 88, the tensile and yield strength values were 75 [520] and 30 [210] respectively, for nominal wall greater than $\frac{3}{8}$ in. [9.5 mm].

SUPPLEMENTARY REQUIREMENTS FOR PIPE REQUIRING SPECIAL CONSIDERATION

One or more of the following supplementary requirements shall apply only when specified in the purchase order. The purchaser may specify a different frequency of test or analysis than is provided in the supplementary requirement. Subject to agreement between the purchaser and manufacturer, retest and retreatment provisions of these supplementary requirements may also be modified.

S1. Product Analysis

S1.1 Product analysis shall be made on each length of pipe. Individual lengths failing to conform to the chemical composition requirements shall be rejected.

S2. Transverse Tension Tests

S2.1 A transverse tension test shall be made on a specimen from one end or both ends of each pipe NPS 8 and over in nominal diameter. If this supplementary requirement is specified, the number of tests per pipe shall also be specified. If a specimen from any length fails to meet the required tensile properties (tensile, yield, and elongation), that length shall be rejected subject to retreatment in accordance with Specification A 999/A 999M and satisfactory retest.

S3. Flattening Test

S3.1 The flattening test of Specification A 999/A 999M shall be made on a specimen from one end or both ends of each pipe. Crop ends may be used. If this supplementary requirement is specified, the number of tests per pipe shall also be specified. If a specimen from any length fails because of lack of ductility prior to satisfactory completion of the first step of the flattening test requirement that pipe shall be rejected subject to retreatment in accordance with Specification A 999/A 999M and satisfactory retest. If a specimen from any length of pipe fails because of a lack of soundness that length shall be rejected, unless subsequent retesting indicates that the remaining length is sound.

S4. Etching Tests

S4.1 The steel shall be homogeneous as shown by etching tests conducted in accordance with the appropriate portions of Method E 381. Etching tests shall be made on a cross section from one end or both ends of each pipe and shall show sound and reasonably uniform material free from injurious laminations, cracks, and similar objectionable defects. If this supplementary requirement is specified, the number of tests per pipe required shall also be specified. If a specimen from any length shows objectionable defects,

the length shall be rejected, subject to removal of the defective end and subsequent retests indicating the remainder of the length to be sound and reasonably uniform material.

S5. Photomicrographs

S5.1 Photomicrographs at 100 diameters may be made from one end of each piece of pipe furnished in sizes 6 in. [152 mm] and larger in the as-furnished condition. Such photomicrographs shall be suitably identified as to pipe size, wall thickness, piece number, and heat. Such photomicrographs are for information only, and shall show the actual metal structure of the pipe as finished.

S6. Ultrasonic Test

S6.1 Each piece of pipe may be ultrasonically tested to determine its soundness throughout the entire length of the pipe. Each piece shall be ultrasonically tested in a circumferential direction in such a manner that the entire piece is scanned by the ultrasonic beam. The calibration standard shall be prepared from a section of pipe which has two notches, one in the inside surface and one in the outside surface. The notches shall be at least $1\frac{1}{2}$ in. [38 mm] long and have a depth of 3% of the wall thickness, or 0.004 in. [0.1 mm], whichever is the greater. Any pipe showing an ultrasonic indication of greater amplitude than the amplitude of the indication from the calibration standard shall be subject to rejection.

S7. Hot Ductility Test for Indicating Weldability

S7.1 A high-temperature ductility test may be made upon each heat of material supplied in heavy-wall pipe sections. An appropriate specimen shall be heated to an initial temperature, cooled 100°F [50°C], then subjected to a tension test, and shall show a minimum reduction of area of 60%. The initial temperature is that temperature 50°F [30°C] below the temperature at which material exhibits zero ductility. Rejection of material shall not be based upon this test.

S8. Retests

S8.1 Upon the purchaser's request, retests shall be made from sections of material removed from any part of the pipe. Failure to meet the requirements stated in this specification shall be cause for rejection.

S9. Stabilization Heat Treatment

S9.1 Subsequent to the solution anneal required in 6.4, Grades TP321, TP321H, TP347, TP347H, TP348, and TP348H shall be given a stabilization heat treatment at a temperature lower than that used for the initial solution annealing heat treatment. The temperature of stabilization heat treatment shall be at a temperature as agreed upon between the purchaser and vendor.

S10. Intergranular Corrosion Test

S10.1 When specified, material shall pass intergranular corrosion tests conducted by the manufacturer in accordance with Practices A 262, Practice E.

NOTE S10.1 — Practice E requires testing on the sensitized condition for low carbon or stabilized grades, and on the as-shipped condition for other grades.

S10.2 A stabilization heat treatment in accordance with Supplementary Requirement S9 may be necessary and is permitted in order to meet this requirement for the grades containing titanium or columbium, particularly in their H versions.

SPECIFICATION FOR PRESSURE VESSEL PLATES, ALLOY STEEL, CHROMIUM-MOLYBDENUM

**SA-387/SA-387M**

(Identical with ASTM Specification A 387/A 387M-06a)

1. Scope

1.1 This specification covers chromium-molybdenum alloy steel plates intended primarily for welded boilers and pressure vessels designed for elevated temperature service.

1.2 Plates are available under this specification in several grades having different alloy contents as follows:

Grade	Nominal Chromium Content, %	Nominal Molybdenum Content, %
2	0.50	0.50
12	1.00	0.50
11	1.25	0.50
22, 22L	2.25	1.00
21, 21L	3.00	1.00
5	5.00	0.50
9	9.00	1.00
91	9.00	1.00

1.3 Each grade except Grades 21L, 22L, and 91 is available in two classes of tensile strength levels as defined in the Tensile Requirements tables. Grades 21L and 22L are available only as Class 1. Grade 91 is available only as Class 2.

NOTE 1 — Grade 911, previously covered by this specification, is now covered by Specification A 1017/A 1017M.

1.4 The maximum thickness of plates is limited only by the capacity of the composition to meet the specified mechanical property requirements.

1.5 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents. Therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with this specification.

2. Referenced Documents

2.1 ASTM Standards:

- A 20/A 20M Specification for General Requirements for Steel Plates for Pressure Vessels
- A 307 Specification for Carbon Steel Bolts and Studs, 60 000 PSI Tensile Strength
- A 435/A 435M Specification for Straight-Beam Ultrasonic Examination of Steel Plates
- A 577/A 577M Specification for Ultrasonic Angle-Beam Examination of Steel Plates
- A 578/A 578M Specification for Straight-Beam Ultrasonic Examination of Plain and Clad Steel Plates for Special Applications
- A 1017/A 1017M Specification for Pressure Vessel Plates, Alloy Steel, Chromium-Molybdenum-Tungsten

3. General Requirements and Ordering Information

3.1 Material supplied to this material specification shall conform to Specification A 20/A 20M. These requirements outline the testing and retesting methods and procedures, permissible variations in dimensions and weight, quality and repair of defects, marking, loading, etc.

3.2 Specification A 20/A 20M also establishes the rules for the ordering information that should be complied with when purchasing material to this specification.

3.3 In addition to the basic requirements of this specification, certain supplementary requirements are available when additional control, testing, or examination is required to meet end use requirements. These include:

- 3.3.1** Vacuum treatment,
- 3.3.2** Additional or special tension testing,
- 3.3.3** Impact testing, and
- 3.3.4** Nondestructive examination.

3.4 The purchaser is referred to the listed supplementary requirements in this specification and to the detailed requirements in Specification A 20/A 20M. If the requirements of this specification are in conflict with the requirements of Specification A 20/A 20M, the requirements of this specification shall prevail.

4. Manufacture

4.1 *Steelmaking Practice* — The steel shall be killed.

5. Heat Treatment

5.1 Except for Grade 91, all plates shall be thermally treated either by annealing, normalizing- and -tempering, or, when permitted by the purchaser, accelerated cooling from the austenitizing temperature by air blasting or liquid quenching, followed by tempering. Minimum tempering temperatures shall be as follows:

Grade	Temperature, °F [°C]
2, 12, and 11	1150 [620]
22, 22L, 21, 21L, and 9	1250 [675]
5	1300 [705]

5.1.1 Grade 91 plates shall be normalized at 1900 to 1975°F [1040 to 1080°C] and shall be tempered at 1350 to 1470°F [730 to 800°C].

5.2 Grade 5, 9, 21, 21L, 22, 22L, and 91 plates ordered without the heat treatment required by 5.1 shall be furnished in either the stress-relieved or the annealed condition.

5.3 For plates ordered without the heat treatment required by 5.1, heat treatment of the plates to conform to 5.1 and to Table 2 or Table 3, as applicable, shall be the responsibility of the purchaser.

6. Chemical Requirements

6.1 The steel shall conform to the requirements as to chemical composition shown in Table 1 unless otherwise modified in accordance with Supplementary Requirement S17, Vacuum Carbon-Deoxidized Steel, in Specification A 20/A 20M for grades other than Grade 11.

7. Metallurgical Structure

7.1 *Austenitic Grain Size* — Grade 2 material shall have a coarse austenitic grain size.

8. Mechanical Requirements

8.1 Tension Test Requirements:

8.1.1 The material as represented by the tension test specimens shall conform to the applicable requirements of Table 2 or Table 3, as specified on the order.

8.1.2 Adjustment of the percentage elongation requirements is permitted in accordance with Specification A 20/A 20M for plates up to $\frac{3}{4}$ in. [20 mm] inclusive, in thickness when an 8 in. [200 mm] gage length is used.

9. Marking

9.1 In addition to the marking required in Specification A 20/A 20M, each plate shall be legibly stamped or stenciled, depending upon the ordered thickness, with the letter *A* for annealed, *N* for normalized and tempered, and *Q* for accelerated cooled and tempered, as applicable.

10. Keywords

10.1 alloy steel; alloy steel plate; pressure containing parts; pressure vessel steels; steel plates; steel plates for pressure vessels

NOTES:

- (1) Not applicable to annealed material.
- (2) See Specification A 20/A 20M, elongation adjustments.
- (3) Measured on round test specimens.
- (4) Measured on flat specimen.

SUPPLEMENTARY REQUIREMENTS

Supplementary requirements shall not apply unless specified in the order. A list of standardized supplementary requirements for use at the option of the purchaser is included in Specification A 20/A 20M. Several of those considered suitable for use with this specification are listed below by title. Other tests may be performed by agreement between the supplier and the purchaser.

- | | |
|---|---|
| S1. Vacuum Treatment, | S7. High-Temperature Tension Test, |
| S2. Product Analysis, | S8. Ultrasonic Examination in Accordance With Specification A 435/A 435M, |
| S3. Simulated Post-Weld Heat Treatment of Mechanical Test Coupons, | S9. Magnetic Particle Examination, |
| S4.1 Additional Tension Test, | S11. Ultrasonic Examination in Accordance With Specification A 577/A 577M, |
| S5. Charpy V-Notch Impact Test, | S12. Ultrasonic Examination in Accordance With Specification A 578/A 578M, and |
| S6. Drop Weight Test (for Material 0.625 in. [16 mm] and over in Thickness), | S17. Vacuum Carbon-Deoxidized Steel. |

ADDITIONAL SUPPLEMENTARY REQUIREMENTS

In addition, the following supplementary requirements are suitable for this application. S62 and S63 are applicable for Grades 22 and 21 only.

S53.

When specified by the purchaser, the axis of the tensile and impact test specimens shall come from the mid-thickness of each plate tested, in lieu of midway between the center thickness and the top or bottom surface of the plate.

S60. Restricted Carbon

S60.1 The maximum carbon content of Grade 5 shall be 0.10%.

S62. Temper Embrittlement Factor

S62.1 The composition of the steel, based on heat analysis, shall be restricted in accordance with the following equations:

$$J = (Si + Mn) \times (P + Sn) \times 10^4 \leq 150$$

(Si, Mn, P and Sn in wt. %)

$$Cu \leq 0.20\%$$

$$Ni \leq 0.30\%$$

S62.1.1 Lower values of J, Cu, and Ni can be specified by agreement between purchaser and the supplier.

S62.1.2 When so specified by the purchaser, the maximum value of J shall not exceed 100.

S62.1.3 The values of J shall be reported.

S62.1.4 If the plates are repaired by welding, the composition of the weld deposit shall be restricted in accordance with the following equations:

$$X = (10P + 5Sb + 4Sn + As)/100 \leq 15$$

(P, Sb, Sn and As in ppm)

$$Cu \leq 0.20\%$$

$$Ni \leq 0.30\%$$

S62.1.5 The values of X shall be reported.

S63. Impact Properties After Step Cooling

S63.1 The Charpy V-notch impact properties shall be determined as follows:

S63.1.1 A sufficient amount of Charpy V-notch test specimens shall be taken from the same location from a plate from each heat of steel to construct two transition temperature curves.

S63.1.2 The test specimens for one transition temperature curve shall be given the minimum post weld heat treatment (PWHT) cycle specified by the purchaser.

S63.2 The test specimens for the other transition temperature curve shall be given the PWHT cycle specified in S63.1.2 plus the following step cooling heat treatment:

Hold at 1100°F (593°C) for 1 h, then cool at 10°F (5.6°C)/h to 1000°F (538°C).

Hold at 1000°F (538°C) for 15 h, then cool at 10°F (5.6°C)/h to 975°F (524°C).

Hold at 975°F (524°C) for 24 h, then cool at 10°F (5.6°C)/h to 925°F (496°C).

Hold at 925°F (496°C) for 60 h, then cool at 5°F (2.8°C)/h to 875°F (468°C).

Hold at 875°F (468°C) for 100 h, then cool at 50°F (27.8°C)/h to 600°F (315°C).

Cool in still air.

S63.3 Test the Charpy V-notch test specimens in accordance with Test Methods and Definitions A 370 to determine the 40 ft-lbs (55 J) transition temperature from each transition temperature curve using a set of three test specimens at each test temperature. The test temperatures shall include tests on the upper and lower shelves and a minimum of four intermediate temperatures.

S63.4 The following requirements shall be met.

$$\nu Tr40 + 2.5\Delta \nu Tr40 \leq 50^\circ F$$

$$\nu Tr55 + 2.5\Delta \nu Tr55 \leq 10^\circ C$$

where:

$\nu Tr40$ ($\nu Tr55$) = the 40 ft-lbs (55 J) transition temperature of the material subjected to the minimum PWHT specified by the purchaser

$\Delta \nu Tr40$ ($\Delta \nu Tr55$) = the shift of the 40 ft-lbs (55 J) transition temperature the of the step cooled material. (The 40 ft-lbs (55 J) transition temperature the of the step cooled material minus that of the material subjected to the minimum PWHT only)

S63.5 The 40 ft-lbs (55 J) transition temperatures for the two material conditions shall be reported.

FIG. S1.1 TRANSITION TEMPERATURE CURVES BEFORE AND AFTER STEP COOL HEAT TREATMENT

PRACTICE FOR ULTRASONIC EXAMINATION OF HEAVY STEEL FORGINGS

SA-388/SA-388M

(Identical with ASTM Specification A 388/A 388M-07.)

1. Scope

1.1 This practice covers the examination procedures for the contact, pulse-echo ultrasonic examination of heavy steel forgings by the straight and angle-beam techniques. The straight beam techniques include utilization of the DGS (Distance Gain-Size) method. See Appendix X3.

1.2 This practice is to be used whenever the inquiry, contract, order, or specification states that forgings are to be subject to ultrasonic examination in accordance with Practice A 388/A 388M.

1.3 The values stated in either SI units or inch-pound units are to be regarded separately as standard. The values stated in each system may not be exact equivalents; therefore, each system shall be used independently of the other. Combining values from the two systems may result in non-conformance with the standard.

1.4 This specification and the applicable material specifications are expressed in both inch-pound units and SI units. However, unless the order specifies the applicable “M” specification designation [SI units], the material shall be furnished to inch-pound units.

1.5 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

2.2 ANSI Standard:

B 46.1 Surface Texture

2.3 Other Document:

Recommended Practice for Nondestructive Personnel Qualification and Certification SNT-TC-1A, (1988 or later)

3. Terminology

3.1 Definitions:

3.1.1 *indication levels (clusters), n*— five or more indications in a volume representing a 2 in. [50 mm] or smaller cube in the forging.

3.1.2 *individual indications, n*— single indications showing a decrease in amplitude as the search unit is moved in any direction from the position of maximum amplitude and which are too small to be considered traveling or planar.

3.1.3 *planar indications, n*— indications shall be considered continuous over a plane if they have a major axis greater than 1 in. [25 mm] or twice the major dimension of the transducer, whichever is greater, and do not travel.

3.1.4 *traveling indications, n*— inductions whose leading edge moves a distance equivalent to 1 in. [25 mm] or more of metal depth with movement of the transducer over the surface of the forging.

4. Ordering Information

4.1 When this practice is to be applied to an inquiry, contract, or order, the purchaser shall so state and shall also furnish the following information:

4.1.1 Designation number (including year date),

4.1.2 Method of establishing the sensitivity in accordance with 8.2.2 and 8.3.3 (Vee- or rectangular-notch),

4.1.2.1 The diameter and test metal distance of the flat-bottom hole and the material of the reference block in accordance with 8.2.2.2,

4.1.3 Quality level for the entire forging or portions thereof in accordance with 11.3, and

4.1.4 Any options in accordance with 1.4, 5.4, 5.5, 6.1, 7.1, 7.2, 8.1.11, 9.1, and 9.2.

5. Apparatus

5.1 An ultrasonic, pulsed, reflection type of instrument shall be used for this examination. The system shall have a minimum capability for examining at frequencies from 1 to 5 MHz. On examining austenitic stainless forgings the system shall have the capabilities for examining at frequencies down to 0.4 MHz.

5.1.1 The ultrasonic instrument shall provide linear presentation (within 5%) for at least 75% of the screen height (sweep line to top of screen). The 5% linearity referred to is descriptive of the screen presentation of amplitude. Instrument linearity shall be verified in accordance with the intent of Practice E 317. Any set of blocks processed in accordance with Practice E 317 or E 428 may be used to establish the specified $\pm 5\%$ instrument linearity.

5.1.2 The electronic apparatus shall contain an attenuator (accurate over its useful range to $\pm 10\%$ (+1 dB) of the amplitude ratio) which will allow measurement of indications beyond the linear range of the instrument.

5.2 *Search Units*, having a transducer with a maximum active area of 1 in.² [650 mm²] with $\frac{3}{4}$ in. [20 mm] minimum to $1\frac{1}{8}$ in. [30 mm] maximum dimensions shall be used for straight-beam scanning (see 8.2); and search units with $\frac{1}{2}$ in. [13 mm] minimum to 1 in. [25 mm] maximum dimensions shall be used for angle-beam scanning (see 8.3).

5.2.1 *Transducers* shall be utilized at their rated frequencies.

5.2.2 Other search units may be used for evaluating and pinpointing indications.

5.3 *Couplants*, having good wetting characteristics such as SAE No. 20 or No. 30 motor oil, glycerin, pine oil, or water shall be used. Couplants may not be comparable to one another and the same couplant shall be used for calibration and examination.

5.4 *Reference Blocks*, containing flat-bottom holes may be used for calibration of equipment in accordance with 5.1.1 and may be used to establish recording levels for straight-beam examination when so specified by the order or contract.

5.5 *DGS Scales*, matched to the ultrasonic test unit and transducer to be utilized, may be used to establish recording levels for straight beam examination, when so specified by the order or contract. The DGS scale range must be selected to include the full thickness cross-section of the forging to be examined. An example of a DGS overlay is found in Appendix X3.

6. Personnel Requirements

6.1 Personnel performing the ultrasonic examinations to this practice shall be qualified and certified in accordance with a written procedure conforming to Recommended Practice No. SNT-TC-1A (1988 or later) or another national standard that is acceptable to both the purchaser and the supplier.

7. Preparation of Forging for Ultrasonic Examination

7.1 Unless otherwise specified in the order or contract, the forging shall be machined to provide cylindrical surfaces for radial examination in the case of round forgings; the ends of the forgings shall be machined perpendicular to the axis of the forging for the axial examination. Faces of disk and rectangular forgings shall be machined flat and parallel to one another.

7.2 The surface roughness of exterior finishes shall not exceed 250 μ in. [6 μ m] unless otherwise shown on the forging drawing or stated in the order or the contract.

7.3 The surfaces of the forging to be examined shall be free of extraneous material such as loose scale, paint, dirt, and so forth.

8. Procedure

8.1 General:

8.1.1 As far as practicable, subject the entire volume of the forging to ultrasonic examination. Because of radii at change of sections and other local configurations, it may be impossible to examine some sections of a forging.

8.1.2 Perform the ultrasonic examination after heat treatment for mechanical properties (exclusive of stress-relief treatments) but prior to drilling holes, cutting keyways, tapers, grooves, or machining sections to contour. If the configuration of the forging required for the treatment for mechanical properties prohibits a subsequent complete

examination of the forging, it shall be permissible to examine prior to treatment for mechanical properties. In such cases, reexamine the forging ultrasonically as completely as possible after heat treatment.

8.1.3 To ensure complete coverage of the forging volume, index the search unit with at least 15% overlap with each pass.

8.1.4 For manual scanning, do not exceed a scanning rate of 6 in./s [150 mm/s].

8.1.5 For automated scanning, adjust scanning speed or instrument repetition rate, or both, to permit detection of the smallest discontinuities referenced in the specification and to allow the recording or signaling device to function. At no time shall the scanning speed exceed the speed at which an acceptable calibration was made.

8.1.6 If possible, scan all sections of forgings in two perpendicular directions.

8.1.7 Scan disk forgings using a straight beam technique from at least one flat face and radially from the circumference, whenever practicable.

8.1.8 Scan cylindrical sections and hollow forgings radially using a straight-beam technique. When practicable, also examine the forging in the axial direction.

8.1.9 In addition, examine hollow forgings by angle-beam technique from the outside diameter surface as required in 8.3.1.

8.1.10 In rechecking or reevaluation by manufacturer or purchaser, use comparable equipment, search units, frequency, and couplant.

8.1.11 Forgings may be examined either stationary or while rotating in a lathe or on rollers. If not specified by the purchaser, either method may be used at the manufacturer's option.

8.2 Straight-Beam Examination:

8.2.1 For straight-beam examination use a nominal $2\frac{1}{4}$ MHz search unit whenever practicable; however, 1 MHz is the preferred frequency for coarse grained austenitic materials and long testing distances. In many instances on examining coarse grained austenitic materials it may be necessary to use a frequency of 0.4 MHz. Other frequencies may be used if desirable for better resolution, penetrability, or detectability of flaws.

8.2.2 Establish the instrument sensitivity by either the reflection, reference-block technique, or DGS method (see Appendix X3 for an explanation of the DGS method).

8.2.2.1 Back-Reflection Technique (Back-Reflection Calibration Applicable to Forgings with Parallel Entry and Back Surfaces) — With the attenuator set at an appropriate level, for example 5 to 1 or 14 dB, adjust the instrument controls to obtain a back reflection approximately 75% of the full-screen height from the opposite

side of the forging. Scan the forging at the maximum amplification setting of the attenuator (attenuator set at 1 to 1). Carry out the evaluation of discontinuities with the gain control set at the reference level. Recalibration is required for significant changes in section thickness or diameter.

NOTE 1 — High sensitivity levels are not usually employed when inspecting austenitic steel forgings due to attendant high level of "noise" or "hash" caused by coarse grain structure.

8.2.2.2 Reference-Block Calibration — The test surface roughness on the calibration standard shall be comparable to, but no better than, the item to be examined. Adjust the instrument controls to obtain the required signal amplitude from the flat-bottom hole in the specified reference block. Utilize the attenuator in order to set up on amplitudes larger than the vertical linearity of the instrument. In those cases, remove the attenuation prior to scanning the forging.

NOTE 2 — When flat-surfaced reference block calibration is specified, adjust the amplitude of indication from the reference block or blocks to compensate for examination surface curvature (an example is given in Appendix X1).

8.2.2.3 DGS Calibration — Prior to use, verify that the DGS overlay matches the transducer size and frequency. Accuracy of the overlay can be verified by reference blocks and procedures outlined in Practice E 317. Overlays are to be serialized to match the ultrasonic transducer and pulse echo testing system that they are to be utilized with.

8.2.2.4 Choose the appropriate DGS scale for the cross-sectional thickness of the forging to be examined. Insert the overlay over the CRT screen, ensuring the DGS scale base line coincides with the sweep line of the CRT screen. Place the probe on the forging, adjust the gain to make the first back-wall echo appear clearly on CRT screen. Using the Delay and Sweep control, shift the screen pattern so that the leading edge of the initial pulse is on zero of the DGS scale and the back-wall echo is on the DGS scale value corresponding to the thickness of the forging. Adjust the gain so the forging back-wall echo matches the height of the DGS reference slope within ± 1 Db. Once adjusted, increase the gain by the Db shown on the DGS scale for the reference slope. Instrument is now calibrated and flaw sizes that can be reliably detected can be directly read from the CRT screen. These flaw sizes are the equivalent flat bottom reflector that can be used as a reference point.

NOTE 3 — The above can be utilized on all solid forgings. Cylindrical hollow forgings, and drilled or bored forgings must be corrected to compensate for attenuation due to the central hole (see Appendix X4).

8.2.3 Recalibration — Any change in the search unit, couplant, instrument setting, or scanning speed from that used for calibration shall require recalibration. Perform a

calibration check at least once every 8 h shift. When a loss of 15% or greater in the gain level is indicated, reestablish the required calibration and reexamine all of the material examined in the preceding calibration period. When an increase of 15% or greater in the gain level is indicated, reevaluate all recorded indications.

8.2.4 During the examination of the forging, monitor the back reflection for any significant reduction in amplitude. Reduction in back-reflection amplitude may indicate not only the presence of a discontinuity but also poor coupling of the search unit with the surface of the forging, nonparallel back-reflection surface, or local variations of attenuation in the forging. Recheck any areas causing loss of back reflection.

8.3 Angle-Beam Examination—Rings and Hollow Forgings:

8.3.1 Perform the examination from the circumference of rings and hollow forgings that have an axial length greater than 2 in. [50 mm] and an outside to inside diameter ratio of less than 2.0 to 1.

8.3.2 Use a 1 MHz, 45° angle-beam search unit unless thickness, OD/ID ratio, or other geometric configuration results in failure to achieve calibration. Other frequencies may be used if desirable for better resolution, penetrability, or detectability of flaws. For angle-beam inspection of hollow forgings up to 2.0 to 1 ratio, provide the transducer with a wedge or shoe that will result in the beam mode and angle required by the size and shape of the cross section under examination.

8.3.3 Calibrate the instrument for the angle-beam examination to obtain an indication amplitude of approximately 75% full-screen height from a rectangular or a 60° V-notch on inside diameter (ID) in the axial direction and parallel to the axis of the forging. A separate calibration standard may be used; however, it shall have the same nominal composition, heat treatment, and thickness as the forging it represents. The test surface finish on the calibration standard shall be comparable but no better than the item to be examined. Where a group of identical forgings is made, one of these forgings may be used as the separate calibration standard. Cut the ID notch depth to 3% maximum of the thickness or $\frac{1}{4}$ in. [6 mm], whichever is smaller, and its length approximately 1 in. [25 mm]. Thickness is defined as the thickness of the forging to be examined at the time of examination. At the same instrument setting, obtain a reflection from a similar OD notch. Draw a line through the peaks of the first reflections obtained from the ID and OD notches. This shall be the amplitude reference line. It is preferable to have the notches in excess metal or test metal when possible. When the OD notch cannot be detected when examining the OD surface, perform the examination when practicable (some ID's may be too small to permit examination), as indicated above from both the

OD and ID surfaces. Utilize the ID notch when inspecting from the OD, and the OD notch when inspecting from the ID. Curve wedges or shoes may be used when necessary and practicable.

8.3.4 Perform the examination by scanning over the entire surface area circumferentially in both the clockwise and counter-clockwise directions from the OD surface. Examine forgings, which cannot be examined axially using a straight beam, in both axial directions with an angle-beam search unit. For axial scanning, use rectangular or 60° V-notches on the ID and OD for the calibration. These notches shall be perpendicular to the axis of the forging and the same dimensions as the axial notch.

9. Recording

9.1 Straight-Beam Examination — Record the following indications as information for the purchaser. These recordable indications do not constitute a rejectable condition unless negotiated as such in the purchase order or contract.

9.1.1 For individual indications, report:

9.1.1.1 In the back-reflection technique, individual indications equal to or exceeding 10% of a nominal back reflection from an adjacent area free from indications, and

9.1.1.2 In the reference-block or DGS technique, indications equal to or exceeding 100% of the reference amplitude.

9.1.2 For indications that are planar, traveling, or clustered, determine the location of the edges and the major and minor axes using the half-amplitude (6dB drop) technique and report:

9.1.2.1 The variation in depth or planar area, or both, of traveling indications,

9.1.2.2 The length of major and minor axes of planar indications, and

9.1.2.3 The volume occupied by indication levels and the amplitude range.

9.2 Angle-Beam Examination — Record discontinuity indications equal to or exceeding 50% of the indication from the reference line. When an amplitude reference line cannot be generated, record discontinuity indications equal to or exceeding 50% of the reference notch. These recordable indications do not constitute a rejectable condition unless negotiated as such in the purchase order.

9.3 Report reduction in back reflection exceeding 50% of the original measured in increments of 10%.

9.4 When recording, corrections must be made for beam divergence at the estimated flaw depth (See Guide E 1065).

9.5 Report indication amplitudes in increments of 10%.

10. Report

10.1 Report the following information:

10.1.1 All recordable indications (see Section 9);

10.1.2 For the purpose of reporting the locations of recordable indications, a sketch shall be prepared showing the physical outline of the forging including dimensions of all areas not inspected due to geometric configuration, the purchaser's drawing number, the purchaser's order number, and the manufacturer's serial number, and the axial, radial, and circumferential distribution of recordable ultrasonic indications;

10.1.3 The designation (including year date) to which the examination was performed as well as the frequency used, method of setting sensitivity, type of instrument, surface finish, couplant, and search unit employed; and

10.1.4 The inspector's name or identity and date the examination was performed.

11. Quality Levels

11.1 This practice is intended for application to forgings, with a wide variety of sizes, shapes, compositions, melting processes, and applications. It is, therefore, impracticable to specify an ultrasonic quality level which would be universally applicable to such a diversity of products. Ultrasonic acceptance or rejection criteria for individual forgings should be based on a realistic appraisal of service requirements and the quality that can normally be obtained in the production of the particular type forging.

11.2 Heavy austenitic stainless steel forgings are more difficult to penetrate ultrasonically than similar carbon or low-alloy steel forgings. The degree of attenuation normally increases with section size; and the noise level, generally or in isolated areas, may become too great to permit detection of discrete indications. In most instances, this attenuation results from inherent coarse grained microstructure of these austenitic alloys. For these reasons, the

methods and standards employed for ultrasonically examining carbon and low-alloy steel forgings may not be applicable to heavy austenitic steel forgings. In general, only straight beam inspecting using a back-reflection reference standard is used. However, utilization of Practice A 745/A 745M for austenitic steel forgings can be considered if flat bottom hole reference standards or angle beam examination of these grades are required.

11.3 Acceptance quality levels shall be established between purchaser and manufacturer on the basis of one or more of the following criteria.

11.3.1 *Straight-Beam Examination:*

11.3.1.1 No indications larger than some percentage of the reference back reflection.

11.3.1.2 No indications equal to or larger than the indication received from the flat-bottom hole in a specific reference block or blocks.

11.3.1.3 No areas showing loss of back reflection larger than some percentage of the reference back reflection.

11.3.1.4 No indications per 11.3.1.1 or 11.3.1.2 coupled with some loss of resultant back reflection per 11.3.1.3.

11.3.1.5 No indications exceeding the reference level specified in the DGS method

11.3.2 *Angle-Beam Examination* — No indications exceeding a stated percentage of the reflection from a reference notch or of the amplitude reference line.

11.4 Intelligent application of ultrasonic quality levels involves an understanding of the effects of many parameters on examination results.

12. Keywords

12.1 angle beam examination; back-reflection; DGS; reference-block; straight beam examination; ultrasonic

SUPPLEMENTARY REQUIREMENTS

The following supplementary requirements shall apply only when specified by the purchaser in the inquiry, contract, or order. Details shall be agreed upon by the manufacturer and the purchaser.

S1. Reporting Criteria

S1.1 Reference block calibration shall be performed using at least three holes, spaced to approximate minimum, mean, and maximum thickness as tested, and shall be used to generate a distance amplitude correction (DAC) curve. The following hole sizes apply:

- (a) $\frac{1}{16}$ in. [1.5 mm] flat bottom holes (FBH) for thicknesses less than 1.5 in. [40 mm].
- (b) $\frac{1}{8}$ in. [3 mm] FBH for thicknesses of 1.5-6 in. [40-150 mm] inclusive.
- (c) $\frac{1}{4}$ in. [6 mm] FBH for thicknesses over 6 in. [150 mm].

S1.2 Reporting criteria include:

- (a) All indications exceeding the DAC curve.
- (b) Two or more indications separated by $\frac{1}{2}$ in. [12 mm] or less.

APPENDICES

(Nonmandatory Information)

X1. TYPICAL TUNING LEVEL COMPENSATION FOR THE EFFECTS OF FORGING CURVATURE

X1.1 The curve (Fig. X1.1) was determined for the following test conditions:

Material	nickel-molybdenum-vanadium alloy steel (Specification A 469/A 469M, Class 4)
Instrument	Type UR Reflectoscope
Search unit	1 $\frac{1}{8}$ in. [30 mm] diameter quartz
Frequency	2 $\frac{1}{4}$ MHz
Reference block	ASTM No. 3-0600 (aluminum)
Reflection area of reference curve	0.010 in. ² [6.5 mm ²] in nickel-molybdenum-vanadium alloy steel
Surface finish	250 μ in. [6 μ m], max, roughness

X1.2 To utilize curve, adjust reflectoscope sensitivity to obtain indicated ultrasonic response on ASTM No. 3-0600 reference block for each diameter as shown. A response of 1 in. [25 mm] sweep-to-peak is used for flat surfaces. Use attenuator to obtain desired amplitude, but do testing at 1 to 1 setting.

X2. INDICATION AMPLITUDE COMPENSATION FOR TEST DISTANCE VARIATIONS

X2.1 The curve (Fig. X2.1) has been determined for the following test conditions:

Material	nickel-molybdenum-vanadium alloy steel (Specification A 469/A 469M, Class 4)
Instrument	Type UR Reflectoscope
Search unit	1 $\frac{1}{8}$ in. [30 mm] diameter quartz
Frequency	2 $\frac{1}{4}$ MHz
Couplant	No. 20 oil
Reference block	ASTM No. 3-0600 (aluminum)
Reflection area of reference curve	0.010 in. ² [6.5 mm ²] in nickel-molybdenum-vanadium alloy steel
Surface finish	250 μ in. [6 μ m], max, roughness

X2.2 To utilize curve, establish amplitude from ASTM reference block to coincide with values from Appendix X1.

X3. BACKGROUND INFORMATION ON THE DGS METHODS

X3.1 The overlay in Fig. X3.1 was designed for a 2.0 MHz, 1 in. [25 mm] diameter probe and a maximum test distance of 39.4 in. [1000 mm]. In order to use this overlay, the sweep time base must be accurately calibrated and aligned with the overlay being used. The back reflection is then adjusted to either the RE + 10 dB line or the RE + 20 dB line, based on the thickness being tested; additional gain (10 or 20 dB) is added as designated by the line being used. The RE + 20 line covers a range to approximately 15.7 in. [400 mm] and the RE + 10 line from 15.7 to 39.4 in. [400 to 1000 mm]. At this calibration level, the flaw size is read directly from the screen. Flaw sizes from 0.078 to 1 in. [2 to 25 mm] can be read directly from the overlay.

X4. COMPENSATION FOR CENTER HOLE ATTENUATION ON CYLINDRICAL BORED OR HOLLOW FORGINGS UTILIZING THE DGS METHOD

X4.1 The hole in a cylindrical bored forging causes sound scatter. In these cases, a correction is required which depends on the wall thickness and bore diameter.

X4.1.1 Determine the correction value in dB from the Nomogram (Fig. X4.1). With the gain-dB control, proceed as described in 8.2.2.4 reducing the flaw detector gain by the correction value determined.

FIG. X1.1 TYPICAL COMPENSATION CURVE FOR EFFECTS OF FORGING CURVATURE

FIG. X2.1 TYPICAL DISTANCE-AMPLITUDE CORRECTION CURVE

FIG. X3.1 EXAMPLE OF DGS OVERLAY

FIG. X4.1 THE INFLUENCE OF A CENTRAL BORE ON THE BACKWALL ECHO AMPLITUDE OF CYLINDRICAL OR PLANE PARALLEL FORGINGS

NOTE: Metric units are presented in this figure to be consistent with DGS scales presently available. Conversion to English units would also be acceptable.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR FERRITIC DUCTILE IRON PRESSURE-RETAINING CASTINGS FOR USE AT ELEVATED TEMPERATURES

SA-395/SA-395M

[Identical with ASTM Specification A 395/A 395M-99(R09).]

1. Scope

1.1 This specification covers ductile iron castings for pressure-retaining parts for use at elevated temperatures. Castings of all grades are suitable for use up to 450°F. For temperatures above 450°F and up to 650°F, only Grade 60–40–18 castings are suitable (Note 1).

1.2 Valves, flanges, pipe fittings, pumps, and other piping components are generally manufactured in advance and supplied from stock by the manufacturer, jobber, or dealer.

1.3 For supplemental casting requirements, Specification A 834 may be utilized.

1.4 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system shall be used independently of the other. Combining values from the two systems may result in nonconformance to the specification.

NOTE 1 — For service other than as specified in this section, reference should be made to Specification A 536 for Ductile Iron Castings.

2. Referenced Documents

2.2 Manufacturer's Standardization Society of the Valve and Fittings Industry Standard:

SP 25 Standard Marking Systems for Valves, Flanges, Pipe Fittings, and Unions

3. Classification

3.1 Castings ordered to this specification are classified by grades based on mechanical property requirements, as listed in Table 1. See note following Table 1.

4. Ordering Information

4.1 Orders for material under this specification shall include the following applicable information:

4.1.1 Drawing, catalog number, or part identifications,

4.1.1.1 For grade 65-45-15, drawing indicating critical area(s) of casting (see 7.2.2 and 7.3.2).

4.1.2 Quantity (weight or number of pieces),

4.1.3 ASTM designation and year of issue,

4.1.4 Grade (See Table 1), if a Grade is not specified, the manufacturer shall supply grade 60-40-18.

4.1.5 Heat-treating requirements (see 5.2.1),

4.1.6 Pressure test requirements (see 7.4.3),

4.1.7 Test samples from castings (see 11.1.1 and 12.1.1),

4.1.8 Test coupons size (see 11.2),

4.1.9 Metallographic option (see 12.1.1),

4.1.10 Place of inspection (see 16.1),

4.1.11 Certification requirements (see 17.1),

4.1.12 Identification marking (see 18.2), and

4.1.13 Supplemental Requirements (see 1.4, 7.4.2, S1 and S2).

5. Materials and Manufacture

5.1 The melting method and the nodularizing practice shall be optional with the foundry.

5.2 Except as provided in 5.2.1, all castings Grade 60-40-18 shall be given a ferritizing heat treatment that produces essentially a ferritic structure that contains no massive carbides.

5.2.1 When specified in the purchase order, Grade 60-40-18 castings may be provided in an as-cast condition provided they comply with the requirements of 7.1 and 7.2.1.

5.2.2 Castings supplied in accordance with 5.2.1 may be stress relieved by agreement between the manufacturer and purchaser.

5.3 Castings Grade 65-45-15 may be provided in as-cast condition or heat treated, provided they comply with the requirements of 7.1, 7.2.2, and 7.3.2.

6. Chemical Requirements

6.1 The casting shall conform to the following requirements for chemical composition (Note 2):

Total carbon, min, %	3.00
Silicon, max, %	2.50
Phosphorus, max, %	0.08

6.1.1 The chemical analysis for total carbon shall be made on chilled cast pencil type specimens or from thin

wafers approximately $\frac{1}{32}$ in. [0.8 mm] thick cut from test coupons. Drillings are not reliable because of the probable loss of graphite.

6.1.2 For each reduction of 0.01% below the maximum specified phosphorus content, an increase of 0.08% silicon above the specified maximum will be permitted up to a maximum of 2.75%.

NOTE 2 — Silicon contents above 2.75%, or phosphorus contents above 0.08 % have a tendency to lower the impact resistance of the material. If the carbon content is below 3.00%, excess cementite may form during cooling and if this is not removed during heat treatment, the impact resistance of the material may be lowered.

7. Requirements

7.1 Tensile Properties:

7.1.1 The ductile iron as represented by the test specimens shall conform to the mechanical property requirements in Table 1.

7.2 Hardness:

7.2.1 For Grade 60-40-18, the hardness of the castings and test specimens shall be within the limits in Table 1.

7.2.2 For Grade 65-45-15, the hardness of test specimen and the critical area(s) of the casting, as identified on the casting drawing, shall be within the limits in Table 1. If the grade 65-45-15 casting drawing does not have critical area(s) of the casting identified, all areas of the casting shall be within the hardness limits in Table 1.

7.3 Microstructure:

7.3.1 For Grade 60-40-18, the microstructure of the separately cast test coupon or the casting shall be essentially ferritic and contain no massive carbides, and have a minimum of 90% Type I and Type II Graphite as in Fig. 1 or Plate I of Test Method A 247.

7.3.2 For Grade 65-45-15, the microstructure of the critical areas of the casting, as identified on the casting drawing, shall be 45% pearlitic, maximum, contain no massive carbides, and have a minimum 90% Type I and Type II Graphite as in Fig. 1 or Plate I of Test Method A 247.

7.4 Pressure Test Requirements:

7.4.1 Each pressure retaining Grade 60-40-18 casting shall be tested after machining to the test pressure specified by the applicable standard of ANSI, ASME Boiler and Pressure Vessel Code, or other pertinent code, and shall show no leaks.

7.4.2 Castings Grade 65-45-15 manufactured under this specification shall be capable of passing hydrostatic test(s) compatible with the rating of the finished cast component. Such tests shall be conducted by the casting manufacturer only when Supplementary Requirement S2 is specified.

7.4.3 Castings Grade 60-40-18, ordered under this specification not covered by ANSI standards and ASME Pressure Vessel Code, and castings for special service applications, shall be tested to such pressures as may be agreed upon by the manufacturer and the purchaser.

7.4.4 For castings Grade 60-40-18, it is realized that the foundry may be unable to perform the hydrostatic test prior to shipment, or that the purchaser may wish to defer testing until additional work or machining has been performed on the casting. Castings ordered in the rough state for final machining by the purchaser may be tested hydrostatically prior to shipment by the manufacturer at pressures to be agreed upon with the purchaser. However, the foundry is responsible for the satisfactory performance of the castings under the final hydrostatic test.

8. Workmanship and Finish

8.1 The surface of the casting shall be examined visually and shall be free from adhering sand, scale, cracks, and hot tears. Any other surface discontinuities shall meet visual acceptance standards specified in the order.

9. Repair

9.1 Castings for valves, flanges, pipe fittings, pumps, and other piping components ordered under applicable ANSI standards shall not be repaired by plugging, welding, brazing, or impregnation.

9.2 Castings Grade 60-40-18 not covered in 9.1 which leak on hydrostatic tests may be repaired by plugging, provided the following requirements are met:

9.2.1 No welding or brazing is permitted.

9.2.2 The diameter of the plug shall not exceed the diameter of a standard 2 in. [ISO R2] pipe plug.

9.2.3 The plugs, where practical, shall conform in all dimensions to the standard ISO $\frac{3}{8}$ plugs. In addition, they shall have full thread engagement corresponding to the thickness in the repaired section. Where a tapered plug is impractical because of the excess wall thickness in terms of plug diameter and coincident thread engagement, other types of plugs may be used provided both full engagement and effective sealing against pressure are obtained. Where possible, the ends of the plug should be ground smooth after installation to conform to the inside and outside contours of the wall of the pressure vessel or pressure part.

9.2.4 The material from which the plug is manufactured shall conform in all respects to the materials specifications that apply to the pressure vessel or pressure part.

9.2.5 The area adjacent to the drilled hole shall be examined by radiography, and shall meet the Level 3 acceptance requirements of Reference Radiographs E 689

and supporting Reference Radiographs E 446, E 186, or E 280 as applicable and defined in accordance with Reference Radiographs E 689.

9.2.6 The thickness of any repaired section in relation to the size of the plug used shall not be less than that given in Table 2.

9.2.7 The minimum radius of repaired sections of cylinders or cones in relation to the size of plug used shall not be less than that given in Table 3.

9.2.8 A repaired area may consist of a maximum of three plugs with a spacing such that the ligaments between adjacent plugs shall not be less than listed in Table 4. Other defective areas may also be repaired by plugging provided the minimum ligament between plugs in adjacent areas is not less than twice the distance from the nearest plug, the values for which are listed in Table 4.

9.3 Surface imperfections in castings Grade 60-40-18 other than valves, flanges, pipe fittings, pumps, and other piping components may be repaired by plugging provided the depth of the plug is not greater than 20% of the thickness of the casting section and the diameter of the plug is not greater than its length. Repair of surface defects may not be done on pressure-containing portions of castings. The plug need not be threaded. The conditions of 9.2.1 and 9.2.4 shall also be satisfied.

10. Sampling

10.1 A lot shall consist of one of the following:

10.1.1 All the metal from a single heating in a batch-type melting furnace.

10.1.2 All the metal poured from two or more batch-type melting furnaces into a single ladle or a single casting.

10.1.3 All the metal poured from a continuous melting furnace for a given period of time between changes in charge, processing conditions, or aim-for chemistry, or 8 h, whichever is the shorter period.

11. Test Coupon

11.1 The separately cast test coupons poured from the same lot as the castings they represent from which the tension test specimen is machined shall be cast to the size and shape shown in Fig. 2, Fig. 3, or Fig. 4. Cast coupons shall be identified with the castings they represent. Sectioning procedure for removing test specimens from Y-blocks is shown in Fig. 5.

11.1.1 Test samples may be removed from castings at locations designated on a drawing or as agreed to by manufacturer and purchaser.

11.1.2 Test bars removed from castings shall conform to Fig. 6. The testing diameter shall be $\frac{1}{2}$ in. [12.5 mm] if possible. Smaller diameters shall be utilized if necessary.

11.2 The test coupon size shall be as mutually agreed upon between the manufacturer and purchaser. In the absence of agreement, it shall be the option of the manufacturer.

11.3 The test coupons shall be cast in molds made of suitable core sand having a minimum wall thickness of $1\frac{1}{2}$ in. [38 mm] for the $\frac{1}{2}$ in. [12.5 mm], 1 in. [25 mm] sizes, and 3 in. [75 mm] for the 3 in. [75 mm] size. The coupons shall be left in the mold until they have changed to a black color (approximately 900°F [480°C] or less). The keel block as shown in Fig. 2 or the modified keel block produced from the mold shown in Fig. 4 may be substituted for the 1 in. [25 mm] block shown in Fig. 3.

11.4 When investment castings are made to this specification, the manufacturer may use test specimens cast to size incorporated in the mold with the castings or separately cast to size using the same type of mold and the same thermal conditions that are used to produce the castings. These test specimens shall be made to the dimensions shown in Fig. 1 of Specification A 732/A 732M or Fig. 5 and Fig. 6 of Test Methods and Definitions A 370.

11.5 The manufacturer shall cast a sufficient number of test coupons to provide for each ferritizing anneal. The test coupons shall be heat treated with the castings they represent. Sectioning of the test coupons prior to heat treating is not permitted.

11.6 The metallographic examination shall be made on a test lug from the test coupon shown in Fig. 7 or from a casting; or from a representative test coupon poured with the casting(s). The test coupon shall represent the metal treated with the nodularizing agent.

12. Number of Tests and Retests

12.1 One tension test shall be made from sections cut from the test coupons (Fig. 5) required by Section 11.

12.1.1 Unless otherwise stated in the contract or order for castings, a metallographic examination may be substituted for the tension test when separately cast test coupons are used. When the microstructure option is used, a minimum of one tension test is required from each day's melt and for each heat treatment (see 12.2).

12.2 If any tension test specimen shows obvious defects, another from the same coupon, or from another coupon/or representing the same metal and the same anneal charge, may be tested. If an apparently sound test specimen fails to conform to this specification, castings may be re-annealed, if required, and two retests made. If either retest

fails to conform to this specification, the castings they represent shall be rejected.

13. Tension Test Specimen Preparation

13.1 The standard machined $\frac{1}{2}$ in. [12.5 mm] round tension test specimen with 2 in. [50 mm] gage length as shown in Fig. 6 shall be used except where the $\frac{1}{2}$ in. [12.5 mm] Y-block test coupon is required. In this case, either of the small size specimens, 0.375 or 0.250 in. [9 or 6.5 mm] round as shown in Fig. 6, shall be used.

14. Test Methods

14.1 Chemical analysis shall be made in accordance with Test Method E 1806.

14.2 The yield strength shall be determined in accordance with Test Methods E 8 using one of the following methods:

14.2.1 The 0.2% off-set method, or

14.2.2 Extension under load method where the yield strength may be determined as the stress producing an elongation under load of 0.375%; that is, 0.0075 in. [0.19 mm] in a gage length of 2 in. [50 mm].

14.3 The hardness of the ductile iron as represented by the test specimens and castings shall be determined in accordance with Test Method E 10.

14.4 The percentage of each graphite type shall be determined by manual counting, semi-automatic, or automatic image analysis methods. The sum of all graphite types shall total to 100%.

15. Records

15.1 Records of the chemical composition, mechanical properties, and metallographic examination, when applicable, shall be systematically made and maintained.

16. Inspection

16.1 Unless otherwise specified in the contract or purchase order, the manufacturer shall be responsible for carrying out all the tests and inspection required by this specification.

16.2 The inspector representing the purchaser shall have entry at all time, while work on the contract of the purchaser is being performed, to all parts of the manufacturer's works which concern the manufacturer of the material ordered. The manufacturer shall afford the inspector all

reasonable facilities to satisfy him that the material is being furnished in accordance with these specifications. Unless otherwise specified, all tests and inspection shall be made at the place of manufacture or by an approved independent laboratory prior to shipment, and shall be so conducted as not to interfere unnecessarily with the operation of the works.

17. Certification

17.1 When agreed upon in writing by the purchaser and the supplier, a certification shall be made on the basis of acceptance of the material. This shall consist of a copy of the manufacturer's test report or a statement by the supplier accompanied by a copy of the test results, that the material has been sampled, tested, and inspected in accordance with the provisions of this specification. Each certification so furnished shall be signed by an authorized agent of the supplier or manufacturer.

18. Product Marking

18.1 Castings for valves, flanges, pipe fittings, and unions shall be marked for material identification in accordance with the Standard Marking System for Valves, Flanges, Pipe Fittings, and Unions, SP-25. Castings for gasketed mechanical couplings and fittings may be marked in accordance with Specification F 1476 or F 1548 respectively.

18.2 Castings, other than valves, flanges, pipe fittings, and unions, shall be identified subject to agreement by the manufacturer and the purchaser.

18.3 Marking shall be in such a position as not to injure the usefulness of the castings.

19. Keywords

19.1 casting; ductile iron; mechanical properties; pressure-retaining; pressure test; tensile strength; tension testing; yield strength

FIG. 1 SUGGESTED CLASSIFICATION OF GRAPHITE FORM IN DUCTILE CAST IRON

NOTE—Graphite types are identical with Plate 1 of Test Method A 247 and are so identified.

FIG. 2 KEEL BLOCK FOR TEST COUPONS

NOTE: The length of the keel block shall be 6 in. [152 mm]

FIG. 3 Y-BLOCKS FOR TEST COUPONS

"Y" Block Size

	For Castings of Thickness Less Than 1/2 in. [13 mm]	For Castings of Thickness 1/2 in. [13 mm] to 1 1/2 in. [38 mm]	For Castings of Thickness of 1 1/2 in. [38 mm] and Over
Dimensions	in. [mm]	in. [mm]	in. [mm]

FIG. 4 MOLD FOR MODIFIED KEEL BLOCK

FIG. 5 SECTIONING PROCEDURE FOR Y-BLOCKS

(a) $\frac{1}{2}$ in. [13 mm] Y-block — two blanks for 0.252 in. [6.40 mm] diameter tension test specimens.

(b) 1 in. [25 mm] Y-block — two blanks for 0.50 in. [12.5 mm] diameter tension test specimens.

(c) 3 in. [75 mm] Y-block — two blanks for 0.50 in. [12.5 mm] diameter tension test specimens.

FIG. 6 STANDARD 1/2 IN. [12.5 MM] ROUND TENSION TEST SPECIMEN WITH 2 IN. [50.0 MM] GAGE LENGTH AND EXAMPLES OF SMALL SIZE SPECIMENS PROPORTIONAL TO THE STANDARD SPECIMEN

- NOTES:
- (1) The reduced section may have a gradual taper from the ends toward the center, with the ends not more than 0.005 in. [0.13 mm] larger in diameter than the center on the standard specimen, and not more than 0.003 in. [0.076 mm] larger in diameter than the center on the small size specimens.
 - (2) If desired, on the small size specimens the length of the reduced section may be increased to accommodate an extensometer. However, reference marks for measurement of elongation should nevertheless be spaced at the indicated gage length.
 - (3) The gage length and fillets shall be as shown, but the ends may be of any form to fit the holders of the testing machine in such a way that the load shall be axial. If the ends are to be held in grips it is desirable, to make the length of the grip section great enough to allow the specimen to extend into the grips a distance equal to two thirds or more of the length of the grips.

FIG. 7 TEST COUPONS FOR MICROSCOPICAL EXAMINATION OF DUCTILE IRON

TABLE 1
MECHANICAL PROPERTY REQUIREMENTS

Property	Grade 60-40-18	Grade 65-45-15
Tensile Strength Minimum, psi [MPa]	60 000 [415]	65 000 [450]
Yield Strength Minimum, psi [MPa]	40 000 [275]	45 000 [310]
Elongation in 2 in. Minimum, %	18	15
Hardness HB, 3000 kgf Load	143-187	156-201

NOTE: If a grade is not specified in the ordering information, grade 60-40-18 will be supplied.

TABLE 2
MINIMUM THICKNESS OF REPAIRED SECTIONS

TABLE 4
MINIMUM LIGAMENT BETWEEN PLUGS^{A,B}

Nominal Plug Diameter, in.	Minimum Ligament Between Plugs, in. [mm]			
	$\frac{1}{8}, \frac{1}{4}, \frac{3}{8}$	$\frac{1}{2}, \frac{3}{4}$	1, $1\frac{1}{4}$	$1\frac{1}{2}, 2$
$\frac{1}{8}, \frac{1}{4}, \frac{3}{8}$	$2\frac{5}{8}$ [67]	$4\frac{1}{8}$ [105]	$6\frac{5}{8}$ [169]	$9\frac{1}{2}$ [242]
$\frac{1}{2}, \frac{3}{4}$	$4\frac{1}{8}$ [105]	$4\frac{1}{8}$ [105]	$6\frac{5}{8}$ [169]	$9\frac{1}{2}$ [242]
1, $1\frac{1}{4}$	$6\frac{5}{8}$ [169]	$6\frac{5}{8}$ [169]	$6\frac{5}{8}$ [169]	$9\frac{1}{2}$ [242]
$1\frac{1}{2}, 2$	$9\frac{1}{2}$ [242]	$9\frac{1}{2}$ [242]	$9\frac{1}{2}$ [242]	$9\frac{1}{2}$ [242]

^A Based on efficiency of 80%.

^B Example: Assume three plugs are required for repair, one $\frac{1}{8}$ in., one $\frac{3}{8}$ in., and one $1\frac{1}{2}$ in. The minimum distance permitted is as follows:

Ligament distance between $\frac{1}{8}$ and $\frac{3}{8}$ in. plugs is $2\frac{5}{8}$ in. [67 mm]

Ligament distance between $\frac{1}{8}$ and $1\frac{1}{2}$ in. plugs is $9\frac{1}{2}$ in. [242 mm]

Ligament distance between $\frac{3}{8}$ and $1\frac{1}{2}$ in. plugs is $9\frac{1}{2}$ in. [242 mm]

SUPPLEMENTARY REQUIREMENTS

The following supplementary requirement shall not apply unless specified in the purchase order.

S1. Casting

S1.1 For Castings Grade 60-40-18, a microstructure test lug is to be cast attached to the casting at the location designated on the casting drawing. The microstructure of the test lug shall be essentially ferritic and contain no massive carbides.

S2. Pressure Test, Casting Grade 65-45-15

S2.1 A hydrostatic test at a pressure agreed upon by the manufacturer and the purchaser shall be applied by the manufacturer.

SPECIFICATION FOR WROUGHT AUSTENITIC STAINLESS STEEL PIPING FITTINGS

SA-403/SA-403M

[Identical to ASTM Specification A 403/A 403M-07 except for the correction of Table 2 Ni minimum for Grade S38815, the deletion of 5.14 and 5.15, clarified heat treatment requirements in 6.1 (Grade S33228) and 6.4, and the deletion of 304/304L/304N in 14.5.]

1. Scope

1.1 This specification covers wrought stainless steel fittings for pressure piping applications.

1.2 Several grades of austenitic stainless steel alloys are included in this specification. Grades are designated with a prefix, WP or CR, based on the applicable ASME or MSS dimensional and rating standards, respectively.

1.3 For each of the WP stainless grades, several classes of fittings are covered, to indicate whether seamless or welded construction was utilized. Class designations are also utilized to indicate the nondestructive test method and extent of nondestructive examination (NDE). Table 1 is a general summary of the fitting classes applicable to all WP grades of stainless steel covered by this specification. There are no classes for the CR grades. Specific requirements are covered elsewhere.

1.4 This specification is expressed in both inch-pound units and in SI units. However, unless the order specifies the applicable “M” specification designation (SI units), the material shall be furnished to inch-pound units.

1.5 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification.

1.6 This specification does not apply to cast steel fittings. Austenitic stainless steel castings are covered in Specifications A 351/A 351M, A 743/A 743M, and A 744/A 744M.

2. Referenced Documents

2.1 ASTM Standards:

A 351/A 351M Specification for Castings, Austenitic, for Pressure-Containing Parts

A 370 Test Methods and Definitions for Mechanical Testing of Steel Products

A 480/A 480M Specification for General Requirements for Flat-Rolled Stainless and Heat-Resisting Steel Plate, Sheet, and Strip

A 743/A 743M Specification for Castings, Iron-Chromium, Iron-Chromium-Nickel, Corrosion Resistant, for General Application

A 744/A 744M Specification for Castings, Iron-Chromium-Nickel, Corrosion Resistant, for Severe Service

A 751 Test Methods, Practices, and Terminology for Chemical Analysis of Steel Products

A 960/A 960M Specification for Common Requirements for Wrought Steel Piping Fittings

E 112 Test Methods for Determining Average Grain Size

E 165 Test Method for Liquid Penetrant Examination

2.2 ASME Standards:

ASME B16.9 Factory-Made Wrought Steel Butt-Welding Fittings

ASME B16.11 Forged Steel Fittings, Socket-Welding and Threaded

2.3 MSS Standards:

MSS SP-25 Standard Marking System for Valves, Fittings, Flanges, and Unions

MSS SP-43 Standard Practice for Light Weight Stainless Steel Butt-Welding Fittings

MSS SP-79 Socket-Welding Reducer Inserts

MSS SP-83 Steel Pipe Unions, Socket-Welding and Threaded

MSS SP-95 Swage(d) Nipples and Bull Plugs

2.4 ASME Boiler and Pressure Vessel Code:

Section VIII Division I, Pressure Vessels

Section IX, Welding Qualifications

2.5 AWS Standards:

A 5.4 Specification for Corrosion-Resisting Chromium and Chromium-Nickel Steel Covered Welding Electrodes

A 5.9 Specification for Corrosion-Resisting Chromium and Chromium-Nickel Steel Welding Rods and Bare Electrodes

2.6 ASNT:

SNT-TC-1A (1984) Recommended Practice for Nondestructive Testing Personnel Qualification and Certification

3. Common Requirements and Ordering Information

3.1 Material furnished to this specification shall conform to the requirements of Specification A 960/A 960M including any supplementary requirements that are indicated in the purchase order. Failure to comply with the common requirements of Specification A 960/A 960M constitutes nonconformance with this specification. In case of conflict between this specification and Specification A 960/A 960M, this specification shall prevail.

3.2 Specification A 960/A 960M identifies the ordering information that should be complied with when purchasing material to this specification.

4. Material

4.1 The material for fittings shall consist of forgings, bars, plates, or seamless or welded tubular products that conform to the chemical requirements in Table 2. See Table 3 for a list of common names.

4.2 The steel shall be melted by one of the following processes:

4.2.1 Electric furnace (with separate degassing and refining optional),

4.2.2 Vacuum furnace, or

4.2.3 One of the former followed by vacuum or electroslag-consumable remelting.

4.3 If secondary melting is employed, the heat shall be defined as all ingots remelted from a primary heat.

5. Manufacture

5.1 Forming — Forging or shaping operations may be performed by hammering, pressing, piercing, extruding, upsetting, rolling, bending, fusion welding, machining, or by a combination of two or more of these operations. The forming procedure shall be so applied that it will not produce injurious defects in the fittings.

5.2 All fittings shall be heat treated in accordance with Section 6.

5.3 Grade WP fittings ordered as Class S shall be of seamless construction and shall meet all requirements of

ASME B16.9, ASME B16.11, MSS SP-79, MSS SP-83, or MSS SP-95.

5.4 Grade WP fittings ordered as Class W shall meet the requirements of ASME B16.9 and:

5.4.1 Shall have all pipe welds made by mill or the fitting manufacturer with the addition of filler metal radiographically examined throughout the entire length in accordance with the Code requirements stated in 5.5, and,

5.4.2 Radiographic inspection is not required on single longitudinal seam welds made by the starting pipe manufacturer if made without the addition of filler metal; and

5.4.3 Radiographic inspection is not required on longitudinal seam fusion welds made by the fitting manufacturer when all of the following conditions have been met:

5.4.3.1 No addition of filler metal,

5.4.3.2 Only one welding pass per weld seam, and,

5.4.3.3 Fusion welding from one side only.

5.4.4 In place of radiographic examination, welds made by the fitting manufacturer may be ultrasonically examined in accordance with the Code requirements stated in 5.6.

5.5 Grade WP fittings ordered as Class WX shall meet the requirements of ASME B16.9 and shall have all welds, whether made by the fitting manufacturer or the starting material manufacturer, radiographically examined throughout their entire length in accordance with Paragraph UW-51 of Section VIII, Division I, of the ASME Boiler and Pressure Vessel Code.

5.6 Grade WP fittings ordered as Class WU shall meet the requirements of ASME B16.9 and shall have all welds, whether made by the fitting manufacturer or the starting material manufacturer, ultrasonically examined throughout their entire length in accordance with Appendix 12 of Section VIII, Division 1 of ASME Boiler and Pressure Vessel Code.

5.7 The radiography or ultrasonic examination of welds for this class of fittings may be done at the option of the manufacturer, either prior to or after forming.

5.8 Personnel performing NDE examinations shall be qualified in accordance with SNT-TC-1A.

5.9 Grade CR fittings shall meet the requirements of MSS SP-43 and do not require nondestructive examination.

5.10 All fittings shall have the welders, welding operators, and welding procedures qualified under the provisions of Section IX of the ASME Boiler and Pressure Vessel Code except that starting pipe welds made without the addition of filler metal do not require such qualification.

5.11 All joints welded with filler metal shall be finished in accordance with the requirements of Paragraph UW-35 (a) of Section VIII, Division I, of the ASME Boiler and Pressure Vessel Code.

5.12 Fittings machined from bar shall be restricted to NPS 4 or smaller. Elbows, return bends, tees, and header tees shall not be machined directly from bar stock.

5.12.1 All caps machined from bar shall be examined by liquid penetrant in accordance with Supplementary Requirement S52 in Specification A 960/A 960M.

5.13 Weld buildup is permitted to dimensionally correct unfilled areas produced during cold forming of stub ends. Radiographic examination of the weld buildup shall not be required provided that all the following steps are adhered to:

5.13.1 The weld procedure and welders or welding operators meet the requirements of 5.10.

5.13.2 Annealing is performed after welding and prior to machining.

5.13.3 All weld surfaces are liquid penetrant examined in accordance with Appendix 8 of Section VIII, Division 1 of the ASME Boiler and Pressure Vessel Code.

5.13.4 Repair of areas in the weld is permitted, but 5.13.1, 5.13.2, and 5.13.3 must be repeated.

5.14 DELETED

5.15 DELETED

5.16 After final heat treatment, all "H-Grade" steel fittings shall have a grain size of 7 or coarser in accordance with Test Methods E 112.

6. Heat Treatment

6.1 All fittings shall be furnished in the heat-treated condition. For H grades, including Grade S33228, separate solution heat treatments are required for solution annealing; in-process heat treatments are not permitted as a substitute for the separate solution annealing treatments. The heat-treat procedure, except for those grades listed in 6.2, shall consist of solution annealing the fittings at a minimum temperature of 1900°F [1040°C] until the chromium carbides go into solution, and then cooling at a sufficient rate to prevent reprecipitation.

6.2 A solution annealing temperature above 1950°F [1065°C] may impair the resistance to intergranular corrosion after subsequent exposure to sensitizing conditions in 321, 321H, 347, and 347H. When specified by the purchaser, a lower temperature stabilization or resolution anneal shall be used subsequent to the initial high-temperature solution anneal (see Supplementary Requirement S2).

6.3 All welding shall be done prior to heat treatment.

6.4 Fittings machined directly from solution-annealed forgings and bar stock that were solution annealed in accordance with 6.1 need not be resolution annealed.

7. Chemical Composition

7.1 The chemical composition of each cast or heat used shall be determined and shall conform to the requirements of the chemical composition for the respective grades of materials listed in Table 2. The ranges as shown have been expanded to include variations of the chemical analysis requirements that are listed in the various specifications for starting materials (pipe, tube, plate, bar, and forgings) normally used in the manufacturing of fittings to this specification. Methods and practices relating to chemical analyses required by this specification shall be in accordance with Test Methods, Practices, and Terminology A 751. Product analysis tolerances in accordance with Specification A 480/A 480M are applicable.

7.2 The steel shall not contain any unspecified elements for the ordered grade to the extent that it conforms to the requirements of another grade for which that element is a specified element having a required minimum content.

7.3 In fittings of welded construction, the alloy content (carbon, chromium, nickel, molybdenum, columbium, and tantalum) of the deposited weld metal shall conform to that required of the base metal or for equivalent weld metal as given in the AWS filler metal specification A5.4 or A5.9 (Type 348 weld metal is listed in AWS A5.9 but not in AWS A5.4). Exceptions are when welding on Types 304L and 304 base metals, the deposited weld metal shall correspond, respectively, to AWS E308L(ER308L) and E308(ER308), when welding on Type 321 base metal, the weld metal shall correspond to AWS Type E347 (ER347 or ER321); and, when welding on S31725, S31726, S31254 or S33228 deposited weld metal shall correspond either to the alloy content of the base metal or to AWS A5.11 E NiCrMo-3 (UNS W86112) (AWS A5.14 Ni Cr Mo-3 (UNS N06625)). On S38815 base metals, the deposited weld metal and filler metal used shall be agreed upon between purchaser and manufacturer.

7.3.1 Supplementary Requirement S1 may be specified where 16-8-2 filler metal is required for joining thick sections of Types 316, 321, or 347 and has adequate corrosion resistance for the intended service.

8. Tensile Properties

8.1 The tensile properties of the fitting material shall conform to the requirements of Table 4. The testing and reporting shall be performed in accordance with Test Methods and Definitions A 370.

8.1.1 Specimens cut either longitudinally or transversely shall be acceptable for the tensile test.

8.1.2 While Table 4 specifies elongation requirements for both longitudinal and transverse specimens, it is not the intent that both requirements apply simultaneously. Instead, it is intended that only the elongation requirement that is appropriate for the specimen used be applicable.

8.2 Records of the tension test made on the starting material shall be certification that the material of the fitting meets the requirements of this specification provided that heat treatments are the same.

8.3 If the raw material was not tested, or if the heat treatment of the raw material was different than the heat treatment of the fitting, the fitting manufacturer shall perform at least one tension test per heat on material representative of the fitting, and in the same condition of heat treatment as the fitting it represents. Qualification of welding procedures shall be in accordance with 5.8.

8.4 If a tension test through the weld is desired, Supplementary Requirement S51 in Specification A 960/A 960M should be specified.

9. Hydrostatic Tests

9.1 Hydrostatic testing is not required by this specification.

9.2 All Grade WP fittings shall be capable of withstanding without failure, leakage, or impairment of serviceability, a test pressure equal to that prescribed for the specified matching pipe or equivalent material.

9.3 All Grade CR fittings, except tees covered in 9.3.1, shall be capable of withstanding without failure, leakage, or impairment of serviceability, a test pressure based on the ratings in MSS SP-43.

9.3.1 Grade CR tees fabricated using intersection welds shall be capable of passing a hydrostatic test based on 70% of the ratings in MSS SP-43.

10. Surface Quality

10.1 Fittings supplied under this specification shall be examined visually. Selected typical surface discontinuities shall be explored for depth. The fittings shall be free from surface discontinuities that penetrate more than 5% of the specified nominal wall thickness, except as defined in 10.3 and 10.4, and shall have a workmanlike finish.

10.2 Surface discontinuities deeper than 5% of the specified nominal wall thickness, except as defined in 10.3 and 10.4, shall be removed by the manufacturer by machining or grinding to sound metal, and the repaired areas shall be well faired. The wall thickness at all points shall be at

least 87½% of the specified nominal wall thickness, and the diameters at all points shall be within the specified limits.

10.3 Surface checks (fish scale) deeper than ¼ in. [0.4 mm] shall be removed.

10.4 Mechanical marks deeper than ⅓ in. [1.6 mm] shall be removed.

10.5 When the removal of a surface discontinuity reduces the wall thickness below 87½% of the specified nominal wall thickness at any point, the fitting shall be subject to rejection or to repair as provided in 10.6.

10.6 Repair by Welding:

10.6.1 Repair of unacceptable imperfections in the base metal is permissible for fittings made to the dimensional standards listed in 1.1 or for other standard fittings made for stock by the manufacturer. Prior approval of the purchaser is required to repair special fittings made to the purchaser's requirements. Welding of unacceptable imperfections in no case shall be permitted when the depth of defect exceeds 33⅓% of the nominal wall thickness or the defect area exceeds 10% of the surface area of the fitting.

10.6.2 The welding procedure and welders shall be qualified in accordance with Section IX of the ASME Boiler and Pressure Vessel Code.

10.6.3 The composition of the weld deposits shall be in accordance with 7.3 and in accordance with the procedure qualification for the applicable material.

10.6.4 Unacceptable imperfections shall be removed by mechanical means or by thermal cutting or gouging methods. Cavities prepared for welding shall be examined with liquid penetrant in accordance with Practice E 165. No cracks are permitted in the prepared cavities. Personnel performing NDE examinations shall be qualified in accordance with SNT-TC-1A.

10.6.5 The weld repair shall be permanently identified with the welder's stamp or symbol in accordance with Section VIII of the ASME Boiler and Pressure Vessel Code.

10.6.6 Weld repair area(s) shall be blended uniformly to the base metal and shall be examined by liquid penetrant in accordance with Practice E 165. No cracks are permitted in the weld or surrounding ½ in. [12.7 mm] of base metal. Personnel performing NDE examinations shall be qualified in accordance with SNT-TC-1A.

10.6.7 After weld repair, material shall be heat treated in accordance with Section 6.

10.7 The fittings shall be free of scale and shall be passivated.

11. Dimensions

11.1 For fittings covered by ASME B16.9, ASME B16.11, MSS SP-43, MSS SP-79, MSS SP-83, or MSS SP-95, the sizes, shapes, and dimensions of the fittings shall be as specified in those standards.

11.1.1 Fittings of size or shape differing from these standards, but meeting all other requirements of this specification, may be furnished in accordance with Supplementary Requirement S58 Specification A 960/A 960M.

12. Rejection and Rehearing

12.1 Material that fails to conform to the requirements of this specification may be rejected. Rejection should be reported to the producer or supplier promptly and in writing. In case of dissatisfaction with the results of the tests, the producer or supplier may make claim for rehearing.

12.2 Fittings that develop defects in shop working or application operations may be rejected. Upon rejection, the manufacturer shall be notified promptly in writing.

13. Test Reports

13.1 Test reports are required for all fittings covered by this specification. Each test report shall include the following information:

13.1.1 The year-date of the specification to which the fitting was furnished,

13.1.2 Heat number or serial number traceable to a heat number,

13.1.3 Chemical analyses for all starting materials,

13.1.4 Mechanical properties of all starting materials,

13.1.5 For construction with filler metal added, weld metal chemical analysis,

13.1.6 For welded fittings, construction method, weld process and procedure specification number,

13.1.7 Heat treatment type,

13.1.8 Results of all nondestructive examinations,

13.1.9 Results of all tests required by Supplementary Requirements and the order, and

13.1.10 Statement that the fitting was manufactured, sampled, tested and inspected in accordance with the specification and was found to meet the requirements.

14. Product Marking

14.1 All fittings shall have the prescribed information stamped or otherwise suitably marked on each fitting in accordance with the latest edition of MSS SP-25. See Table 5 for marking examples of grades and classes.

14.2 Marking paint or ink shall not contain harmful amounts of chlorides, metals, or metallic salt, such as zinc or copper, that cause corrosive attack on heating. On wall thicknesses thinner than 0.083 in. [2.1 mm], no metal impression stamps shall be used. Vibrating pencil marking is acceptable.

14.3 The prescribed information for butt-welding fittings shall be: the manufacturer's name or trademark (see Note 1), schedule number or nominal wall thickness designation, size, grade (see Table 2), class, and the heat number or manufacturer's heat identification. The class S marking need not be added to the material grade for threaded or socket-welded fittings.

14.4 The prescribed information for threaded or socket-welding fittings shall be: the manufacturer's name or trademark (see Note 1), pressure class or schedule number, grade (see Table 2) and class, and heat number or manufacturer's heat identification.

NOTE 1 — For purposes of identification marking, the manufacturer is considered the organization that certifies that the piping component complies with this specification.

14.5 Fittings meeting the chemical and mechanical property requirements of Table 2 and Table 4 for more than one grade designation may be marked with more than one class or grade designation, such as WP304/304H; WP304/304L; WP316/316L, etc.

14.6 Bar Coding — In addition to the requirements in 14.1, 14.2, 14.3, 14.4, and 14.5, bar coding is acceptable as a supplemental identification method. The purchaser may specify in the order a specific bar coding system to be used. The bar coding system, if applied at the discretion of the supplier, should be consistent with one of the published industry standards for bar coding. If used on small fittings, the bar code may be applied to the box or a substantially applied tag.

15. Keywords

15.1 austenitic stainless steel; corrosive service applications; pipe fittings; steel; piping applications; pressure containing parts; stainless steel fittings

TABLE 2
CHEMICAL REQUIREMENTS (CONT'D)

NOTE 1—Where an ellipsis (...) appears in this table, there is no requirement.

NOTES:

^A See Section 15 for marking requirements.

^B Maximum, unless otherwise indicated.

^C The method of analysis for nitrogen shall be a matter of agreement between the purchaser and manufacturer.

^D Columbium 0.10–0.30%; Vanadium, 0.10–0.30%.

^E For small diameter or thin walls, or both, where many drawing passes are required, a carbon maximum of 0.040% is necessary in grades TP304L and TP316L. Small outside diameter tubes are defined as those less than 0.500 in. [12.7 mm] in outside diameter and light wall tubes as those less than 0.049 in. [1.24 mm] in average wall thickness.

^F On pierced tubing, the nickel may be 11.0–16.0%.

^G 5 X (C + N₂) – 0.70.

^H 4 X (C + N₂) – 0.70.

^I The columbium content shall be not less than ten times the carbon content and not more than 1.10%.

^J The columbium content shall be not less than eight times the carbon content and not more than 1.10%.

TABLE 5
PRODUCT MARKING EXAMPLES FOR GRADES AND CLASSES

Grade and Class Marking	Description
CR304	Single grade: No classes in CR grades
CR304/304L	Multiple grades, meet chemical and mechanical properties of each
WP304-S	Single grade: seamless
WP304-W	Single grade; welded: RT or UT pipe welds with filler metal and all fitting manufacturer's welds
WP304-WX	Single grade; welded: RT all welds with or without filler metal
WP304-WU	Single grade; welded: UT all welds with or without filler metal
WP304-304L-S	Multiple grades: meet chemical and mechanical properties of each: seamless

SUPPLEMENTARY REQUIREMENTS

One or more of the supplementary requirements described below or appearing in Specification A 960/A 960M may be included in the order or contract. When so included, a supplementary requirement shall have the same force as if it were in the body of the specification. Supplementary requirement details not fully described shall be agreed upon between the purchaser and the supplier.

S1. Special Filler Metal

S1.1 Filler metal shall be AWS Type E16-8-2 or ER 16-8-2 (AWS Specifications A5.4 and A5.9, respectively). Fittings welded with 16-8-2 weld metal shall be marked WP ____ HRW or CR ____ HRW, as appropriate.

given a stabilization heat treatment at 1500 to 1600°F [815 to 870°C] for a minimum of 2h/in. [4.7 min/mm] of thickness and then cooling in the furnace or in air. In addition to the marking required in Section 14, the grade designation symbol shall be followed by the symbol “S2.”

S2. Stabilization Treatment

S2.1 Subsequent to the solution anneal required by 6.2, Grades 321, 321H, 347, 347H, 348, and 348H shall be

SPECIFICATION FOR WELDED LARGE DIAMETER AUSTENITIC STEEL PIPE FOR CORROSIVE OR HIGH-TEMPERATURE SERVICE

SA-409/SA-409M

(Identical with ASTM Specification A 409/A 409M-95a^{e1} except for clarified heat treatment requirements for H grade stainless steels and S30815 editorial corrections in para. 5.3.1, Tables 1, 2, and 3, deletion of 5.3.2.2 and 5.3.2.3 for the non-heat treated pipe provisions, and the inclusion of a grain size requirement in para. 5.1.1 for H grade stainless steels. A requirement for ASME Stamping has been added and additional requirements apply as shown in the subtitle of the specification.)

All products furnished under this SA specification are intended for application under the rules of Section III for Class 3 Piping or for application under the rules of Section VIII-1. Furnishing of such products is limited to manufacturers who hold the appropriate ASME Code Symbol Stamp. Weld procedures, welders, and welding machine operators shall be qualified in accordance with ASME Boiler and Pressure Vessel Code, Section IX. The product shall meet all applicable requirements of Class 3 piping or Section VIII-1, if applicable including those requirements pertaining to heat treatment and butt welds. Authorized inspection at the point of manufacture and application of the appropriate Code Symbol Stamp is required.

The applicable ASME partial data report form, signed by an authorized inspector, and a certified mill test report shall be furnished for each lot of pipe. The term "lot" applies to all pipe of the same mill heat of material and wall thickness which is heat treated in one furnace charge. For pipe which is not heat treated or which is heat treated in a continuous furnace, a lot shall consist of each 200 ft. [61 m] or fraction thereof of all pipe of the same mill heat of material and wall thickness, subjected to the same heat treatment. For pipe which is heat treated in a batch-type furnace which is automatically controlled within a 50°F range and is equipped with recording pyrometer so that the heating records are available, a lot may be defined the same as for continuous furnaces. Each length of pipe shall be marked in such a manner as to identify each such piece with the "lot" and the representative certified mill test report.

1. Scope

1.1 This specification covers straight seam or spiral seam electric-fusion-welded, light-wall, austenitic chromium-nickel alloy steel pipe for corrosive or high-temperature service. The sizes covered are NPS 14 to 30 with extra light (Schedule 5S) and light (Schedule 10S) wall thicknesses. Table X1.1 shows the wall thicknesses of Schedule 5S and 10S pipe. Pipe having other dimensions may be furnished provided such pipe complies with all other requirements of this specification.

1.2 Several grades of alloy steel are covered as indicated in Table 1.

1.3 Optional supplementary requirements are provided. These call for additional tests to be made, and when desired shall be stated in the order, together with the number of such tests required.

1.4 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification. The inch-pound units shall apply unless the "M" designation of this specification is specified in the order.

NOTE 1—The dimensionless designator NPS (nominal pipe size) has been substituted in this standard for such traditional terms as "nominal diameter," "size," and "nominal size."

3. Ordering Information

3.1 Orders for material to this specification should include the following, as required, to describe the desired material adequately:

3.1.1 Quantity (feet, centimeters, or number of lengths),

3.1.2 Name of material (straight seam or spiral seam electric-fusion-welded austenitic steel pipe),

3.1.3 Grade (Table 1),

3.1.4 Size (outside diameter and schedule number, or wall thickness),

3.1.5 Length (specific or random) (Section 11),

3.1.6 End finish (Section on Ends of Specification A 530/A 530M),

3.1.7 Optional requirements (5.2.1 to 5.2.3 removal of weld bead; 5.3.2, special heat treatment; 15.2, nondestructive test; 10.1.1, outside diameter tolerance; 11.2, length circumferentially welded; 12.3, repair by welding and heat treatment subsequent to repair welding; 12.4, sand blasted or pickled; 17.1 Certification; Supplementary Requirements S1 to S6).

3.1.8 Specification designation, and

3.1.9 Special requirements.

4. General Requirements

4.1 Material furnished to this specification shall conform to the applicable requirements of the current edition

of Specification A 530/A 530M, unless otherwise provided herein.

5. Materials and Manufacture

5.1 If a specific type of melting is required by the purchaser it shall be stated on the order.

5.1.1 The grain size for all H grades and S30815 shall be No. 7 or coarser, when determined according to ASTM E 112 Test Methods.

5.2 Welding:

5.2.1 The welds shall be made by the manual or automatic electric-welding process. For manual welding, the operator and procedure shall be qualified in accordance with the ASME Boiler and Pressure Vessel Code, Section IX. Unless otherwise specified on the purchase order, the pipe may be welded with or without filler metal when the automatic electric-welding process is used.

5.2.2 The weld surface on either side of the weld may be flush with the base plate or may have a reasonably uniform crown, not to exceed $\frac{1}{16}$ in. [2 mm]. Any weld reinforcement may be removed at the manufacturer's option or by agreement between the manufacturer and purchaser. The contour of the reinforcement should be reasonably smooth and free from irregularities. The weld metal shall be fused uniformly into the plate surface. No concavity of contour is permitted unless the resulting thickness of weld metal is equal to or greater than the minimum thickness of the adjacent base metal.

5.2.3 Weld defects, as determined by specified inspection requirements, shall be repaired by removal to sound metal and rewelding.

5.3 Heat Treatment:

5.3.1 Except as provided in 5.3.2, all pipe shall be furnished in the heat-treated condition. For H grades and S30815, separate solution heat treatments are required for solution annealing; in-process heat treatments are not permitted as a substitute for the separate solution annealing treatments. The heat-treatment procedure shall consist of heating the material to a minimum temperature of 1900°F [1040°C], except for S31254 and S30815 which shall be heat treated to 2100°F [1150°C] and 1920°F [1050°C] respectively and for S34565 which shall be heat treated in the range 2050°F [1120°C] to 2140°F [1170°C], all materials to be followed by quenching in water or rapidly cooling by other means.

5.3.2 The purchase order shall specify one of the following conditions if the heat-treated condition specified in 5.3.1 is not desired by the purchaser:

5.3.2.1 A final heat-treatment temperature under 1900°F [1040°C]. Each pipe supplied under this requirement shall be stenciled with the final heat-treatment temperature in degrees Fahrenheit or degrees Celsius after the

suffix “HT”. Controlled structural or special service characteristics may be specified as a guide for the most suitable heat treatment.

5.3.2.2 DELETED

5.3.2.3 DELETED

5.4 A solution annealing temperature above 1950°F [1065°C] may impair the resistance to intergranular corrosion after subsequent exposure to sensitizing conditions in TP321, TP347, and TP348. When specified by the purchaser, a lower temperature stabilization or re-solution anneal shall be used subsequent to the initial high temperature solution anneal (see Supplementary Requirement S5).

6. Chemical Composition

6.1 Each type of stainless steel or alloy shall conform to the requirements as to chemical composition prescribed in Table 1.

6.2 Unless otherwise specified in the purchase order, the chemical composition of the welding filler metal shall conform to the requirements of the applicable AWS specification for the corresponding grade shown in Table 2. Grades with no filler metal classification indicated shall be welded with filler metals producing deposited weld metal having a composition in accordance with the chemical composition specified in Table 1. The method of analysis for nitrogen and cerium shall be a matter of agreement between the purchaser and manufacturer. The purchaser may choose a higher-alloy filler metal when needed for corrosion resistance.

7. Tensile Requirements

7.1 The tensile properties of the plate or sheet used in making the pipe shall conform to the requirements prescribed in Table 3. Certified mill test reports shall be submitted to the pipe manufacturer.

7.2 A transverse tension test taken across the welded joint of the finished pipe shall meet the same minimum tensile strength requirements as the sheet or plate. The weld section on the tension specimen shall be in the the same condition as the finished pipe (with or without bead as specified).

8. Mechanical Tests Required

8.1 Tension Test — One transverse tension test of the weld shall be made on each lot (Note 2) of finished pipe.

NOTE 2—The term “lot” applies to each 200 ft [60 m] or less of pipe of the same NPS and wall thickness (or schedule number) which is produced from the same heat of steel and subjected to the same finishing treatment in a continuous furnace. When final heat treatment is in a batch-type furnace, the lot shall include only that pipe which is heat treated in

the same furnace charge. When no heat treatment is performed following final forming operations, the lot shall include each 200 ft [60 m] or less of pipe of the same NPS and wall thickness (or schedule number) which is produced from the same heat of steel.

8.2 Transverse Guided-Bend Weld Test — One test (two specimens) of the weld shall be made on each lot (Note 2) of finished pipe.

8.3 Pressure or Nondestructive Electric Test — Each length of pipe shall be subjected to a pressure test or a nondestructive electric test as prescribed in Section 5.

9. Permissible Variations in Wall Thickness

9.1 The minimum wall thickness at any point shall not be more than 0.018 in. [0.46 mm] under the specified wall thickness. (This tolerance is slightly more than commercial tolerances on sheet and plate to allow for possible loss of thickness caused by manufacturing operations.)

10. Permissible Variations in Dimensions

10.1 Permissible variations in dimensions shall not exceed the following at any point in each length of pipe.

10.1.1 Specified Diameter — Where the specified wall thickness is less than 0.188 in. [4.8 mm], the actual outside diameter, based on circumferential measurement, shall not vary more than $\pm 0.20\%$ from the specified outside diameter. Where the specified wall thickness is 0.188 in. [4.8 mm] and heavier, the actual outside diameter, based on circumferential measurement, may vary a maximum of $\pm 0.40\%$ from the specified outside diameter. (Outside diameter tolerances closer than shown above may be obtained by agreement between the pipe manufacturer and purchaser.)

10.1.2 Out-of-Roundness — The difference between the major and the minor outside diameter shall not be more than 1.5% of the specified outside diameter.

10.1.3 Alignment (Camber) — Using a 10 ft [3.0 m] straightedge placed so that both ends are in contact with the pipe, the camber shall not be more than $\frac{3}{16}$ in. [4.8 mm].

11. Lengths

11.1 Unless otherwise specified in the purchase order, pipe of NPS 22 or less will be furnished in random lengths of 9 to 12 ft (Note 3). For outside diameters of over NPS 22, the minimum length will be 5 ft (Note 3).

NOTE 3—This value(s) applies when the inch-pound designation of this specification is the basis of purchase. The corresponding metric value(s) shall be agreed upon between the manufacturer and the purchaser.

11.2 When specified by the purchaser, two or more lengths may be circumferentially welded together to produce longer lengths.

11.3 Circumferentially welded joints shall be of the same quality as the longitudinal joints.

12. Workmanship, Finish, and Appearance

12.1 The finished pipe shall have a workmanlike finish.

12.2 *Repair of Defects by Machining or Grinding* — Pipe showing moderate slivers or other surface defects may be machined or ground inside or outside to a depth which will ensure the removal of all defects providing the wall thickness is not reduced below the minimum specified in 9.1.

12.3 *Repair of Defects by Welding* — Defects which violate minimum wall thickness may be repaired by welding, but only with the approval of the purchaser. Areas shall be suitably prepared for welding with tightly closed defects removed by grinding. Open, clean defects, such as pits or impressions, may require no preparation. All welders, welding operators, and weld procedures shall be qualified to the ASME Boiler and Pressure Vessel Code, Section IX. Unless the purchaser specifies otherwise, pipe required to be heat treated under the provisions of 5.3 shall be heat treated or reheat treated following repair welding. Repaired lengths, where repair depth is greater than $\frac{1}{4}$ of the thickness, shall be pressure tested or repressure tested after repair and heat treatment (if any). Repair welds shall also be examined by suitable non-destructive examination techniques, including any techniques specifically required of the primary weld.

12.4 The pipe shall be free of scale and contaminating iron particles. Pickling, blasting, or surface finishing is not mandatory when pipe is bright annealed. The purchaser may request that a passivating treatment be applied.

13. Test Specimens

13.1 Transverse tension and bend test specimens may be taken from a test plate of the same material as the pipe, made by attaching a formed cylinder to the end of the pipe and welding the abutting edges as a continuation and duplication of the seam of the pipe (run-off plate). As an alternative to a formed cylinder, the run-off plate may consist of flat plates with reinforcing bars clamped to the underside to prevent distortion. The run-off plate material shall be of the same heat, preferably shear croppings from the same plate.

13.2 When heat treatment is required, test specimens shall be cut from pipe after the heat treating has been completed, or specimens removed from the pipe prior to heat treating shall be heat treated with the pipe.

14. Transverse Guided-Bend Weld Tests

14.1 Two bend test specimens shall be taken transversely across the weld. One shall be subject to a face guided-bend test and the second to a root guided-bend test. One specimen shall be bent with the inside surface of the pipe against the plunger, and the other with the outside surface against the plunger.

14.2 The bend test shall be acceptable if no cracks or other defects exceeding $\frac{1}{8}$ in. [3 mm] in any direction are present in the weld metal or between the weld and the pipe metal after bending. Cracks which originate along the edges of the specimen during testing, and that are less than $\frac{1}{4}$ in. [6.5 mm] measured in any direction shall not be considered.

15. Pressure Tests

15.1 Where hydrostatic test equipment is not available, the pipe may be air or gas pressure tested with an internal pressure of 100 psi [700 kPa]. The weld and weld area shall be inspected with the use of soap solution or any other prepared solution which will detect the leakage of air or gas from the inside.

15.2 Instead of a pressure test, when mutually agreed upon between the purchaser and manufacturer, the entire weld area of each pipe, including circumferential welds, may be tested by nondestructive testing methods. These methods shall be capable of detecting both surface and subsurface defects.

16. Inspection

16.1 When specified in the purchase order, the pipe may be inspected at the manufacturer's plant by an inspector representing the purchaser. The inspector shall have entry at all times. The manufacturer shall afford the inspector all reasonable facilities to satisfy him that the material is being furnished in accordance with these specifications.

17. Certification

17.1 Upon request of the purchaser in the contract or order, certification in accordance with the provisions of Specification A 530/A 530M shall be furnished. When specified on the purchase order or when a specific type of melting has been specified on the purchase order, the type of melting used shall also be reported to the purchaser or the purchaser's representative.

18. Product Marking

18.1 Each length of pipe manufactured in accordance with this specification shall have the following identifying marking within 12 in. [300 mm] of one end: manufacturer's name or trade-mark, specification number, grade number of the alloy, the manufacturer's heat number, size, and

schedule number. Additional marking requirements for heat treatment are described in Supplementary Requirement S2.

18.2 Marking shall be legibly stenciled with a suitable paint or permanent marking compound, except when otherwise specified by the purchaser.

SUPPLEMENTARY REQUIREMENTS

One or more of the following supplementary requirements shall apply only when specified in the purchase order. The purchaser may specify a different frequency of test or analysis than is provided in the supplementary requirement. Subject to agreement between the purchaser and manufacturer, retest and retreatment provisions of these supplementary requirements may also be modified.

S1. Product Analysis

S1.1 At the request of the purchaser a product analysis of one coupon representing finished sheet or plate from each heat shall be made by the pipe manufacturer. The drillings for product analysis may be taken from shear crop or test specimens. The results of product analysis shall conform to the requirements in Table 1 and shall be reported to the purchaser.

S2. Radiographic Examination

S2.1 Weld soundness shall be determined through radiographic examination made in accordance with requirements as agreed upon between the pipe manufacturer and purchaser.

S3. Corrosion Requirements

S3.1 Boiling Nitric Acid Test — Except for Grade TP321, coupons representing finished pipe made of nonmolybdenum-bearing material (0.50% and less molybdenum) shall meet the requirement of the boiling nitric acid test conducted according to Practice C of Practices A 262. The condition of the test specimens and the corrosion rates are as follows: Type 347 and Type 348 shall be tested in the sensitized condition (heated for 1 h at 1240°F [675°C]) and the rate of penetration shall not exceed 0.0020 in. [0.05 mm]/month. All other nonmolybdenum-bearing types, except for Grade TP321, shown in Table 1 shall be tested in the annealed and unsensitized condition and the rate of penetration shall not exceed 0.0015 in. [0.04 mm]/month.

S3.2 Acidified Copper Sulfate Test — Coupons representing finished pipe made of molybdenum-bearing material and Type 321 (over 0.50% molybdenum) shall meet the requirements of the copper-copper sulfate-sulfuric acid test (intergranular corrosion test) conducted in accordance with Practice E of Practices A 262. The condition of the

test specimen is as follows: All molybdenum-bearing types shown in Table 1 shall be tested in the annealed and unsensitized condition. Type 321 shall be tested in the sensitized condition (heated for 1 h at 1240°F [675°C]). All specimens shall meet the requirements of the prescribed bend test.

S4. Ferrite Control of Weld Deposits

S4.1 The ferrite content of the deposited weld metal in any length of pipe may be determined. The procedural details pertaining to this subject (that is, welding, plate and weld deposit chemistry, testing equipment and method, number and location of test sites, and ferrite control limits) shall be a matter for agreement between the purchaser and the manufacturer.

S5. Stabilizing Heat Treatment

S5.1 Subsequent to the heat treatment required in 5.3, Grades TP321, TP347, and TP348 shall be given a stabilization heat treatment at a temperature lower than that used for the initial solution annealing heat treatment. The temperature of stabilization heat treatment shall be at a temperature as agreed upon between the purchaser and vendor.

S6. Intergranular Corrosion Test

S6.1 When specified, material shall pass intergranular corrosion test conducted by the manufacturer in accordance with Practices A 262, Practice E.

NOTE 4—Practice E requires testing of the sensitized condition for low carbon or stabilized grades, and on the as-shipped condition for other grades.

S6.2 A stabilization heat treatment in accordance with Supplementary Requirement S5 may be necessary and is permitted in order to meet this requirement for the grades containing titanium or columbium.

SPECIFICATION FOR STEEL, SHEET, CARBON, FOR PRESSURE VESSELS

SA-414/SA-414M

(Identical with ASTM Specification A 414/A 414M-07.)

(10)

1. Scope

1.1 This specification covers hot-rolled carbon steel sheet for pressure vessels involving fusion welding or brazing. Welding and brazing technique is of fundamental importance and shall be in accordance with commercial practices.

1.2 The following grades are included in this specification:

Grade	Mechanical Requirements			
	Yield Strength, min		Tensile Strength, min	
	ksi	MPa	ksi	MPa
A	25	170	45	310
B	30	205	50	345
C	33	230	55	380
D	35	240	60	415
E	38	260	65	450
F	42	290	70	485
G	45	310	75	515

1.3 Hot-rolled carbon steel sheet is generally furnished in cut lengths and to decimal thickness only. Coils may be furnished, provided tension test specimens are taken to represent the middle of the slab as required by 5.1.4. The purchaser should recognize this may require cutting the coils to obtain test samples and results in half-size coils. The sheet is furnished to the following size limits:

Thickness, in. [mm]	Width, in. [mm] Over 12 [Over 300]
0.270 to 0.230 [7.0 to 6.0]	sheet (coils only)
Under 0.230 to 0.057 [6.0 to 1.5]	sheet

1.4 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system shall be used independently of the other. Combining

values from the two systems may result in nonconformance with the specification.

1.5 Tolerances are found in General Requirements Specifications A 568/A 568M and A 635/A 635M. The appropriate General Requirements specification is applied based on the thickness and width of the product ordered.

2. Referenced Documents

2.1 ASTM Standards:

A 568/A 568M Specification for Steel, Sheet, Carbon, Structural, and High-Strength, Low-Alloy, Hot-Rolled and Cold-Rolled, General Requirements for
A 635/A 635M Specification for Steel, Sheet and Strip, Heavy-Thickness Coils, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy, and High-Strength Low-Alloy with Improved Formability, General Requirements for

3. Ordering Information

3.1 Orders for material under this specification shall include the following information, as required, to describe the material adequately:

3.1.1 Designation or specification number, date of issue, and grade,

3.1.2 Copper bearing steel, when required,

3.1.3 Special requirements, if required,

3.1.4 Condition — pickled (or blast cleaned), if required (material so ordered will be oiled unless ordered dry), and

3.1.5 Dimensions, including type of edges.

3.1.5.1 As agreed upon between the purchaser and the producer, material ordered to this specification will be supplied to meet the appropriate standard or restricted

thickness tolerance table shown in Specification A 568/A 568M or Specification A 635/A 635M.

NOTE 1 — Not all producers are capable of meeting all of the limitations of the thickness tolerance tables in Specification A 568/A 568M or Specification A 635/A 635M. The purchaser should contact the producer regarding possible limitations prior to placing an order.

3.1.6 Cast or heat analysis, or test report request, or both, if required.

NOTE 2 — A typical ordering description is as follows: “ASTM A 414, Grade A, Hot-Rolled Sheet, 0.100 in. [2.54 mm] by 36 in. [914.4 mm] by 96 in. [2438 mm], cut edges.

4. Chemical Requirements

4.1 *Cast or Heat Analysis* — The analysis of the steel shall conform to the requirements prescribed in Table 1.

4.1.1 Unspecified elements may be present. Limits on elements shall be as stated in Table 2.

4.1.1.1 Each of the elements listed in Table 2 shall be included in the report of the heat analysis. When the amount of an element present is less than 0.02%, the analysis may be reported as “<0.02%.”

4.2 *Product, Check, or Verification Analysis* — Analyses may be made by the purchaser from finished material representing each heat.

4.3 *Deoxidation* — For all grades, killed steel is required. See Table 1 and footnotes A and B.

5. Mechanical Property Requirements

5.1 *Tensile Strength*:

5.1.1 *Requirements* — Material as represented by the test specimen shall conform to the tensile requirements specified in Table 3.

5.1.2 *Number of Tests* — Two tensile tests shall be made from the product of each slab as rolled.

5.1.3 *Location and Orientation (see Fig. 1)*:

5.1.3.1 Tensile test specimens shall be taken at locations representing the middle and back end of each slab as rolled.

5.1.3.2 Tensile test samples shall be taken from the full thickness of the sheet as rolled.

5.1.3.3 Tensile test specimens shall be taken from a location approximately halfway between the center of the sheet and the edge of the material as-rolled.

5.1.3.4 Tensile test specimens shall be taken with the axis of the test specimen perpendicular to the rolling direction (transverse test).

5.1.4 *Test Method* — Yield strength shall be determined by either the 0.2% offset method or by the 0.5% extension under load method, unless otherwise specified.

6. General Requirements for Delivery

6.1 Material furnished under this specification shall conform to the applicable requirements of the current edition of Specification A 568/A 568M or Specification A 635/A 635M unless otherwise provided herein.

7. Workmanship

7.1 The material shall be free from injurious defects (see Specifications A 568/A 568M or A 635/A 635M, as appropriate due to thickness).

8. Finish and Appearance

8.1 *Surface Finish*:

8.1.1 Unless otherwise specified, the material shall be furnished without removing the hot-rolled oxide or scale.

8.1.2 When required, the material may be specified to be pickled or blast cleaned.

8.2 *Oiling*:

8.2.1 Unless otherwise specified, the material shall be furnished not oiled.

8.2.2 When specified to be pickled or blast cleaned, the material shall be furnished oiled. When required, pickled or blast-cleaned material may be specified to be furnished dry.

8.3 *Edges* — Unless otherwise specified, mill edges shall be furnished on material that has not had the hot-rolled oxide or scale removed and cut edges shall be furnished on material that has had the hot-rolled oxide or scale removed.

9. Certification and Reports

9.1 The manufacturer or processor shall furnish copies of a test report showing the results of the heat analysis and mechanical property tests made to determine compliance with this specification.

9.2 The report shall include the purchase order number, the specification number and year date, product designation, grade, the heat number, and heat analysis and mechanical properties as indicated by the tension test.

9.3 A signature is not required on the test report. However, the document shall clearly identify the organization submitting the report. Notwithstanding the absence of a signature, the organization submitting the report is responsible for the content of the report.

9.4 A Material Test Report, Certificate of Inspection, or similar document printed from or used in electronic form from an electronic data interchange (EDI) transmission shall be regarded as having the same validity as a

counterpart printed in the certifier's facility. The content of the EDI transmitted document must meet the requirements of the invoked ASTM standard and the purchaser and supplier. Notwithstanding the absence of a signature, the organization submitting the EDI transmission is responsible for the content of the report.

10. Product Marking

10.1 The name or brand of the manufacturer, heat and slab number, specification designation number, and grade shall be legibly and durably marked on each cut length sheet in two places not less than 12 in. [300 mm] from the edges. Cut length sheets, the maximum lengthwise and crosswise, dimensions of which do not exceed 72 in.

[1800 mm], shall be legibly and durably marked in one place approximately midway between the center and a side edge. The manufacturer's test identification number shall be legibly and durably marked on each test specimen. Steel die marking of sheets is prohibited on material <0.250 in. [6 mm].

10.2 For coil product, the information required in 10.1 shall be legibly and durably marked both on each coil and on a tag affixed to each coil.

Phosphorus, max	0.035	0.035	0.035	0.035	0.035	0.035	0.035
Sulfur, max	0.035	0.035	0.035	0.035	0.035	0.035	0.035
Aluminum ⁴	0.02–0.08	0.02–0.08	0.02–0.08	0.02–0.08	0.02–0.08	0.02–0.08	0.02–0.08
Silicon ⁴	0.30	0.30	0.30	0.30	0.30	0.30	0.30
Copper, when copper steel is specified, min	0.20	0.20	0.20	0.20	0.20	0.20	0.20

⁴ The steel shall be considered aluminum-silicon killed when the silicon is between 0.15 and 0.30, otherwise it shall be considered aluminum killed.

TABLE 2
LIMITS ON UNSPECIFIED ELEMENTS (See 4.1.1)

Copper, max % ^A	Heat analysis	0.40
	Product analysis	0.43
Nickel, max % ^A	Heat analysis	0.40
	Product analysis	0.43
Chromium, max % ^{A,B}	Heat analysis	0.30
	Product analysis	0.34
Molybdenum, max % ^{A,B}	Heat analysis	0.12
	Product analysis	0.13
Vanadium, max % ^C	Heat analysis	0.03
	Product analysis	0.04
Columbium, max % ^C	Heat analysis	0.02
	Product analysis	0.03

^A The sum of copper, nickel, chromium, and molybdenum shall not exceed 1.00% on heat analysis. When one or more of these elements are specified, the sum does not apply; in which case, only the individual limits on the remaining unspecified elements will apply.

^B The sum of chromium and molybdenum shall not exceed 0.32% on heat analysis. When one or more of these elements are specified, the sum does not apply; in which case, only the individual limits on the remaining unspecified elements will apply.

^C By agreement, the heat analysis limits for vanadium or columbium, or both, may be increased up to 0.10% and 0.05%, respectively.

SPECIFICATION FOR PIPING FITTINGS OF WROUGHT CARBON STEEL AND ALLOY STEEL FOR LOW-TEMPERATURE SERVICE

SA-420/SA-420M

(Identical with ASTM Specification A 420/A 420M-04)

1. Scope

1.1 This specification covers wrought carbon steel and alloy steel fittings of seamless and welded construction, covered by the latest revision of ASME B16.9, ASME B16.11, MSS-SP-79, and MSS SP-95. Fittings differing from these ASME and MSSVF standards shall be furnished in accordance with Supplementary Requirement S58 of Specification A 960. These fittings are for use in pressure piping and pressure vessel service at low temperatures.

1.2 Optional supplementary requirements are provided for fittings where a greater degree of examination is desired. When desired, one or more of these supplementary requirements shall be specified in the order.

1.3 This specification is expressed in both inch-pound units and in SI units. However, unless the order specifies the applicable “M” specification designation (SI units), the material shall be furnished to inch-pound units.

1.4 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other.

2. Referenced Documents

2.1 In addition to those Referenced Documents listed in Specification A 960, the following list of standards apply to this specification.

2.2 *ASTM Standards:*

A 370 Test Methods and Definitions for Mechanical Testing of Steel Products
A 960 Specification for Common Requirements for Wrought Steel Piping Fittings

2.3 *ASME Standards:*

B 16.9 Factory-Made Wrought Steel Butt-Welding Fittings
B 16.11 Forged Steel Fittings, Socket-Welding Threaded Section VIII Division 1, Pressure Vessels

2.4 *MSS Standards:*

MSS SP-25 Standard Marking System for Valves, Fittings, Flanges, and Unions
MSS SP-79 Socket Welding Reducer Inserts
MSS SP-95 Swage(d) Nipples and Bull Plugs

2.5 *ASNT Standard:*

ASNT (1984) Recommended Practice No. SNT-TC-1A

3. Ordering Information

3.1 See Specification A 960.

4. General Requirements

4.1 Product furnished to this specification shall conform to the requirements of Specification A 960, including any supplementary requirements that are indicated in the purchase order. Failure to comply with the general requirements of Specification A 960 constitutes non-conformance with this specification. In case of conflict between the requirements of this specification and Specification A 960, this specification shall prevail.

5. Material

5.1 The material for fittings shall consist of forgings, bars, plates, seamless or fusion welded tubular products with filler metal added. It shall conform to the chemical requirements in Table 1, and be made by one of the following processes: open-hearth, basic-oxygen, or electric-furnace. The steels shall be made using recognized melting

practices necessary to produce steels that shall meet the impact requirements of this specification.

6. Manufacture

6.1 Forging or forming operations shall be performed by hammering, pressing, piercing, extruding, upsetting, working, bending, fusion-welding, or machining, or by a combination of two or more of these operations. The forming procedure shall be so applied that it will not produce injurious defects in the fittings.

6.2 All welds, including welds in tubular products from which fittings are made, shall be (1) made by welders, welding operators and welding procedures qualified under the provisions of ASME Section IX, (2) heat treated in accordance with Section 7 of this specification, and (3) nondestructively examined throughout the entire length of each weld in accordance with Section 14 of this specification. The radiography of welds shall be done either prior to or after forming at option of manufacturer. Personnel performing NDE examinations shall be qualified in accordance with SNT-TC-1A.

6.3 The welded joints of the fittings shall be finished in accordance with the requirements of Paragraph UW-35(a) of Section VIII, Division 1 of ASME Boiler and Pressure Vessel Code.

6.4 All butt-weld tees manufactured by cold-forming methods shall be liquid penetrant or magnetic particle examined by one of the methods specified in Supplementary Requirement S52 or S53 of Specification A 960. This examination shall be performed after final heat treatment by NDE personnel qualified under the provisions of ASNT Recommended Practice No. SNT-TC-1A. Only the side-wall areas of the tee need be examined. This area is defined by a circle that covers the area from the weld bevel of the branch outlet to the centerline of the body or run. Internal and external surfaces shall be examined when size permits accessibility. After the removal of any cracks, the tees shall be re-examined by the original method. Acceptable tees shall be marked with the symbol PT or MT, as applicable, to indicate compliance.

6.5 Stubends may be produced with the entire lap added by the welding of a ring, made from plate or bar of the same alloy grade and composition, to the outside of a straight section of pipe, provided the weld is double welded, is a full penetration joint, satisfies the requirements of 6.2 for qualifications and radiography and 7.1 for post weld heat treatment.

7. Heat Treatment

7.1 All fittings shall be furnished in the normalized, normalized and tempered, annealed, or quenched and tempered condition. All welding shall be completed prior to the austenitizing heat treatment.

7.2 The full thickness of the material from which impact test specimens are to be obtained shall be heat treated with a furnace charge as specified in 10.4.2 or 10.4.3.

7.3 After forming, the fittings shall be allowed to cool below the lower critical before applying one of the heat treatments listed in 7.1.

7.4 When the fittings are to be post-weld heat treated after being welded by the purchaser and when so specified in the order, the test specimens shall be subjected to the same post-weld heat treatment. The purchaser shall use the post-weld heat treatment shown in Table 2, unless otherwise specified in the order.

8. Chemical Composition

8.1 The steel shall conform to requirements of chemical composition for the respective material prescribed in Table 1.

8.2 The steel shall not contain any unspecified elements for the ordered grade to the extent that it then conforms to the requirements of another grade for which that element is a specified element having a required minimum content.

8.3 The chemical composition of weld metal is not required to meet the same limits of the base materials however, the composition of the weld deposit shall be such that it meets the minimum mechanical and impact requirements of this specification. In general, the alloy content shall be similar to that of the base metal but shall not exceed 6% except in the case of fittings of 9% nickel steel.

8.4 A product analysis is optional.

9. Tensile Properties

9.1 The tensile properties of the fittings material shall conform to the requirements for the applicable grade of material as listed in Table 3.

9.2 At least one tension test shall be made on each heat of material and in the same condition of heat treatment as the finished fittings it represents provided that the wall thickness of the fitting and the representative sample thickness do not vary more than $\frac{1}{4}$ in. [6 mm]. At least one tension test per heat of weld metal shall be made after heat treatment in the same manner as the base metal. Results need not be reported unless Supplementary Requirement S51 of Specification A 960 is specified.

9.3 Records of the tension tests shall be certification that the material of the fitting meets the tensile requirements of this specification.

10. Impact Test Properties

10.1 Properties:

10.1.1 The notched bar impact properties of the base metal and weld metal shall conform to the requirements of Table 4 or Table 5 for the applicable grade of material.

10.1.2 Retest – When the average value of the three specimens equals or exceeds the minimum value permitted for a single specimen and the value for more than one specimen is below the required average value, or when the value for one specimen is below the minimum value permitted for a single specimen, a retest of three additional specimens shall be made. The value for each of these retest specimens shall equal or exceed the required average value. When an erratic result is caused by a defective specimen, or there is uncertainty in test procedure, a retest shall be allowed.

10.2 Procedures:

10.2.1 All material furnished under this specification shall be tested for impact resistance at the temperature for the respective grade in Table 6. Exceptions to these requirements are permissible when agreed upon between the purchaser and producer and specified in the order, in that the impact test is acceptable when made at temperatures different from those shown in Table 6, provided the test temperature is at least as low as the intended service temperature, and fittings are suitably marked in accordance with Section 18 to identify the reported test temperature.

10.2.2 The notched-bar impact test shall be made in accordance with the procedure for the simple-beam, Charpy-type test of Test Methods and Definitions A 370. Each impact test shall consist of breaking three specimens.

10.3 Specimens:

10.3.1 Notched-bar impact specimens shall be simple-beam, Charpy-type A with a V-notch in accordance with Test Methods and Definitions A 370. Standard specimens 10 by 10 mm in cross section shall be used unless the material to be tested is of insufficient thickness, in which case the largest obtainable standard subsize impact specimens shall be used. When the size or shape of the finished fittings is insufficient to permit obtaining the smallest standard subsize impact specimens, an impact test by the fitting manufacturer will not be required. The material from which the specimens are taken shall be heat treated with a furnace charge in accordance with 10.4.2 or 10.4.3. Impact tests shall be made from either the raw material from which the fittings are made or from a finished fitting at the option of the manufacturer.

10.3.2 Test specimens shall be obtained so that the longitudinal axis of the specimen is parallel to the longitudinal axis of the fitting while the axis of the “V” shall be perpendicular to the surface. On wall thickness over 1 in.

[25 mm] the specimens shall be obtained with their longitudinal axis located $\frac{1}{2}$ in. [13 mm] from the outer surface.

10.3.3 When testing welds, the notch of the specimen shall be in the welded joint and, where the diameter and wall thickness permit, the longitudinal axis of the specimen shall be transverse to the longitudinal axis of the weld. The axis of the notch shall be perpendicular to the surface.

10.4 Number of Tests:

10.4.1 A notched-bar impact test, consisting of breaking three specimens shall be made. Each test shall represent only such fittings from a heat that do not vary from the thickness of the material from which the test specimens are taken by more than $\frac{1}{4}$ in. [6 mm].

10.4.2 When heat treatment is performed in furnaces not equipped with calibrated recording pyrometers, one impact test shall be made for each heat in each heat-treatment load. Test specimens shall be included with each furnace charge. If this heat treatment is conducted in continuous-type furnaces not equipped with calibrated recording pyrometers, then one test per heat shall be conducted for each 5000 lb or 2550 kg (or less) of product.

10.4.3 When heat treatment is performed in furnaces controlled within a 50°F [28°C] range and equipped with calibrated recording pyrometers so that records of heat treatment are available, then one impact test from each heat is required, provided that all other heat treatments are conducted at the same temperatures and within the same 50°F [28°C] range as the furnace charge that contained the test specimens.

10.4.4 On fittings of welded construction, additional impact tests of the same number as required in 10.4.1 or 10.4.2 shall be made to test the weld metal.

10.4.5 Specimens showing defects while being machined or prior to testing shall be discarded, and replacements shall be considered as original specimens.

10.5 Retreatment:

10.5.1 If the results of impact tests conducted in accordance with 10.4.2 and 10.4.3 fail to conform to the test requirements specified in 10.1, that group of fittings shall be retreated and submitted for test. No group of fittings shall be retreated more than twice.

11. Hydrostatic Tests

11.1 Hydrostatic testing of fittings is not required by this specification.

11.2 All fittings shall be capable of withstanding without failure, leakage, or impairment of their serviceability, a hydrostatic test pressure equal to that prescribed for the specified matching pipe of equivalent material.

12. Dimensions

12.1 Butt-welding fittings and butt-welding short-radius elbows and returns purchased in accordance with this specification shall conform to the dimensions and tolerances given in the latest revision of ASME B16.9. Steel socket-welding and threaded fittings purchased in accordance with this specification shall conform to the sizes, shapes, dimensions, and tolerances specified in the latest revision of ASME B16.11.

12.2 Fittings of size or shape differing from these standards, but meeting all other requirements of the specification, shall be furnished in accordance with Supplementary Requirement S58 of Specification A 960 only by agreement with the purchaser.

13. Surface Quality

13.1 See Specification A 960.

13.2 Repair by Welding (Base Metal):

13.2.1 Repair welding, by the manufacturer, is permissible for parts made to dimensional standards such as those of ASME or equivalent standards.

13.2.2 Prior approval of the purchaser shall be required to weld repair special parts made to the purchaser's dimensional requirements.

13.2.3 Welding shall be accomplished with a weld procedure designed to produce low hydrogen in the weldment. Short circuit gas metal arc welding is permissible only with the approval of the purchaser.

13.2.4 The weld repair shall be permanently identified with the welder's stamp or symbol in accordance with Section IX of the ASME Boiler and Pressure Vessel Code.

13.2.5 After weld repair, material shall be heat treated in accordance with 7.1.

13.2.6 Tension and impact testing of representative deposited weld metal for each heat shall meet the requirements of 9.2 and 10.1.

14. Radiographic Examination

14.1 All fusion-welded butt joints shall be radiographically examined throughout the entire length in accordance with Paragraph UW-51 of Section VIII, Division 1, of the ASME Boiler and Pressure Vessel Code. Instead of radiographic examination, welds made by the manufacturer may be ultrasonically examined in accordance with Appendix 12 of Section VIII, Division 1, of the ASME Boiler and Pressure Vessel Code. In general, radiography or ultrasonic examination shall be performed after all forming operations have been completed. Fittings made from fusion-welded

pipe need not be radiographed if the pipe has been radiographed, provided the fitting forming process does not materially affect the weld.

15. Inspection

15.1 All tests and inspections shall be made at the place of manufacture, unless otherwise agreed to.

15.2 Other tests, when required by agreement shall be made from materials of the lots covered in the order.

16. Rejection and Rehearing

16.1 Material that fails to conform to the requirements of this specification shall be rejected. Rejection should be reported to the producer or supplier promptly and in writing. In case of dissatisfaction with the results of the test, the producer or supplier shall make claim for a rehearing.

16.2 Fittings that develop defects in shop working or application operations shall be rejected. Upon rejection, the manufacturer shall be notified promptly in writing.

17. Certification

17.1 When requested by the purchaser, the manufacturer shall provide a certificate of compliance to this specification. In addition, if requested to provide test reports, the manufacturer shall also provide the following where applicable:

17.1.1 Chemical analysis results, Section 8 (Table 1),

17.1.2 Tensile property results, Section 9 (Table 3) report yield strength and ultimate strength in ksi [MPa] and elongation in percent,

17.1.3 Impact test results, Section 10 (Table 4 and Table 5),

17.1.4 Type heat treatment, Section 7,

17.1.5 Radiographic examination statement, Section 14, and

17.1.6 Any supplemental testing required by the purchase order.

17.2 Certification shall state whether welds have been examined radiographically or ultrasonically.

17.3 Letters of compliance and test results shall state the specification number, year of issue, revision letter (if any), grade and class of the fittings.

18. Product Marking

18.1 All fittings shall have the prescribed information marked on each fitting in accordance with MSS SP-25, latest revision.

18.1.1 Fittings shall be marked by any method which will permanently identify the fittings and not result in sharp discontinuities. Stamping, when used, shall be done with blunt-nosed continuous or blunt-nosed interrupted dot stamps.

18.1.2 When agreed upon between the purchaser and producer, and specified in the order, the markings shall be painted or stenciled on the fitting or stamped on a metal or plastic tag which shall be securely attached to the fitting.

18.2 The prescribed information for butt-welding fittings shall be: the manufacturer's name or trademark (see Note 1), material designation or grade, schedule number or nominal wall thickness designation, and the heat number or manufacturer's heat identification. Fittings containing welds that have been ultrasonically examined instead of radiography shall be marked U after heat identity.

NOTE 1 — For purposes of identification marking, the manufacturer is considered the organization that certifies the piping component complies with this specification.

18.3 The prescribed information for threaded or socket welding fittings shall be: the manufacturer's name or trademark, material designation or grade, pressure class or schedule number, and size.

18.4 When size does not permit complete marking, identification marks shall be omitted in the reverse order of those listed above and in accordance with MSS SP-25.

18.5 The impact test temperature shall also be shown if it is different from the standard test temperature specified in Table 6, for example: WPL-6-60 or WPL3-176.

18.6 Bar Coding — In addition to the requirements in 18.1, 18.2, 18.3, 18.4, and 18.5, bar coding is acceptable as a supplemental identification method. The purchaser may specify in the order a specific bar coding system to be used. The bar coding system, if applied at the discretion of the supplier, should be consistent with one of the published industry standards for bar coding. If used on small fittings, the bar code may be applied to the box or a substantially applied tag.

TABLE 1
CHEMICAL REQUIREMENTS

Grade ^A	Composition, %										
	C	Mn	P	S	Si	Ni	Cr	Mo	Cu	Cb	V
WPL6	0.30	0.50–1.35	0.035	0.040	0.15–0.40	0.40	0.30	0.12	0.40	0.02 ^B	0.08
WPL9	0.20	0.40–1.06	0.030	0.030	...	1.60–2.24	...	...	0.75–1.25	...	...
WPL3 ^C	0.20	0.31–0.64	0.05	0.05	0.13–0.37	3.2–3.8	...	...	...	...	...
WPL8 ^D	0.13	0.90	0.030	0.030	0.13–0.37	8.4–9.6	...	...	...	...	...

NOTE 1 — All requirements are maximum unless otherwise indicated.

NOTE 2 — Where an ellipsis (...) appears in this table, there is no requirement.

^A When fittings are of welded construction, the symbols above shall be supplemented by the letter "W."

^B By agreement, the limit for Columbium may be increased up to 0.05% on heat analysis and 0.06% on product analysis.

^C Fittings made from plate or forgings may have 0.90% max manganese.

^D Fittings made from plate may have 0.98% max manganese.

TABLE 2
POST-WELD HEAT TREATMENT

Grade	Metal Temperature		Minimum Holding Time
	°F	°C	
WPL6	1100–1200	595–650	1 h/in. [25 mm] $\frac{3}{4}$ h min
WPL3	1100–1150	540–620	$\frac{1}{4}$ h/in. [25 mm] 1 h min
WPL8	1050–1100	565–595	$\frac{1}{2}$ h/in. [25 mm] 1 h min
WPL9 ⁴	1025–1085	550–585	1 h/in. [25 mm] 2 h min

⁴ 2 in. [51 mm] thickness and over. The cooling rate shall not be less than 300°F [150°C] per hour down to a temperature of 600°F [315°C].

TABLE 3
TENSILE REQUIREMENTS

Requirement	Grade			
	WPL6	WPL9	WPL3	WPL8
Tensile strength, min ksi [MPa]	60 [415]–85 [585]	63 [435]–88 [610]	65 [450]–90 [620]	100 [690]–125 [865]
Yield strength, min ksi [MPa]	35 [240]	46 [315]	35 [240]	75 [515]

Elongation Requirements	Grades							
	WPL6		WPL9		WPL3		WPL8	
	Longi- tudinal	Trans- verse	Longi- tudinal	Trans- verse	Longi- tudinal	Trans- verse	Longi- tudinal	Trans- verse
Standard round specimen, or small proportional specimen, min % in 4 D	22	12	20	...	22	14	16	...
Rectangular specimen for wall thickness $\frac{5}{16}$ in. [7.94 mm] and over, and for all small sizes tested in full section; min % in 2 in. or 50 mm	30	16.5	28	18	30	20	22	...
Rectangular specimen for wall thickness less than $\frac{5}{16}$ in [7.94 mm]; min % in 2 in. or 50 mm ($\frac{1}{2}$ in. [12.7 mm] wide specimen)	A	A	A	A	A	A	A	...

Note 1 — Where an ellipsis (. . .) appears in this table, there is no requirement.

⁴ For each $\frac{1}{32}$ in. [0.79 mm] decrease in wall thickness below $\frac{5}{16}$ in. [7.94 mm], a deduction of 1.5% (grades WPL6, WPL9, and WPL3) or 1.25% (WPL8) for longitudinal and 1.0% (grades WPL6, WPL9, and WPL3) for transverse from the values shown above is permitted. The following table gives the minimum value for various wall thicknesses:

Wall Thickness		Grades							
in.	[mm]	WPL6		WPL9		WPL3		WPL8	
		Longi- tudinal	Trans- verse	Longi- tudinal	Trans- verse	Longi- tudinal	Trans- verse	Longi- tudinal	Trans- verse
$\frac{5}{16}$ (0.312)	[7.94]	30.0	16.5	28.0	18.0	30.0	20.0	22.0	...
$\frac{9}{32}$ (0.281)	[7.14]	28.5	15.5	26.5	17.0	28.5	19.0	20.75	...
$\frac{1}{4}$ (0.250)	[6.35]	27.0	14.5	25.0	16.0	27.0	18.0	19.5	...
$\frac{7}{32}$ (0.219)	[5.56]	25.5	...	23.5	...	25.5	...	18.25	...
$\frac{3}{16}$ (0.188)	[4.76]	24.0	...	22.0	...	24.0	...	17.0	...
$\frac{5}{32}$ (0.156)	[3.97]	22.5	...	20.5	...	22.5	...	15.75	...
$\frac{1}{8}$ (0.125)	[3.17]	21.0	...	19.0	...	21.0	...	14.5	...
$\frac{3}{32}$ (0.094)	[2.38]	19.5	...	17.5	...	19.5	...	13.25	...
$\frac{1}{16}$ (0.062)	[1.59]	18.0	...	16.0	...	18.0	...	12.0	...

NOTE — The preceding table gives the computed minimum elongation value for each $\frac{1}{32}$ in. [0.79 mm] decrease in wall thickness. Where the wall thickness lies between two values above, the minimum elongation value is determined by the following equations:

Direction of Test	Equations			
	WPL6	WPL9	WPL3	WPL8
Longitudinal	$E = 48t + 15.00$	$48t + 13.00$	$E = 48t + 15.00$	$40t + 9.50$
Transverse	$t = 32t + 6.50$	$32t + 8.00$	$E = 32t + 10.00$	...

where:

E = elongation in 2 in. or 50 mm, %, and

t = actual thickness of specimen, in.

WPL8	−320 [−195]

SUPPLEMENTARY REQUIREMENTS

One or more of the supplementary requirements appearing in Specification A 960 may be included in the order or contract. When so included, a supplementary requirement shall have the same force as if it were in the body of the specification. Supplementary requirement details not fully described shall be agreed upon between the purchaser and the supplier.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR SEAMLESS AND ELECTRIC-WELDED LOW-ALLOY STEEL TUBES

SA-423/SA-423M

[Identical with ASTM Specification A 423/A 423M-95(R04).]

1. Scope

1.1 This specification covers minimum-wall-thickness, seamless and electric-resistance welded, low-alloy steel tubes for pressure containing parts such as economizers or other applications where corrosion resistance is important.

1.2 The tubing sizes and thicknesses usually furnished to this specification are $\frac{1}{2}$ to 5 in. [12.7 to 127 mm] in outside diameter and 0.035 to 0.500 in. [0.9 to 12.7 mm] inclusive, in minimum wall thicknesses. Tubing having other dimensions may be furnished, provided such tubes comply with all other requirements of this specification.

1.3 Mechanical property requirements do not apply to tubing smaller than $\frac{1}{4}$ in. [3.2 mm] in inside diameter or 0.015 in. [0.4 mm] in thickness.

1.4 An optional supplementary requirement is provided and, when desired, shall be so stated in the order.

1.5 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification. The inch-pound units shall apply unless the "M" designation of this specification is specified in the order.

2. Referenced Document

E 273 Practice for Ultrasonic Examination of Longitudinal Welded Pipe and Tubing
A 450/A 450M Specification for General Requirements for Carbon, Ferritic Alloy, and Austenitic Alloy Steel Tubes

3. Ordering Information

3.1 Orders for material under this specification shall include the following, as required, to describe the desired material adequately;

- 3.1.1** Quantity (feet, metres, or number of lengths),
- 3.1.2** Name of material (seamless or electric-resistance welded tubes),
- 3.1.3** Grade (Table 1),
- 3.1.4** Manufacture (hot finished or cold finished),
- 3.1.5** Size (outside diameter and minimum wall thickness)
- 3.1.6** Length (specific or random),
- 3.1.7** Optional requirements (hydrostatic or electric test, 13.7),
- 3.1.8** Test report required (see Certification Section of Specification A 450/A 450M),
- 3.1.9** Specification designation, and
- 3.1.10** Special requirements and any supplementary requirements selected.

4. Manufacture

4.1 Tubes made by the seamless process may be hot finished or cold finished.

5. Heat Treatment

5.1 All tubes shall be normalized or given such heat treatment as may be necessary to conform to the requirements of this specification.

6. Chemical Composition

6.1 The steel shall conform to requirements as to chemical composition prescribed in Table 1.

7. Product Analysis

7.1 An analysis of either one billet, one length of flat-rolled stock or one tube shall be made from each heat. The chemical composition thus determined shall conform to the requirements specified.

7.2 If the original test for product analysis fails, retests of two additional billets, lengths of flat-rolled stock, or tubes shall be made. Both retests, for the elements in question shall meet the requirements of the specification; otherwise all remaining material in the heat or lot (Note 1) shall be rejected or, at the option of the producer, each billet, length of flat-rolled stock or tube may be individually tested for acceptance. Billets, lengths of flat-rolled stock or tubes which do not meet the requirements of the specification shall be rejected.

NOTE 1—For flattening, flaring, and flange requirements, the term *lot* applies to all tubes prior to cutting of the same nominal size and wall thickness that are produced from the same heat of steel. When final heat treatment is in a batch-type furnace, a lot shall include only those tubes of the same size and from the same heat which are heat treated in the same furnace charge. When the final heat treatment is in a continuous furnace the number of tubes of the same size and from the same heat in a lot shall be determined from the size of the tubes as prescribed in Table 2.

NOTE 2—For tensile and hardness test requirements, the term *lot* applies to all tubes prior to cutting, of the same nominal diameter and wall thickness that are produced from the same heat of steel. When final heat treatment is in a batch-type furnace, a lot shall include only those tubes of the same size and the same heat which are heat treated in the same furnace charge. When the final heat treatment is in a continuous furnace, a lot shall include all tubes of the same size and heat, heat treated in the same furnace at the same temperature, time at heat, and furnace speed.

8. Tensile Requirements

8.1 The material shall conform to the requirements as to tensile properties prescribed in Table 3.

9. Hardness Requirements

9.1 The tubes shall have a hardness number not exceeding 170 HB or 87 HRB.

10. Forming Operations

10.1 Tubes when inserted in the boiler shall stand expanding and beading without showing cracks or flaws.

11. Mechanical Tests Required

11.1 Tension Test — One tension test shall be made on a specimen for lots of not more than 50 tubes. Tension

tests shall be made on specimens from two tubes for lots of more than 50 tubes (Note 2).

11.2 Flattening Test — One flattening test shall be made on specimens from each end of one finished tube, not the one used for the flaring or flanging test, from each lot (Note 1).

11.3 Flaring Test (Seamless Tubes) — One flaring test shall be made on specimens from each end of one finished tube, not the one used for the flattening test, from each lot (Note 1).

11.4 Flange Test (Welded Tubes) — One flange test shall be made on specimens from each end of one finished tube, not the one used for the flattening test, from each lot (Note 1).

11.5 Hardness Test — Brinell or Rockwell hardness tests shall be made on specimens from two tubes from each lot (Note 2).

11.6 Reverse Flattening Test — For welded tubes, one reverse flattening test shall be made on a specimen from each 1500 ft [460 m] of finished tubing.

11.7 Hydrostatic or Nondestructive Electric Test — Each tube shall be subjected to the hydrostatic test, or, instead of this test, a nondestructive electric test may be used when specified by the purchaser.

12. General Requirements

12.1 Material furnished under this specification should conform to the applicable requirements of the current edition of Specification A 450/A 450M, unless otherwise provided herein.

13. Product Marking

13.1 In addition to the marking prescribed in Specification A 450/A 450M, the marking shall include whether hot finished or cold finished, and whether seamless or welded.

14. Keywords

14.1 Seamless steel tube; steel tube; alloy; welded steel tube

TABLE 1
CHEMICAL REQUIREMENTS

	Composition, %	
	Grade 1	Grade 2
Carbon, max	0.15	0.15
Manganese, max	0.55	0.50–1.00
Phosphorus	0.06–0.16	0.04 max
Sulfur, max	0.060	0.05
Silicon, min	0.10	. . .
Copper	0.20–0.60	0.30–1.00
Chromium	0.24–1.31	. . .
Nickel	0.20–0.70	0.40–1.10
Molybdenum, min	. . .	0.10

TABLE 2
NUMBER OF TUBES IN A LOT HEAT TREATED BY
THE CONTINUOUS PROCESS

Size of Tube	Size of Lot
2 in. [50.8 mm] and over in outside diameter and 0.200 in. [5.1 mm] and over in wall thickness	not more than 50 tubes
Less than 2 in. [50.8 mm] but over 1 in. [25.4 mm] in outside diameter or over 1 in. [25.4 mm] in outside diameter and under 0.200 in. [5.1 mm] in wall thickness	not more than 75 tubes
1 in. [25.4 mm] or less in outside diameter	not more than 125 tubes

TABLE 3
TENSILE REQUIREMENTS

Tensile strength, min, ksi [MPa]	60 [415]
Yield strength, min, or 50 mm, ksi [MPa]	37 [255]
Elongation in 2 in. or 50 mm, min, %	25
For longitudinal strip tests a deduction for each $\frac{1}{32}$ in. [0.8 mm] decrease in wall thickness below $\frac{3}{16}$ in. [8 mm] from the basic minimum elongation of the following percentage points shall be made	1.25 ⁴

⁴ Calculated elongation requirements shall be rounded to the nearest whole number.

SUPPLEMENTARY REQUIREMENTS

The following supplementary requirement shall apply only when specified by the purchaser in the inquiry, contract, or order. Details of this supplemental requirement shall be agreed upon by the manufacturer and the purchaser.

S1. Surface Condition

S1.1 If pickling or shot-blasting, or both, are required, this shall be specifically stated in the order and shall be done at the purchaser's expense.

ADDITIONAL SUPPLEMENTARY REQUIREMENTS

The following supplementary requirements may become a part of the specification when specified in the inquiry or invitation to bid, and purchase order or contract. These requirements shall not be considered unless specified in the order and the necessary tests shall be made at the mill.

S2. Additional Testing of Welded Tubing per ASME Request

S2.1 Each tube shall be subjected to an ultrasonic inspection employing Practices E 273 or E 213 with the rejection criteria referenced in Specification A 450/A 450M.

S2.2 If Practice E 273 is employed, a 100% volumetric inspection of the entire length of each tube shall also be performed using one of the non-destructive electric tests permitted by Specification A 450/A 450M.

S2.3 The test methods described in the supplement may not be capable of inspecting the end portions of tubes. This condition is referred to as end effect. This portion, as determined by the manufacturer, shall be removed and discarded.

S2.4 In addition to the marking prescribed in Specification A 450/A 450M, "S2" shall be added after the grade designation.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR CENTRIFUGALLY CAST FERRITIC ALLOY STEEL PIPE FOR HIGH- TEMPERATURE SERVICE

SA-426/SA-426M

(Identical with ASTM Specification A 426/A 426M-07 except for a correction to the molybdenum content for Grade CP91 in Table 1.)

1. Scope

1.1 This specification covers centrifugally cast alloy steel pipe intended for use in high-temperature, high-pressure service.

1.2 Several grades of ferritic steels are covered. Their compositions are given in Table 1.

1.3 Supplementary Requirements S1 through S12 are provided. The supplementary requirements provide for additional tests of an optional nature and when desired shall be so stated in the order (Section 4).

1.4 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of each other. Combining values from the two systems may result in nonconformance with the specification.

Section IX Welding Qualifications

3. Ordering Information

3.1 Orders for material under this specification shall include the following, as required, to describe the desired material adequately:

3.1.1 Quantity (feet, centimetres, or number of lengths),

3.1.2 Name of material (centrifugally cast pipe),

3.1.3 Specification number,

3.1.4 Grade (Table 1),

3.1.5 Size (outside or inside diameter and minimum wall thickness),

3.1.6 Length (specific or random) (Section on Permissible Variations in Length of Specification A 999/A 999M),

3.1.7 End finish (Section on Ends of Specification A 999/A 999M),

3.1.8 Optional Requirements S1 through S12 and Section 14.1,

3.1.9 Test report required (Section on Certified Test Report of Specification A 999/A 999M),

3.1.10 Service temperature if over 1000°F [540°C] (Note 1), and

3.1.11 Special requirements or additions to specification.

4. General Requirements for Delivery

4.1 Material furnished under this specification shall conform to the applicable requirements of the current edition of Specification A 999/A 999M unless otherwise provided herein.

5. Materials and Manufacture

5.1 Heat-Treatment — The pipe shall be furnished in the normalized and tempered or liquid-quenched and tempered condition (Note 1). The temperature for tempering shall not be less than 1250°F [675°C] except for Grades CP1, CP2, CP11, CP12, and CP15 for which the temperature for tempering shall not be less than 1100°F [595°C]. Grade CP91 shall be normalized at 1900–1975°F (1040–1080°C) and tempered at 1350–1470°F (730–800°C).

5.1.1 Heat treatment shall be performed after the pipe has been allowed to cool below the transformation range. Definition of heat-treatment terms shall be as given in Terminology A 941.

NOTE 1 — Except for Grade CP91, it is recommended that the temperature for tempering should be at least 100°F [55°C] above the intended service temperature. The purchaser shall advise the manufacturer of the service temperature when it is over 1000°F [540°C].

5.2 Machining — The pipe shall be machined on the inner and outer surfaces to a roughness value no greater than 250 μ in. [6.35 μ m] arithmetical average deviation (AA) from the mean line unless otherwise specified as in ANSI B46.1.

6. Chemical Analysis

6.1 Heat Analysis — An analysis of each heat shall be made by the manufacturer to determine the percentages of elements specified in Table 1. The analysis shall be made on a test sample taken preferable during the pouring of the heat. The chemical composition thus determined shall conform to the requirements specified in Table 1 (Note 2).

NOTE 2 — The role of alloying elements in the development of Grade CP91 has been extensively investigated. V and Nb contribute to precipitation strengthening by forming fine and coherent precipitation of M(C,N)X carbo-nitrides in the ferrite matrix. V also precipitates as VN during tempering or during creep. Therefore, the addition of strong nitride forming elements, those with a stronger affinity for nitrogen than Nb and V, as deoxidation agents, interferes with these high-temperature strengthening mechanisms.

6.2 Product Analysis — A product analysis may be made by the purchaser. The sample for analysis shall be selected so as to be representative of the pipe being analyzed. The chemical composition thus determined shall conform to the requirements of Table 1.

7. Tensile and Hardness Requirements

7.1 Steel used for the castings shall conform to the tensile and hardness requirements specified in Table 2.

8. Permissible Variations in Dimensions

8.1 Thickness — The wall thickness shall not vary over that specified by more than $\frac{1}{8}$ in. [3 mm]. There shall be no variation under the specified wall thickness.

9. Number of Tests

9.1 One tension and one hardness test shall be made from each heat.

9.2 If a specimen is machined improperly or if flaws are revealed by machining or during testing, the specimen may be discarded and another substituted from the same heat.

10. Retests

10.1 If the results of the mechanical tests for any heat do not conform to the requirements specified, the castings may be reheat-treated and retested, but may not be re-austenitized more than twice.

11. Test Specimens

11.1 Test coupons from which tension test specimens are prepared shall be removed from heat-treated casting prolongations.

11.2 When agreed upon between the manufacturer and the purchaser, test coupons from which test specimens are prepared shall be cast attached to separate blocks from the same heat as the casting represented. The test blocks shall be heat treated in the same manner as the casting represented.

11.3 Tension test specimens shall be machined to the form and dimensions of the standard round 2 in. [50 mm] gage length specimens shown in Fig. 6 of Test Methods and Definitions A 370.

12. Hydrostatic Test

12.1 Each length of pipe shall be hydrostatically tested in accordance with Specification A 999/A 999M.

12.2 When agreed to between the manufacturer and the purchaser and so stated in the order, the hydrostatic test may be deferred and shall be performed later by the purchaser. Pipe furnished without the hydrostatic test shall include with the mandatory marking the letters "NH." The manufacturer is responsible for the satisfactory performance of the casting when it is tested.

12.3 When certification is required by the purchaser and the hydrostatic test has been omitted, the certification shall clearly state "not hydrostatically tested." The specification number and material grade shown on the certification shall be followed by the letters "NH."

13. Visual Inspection

13.1 The surface of the casting shall be free from cracks and hot tears as determined by visual examination. Other surface imperfections shall be judged in accordance with visual acceptance criteria which may be specified in the order.

14. Rework and Retreatment

14.1 Defects as defined in Section 14 shall be removed and their removal verified by visual inspection of the resultant cavities. Defects that are located by inspecting with supplementary requirements S6, S7, S8, or S9 shall be removed or reduced to an acceptable size.

14.2 If removal of the defect does not infringe upon the minimum wall thickness, the depression may be blended uniformly into the surrounding surface.

14.3 If the cavity resulting from defect removal infringes upon the minimum wall thickness, weld repair

is permitted subject to the purchaser's approval. The composition of the weld rod used shall be suitable for the composition of the metal being welded.

14.3.1 Only welders and procedures qualified in accordance with *ASME Boiler and Pressure Vessel Code*, Section IX, shall be used. All repair welds will be inspected to the same quality standards used to inspect the casting.

14.4 Local or full heat treatment in accordance with tempering temperatures specified in 5.1 shall follow welding.

15. Rejection

15.1 Each length of pipe received from the manufacturer may be inspected by the purchaser and, if it does not meet the requirements of the specification based on the inspection and test method as outlined in the specification, the pipe may be rejected and the manufacturer shall be notified. Disposition of rejected pipe shall be a matter of agreement between the manufacturer and the purchaser.

16. Product Marking

16.1 Each length of pipe shall be legibly marked with the manufacturer's name or brand, the specification number and grade. In addition, heat numbers or serial numbers that are traceable to heat numbers shall be marked on each length of pipe.

17. Keywords

17.1 alloy steel, centrifugal; ferritic; high-temperature service; pipe; stainless steel; steel castings

^A Elongation in 2 in. (50 mm) using a standard round specimen, in either the transverse or longitudinal direction.

SUPPLEMENTARY REQUIREMENTS

Supplementary requirements shall be applied only when specified by the purchaser. Details of the supplementary requirements shall be agreed upon between the manufacturer and purchaser. The specified tests shall be performed by the manufacturer prior to shipment of the castings.

S1. Additional Tension Tests

S1.1 Additional tension tests shall be made at a temperature to be specified by the customer, and the properties to be met are a matter of agreement between the purchaser and manufacturer.

S2. Flattening Test

S2.1 The flattening test shall be made on specimens from one or both ends of each length of pipe. If the specimen from any end of any length fails to conform to the requirements of Specification A 999/A 999M, that length shall be rejected.

S3. Photomicrographs

S3.1 The manufacturer shall furnish one photomicrograph at 100 diameters from one specimen of as-finished pipe from each heat in each heat-treatment lot. Such photomicrographs shall be suitable identified as to pipe size, wall thickness, and heat. Such photomicrographs are for information only, to show the actual metal structure of the pipe as furnished. No photo-micrographs for the individual pieces purchased shall be required except as specified in Section S4.

S4. Photomicrographs for Individual Pieces

S4.1 The manufacturer shall furnish photomicrographs from one or both ends of each pipe. All photomicrographs required shall be properly identified as to heat number, size, and wall thickness of pipe from which the section was taken. Photomicrographs shall be further identified to permit association of each photomicrograph with the individual length of pipe it represents.

S5. Metal Structure and Etching Tests

S5.1 Etching tests shall be made on transverse sections from the pipe and shall reveal the macrostructure of the material. Such tests are for information only.

S6. Radiographic Examination

S6.1 The castings shall be examined for internal defects by means of X rays or gamma rays. The inspection procedure shall be in accordance with Guide E 94 and the types

and degrees of discontinuities considered shall be judged by Reference Radio-graphs E 186, E 280, or E 446. The extent of the examination and the basis for acceptance shall be subject to agreement between the manufacturer and the purchaser.

S7. Liquid Penetrant Examination

S7.1 The castings shall be examined for surface discontinuities by means of liquid penetrant inspection. The method of performing the liquid penetrant test shall be in accordance with Practice E 165. The areas to be inspected, the methods and types of liquid penetrants to be used, the developing procedure, and the basis for acceptance shall be as specified on the inquiry or invitation to bid and on the purchase order or contract or both, or as agreed upon between the manufacturer and purchaser.

S8. Magnetic Particle Inspection

S8.1 The castings shall be examined by magnetic particle inspection. The inspection procedure used shall be in accordance with Practice E 709. The extent of examination and the basis for acceptance shall be subject to agreement between the manufacturer and the purchaser.

S9. Ultrasonic Inspection

S9.1 The castings shall be examined ultrasonically in accordance with Practice A 609/A 609M. The extent of the examination and the basis of acceptance shall be subject to agreement between the manufacturer and the purchaser.

S10. Residual Elements

S10.1 An analysis for the elements specified in Table S1 shall be included in those analyses specified in Section 6. The chemical composition thus determined shall conform to the requirements of Table S1.

S11. Charpy Impact Test

S11.1 Charpy impact test properties shall be determined on each heat from a set of three Charpy V-notch specimens.

The test coupons shall be taken as specified for tension specimens in Section 11 and tested at a test temperature agreed upon by the manufacturer and purchaser. The acceptance requirements shall be either energy absorbed or lateral expansion or percent shear area, and shall be that agreed upon by the manufacturer and purchaser. Test specimens shall be prepared as Type A and tested in accordance with Test Methods and Definitions A 370.

S11.2 Absorbed Energy Value, of three specimens shall not be less than that agreed upon by the manufacturer and purchaser, with no more than one value permitted below the minimum average specified and no value permitted below the minimum specified for a single specimen.

S11.3 Lateral Expansion Value, shall be agreed upon by the manufacturer and purchaser.

S11.4 Percent Shear Area, shall be agreed upon by the manufacturer and purchaser.

S12. Drop Weight Test

S12.1 Drop weight test properties shall be determined by preparing and testing either Type P1, P2, or P3 specimens in accordance with Test Method E 208. The test coupons shall be taken as specified for tension specimens in Section 11. The crack starter weld shall be deposited on the surface of the specimen which was nearest to the casting surface. Each test shall consist of at least two specimens tested at a temperature agreed upon by the manufacturer and purchaser. Each specimen shall exhibit a “no break” performance.

SPECIFICATION FOR STRAIGHT-BEAM ULTRASONIC EXAMINATION OF STEEL PLATES

SA-435/SA-435M

[Identical with ASTM Specification A 435/A 435M-90(R07).]

1. Scope

1.1 This specification covers the procedure and acceptance standards for straight-beam, pulse-echo, ultrasonic examination of rolled fully killed carbon and alloy steel plates, $\frac{1}{2}$ in. [12.5 mm] and over in thickness. It was developed to assure delivery of steel plates free of gross internal discontinuities such as pipe, ruptures, or laminations and is to be used whenever the inquiry, contract, order, or specification states that the plates are to be subjected to ultrasonic examination.

1.2 Individuals performing examinations in accordance with this specification shall be qualified and certified in accordance with the requirements of the latest edition of ASNT SNT-TC-1A or an equivalent accepted standard. An equivalent standard is one which covers the qualification and certification of ultrasonic nondestructive examination candidates and which is acceptable to the purchaser.

1.3 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents, therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification.

2. Referenced Document

2.1 *ASNT Standard:*
SNT-TC-1A

3. Apparatus

3.1 The manufacturer shall furnish suitable ultrasonic equipment and qualified personnel necessary for performing the test. The equipment shall be of the pulse-echo straight beam type. The transducer is normally 1 to $1\frac{1}{8}$ in.

[25 to 30 mm] in diameter or 1 in. [25 mm] square; however, any transducer having a minimum active area of 0.7 in.^2 [450 mm^2] may be used. The test shall be performed by one of the following methods: direct contact, immersion, or liquid column coupling.

3.2 Other search units may be used for evaluating and pinpointing indications.

4. Test Conditions

4.1 Conduct the examination in an area free of operations that interfere with proper functioning of the equipment.

4.2 Clean and smooth the plate surface sufficiently to maintain a reference back reflection from the opposite side of the plate at least 50% of the full scale during scanning.

4.3 The surface of plates inspected by this method may be expected to contain a residue of oil or rust or both. Any specified identification which is removed when grinding to achieve proper surface smoothness shall be restored.

5. Procedure

5.1 Ultrasonic examination shall be made on either major surface of the plate. Acceptance of defects in close proximity may require inspection from the second major surface. Plates ordered in the quenched and tempered condition shall be tested following heat treatment.

5.2 A nominal test frequency of $2\frac{1}{4}$ MHz is recommended. Thickness, grain size, or microstructure of the material and nature of the equipment or method may require a higher or lower test frequency. However, frequencies less than 1 MHz may be used only on agreement with the purchaser. A clear, easily interpreted trace pattern should be produced during the examination.

5.3 Conduct the examination with a test frequency and instrument adjustment that will produce a minimum 50 to a maximum 75% of full scale reference back reflection from the opposite side of a sound area of the plate. While calibrating the instrument, sweep the crystal along the plate surface for a distance of at least 17 or 6 in. [150 mm], whichever is the greater, and note the position of the back reflection. A shift in location of the back reflection during calibration shall be cause for recalibration of the instrument.

5.4 Scanning shall be continuous along perpendicular grid lines on nominal 9 in. [225 mm] centers, or at the manufacturer's option, shall be continuous along parallel paths, transverse to the major plate axis, on nominal 4 in. [100 mm] centers, or shall be continuous along parallel paths parallel to the major plate axis, on 3 in. [75 mm] or smaller centers. A suitable couplant such as water, soluble oil, or glycerin, shall be used.

5.5 Scanning lines shall be measured from the center or one corner of the plate. An additional path shall be scanned within 2 in. [50 mm] of all edges of the plate on the scanning surface.

5.6 Where grid scanning is performed and complete loss of back reflection accompanied by continuous indications is detected along a given grid line, the entire surface area of the squares adjacent to this indication shall be scanned continuously. Where parallel path scanning is performed and complete loss of back reflection accompanied

by continuous indications is detected, the entire surface area of a 9 by 9 in. [225 by 225 mm] square centered on this indication shall be scanned continuously. The true boundaries where this condition exists shall be established in either method by the following technique: Move the transducer away from the center of the discontinuity until the heights of the back reflection and discontinuity indications are equal. Mark the plate at a point equivalent to the center of the transducer. Repeat the operation to establish the boundary.

6. Acceptance Standards

6.1 Any discontinuity indication causing a total loss of back reflection which cannot be contained within a circle, the diameter of which is 3 in. [75 mm] or one half of the plate thickness, whichever is greater, is unacceptable.

6.2 The manufacturer reserves the right to discuss rejectable ultrasonically tested plates with the purchaser with the object of possible repair of the ultrasonically indicated defect before rejection of the plate.

6.3 The purchaser's representative may witness the test.

7. Marking

7.1 Plates accepted in accordance with this specification shall be identified by stamping or stenciling UT 435 adjacent to marking required by the material specification.

SUPPLEMENTARY REQUIREMENTS

The following shall apply only if specified in the order:

- S1.** Instead of the scanning procedure specified by 5.4 and 5.5, and as agreed upon between manufacturer and purchaser, 100% of one major plate surface shall be scanned. Scanning shall be continuous along parallel paths, transverse or parallel to the major plate axis, with not less than 10% overlap between each path.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR ALLOY-STEEL TURBINE-TYPE BOLTING MATERIAL SPECIALLY HEAT TREATED FOR HIGH-TEMPERATURE SERVICE

SA-437/SA-437M

(Identical with ASTM Specification A 437/A 437M-06.)

1. Scope

1.1 This specification covers alloy-steel bolting material specially heat treated for high-temperature service, such as steam turbine, gas turbine, and similar uses. This material requires special processing and should not be used in general-purpose applications. The term “bolting material,” as used in this specification, covers rolled or forged bars, bolts, nuts, screws, washers, studs, and stud bolts. The bars shall be hot wrought. The material may be further processed by centerless grinding or by cold drawing.

1.2 The high-temperature properties of the material covered by this specification are dependent upon special heat treatment, which is required. Although the high-temperature properties are not specified, they are implied by control of the chemistry, heat treatment, and room-temperature properties of the material.

NOTE 1— High-temperature tests shall not be required, unless made a matter of agreement between the manufacturer and the purchaser.

1.3 Three levels of bolting strength are covered, designated Grades B4B, B4C, and B4D. Selection will depend on the design and the stresses and service for which the product is to be used.

NOTE 2— When ordering material under this specification, or when incorporating this specification as a reference in any individual specification, the purchaser must designate the steel by identification symbol or analysis, or both, and definitely specify the minimum mechanical properties required as selected from Table 1.

1.4 Supplementary requirements of an optional nature are provided for use at the option of the purchaser. The supplementary requirements shall apply only when specified individually by the purchaser in the purchase order or contract.

1.5 This specification is expressed in both inch-pound units and in SI units. However, unless the order specifies

the applicable “M” specification designation (SI units), the material shall be furnished to inch-pound units.

1.6 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification.

2. Referenced Documents

2.1 ASTM Standards:

A 962/A 962M Specification for Common Requirements for Steel Fasteners or Fastener Materials, or Both, Intended for Use at Any Temperature from Cryogenic to the Creep Range

3. Common Requirements

3.1 Material and Fasteners supplied to this specification shall conform to the requirements of Specification A 962/A 962M. These requirements include test methods, finish, thread dimensions, marking certification, optional supplementary requirements, and others. Failure to comply with the requirements of Specification A 962/A 962M constitutes nonconformance with this specification. In case of conflict between this specification and Specification A 962/A 962M, this specification shall prevail.

4. Ordering Information

4.1 The inquiry and order should indicate the following:

4.1.1 Specification designation, grade and class, issue date and revision letter,

4.1.2 Quantity (weight or number of pieces),

4.1.3 Description (bars, bolts, nuts, etc.),

4.1.4 Dimensions,

4.1.5 Finish, and

4.1.6 Impact testing of nuts, if required (see Section 9).

5. Discard

5.1 A sufficient discard shall be made from each ingot to ensure freedom from injurious piping and undue segregation.

6. Heat Treatment

6.1 The material Grades B4B and B4C shall be heated to a temperature range of 1875 to 1925°F [1025 to 1050°C] and liquid quenched to below 600°F [316°C]. The material Grades B4B and B4C shall then be uniformly reheated for tempering at a tempering temperature at least 100°F [55°C] higher than the proposed operating temperature but not less than 1150°F [620°C], then air or furnace cooled to room temperature. The material shall be at the tempering temperature for a minimum of 2 h. Double tempering may be used to enhance properties.

6.2 Material Grade B4D shall be heated to a temperature range of 1700 to 1750°F [925 to 954°C] and oil quenched. The material shall then be uniformly reheated or tempered at a temperature of 1200°F [650°C] minimum, followed by air or furnace cooling to room temperature.

6.3 Stress relieving treatment of the bar material is required after any stretcher, roller, or rotary-straightening or cold-finishing operations performed after heat treatment for mechanical properties. Local gagging or press straightening to correct camber limitations in excess of $\frac{1}{4}$ in. in any 5 ft [6 mm in any 1.5 m] shall be followed by a stress relieving heat treatment. The minimum stress relieving temperature shall be 100°F [55°C] below the minimum tempering temperature as shown in 6.1 for Grades B4B and B4C or in 6.2 for Grade B4D.

7. Chemical Composition

7.1 The material shall conform to the requirements as to chemical composition specified in Table 2.

8. Tensile Requirements

8.1 The material shall conform to the requirements as to tensile properties prescribed in Table 1 at room temperature after heat treatment.

8.2 The longitudinal axis of the test specimen shall be parallel to the direction of rolling.

9. Impact Requirements

9.1 The material Grades B4B, B4C, and B4D shall conform to the requirements as to impact properties prescribed in Table 3 at room temperature after heat treatment.

10. Hardness Tests

10.1 The material Grades B4B, B4C, and B4D shall conform to the requirements as to hardness as prescribed in Table 4 and Table 5 at room temperature after heat treatment.

11. Workmanship, Finish, and Appearance

11.1 Standard permissible variations of bars shall be as set forth in Table 6.

12. Nuts and Washers

12.1 When specified by the purchaser, the nuts shall be subject to the impact and tension requirements of this specification. The tests shall be made on test specimens taken from the bar or plate used in the manufacture of the nuts.

13. Threads

13.1 All threads shall be formed after heat treatment.

14. Nondestructive Inspection

14.1 Each bar or forged blank of starting material shall be subjected to NDE following final heat treatment. The method used shall be either the Eddy Current (EC), the Magnetic Particle (MPI) (wet or dry), the Liquid Penetrant (LPI), the Ultrasonic (UT), or the Visual Testing (VT), at the option of the producer. For LPI or MPI, linear indications (those indications longer than $\frac{1}{16}$ in. [1.5 mm] with a length greater than three times their width) are unacceptable.

able. For UT or ET, reject levels for linear indications shall be based on the alarm response from a surface notch with a maximum depth of 0.012 in. [.30 mm] in a calibration bar. Product being subjected to VT shall be pickled prior to inspection. VT indications longer than $\frac{1}{8}$ in. are prohibited.

15. Keywords

15.1 bolts — steel; chromium alloy steel; fasteners — steel; marking on fasteners; nuts — steel; steel bars — alloy; steel bolting material; temperature service applications — high; turbine materials

SUPPLEMENTARY REQUIREMENTS

One or more of the following supplementary requirements shall be applied only when specified by the purchaser in the inquiry, contract, or order; in which event the specified tests shall be made before shipment of the product.

S1. Non-Destructive Examination

S1.1 NDE is required following all machining and threading. The acceptance criteria of 14.1 shall apply.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR HEX CAP SCREWS, BOLTS AND STUDS, STEEL, HEAT TREATED, 120/105/90 ksi MINIMUM TENSILE STRENGTH, GENERAL USE (10)

SA-449

(Identical with ASTM Specification A 449-07b, except for requiring that all mating fastener components be coated by the same zinc-coating process in 5.1.4, the deletion of private label distributor in 16.1 and 16.3.2, and the removal of reference to bolts in para. 6.4.)

1. Scope

1.1 This specification covers quenched and tempered steel hex cap screws, bolts, and studs having a minimum tensile strength of 120 ksi for diameters 1.0 in. and smaller; 105 ksi for diameters over 1.0 in. to 1½ in.; and 90 ksi for diameters 1¾ in. to 3.0 in. inclusive. The term “fasteners” in this specification denotes hex cap screws, bolts, and studs.

1.2 The fasteners are intended for general engineering use.

1.3 The fasteners are furnished in diameters ¼ to 3.0 in. inclusive. They are designated by type denoting chemical composition as follows:

Type	Description
Type 1	Plain carbon steel, carbon boron steel, alloy steel, or alloy boron steel
Type 2	Withdrawn 2003
Type 3	Weathering steel

1.4 Terms used in this specification are defined in Terminology F 1789 unless otherwise defined in this specification.

1.5 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are provided for information purposes only.

1.6 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

B18.2.1 Square and Hex Bolts and Screws

B18.24 Part Identifying Number (PIN) Code System Standard for B18 Fastener Products

3. Ordering Information

3.1 Orders for fasteners under this specification shall include the following:

3.1.1 Quantity (number of pieces),

3.1.2 Size, including nominal diameter and length,

3.1.3 Name of product,

3.1.4 Type, that is, Type 1, or Type 3 as required,

3.1.5 ASTM designation and year of issue, and

3.1.6 Other components such as nuts and washers if required.

3.1.7 Hot-Dip or Mechanically Deposited Zinc Coatings — For hot-dip or mechanically deposited zinc coatings covered by 5.1 and requiring over-tapped nuts, specify the zinc coating process required, that is, hot-dip, mechanically deposited, or no preference (see 5.1).

3.1.8 Other Coatings — Specify other protective coating if required (see 5.2).

3.1.9 Specify if inspection at point of manufacture is required.

3.1.10 Test reports if required.

3.1.11 Supplementary or special requirements.

3.1.12 For establishment of a part identifying system, see ASME B18.24.

NOTE 1 — A typical ordering description follows: 1000 pieces $\frac{1}{8}$ in. diameter $\times$ 4.0 in. long hex cap screw, Type 1, ASTM A 449-XX, each with one finished hex nut ASTM A 563, Grade DH. Each component mechanically zinc coated in accordance with B 695, Class 5, Type II.

3.2 Suitable Nuts and Washers:

3.2.1 Suitable nuts are covered in Specification A 563. Unless otherwise specified, the grade and style of nut shall be as follows:

Fastener Size and Surface Finish	Nut Grade and Style ^A
$\frac{1}{4}$ to $1\frac{1}{2}$ in., plain (or with coating of insufficient thickness to require over-tapped nuts)	B, hex
Over $1\frac{1}{2}$ to 3 in., plain (or with coating of insufficient thickness to require over-tapped nuts)	A, heavy hex
$\frac{1}{4}$ to 3 in., zinc-coated (or with a coating thickness requiring over-tapped nuts)	DH, heavy hex
$\frac{1}{4}$ to 3 in., Type 3	C3, DH3, heavy hex

^A Nuts of other grades and styles having specified proof load stresses (Specification A 563, Table 3) greater than the specified grade and style of nuts are suitable.

3.2.2 Unless otherwise specified, washers ordered with fasteners shall be furnished to the requirements of Specification F 436, Type 1 or Specification F 436, Type 3. Washers for A 449 Type 3 fasteners shall conform to Specification F 436 Type 3.

4. Materials and Manufacture

4.1 Heat Treatment:

4.1.1 Type 1 fasteners produced from medium carbon steel shall be quenched in a liquid medium from the austenitizing temperature.

4.1.2 Type 1 fasteners produced from medium carbon steel to which chromium, nickel, molybdenum, or

boron were intentionally added, and Type 3 fasteners, shall be quenched in oil from the austenitizing temperature.

4.1.3 Type 1 and Type 3 fasteners, regardless of the steel used, shall be tempered by reheating to not less than 800°F.

4.2 Threading — Threads shall be rolled, cut, or ground.

4.3 Secondary Processing — If any processing which can affect the mechanical properties of the fasteners is performed after the initial testing, the fasteners shall be retested for all specified mechanical properties affected by the reprocessing.

5. Protective Coatings

5.1 Zinc, Hot Dip, and Mechanically Deposited Requiring Over-tapped Nuts:

5.1.1 When zinc-coated fasteners are required, the purchaser shall specify the zinc-coating process, such as, hot-dip, mechanically deposited, or no preference.

5.1.2 When hot dip is specified, the fasteners shall be zinc coated by the hot-dip process in accordance with the requirements of Specification F 2329.

5.1.3 When mechanically deposited is specified, the fasteners shall be zinc coated by the mechanical deposition process in accordance with the requirements of Class 55 of Specification B 695.

5.1.4 When no preference is specified, the supplier may furnish either a hot-dip zinc coating in accordance with Specification F 2329, or a mechanically deposited zinc coating in accordance with Specification B 695, Class 55. All mating components shall be coated by the same zinc coating process, and the suppliers' option shall be limited to one process per item with no mixed processes in a lot.

NOTE 2 — When the intended application requires that assembled tension exceeds 50% of minimum bolt or stud proof load, an anti-galling lubricant may be needed. Application of such a lubricant to nuts and a test of the lubricant efficiency are provided in Supplementary Requirement S1 of Specification A 563 and should be specified when required.

5.2 Other Coatings:

5.2.1 When other coatings are required, the purchaser shall specify the coating specification, including the classification codes or grade numbers to identify the coating material, thickness, supplemental treatments, or other requirements to define the coating. The fasteners shall be coated in accordance with and conform to the specified coating specification.

5.2.2 When a specification does not apply, the purchaser shall specify the desired coating, coating thickness, supplemental treatments, or other requirements to define the coating.

6. Chemical Composition

6.1 Type 1 fasteners shall be plain carbon steel, carbon boron steel, alloy steel, or alloy boron steels, at the manufacturer's option, conforming to the requirements in Table 1.

6.2 Type 3 fasteners shall be weathering steel and shall conform to one of the chemical compositions specified in Table 2. The selection of the chemical composition, A, B, C, D, E or F, shall be at the option of the manufacturer. See Guide G 101 for methods of estimating the atmospheric corrosion resistance of low alloy steel.

6.3 Product analyses made on finished fasteners representing each lot shall conform to the product analysis requirements specified in Table 1 or Table 2, as applicable.

6.4 Heats of steel to which bismuth, selenium, tellurium, or lead has been intentionally added shall not be permitted. Compliance shall be based on certification that heats of steel having any of the listed elements intentionally added were not used.

6.5 Chemical analyses shall be performed in accordance with Test Methods, Practices, and Terminology A 751.

7. Mechanical Properties

7.1 Hardness — The fasteners shall conform to the hardness specified in Table 3. See Table 3, Note A.

7.2 Tensile Properties:

7.2.1 Except as permitted in 7.2.2 for long fasteners and 7.2.3 for short fasteners, hex cap screws and hex and square head bolts in sizes 1.00 in. and smaller having a length of $2\frac{1}{4}D$ and longer and sizes $1\frac{1}{8}$ to $1\frac{1}{2}$ in. inclusive having a length of 3D and longer shall be wedge tested full size. Bolts with heads other than hex or square shall be axially tested. Both wedge and axially tested hex cap screws and bolts shall conform to the proof load or alternative proof load, and minimum wedge tensile load in Tables 4 and 5, as applicable. The load applied during proof load testing shall be equal to or greater than the proof load in Table 4 or Table 5 as applicable.

7.2.2 Hex cap screws and square head bolts larger than $1\frac{1}{2}$ in. diameter, other than those excepted in 7.2.3, shall preferably be tested full size and when so tested shall conform to the tensile strength and either the specified proof load or yield strength requirements in Tables 4 and 5, as applicable. When equipment of sufficient capacity for full size testing is not available, or when the length of the bolt makes full size testing impractical, machined specimens shall be tested and shall conform to the requirements of Table 6.

7.2.3 Sizes 1.00 in. and smaller having a length shorter than $2\frac{1}{4}D$ down to 2D inclusive, which cannot be

wedge tensile tested shall be axially tension tested full size and shall conform to the minimum tensile load and proof load or alternate proof load specified in Tables 4 and 5. Sizes 1.00 in. and smaller having a length shorter than 2D which cannot be axially tensile tested shall be qualified on the basis of hardness.

7.2.4 Studs 3D and longer shall be axially tension tested full size and shall conform to the tensile and proof load or alternate proof load specified in Table 4 and Table 5, as applicable. When equipment for full size testing is not available, or when the studs are too long for full size testing, machined specimens shall be tested and shall conform to the tensile requirements in Table 6.

7.2.5 If fasteners are subjected to both hardness and tensile tests, the tensile test results shall take precedence in the event of low hardness test results.

7.2.6 If fasteners are subjected to both full size and machined specimen tests, the full size test results shall take precedence if the results of the two methods differ.

8. Dimensions

8.1 Head and Body:

8.1.1 Hex Cap Screws — Unless otherwise specified, hex cap screws shall be furnished with dimensions conforming to ASME B18.2.1.

8.1.2 Bolts — When styles other than specified in 8.1.1 are required, they shall have dimensions conforming to those specified by the purchaser.

8.1.3 Studs — Studs shall have dimensions conforming to those specified by the purchaser.

8.2 Threads:

8.2.1 Uncoated — Unless otherwise specified, uncoated threads shall be the Unified Coarse Thread Series as specified in the latest issue of ASME B1.1, and shall have Class 2A tolerances.

8.2.2 Coated — Unless otherwise specified, zinc-coated bolts, to be used with zinc-coated nuts or tapped holes, which are tapped oversize in accordance with Specification A 563, shall have UNC Class 2A threads before hot-dip or mechanically deposited zinc-coating. After zinc coating, the pitch diameter and major diameter shall not exceed the Class 2A limits by more than the following amounts:

Nominal Diameter (in.)	Oversize Limit, in. ^A	
	Hot-Dip Zinc	Mechanical Zinc
1/4	0.016	0.012
5/16, 3/8	0.017	0.012
7/16, 1/2	0.018	0.012
9/16, 5/8, 3/4	0.020	0.013
7/8	0.022	0.015
1.0 to 1 1/4	0.024	0.016
1 3/8, 1 1/2	0.027	0.018
1 3/4 to 3.0, incl	0.050	0.033

^AHot-dip zinc nuts are tapped oversize after coating and mechanical zinc coated nuts are tapped oversize before coating.

8.2.3 Unless otherwise specified, fasteners electroplated or mechanically coated to 0.0005 in. or less, threads prior to plating shall conform to ASME B1.1 Class 2A and after plating shall not exceed the Class 3A maximum limits, that is, Class 2A plus the allowance.

9. Workmanship, Finish, and Appearance

9.1 Surface discontinuity limits, inspection, and evaluation shall be in accordance with Specification F 788/F 788M.

10. Number of Tests and Retests

10.1 Testing Responsibility:

10.1.1 Each lot shall be tested by the manufacturer prior to shipment in accordance with the lot identification control quality assurance plan in 10.2-10.5.

10.1.2 When fasteners are furnished by a source other than the manufacturer, the responsible party as defined in 15.1 shall be responsible for assuring all tests have been performed and the fasteners comply with the requirements of this specification (see 4.3).

10.2 Purpose of Lot Inspection — The purpose of a lot inspection program is to ensure that each lot conforms to the requirements of this specification. For such a plan to be fully effective, it is essential that secondary processors, distributors, and purchasers maintain the identification and integrity of each lot until the product is installed.

10.3 Lot Processing — All fasteners shall be processed in accordance with a lot identification-control quality assurance plan. The manufacturer, secondary processors, and distributors shall identify and maintain the integrity of each lot from raw material selection through all operations and treatments to final packing and shipment. Each lot shall be assigned its own lot-identification number, each lot shall be tested, and the inspection test reports for each lot shall be retained.

10.4 Lot Definition:

10.4.1 Standard Lot — A lot shall be a quantity of uniquely identified fasteners of the same nominal size and length produced consecutively at the initial operation from a single mill heat of material and processed at one time, by the same processor in the same manner so that statistical sampling is valid. The identity of the lot and lot integrity shall be maintained throughout all subsequent operations and packaging.

10.5 Number of Tests — The minimum number of tests from each lot for the tests specified below shall be as follows:

Tests	Number of Test in Accordance With
Hardness, tensile strength, proof load	Guide F 1470
Coating weight/thickness	The referenced coating specification ^A
Surface discontinuities	Specification F 788/F 788M
Dimensions and thread fit	ASME B18.2.1

^AGuide F 1470 if the coating specification does not specify a testing frequency.

11. Test Methods

11.1 Tensile, proof load, and hardness tests shall be conducted in accordance with Test Methods F 606.

11.2 Tensile strength for hex cap screws and hex and square bolts shall be determined using the wedge or axial tension testing method of full size product method or the machined test specimens method depending on size and length as specified in 7.2.2–7.2.6. Bolts with heads other than hex or square shall be axially tested. Fracture on full size tests shall be in the body or threads of the fastener without a fracture at the junction of the head and body.

11.3 Studs shall be tested by the axial tension method as described in the second paragraph of axial tension testing of full size products in the Test Methods section of Test Methods F 606.

11.4 Proof load shall be determined using Method 1, length measurement, or Method 2, yield strength, at the option of the manufacturer.

12. Inspection

12.1 If the inspection described in 12.2 is required by the purchaser, it shall be specified in the inquiry and contract or order.

12.2 The purchaser's representative shall have free entry to all parts of the manufacturer's works or supplier's place of business that concern the manufacture or supply of

the fasteners. The manufacturer shall afford the purchaser's representative all reasonable facilities to satisfy him that the fasteners are being furnished in accordance with this specification. All tests and inspections required by the specification that are requested by the purchaser's representative shall be made before shipment, and shall be conducted as not to interfere unnecessarily with the operation of the manufacturer's works or supplier's place of business.

13. Rejection and Rehearing

13.1 Disposition of nonconforming fasteners shall be in accordance with the section on Disposition of Nonconforming Lots of Guide F 1470.

14. Certification

14.1 When specified on the purchase order, the manufacturer or supplier, whichever is the responsible party as defined in Section 15, shall furnish the purchaser test reports which include the following:

14.1.1 Heat analysis, heat number, and a statement certifying that heats having the elements listed in 6.4 intentionally added were not used to produce the fasteners,

14.1.2 Results of hardness, tensile, an proof load tests,

14.1.3 Zinc coating measured coating weight/thickness for coated fasteners,

14.1.4 Statement of compliance with dimensional and thread fit requirements,

14.1.5 Lot number and purchase order number,

14.1.6 Complete mailing address of responsible party, and

14.1.7 Title and signature of the individual assigned certification responsibility by the company officers.

14.2 Failure to include all the required information on the test report shall be cause for rejection.

15. Responsibility

15.1 The party responsible for the fastener shall be the organization that supplies the fastener to the purchaser.

16. Product Marking

16.1 *Manufacturers Identification* — All hex cap screws and bolts and one end of studs $\frac{3}{8}$ in. and larger, and whenever feasible studs smaller than $\frac{3}{8}$ in., shall be marked by the manufacturer with a unique identifier to identify the manufacturer.

16.2 Type Identification:

16.2.1 Type 1 hex cap screws and bolts and one end of Type 1 studs $\frac{3}{8}$ in. and larger, and whenever feasible studs smaller than $\frac{3}{8}$ in., shall be marked "A 449."

16.2.2 All Type 3 hex cap screws, bolts, and studs shall be marked to indicate that they are produced from weathering steel. Heads of type 3 hex cap screws and bolts shall be marked "A 449" underlined. Type 3 studs $\frac{3}{8}$ in. and larger, and whenever feasible studs smaller than $\frac{3}{8}$ in., shall be marked "A 449" underlined on at least one end. Studs under $\frac{3}{8}$ in. not marked "A 449" underlined, shall be marked with the use of additional marks to indicate that they are produced from weathering steel.

16.3 Marking Location and Methods:

16.3.1 All markings shall be located on the top of a hex cap screw and bolt heads and on one end of studs and shall be either raised or depressed at the manufacturer's option.

16.3.2 Type and manufacturer's identification shall be separate and distinct. The two identifications shall preferably be in different locations and, when on the same level, shall be separated by at least two spaces.

16.4 *Acceptance Criteria* — Fasteners which are not marked in accordance with these provisions shall be considered nonconforming and subject to rejection.

17. Packaging and Package Marking

17.1 Packaging:

17.1.1 Unless otherwise specified, packaging shall be in accordance with Practice D 3951.

17.1.2 When special packaging requirements are required, they shall be defined at the time of the inquiry and order.

17.2 Package Marking:

17.2.1 Each shipping unit shall include or be plainly marked with the following information:

17.2.1.1 ASTM designation and type,

17.2.1.2 Size,

17.2.1.3 Name and brand or trademark of the manufacturer,

17.2.1.4 Number of pieces,

17.2.1.5 Lot number,

17.2.1.6 Purchase order number, and

17.2.1.7 Country of origin.

18. Keywords

18.1 bolts; carbon steel; hex cap screws; steel; studs

NOTES:

^A A, B, C, D, E, and F are classes of material used for Type 3 fasteners. Selection of a class shall be at the option of the bolt manufacturer.

^B These elements are not specified or required.

TABLE 3
 HARDNESS REQUIREMENTS FOR HEX CAP SCREWS, BOLTS, AND STUDS

Nominal Diameter, in.	Length, in.	Brinell		Rockwell C	
		Min.	Max.	Min.	Max.
$\frac{1}{4}$ to 1, inclusive	Less than 2D ^A	253	319	25	34
	2D and over	...	319	...	34
Over 1 to 1 $\frac{1}{2}$, inclusive	Less than 3D ^A	223	286	19	30
	3D and over	...	286	...	30
Over 1 $\frac{1}{2}$ to 3, inclusive	Less than 3D ^A	183	235	...	...
	3D and over	...	235	...	...

NOTE:

^A Hex cap screws and bolts larger than 1.00 in. diameter and shorter than 3D and all studs shorter than 3D are subject only to minimum and maximum hardness.

D = Nominal diameter or thread size

TABLE 4
TENSILE LOAD REQUIREMENTS FOR COARSE-THREAD FULL-SIZE HEX CAP SCREWS, BOLTS AND STUDS

Bolt or Stud Diameter, in.	Threads per inch ^A	Stress Area, ^B in. ²	Tensile Load, min, lbf ^C	Proof Load, Length Measurement Method, lbf ^C	Alternative Proof Load, Yield Strength Method (0.2% Offset), min, lbf ^C
Column 1	Column 2	Column 3	Column 4	Column 5	Column 6
1/4	20	0.0318	3 800	2 700	2 900
5/16	18	0.0524	6 300	4 450	4 800
3/8	16	0.0775	9 300	6 600	7 100
7/16	14	0.1063	12 750	9 050	9 800
1/2	13	0.1419	17 050	12 050	13 050
9/16	12	0.182	21 850	15 450	16 750
5/8	11	0.226	27 100	19 200	20 800
3/4	10	0.334	40 100	28 400	30 700
7/8	9	0.462	55 450	39 250	42 500
1	8	0.606	72 700	51 500	55 750
1 1/8	7	0.763	80 100	56 450	61 800
1 1/4	7	0.969	101 700	71 700	78 500
1 3/8	6	1.155	121 300	85 450	93 550
1 1/2	6	1.405	147 500	104 000	113 800
1 3/4	5	1.90	171 000	104 500	110 200
2	4 1/2	2.50	225 000	137 500	145 000
2 1/4	4 1/2	3.25	292 500	178 750	188 500
2 1/2	4	4.00	360 000	220 000	232 000
2 3/4	4	4.93	443 700	271 150	286 000
3	4	5.97	537 300	328 350	346 200

NOTES:

^A For 8 threads per in., sizes 1 1/8 to 1 1/2 in., inclusive, stresses of 105 000 psi, 74 000 psi, and 81 000 psi shall be used for calculating the values in columns 4, 5, and 6 respectively.

^B The stress area is taken from ASME B1.1 which uses the equation below to calculate the values:

$$A_s = 0.7854 [D - (0.9743/n)]^2$$

where:

A_s = stress area, in.²,
 D = nominal diameter, and
 n = threads per inch

^C Values tabulated are based on the following:

Bolt Size, in.	Column 4, psi	Column 5, psi	Column 6, psi
1/4 to 1, incl.	120 000	85 000	92 000
1 1/8 to 1 1/2, incl.	105 000	74 000	81 000
1 3/4 to 3, incl.	90 000	55 000	58 000

TABLE 5

TABLE 6
 TENSILE STRENGTH REQUIREMENTS FOR SPECIMENS MACHINED FROM HEX CAP SCREWS, BOLTS AND STUDS

Nominal Diameter, in.	Tensile Strength, min, psi	Yield Strength, min, psi	Elongation in 4 <i>D</i> , min, %	Reduction of Area, min, %
1/4 to 1, incl	120 000	92 000	14	35
Over 1 to 1 1/2, incl	105 000	81 000	14	35
Over 1 1/2 to 3, incl	90 000	58 000	14	35

SUPPLEMENTARY REQUIREMENT

S1. Marking

S1.1 Studs that are continuously threaded with the same class of thread shall be marked on each end with the marking required by Section 16.

S1.2 Marking small sizes (customarily less than 0.375 in.) may not be practical. Consult the producer for the minimum size that can be marked.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR GENERAL REQUIREMENTS FOR CARBON, FERRITIC ALLOY, AND AUSTENITIC ALLOY STEEL TUBES

SA-450/SA-450M

(Identical with ASTM Specification A 450/A 450M-96.)

1. Scope

1.1 This specification covers a group of requirements which, with the exceptions of 4.3 and Sections 5, 6, 17, 18, 19, 20, 21, 22, and 23, are mandatory requirements to the following ASTM tubular product specifications:

Title of Specification	ASTM Designation ^A
Seamless Low-Carbon and Carbon-Molybdenum Steel Still Tubes for Refinery Service	A 161
Electric-Resistance-Welded Carbon Steel and Carbon-Manganese Steel Boiler Tubes	A 178/A 178M
Seamless Cold-Drawn Low-Carbon Steel Heat-Exchanger and Condenser Tubes	A 179/A 179M
Seamless Carbon Steel Boiler Tubes for High-Pressure Service	A 192/A 192M
Seamless Cold-Drawn Intermediate Alloy-Steel Heat-Exchanger and Condenser Tubes	A 199/A 199M
Seamless Intermediate Alloy-Steel Still Tubes for Refinery Service	A 200
Seamless Carbon-Molybdenum Alloy-Steel Boiler and Superheater Tubes	A 209/A 209M
Seamless Medium-Carbon Steel Boiler and Superheater Tubes	A 210/A 210M
Seamless Ferritic and Austenitic Alloy-Steel Boiler, Superheater, and Heat-Exchanger Tubes	A 213/A 213M
Electric-Resistance-Welded Carbon Steel Heat-Exchanger and Condenser Tubes	A 214/A 214M
Electric-Resistance-Welded Carbon Steel Boiler and Superheater Tubes for High-Pressure Service	A 226/A 226M
Welded Austenitic Steel Boiler, Superheater, Heat-Exchanger, and Condenser Tubes	A 249/A 249M
Electric-Resistance-Welded Ferritic Alloy-Steel Boiler and Superheater Tubes	A 250/A 250M

Title of Specification	ASTM Designation ^A
Seamless and Welded Ferritic and Martensitic Stainless Steel Tubing for General Service	A 268/A 268M
Seamless and Welded Austenitic Stainless Steel Tubing for General Service	A 269
Seamless and Welded Austenitic Stainless Steel Sanitary Tubing	A 270
Seamless Austenitic Chromium-Nickel Steel Still Tubes for Refinery Service	A 271
Seamless and Welded Carbon and Alloy-Steel Tubes for Low-Temperature Service	A 334/A 334M
Seamless and Electric-Welded Low-Alloy Steel Tubes	A 423/A 423M
Electric-Resistance-Welded Coiled Steel Tubing for Gas and Fuel Oil Lines	A 539
Seamless Cold-Drawn Carbon Steel Feedwater Heater Tubes	A 556/A 556M
Electric-Resistance-Welded Carbon Steel Feedwater Heater Tubes	A 557/A 557M
Welded Austenitic Stainless Steel Feedwater Heater Tubes	A 688/A 688M
Seamless Medium-Strength Carbon-Molybdenum Alloy-Steel Boiler and Superheater Tubes	A 692
Austenitic Stainless Steel Tubing for Breeder Reactor Core Components	A 771
Seamless and Welded Ferritic/Austenitic Stainless Steel Tubing for General Service	A 789/A 789M
Welded Unannealed Ferritic Stainless Steel Tubing	A 791/A 791M
Welded Ferritic Stainless Steel Feedwater Heater Tubes	A 803/A 803M
Seamless, Cold-Drawn Carbon Steel Tubing for Hydraulic System Service	A 822
Austenitic and Ferritic Stainless Steel Duct Tubes for Breeder Reactor Core Components	A 826
High-Frequency Induction-Welded, Unannealed Austenitic Steel Condenser Tubes	A 851

^AThese designations refer to the latest issue of the respective specifications.

1.2 One or more of Sections 4.3, 5, 6, 17, 18, 19, 20, 21, 22, and 23 apply when the product specification or purchase order has a requirement for the test or analysis described by these sections.

1.3 In case of conflict between a requirement of the product specification and a requirement of this general requirement specification only the requirement of the product specification need be satisfied.

1.4 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification. The inch-pound units shall apply unless the "M" designation (SI) of the product specification is specified in the order.

3. Process

3.1 The steel may be made by any process.

3.2 If a specific type of melting is required by the purchaser, it shall be as stated on the purchase order.

3.3 The primary melting may incorporate separate degassing or refining and may be followed by secondary melting, such as electroslog remelting or vacuum-arc remelting. If secondary melting is employed, the heat shall be defined as all of the ingots remelted from a single primary heat.

3.4 Steel may be cast in ingots or may be strand cast. When steel of different grades is sequentially strand cast, identification of the resultant transition material is required. The producer shall remove the transition material by an established procedure that positively separates the grades.

4. Chemical Composition

4.1 Samples for chemical analysis, and method of analysis, shall be in accordance with Test Methods, Practices, and Terminology A 751.

4.2 Heat Analysis — An analysis of each heat of steel shall be made by the steel manufacturer to determine the percentages of the elements specified. If secondary melting processes are employed, the heat analysis shall be obtained from one remelted ingot or the product of one remelted ingot of each primary melt. The chemical composition thus determined, or that determined from a product analysis made by the tubular product manufacturer, shall conform to the requirements specified in the product specification.

4.2.1 For stainless steels ordered under product specifications referencing this specification of general requirements, the steel shall not contain an unspecified element, other than nitrogen, for the ordered grade to the extent that the steel conforms to the requirements of another grade for which that element is a specified element having a required minimum content. For this requirement, a grade is defined as an alloy described individually and identified by its own UNS designation in a table of chemical requirements within any specification listed within the scope as being covered by this specification.

4.3 Product Analysis — Product analysis requirements and options, if any, are contained in the product specification.

5. Tensile Properties

5.1 The material shall conform to the requirements as to tensile properties prescribed in the individual specification.

5.2 The yield strength corresponding to a permanent offset of 0.2% of the gage length or to a total extension of 0.5% of the gage length under load shall be determined.

5.3 If the percentage of elongation of any test specimen is less than that specified and any part of the fracture is more than $\frac{3}{4}$ in. [19.0 mm] from the center of the gage length, as indicated by scribe marks on the specimen before testing, a retest shall be allowed.

6. Standard Weights

6.1 The calculated weight per foot, based upon a specified minimum wall thickness, shall be determined by the following equation:

$$W = C(D - t)t \quad (1)$$

where:

$C = 10.69$ [0.02466/15],

$W =$ weight, lb/ft [kg/m],

$D =$ specified outside diameter, in. [mm], and

$t =$ specified minimum wall thickness, in. [mm]

6.2 The permissible variations from the calculated weight per foot [kilogram per metre] shall be as prescribed in Table 1.

7. Permissible Variations in Wall Thickness

7.1 Variations from the specified minimum wall thickness shall not exceed the amounts prescribed in Table 2.

7.2 For tubes 2 in. [50.8 mm] and over in outside diameter and 0.220 in. [5.6 mm] and over in thickness, the variation in wall thickness in any one cross section of any one tube shall not exceed the following percentage of the actual mean wall at the section. The actual mean wall is defined as the average of the thickest and thinnest wall in that section.

Seamless tubes $\pm 10\%$
Welded tubes $\pm 5\%$

7.3 When cold-finished tubes as ordered require wall thicknesses $\frac{3}{4}$ in. [19.1 mm] or over, or an inside diameter 60% or less of the outside diameter, the permissible variations in wall thickness for hot-finished tubes shall apply.

8. Permissible Variations in Outside Diameter

8.1 Except as provided in 8.2.1 and 8.3, variations from the specified outside diameter shall not exceed the amounts prescribed in Table 3.

8.2 Thin-wall tubes usually develop significant ovality (out of roundness) during final annealing, or straightening, or both. Thin-wall tubes are defined as those meeting the specified outside diameters and specified wall thicknesses set forth as follows:

Specified Outside Diameter	Specified Wall Thickness
2 in. [50.8 mm] and less	2% or less of specified outside diameter
Greater than 2 in. [50.8 mm]	3% or less of specified outside diameter
All diameters	0.020 in. [0.5 mm] or less

8.2.1 The diameter tolerances of Table 3 are not sufficient to provide for additional ovality expected in thin-wall tubes, and, for such tubes, are applicable only to the *mean* of the extreme (maximum and minimum) outside diameter readings in any one cross section. However, for thin wall tubes the *difference* in extreme outside diameter readings (ovality) in any one cross section shall not exceed the following ovality allowances:

Outside Diameter	Ovality Allowance
1 in. [25.4 mm] and under	0.020 in. [0.5 mm]
Over 1 in. [25.4 mm]	2.0% of specified outside diameter

8.3 For cold-finished seamless austenitic and ferritic/austenitic tubes an ovality allowance is necessary for all sizes less than 2 in. [50.8 mm] outside diameter since they are likely to become out of round during their final heat treatment. In such tubes, the maximum and minimum diameters at any cross section shall deviate from the nominal diameter by no more than ± 0.010 in. [± 0.25 mm]; however, the mean diameter at that cross section must still be within the given permissible variation given in Table 3. In the event of conflict between the provisions of 8.3 and those of 8.2.1, the larger value of ovality tolerance shall apply.

9. Permissible Variations in Length

9.1 Variations from the specified length shall not exceed the amounts prescribed in Table 4.

10. Permissible Variations in Height of Flash on Electric-Resistance-Welded Tubes

10.1 For tubes over 2 in. [50.8 mm] in outside diameter, or over 0.135 in. [3.44 mm] in wall thickness, the flash on the inside of the tubes shall be mechanically removed by cutting to a maximum height of 0.010 in. [0.25 mm] at any point on the tube.

10.2 For tubes 2 in. [50.8 mm] and under in outside diameter and 0.135 in. [3.4 mm] and under in wall thickness, the flash on the inside of the tube shall be mechanically removed by cutting to a maximum height of 0.006 in. [0.15 mm] at any point on the tube.

11. Straightness and Finish

11.1 Finished tubes shall be reasonably straight and have smooth ends free of burrs. They shall have a workmanlike finish. Surface imperfections (Note 1) may be removed by grinding, provided that a smooth curved surface is maintained, and the wall thickness is not decreased to less than that permitted by this or the product specification. The outside diameter at the point of grinding may be reduced by the amount so removed.

NOTE 1—An imperfection is any discontinuity or irregularity found in the tube.

12. Repair by Welding

12.1 Repair welding of base metal defects in tubing is permissible only with the approval of the purchaser and with the further understanding that the tube shall be marked “WR” and the composition of the deposited filler metal shall be suitable for the composition being welded. Defects shall be thoroughly chipped or ground out before welding and each repaired length shall be reheat treated or stress relieved as required by the applicable specification. Each length of repaired tube shall be tested hydrostatically as required by the product specification.

12.2 Repair welding shall be performed using procedures and welders or welding operators that have been qualified in accordance with ASME Boiler and Pressure Vessel Code, Section IX.

13. Retests

13.1 If the results of the mechanical tests of any group or lot do not conform to the requirements specified in the individual specification, retests may be made on additional tubes of double the original number from the same group or lot, each of which shall conform to the requirements specified.

14. Retreatment

14.1 If the individual tubes or the tubes selected to represent any group or lot fail to conform to the test requirements, the individual tubes or the group or lot represented may be retreated and resubmitted for test. Not more than two reheat treatments shall be permitted.

15. Test Specimens

15.1 Test specimens shall be taken from the ends of finished tubes prior to upsetting, swaging, expanding, or other forming operations, or being cut to length. They shall be smooth on the ends and free of burrs and flaws.

15.2 If any test specimen shows flaws or defective machining, it may be discarded and another specimen substituted.

16. Method of Mechanical Testing

16.1 The specimens and mechanical tests required shall be made in accordance with Annex A2 of Test Methods and Definitions A 370.

16.2 Specimens shall be tested at room temperature.

16.3 Small or subsize specimens as described in Test Methods and Definitions A 370 may be used only when there is insufficient material to prepare one of the standard specimens. When using small or subsize specimens, the largest one possible shall be used.

17. Flattening Test

17.1 A section of tube not less than $2\frac{1}{2}$ in. [63 mm] in length for seamless and not less than 4 in. [100 mm] in length for welded shall be flattened cold between parallel plates in two steps. For welded tubes, the weld shall be placed 90° from the direction of the applied force (at a point of maximum bending). During the first step, which is a test for ductility, no cracks or breaks, except as provided for in 17.4, on the inside, outside, or end surfaces shall occur in seamless tubes, or on the inside or outside surfaces of welded tubes, until the distance between the plates is less than the value of H calculated by the following equation:

$$H = \frac{(1 + e)t}{e + t/D} \quad (2)$$

where:

- H = distance between flattening plates, in. [mm],
- t = specified wall thickness of the tube, in. [mm],
- D = specified outside diameter of the tube, in. [mm], and
- e = deformation per unit length (constant for a given grade of steel: 0.07 for medium-carbon steel (maximum specified carbon 0.19% or greater), 0.08 for ferritic alloy steel, 0.09 for austenitic steel, and 0.09 for low-carbon steel (maximum specified carbon 0.18% or less)).

During the second step, which is a test for soundness, the flattening shall be continued until the specimen breaks or the opposite walls of the tube meet. Evidence of laminated or unsound material, or of incomplete weld that is revealed during the entire flattening test shall be cause for rejection.

17.2 Surface imperfections in the test specimens before flattening, but revealed during the first step of the flattening test, shall be judged in accordance with the finish requirements.

17.3 Superficial ruptures resulting from surface imperfections shall not be cause for rejection.

17.4 When low D -to- t ratio tubular products are tested, because the strain imposed due to geometry is unreasonably high on the inside surface at the six and twelve o'clock locations, cracks at these locations shall not be cause for rejection if the D to t ratio is less than 10.

18. Reverse Flattening Test

18.1 A section 4 in. [100 mm] in length of finished welded tubing in sizes down to and including $\frac{1}{2}$ in. [12.7 mm] in outside diameter shall be split longitudinally 90° on each side of the weld and the sample opened and flattened with the weld at the point of maximum bend. There shall be no evidence of cracks or lack of penetration or overlaps resulting from flash removal in the weld.

19. Flaring Test

19.1 A section of tube approximately 4 in. [100 mm] in length shall stand being flared with a tool having a 60° included angle until the tube at the mouth of the flare has been expanded to the percentages specified in Table 5 without cracking or showing imperfections rejectable under the provisions of the product specification.

20. Flange Test

20.1 A section of tube shall be capable of having a flange turned over at a right angle to the body of the tube without cracking or showing imperfections rejectable under the provisions of the product specification. The width of the flange for carbon and alloy steels shall be not less than the percentages specified in Table 6. For the austenitic grades, the width of the flange for all sizes listed in Table 6 shall be not less than 15%.

21. Hardness Test

21.1 For tubes 0.200 in. [5.1 mm] and over in wall thickness, either the Brinell or Rockwell hardness test shall be used. When Brinell hardness testing is used, a 10 mm ball with 3000, 1500, or 500 kg load, or a 5 mm ball with 750 kg load may be used, at the option of the manufacturer.

21.2 For tubes less than 0.200 in. [5.1 mm] to and including 0.065 in. [1.7 mm] in wall thickness, the Rockwell hardness test shall be used.

21.3 For tubes less than 0.065 in. [1.7 mm] in wall thickness, the hardness test shall not be required.

21.4 The Brinell hardness test may be made on the outside of the tube near the end, on the outside of a specimen cut from the tube, or on the wall cross section of a

specimen cut from the tube at the option of the manufacturer. This test shall be made so that the distance from the center of the impression to the edge of the specimen is at least 2.5 times the diameter of the impression.

21.5 The Rockwell hardness test may be made on the inside surface, on the wall cross section, or on a flat on the outside surface at the option of the manufacturer.

21.6 For tubes furnished with upset, swaged, or otherwise formed ends, the hardness test shall be made as prescribed in 21.1 and 21.2 on the outside of the tube near the end after the forming operation and heat treatment.

21.7 For welded or brazed tubes, the hardness test shall be made away from the joints.

21.8 When the product specification provides for Vickers hardness, such testing shall be in accordance with Test Method E 92.

22. Hydrostatic Test

22.1 Except as provided in 22.2 and 22.3, each tube shall be tested by the manufacturer to a minimum hydrostatic test pressure determined by the following equation:

$$\text{Inch-Pound Units: } P = 32000 \, t/D \quad (3)$$

$$\text{SI Units: } P = 220.6 \, t/D$$

where:

P = hydrostatic test pressure, psi or MPa,
 t = specified wall thickness, in. or mm, and
 D = specified outside diameter, in. or mm.

22.1.1 The hydrostatic test pressure determined by eq. (3) shall be rounded to the nearest 50 psi [0.5 MPa] for pressure below 1000 psi [7 MPa], and to the nearest 100 psi [1 MPa] for pressures 1000 psi [7 MPa] and above. The hydrostatic test may be performed prior to cutting to final length, or prior to upsetting, swaging, expanding, bending, or other forming operations, or both.

22.2 Regardless of the determination made by eq. (3), the minimum hydrostatic test pressure required to satisfy these requirements need not exceed the values given in Table 7. This does not prohibit testing at higher pressures at manufacturer's option or as provided in 22.3.

22.3 With concurrence of the manufacturer, a minimum hydrostatic test pressure in excess of the requirements of 22.2 or 22.1, or both, may be stated on the order. The tube wall stress shall be determined by the following equation:

$$S = PD/2t \quad (4)$$

where:

S = tube wall stress, psi or MPa, and all other symbols as defined in 22.1.

22.4 The test pressure shall be held for a minimum of 5 s.

22.5 If any tube shows leaks during the hydrostatic test, it shall be rejected.

22.6 The hydrostatic test may not be capable of testing the end portion of the pipe. The lengths of pipe that cannot be tested shall be determined by the manufacturer and, when specified in the purchase order, reported to the purchaser.

23. Air Underwater Pressure Test

23.1 When this test is employed, each tube, with internal surface clean and dry, shall be internally pressurized to 150 psi [1000 kPa] minimum with clean and dry compressed air while being submerged in clear water. The tube shall be well-lighted, preferably by underwater illumination. Any evidence of air leakage of the pneumatic couplings shall be corrected prior to testing. Inspection shall be made of the entire external surface of the tube after holding the pressure for not less than 5 s after the surface of the water has become calm. If any tube shows leakage during the air underwater test, it shall be rejected. Any leaking areas may be cut out and the tube retested.

24. Nondestructive Electric Test

24.1 When nondestructive examination is specified by the purchaser or the product specification, each tube shall be examined by a nondestructive examination method in accordance with Practice E 213, Practice E 309 (for ferromagnetic materials), Practice E 426 (for non-magnetic materials), or Practice E 570. Upon agreement, Practice E 273 shall be employed in addition to one of the full periphery tests. The range of tube sizes that may be examined by each method shall be subject to the limitations in the scope of that practice. In case of conflict between these methods and practices and this specification, the requirements of this specification shall prevail.

24.2 The following information is for the benefit of the user of this specification:

24.2.1 Calibration standards for the nondestructive electric test are convenient standards for calibration of nondestructive testing equipment only. For several reasons, including shape, orientation, width, etc., the correlation between the signal produced in the electric test from an imperfection and from calibration standards is only approximate. A purchaser interested in ascertaining the nature (type, size, location, and orientation) of discontinuities that can be detected in the specific application of these examinations should discuss this with the manufacturer of the tubular product.

24.2.2 The ultrasonic examination referred to in this specification is intended to detect longitudinal discontinuities having a reflective area similar to or larger than the calibration reference notches specified in 23.4. The examination may not detect circumferentially oriented imperfections or short, deep defects.

24.2.3 The eddy current examination referenced in this specification has the capability of detecting significant discontinuities, especially of the short abrupt type. Practices E 309 and E 426 contain additional information regarding the capabilities and limitations of eddy-current examination.

24.2.4 The flux leakage examination referred to in this specification is capable of detecting the presence and location of significant longitudinally or transversely oriented discontinuities. The provisions of this specification only provide for longitudinal calibration for flux leakage. It should be recognized that different techniques should be employed to detect differently oriented imperfections.

24.2.5 The hydrostatic test referred to in Section 22 is a test method provided for in many product specifications. This test has the capability of finding defects of a size permitting the test fluid to leak through the tube wall and may be either visually seen or detected by a loss of pressure. This test may not detect very tight, through-the-wall defects or defects that extend an appreciable distance into the wall without complete penetration.

24.2.6 A purchaser interested in ascertaining the nature (type, size, location, and orientation) of discontinuities that can be detected in the specific application of these examinations should discuss this with the manufacturer of the tubular products.

24.3 *Time of Examination* — Nondestructive examination for specification acceptance shall be performed after all deformation processing, heat treating, welding, and straightening operations. This requirement does not preclude additional testing at earlier stages in the processing.

24.4 *Surface Condition:*

24.4.1 All surfaces shall be free of scale, dirt, grease, paint, or other foreign material that could interfere with interpretation of test results. The methods used for cleaning and preparing the surfaces for examination shall not be detrimental to the base metal or the surface finish.

24.4.2 Excessive surface roughness or deep scratches can produce signals that interfere with the test.

24.5 *Extent of Examination:*

24.5.1 The relative motion of the tube and the transducer(s), coil(s), or sensor(s) shall be such that the entire tube surface is scanned, except for end effects as noted in 24.5.2.

24.5.2 The existence of end effects is recognized, and the extent of such effects shall be determined by the manufacturer, and, if requested, shall be reported to the purchaser. Other nondestructive tests may be applied to the end areas, subject to agreement between the purchaser and the manufacturer.

24.6 Operator Qualifications:

24.6.1 The test unit operator shall be certified in accordance with SNT TC-1-A, or an equivalent documented standard agreeable to both purchaser and manufacturer.

24.7 Test Conditions:

24.7.1 For examination by the ultrasonic method, the minimum nominal transducer frequency shall be 2.0 MHz, and the maximum transducer size shall be 1.5 in. (38 mm).

24.7.2 For eddy current testing, the excitation coil frequency shall be chosen to ensure adequate penetration, yet provide good signal-to-noise ratio.

24.7.2.1 The maximum coil frequency shall be:

Specified Wall Thickness	Maximum Frequency
<0.050 in.	100 KHz
0.050 to 0.150	50
>0.150	10

24.8 References Standards:

24.8.1 Reference standards of convenient length shall be prepared from a length of tube of the same grade, specified size (outside diameter and wall thickness), surface finish and heat treatment condition as the tubing to be examined.

24.8.2 For eddy current testing, the reference standard shall contain, at the option of the manufacturer, any one of the following discontinuities:

24.8.2.1 Drilled Hole — The reference standard shall contain three or more holes, equally spaced circumferentially around the tube and longitudinally separated by a sufficient distance to allow distinct identification of the signal from each hole. The holes shall be drilled radially and completely through the tube wall, with care being taken to avoid distortion of the tube while drilling. The holes shall not be larger than 0.031 in. (0.8 mm) in diameter. As an alternative, the producer may choose to drill one hole and run the calibration standard through the test coil three times, rotating the tube approximately 120° each time. More passes with smaller angular increments may be used, provided testing of the full 360° of the coil is obtained. For welded tubing, if the weld is visible, one of the multiple holes or the single hole shall be drilled in the weld.

24.8.2.2 Transverse Tangential Notch — Using a round tool or file with a $\frac{1}{4}$ in. [6.4 mm] diameter, a notch shall be milled or filed tangential to the surface and transverse to the longitudinal axis of the tube. Said notch shall have a depth not exceeding 12½% of the specified wall thickness of the tube or 0.004 in. [0.1 mm], whichever is greater.

24.8.2.3 Longitudinal Notch — A notch 0.031 in. [0.8 mm] or less in width shall be machined in a radial plane parallel to the tube axis on the outside surface of the tube, to have a depth not exceeding 12½% of the specified wall thickness of the tube or 0.004 in. [0.1 mm], whichever is greater. The length of the notch shall be compatible with the testing method.

24.8.3 For ultrasonic testing, the reference ID and OD notches shall be any one of the three common notch shapes shown in Practice E 213, at the option of the manufacturer. The depth of notches shall not exceed 12½% of the specified wall thickness of the tube or 0.004 in. [0.1 mm], whichever is greater. The width of the notch shall not exceed two times the depth. For welded tubing, the notch shall be placed in the weld, if the weld is visible.

24.8.4 For flux leakage testing, the longitudinal reference notches shall be straight-sided notches machined in a radial plane parallel to the tube axis on the inside and outside surfaces of the tube. Notch depth shall not exceed 12½% of the specified wall thickness, or 0.004 in. [0.1 mm], whichever is greater. Notch length shall not exceed 1 in. [25 mm], and the width shall not exceed the depth. Outside diameter and inside diameter notches shall have sufficient separation to allow distinct identification of the signal from each notch.

24.8.5 More or smaller reference discontinuities, or both, may be used by agreement between the purchaser and the manufacturer.

24.9 Standardization Procedure:

24.9.1 The test apparatus shall be standardized at the beginning and end of each series of tubes of the same specified size (diameter and wall thickness), grade and heat treatment condition, and at intervals not exceeding 4 h during the examination of such tubing. More frequent standardizations may be performed at the manufacturer's option or may be required upon agreement between the purchaser and the manufacturer.

24.9.2 The test apparatus shall also be standardized after any change in test system settings, change of operator, equipment repair, or interruption due to power loss or shutdown.

24.9.3 The reference standard shall be passed through the test apparatus at the same speed and test system settings as the tube to be tested, except that, at the manufacturer's discretion, the tubes may be tested at a higher sensitivity.

24.9.4 The signal-to-noise ratio for the reference standard shall be 2.5:1 or greater, and the reference signal amplitude for each discontinuity shall be at least 50% of full scale of the display. In establishing the noise level, extraneous signals from identifiable surface imperfections on the reference standard may be ignored. When reject filtering is used during UT testing, linearity must be demonstrated.

24.9.5 If, upon any standardization, the reference signal amplitude has decreased by 29% (3.0 dB), the test apparatus shall be considered out of standardization. The test system settings may be changed, or the transducer(s), coil(s), or sensor(s) adjusted, and the unit restandardized, but all tubes tested since the last acceptable standardization must be retested.

24.10 Evaluation of Imperfections:

24.10.1 Tubing producing a test signal to or greater than the lowest signal produced by the reference standard shall be designated suspect, shall be clearly marked or identified, and shall be separated from the acceptable tubing.

24.10.2 Such suspect tubing shall be subject to one of the following three dispositions:

24.10.2.1 The tubes may be rejected without further examination, at the discretion of the manufacturer.

24.10.2.2 If the test signal was produced by imperfections such as scratches, surface roughness, dings, straightener marks, loose ID bead and cutting chips, steel die stamps, stop marks, tube reducer ripple, or chattered flash trim, the tubing may be accepted or rejected depending on visual observation of the severity of the imperfection, the type of signal it produces on the testing equipment used, or both.

24.10.2.3 If the test signal was produced by imperfections which cannot be identified, or was produced by cracks or crack-like imperfections, the tubing shall be rejected.

24.10.3 Any tubes with imperfections of the types in 24.10.2.2 and 24.10.2.3, exceeding 0.004 in. (0.1 mm) or 12½% of the specified minimum wall thickness (whichever is greater) in depth shall be rejected.

24.10.4 Rejected tubes may be reconditioned and retested providing the wall thickness is not decreased to less than that required by this or the product specification. If grinding is performed, the outside diameter in the area of grinding may be reduced by the amount so removed. To be accepted, reconditioned tubes must pass the nondestructive examination by which they were originally rejected.

25. Inspection

25.1 The inspector representing the purchaser shall have entry at all times while work on the contract of the purchaser is being performed, to all parts of the manufacturer's works that concern the manufacture of the material ordered. The manufacturer shall afford the inspector all reasonable facilities to satisfy him that the material is being furnished in accordance with this specification. All required tests and inspection shall be made at the place of manufacture prior to shipment, unless otherwise specified, and shall be conducted so as not to interfere unnecessarily with the operation of the works.

26. Rejection

26.1 Each length of tubing received from the manufacturer may be inspected by the purchaser and, if it does not meet the requirements of the specification based on the inspection and test method as outlined in the specification, the length may be rejected and the manufacturer shall be notified. Disposition of rejected tubing shall be a matter of agreement between the manufacturer and the purchaser.

26.2 Material that fails in any of the forming operations or in the process of installation and is found to be defective shall be set aside and the manufacturer shall be notified for mutual evaluation of the material's suitability. Disposition of such material shall be a matter for agreement.

27. Certified Test Report

27.1 When specified in the purchase order or contract, the producer or supplier shall furnish a Certified Test Report certifying that the material was manufactured, sampled, tested, and inspected in accordance with the Specification, including year date, the Supplementary Requirements, and any other requirements designated in the purchase order or contract, and that the results met the requirements of that Specification, the Supplementary Requirements, and the other requirements. A signature or notarization is not required on the Certified Test Report, but the document shall be dated and shall clearly identify the organization submitting the Report.

NOTE 2—Notwithstanding the absence of a signature or notarization, the organization submitting the Report is responsible for the contents of the Report.

27.2 In addition, the Certified Test Report shall include the following information and test results, when applicable:

27.2.1 Heat Number,

27.2.2 Heat Analysis,

27.2.3 Product Analysis, when specified,

27.2.4 Tensile Properties,

27.2.5 Width of the gage length, when longitudinal strip tension test specimens are used,

27.2.6 Flattening Test acceptable,

27.2.7 Reverse Flattening Test acceptable,

27.2.8 Flaring Test acceptable,

27.2.9 Flange Test acceptable,

27.2.10 Hardness Test values,

27.2.11 Hydrostatic Test pressure,

27.2.12 Non-destructive Electric Test method,

27.2.13 Impact Test results, and

27.2.14 Other test results or information required to be reported by the product specification.

27.3 Test results or information required to be reported by supplementary requirements, or other requirements designated in the purchase order or contract shall be reported, but may be reported in a separate document.

27.4 The Certified Test Report shall include a statement of explanation for the letter added to the specification number marked on the tubes (see 28.3), when all of the requirements of the specification have not been completed. The purchaser must certify that all requirements of the specification have been completed before removal of the letter (that is, X, Y, or Z).

28. Product Marking

28.1 Each length of tube shall be legibly stenciled with the manufacturer's name or brand, the specification number, and grade. The marking need not include the year date of the specification. For tubes less than 1¼ in. [31.8 mm] in diameter and tubes under 3 ft [1 m] in length, the required information may be marked on a tag securely attached to the bundle or box in which the tubes are shipped.

28.2 For austenitic tubes, the marking paint or ink shall not contain any harmful metal, or metal salts, such as zinc, lead, or copper, which cause corrosive attack on heating.

28.3 When it is specified that certain requirements of a specification adopted by the ASME Boiler and Pressure Vessel Committee are to be completed by the purchaser upon receipt of the material, the manufacturer shall indicate that all requirements of the specification have not been completed by a letter such as X, Y, or Z, immediately following the specification number. This letter may be removed after completion of all requirements in accordance with the specification. An explanation of specification requirements to be completed is provided in Section 27.

28.4 Bar Coding — In addition to the requirements in 28.1, 28.2, and 28.3, bar coding is acceptable as a supplementary identification method. Bar coding should be consistent with the Automotive Industry Action Group (AIAG) standard prepared by the Primary Metals Subcommittee of the AIAG Bar Code Project Team.

29. Packaging, Marking, and Loading

29.1 When specified on the purchase order, packaging, marking, and loading for shipment shall be in accordance with the procedures of Practices A 700.

30. Government Procurement

30.1 Scale Free Pipe:

30.1.1 When specified in the contract or order, the following requirements shall be considered in the inquiry contract or order, for agencies of the U.S. Government where scale free tube is required. These requirements shall take precedence if there is a conflict between these requirements and the product specification.

30.1.2 Tube shall be ordered to outside diameter (OD) and wall thickness.

30.1.3 Responsibility for Inspection — Unless otherwise specified in the contract or purchase order, the manufacturer is responsible for the performance of all inspection and test requirements specified. The absence of any inspection requirements in the specification shall not relieve the contractor of the responsibility for ensuring that all products or supplies submitted to the Government for acceptance comply with all requirements of the contract. Sampling inspection, as part of the manufacturing operations, is an acceptable practice to ascertain conformance to requirements, however, this does not authorize submission of known defective material, either indicated or actual, nor does it commit the Government to accept the material. Except as otherwise specified in the contract or purchase order, the manufacturer may use his own or any other suitable facilities for the performance of the inspection and test requirements unless disapproved by the purchaser at the time the order is placed. The purchaser shall have the right to perform any of the inspections and tests set forth when such inspections and tests are deemed necessary to ensure that the material conforms to the prescribed requirements.

30.1.4 Sampling for Flattening and Flaring Tests and for Visual and Dimensional Examination — Minimum sampling for flattening and flaring tests and visual and dimensional examination shall be as follows:

Lot Size (pieces per lot)		Sample Size
2 to	8	Entire lot 8
9 to	90	
91 to	150	12
151 to	280	19
281 to	500	21
501 to	1200	27
1201 to	3200	35
3201 to	10 000	38
10 001 to	35 000	46

In all cases, the acceptance number is zero and the rejection number is one. Rejected lots may be screened and resubmitted for visual and dimensional examination. All defective items shall be replaced with acceptable items prior to lot acceptance.

30.1.5 Sampling for Chemical Analysis — One sample for chemical analysis shall be selected from each of two tubes chosen from each lot. A lot shall be all material poured from one heat.

30.1.6 Sampling for Tension and Bend Test — One sample shall be taken from each lot. A lot shall consist of all tube of the same outside diameter and wall thickness manufactured during an 8-h shift from the same heat of steel, and heat treated under the same conditions of temperature and time in a single charge in a batch type furnace, or heat treated under the same condition in a continuous furnace, and presented for inspection at the same time.

30.1.7 Hydrostatic and Ultrasonic Tests — Each tube shall be tested by the ultrasonic (when specified) and hydrostatic tests.

30.1.8 Tube shall be free from heavy oxide or scale. The internal surface of hot finished ferritic steel tube shall be pickled or blast cleaned to a free of scale condition equivalent to the CSA2 visual standard listed in SSPC-SP6. Cleaning shall be performed in accordance with a written procedure that has been shown to be effective. This procedure shall be available for audit.

30.1.9 In addition to the marking in Specification A 530/A 530M, each length of tube $\frac{1}{4}$ in. outside diameter and larger shall be marked with the following listed information. Marking shall be in accordance with FED-STD-183 and MIL-STD-792. (a) Outside diameter, wall thickness, and length (b) Heat or lot identification number.

30.1.10 Tube shall be straight to within the tolerances specified in Table 8.

30.1.11 When specified, each tube shall be ultrasonically examined in accordance with MIL-STD-271, except that the notch depth in the calibration standard shall be 5% of the wall thickness or 0.005 in., whichever is greater. Any tube which produces an indication equal to or greater than 100% of the indication from the calibration standard shall be rejected.

30.1.12 The tube shall be free from repair welds, welded joints, laps, laminations, seams, visible cracks, tears, grooves, slivers, pits, and other imperfections detrimental to the tube as determined by visual and ultrasonic examination, or alternate tests, as specified.

30.1.13 Tube shall be uniform in quality and condition and have a finish conforming to the best practice for standard quality tubing. Surface imperfections such as handling marks, straightening marks, light mandrel and die marks, shallow pits, and scale pattern will not be considered injurious if the imperfections are removable within the tolerances specified for wall thickness or 0.005 in., whichever is greater. The bottom of imperfections shall be visible and the profile shall be rounded and faired-in.

30.1.14 No weld repair by the manufacturer is permitted.

30.1.15 Preservation shall be level A or commercial, and packing shall be level A, B, or commercial, as specified. Level A preservation and level A or B packing shall be in accordance with MIL-STD-163 and commercial preservation and packing shall be in accordance with Practices A 700 or Practice D 3951.

31.1 alloy steel tube; austenitic stainless steel; carbon steel tube; general delivery; stainless steel tube; steel tube

TABLE 1
PERMISSIBLE VARIATIONS IN WEIGHT PER FOOT⁴

Method of Manufacture	Permissible Variation in Weight per Foot, %	
	Over	Under
Seamless, hot-finished	16	0
Seamless, cold-finished:		
1½ in. [38.1 mm] and under OD	12	0
Over 1½ in. [38.1 mm] OD	13	0
Welded	10	0

⁴ These permissible variations in weight apply to lots of 50 tubes or more in sizes 4 in. [101.6 mm] and under in outside diameter, and to lots of 20 tubes or more in sizes over 4 in. [101.6 mm] in outside diameter.

TABLE 2
PERMISSIBLE VARIATIONS IN WALL THICKNESS⁴

Outside Diameter, in. [mm]	Wall Thickness, %							
	Over 0.095 to 0.150				Over 0.150 to 0.180			
	0.095 [2.4] and Under		[2.4 to 3.8], incl		[3.8 to 4.6], incl		Over 0.180, [4.6]	
	Over	Under	Over	Under	Over	Under	Over	Under
Seamless, Hot-Finished Tubes								
4 [101.6] and under	40	0	35	0	33	0	28	0
Over 4 [101.6]	...	...	35	0	33	0	28	0
Seamless, Cold-Finished Tubes								
	Over				Under			
1½ [38.1] and under	20				0			
Over 1½ [38.1]	22				0			
Welded Tubes								
All sizes	18				0			

⁴ These permissible variations in wall thickness apply only to tubes, except internal-upset tubes, as rolled or cold-finished, and before swaging, expanding, bending, polishing, or other fabricating operations.

TABLE 3
PERMISSIBLE VARIATIONS IN OUTSIDE DIAMETER⁴

Outside Diameter, in. [mm]	Permissible Variations, in. [mm]	
	Over	Under
Hot-Finished Seamless Tubes		
4 [101.6] and under	¼ [0.4]	⅜ [0.8]
Over 4 to 7½ [101.6 to 190.5], incl	¼ [0.4]	¾ [1.2]
Over 7½ to 9 [190.5 to 228.6], incl	¼ [0.4]	⅞ [1.6]
Welded Tubes and Cold-Finished Seamless Tubes		
Under 1 [25.4]	0.004 [0.1]	0.004 [0.1]
1 to 1½ [25.4 to 38.1], incl	0.006 [0.15]	0.006 [0.15]
Over 1½ to 2 [38.1 to 50.8], excl	0.008 [0.2]	0.008 [0.2]
2 to 2½ [50.8 to 63.5], excl	0.010 [0.25]	0.010 [0.25]
2½ to 3 [63.5 to 76.2], excl	0.012 [0.3]	0.012 [0.3]
3 to 4 [76.2 to 101.6], incl	0.015 [0.38]	0.015 [0.38]
Over 4 to 7½ [101.6 to 190.5], incl	0.015 [0.38]	0.025 [0.64]
Over 7½ to 9 [190.5 to 228.6], incl	0.015 [0.38]	0.045 [1.14]

⁴ Except as provided in 8.2 and 8.3, these permissible variations include out-of-roundness. These permissible variations in outside diameter apply to hot-finished seamless, welded and cold-finished seamless tubes before other fabricating operations such as upsetting, swaging, expanding, bending, or polishing.

TABLE 4
PERMISSIBLE VARIATIONS IN LENGTH⁴

Method of Manufacture	Outside Diameter, in. [mm]	Cut Length, in. [mm]	
		Over	Under
Seamless, hot-finished	All sizes	⅜ [5]	0 [0]
Seamless, cold-finished	Under 2 [50.8]	⅜ [3]	0 [0]
	2 [50.8] and over	⅜ [5]	0 [0]
Welded	Under 2 [50.8]	⅜ [3]	0 [0]
	2 [50.8] and over	⅜ [5]	0 [0]

⁴ These permissible variations in length apply to tubes before bending. They apply to cut lengths up to and including 24 ft [7.3 m]. For lengths over 24 ft [7.3 m], the above over-tolerances, of ⅜ in. [3 mm] for each 10 ft [3 m] or fraction thereof over 24 ft or ⅜ in. [3 mm], whichever is lesser.

TABLE 5
FLARING TEST REQUIREMENTS

Ratio of Inside Diameter to Outside Diameter ^A	Minimum Expansion of Inside Diameter, %	
	Carbon, Carbon-Molybdenum, and Austenitic Steels	Other Ferritic Alloy Steels
0.9	21	15
0.8	22	17
0.7	25	19
0.6	30	23
0.5	39	28
0.4	51	38
0.3	68	50

^A In determining the ratio of inside diameter to specified outside diameter, the inside diameter shall be defined as the actual mean inside diameter of the material tested.

TABLE 7
HYDROSTATIC TEST PRESSURES

Outside Diameter of Tube, in. [mm]	Hydrostatic Test Pressure, psi [MPa]
Under 1 [25.4]	1000 [7]
1 to 1½ [25.4 to 38.1], excl	1500 [10]
1½ to 2 [38.1 to 50.8], excl	2000 [14]
2 to 3 [50.8 to 76.2], excl	2500 [17]
3 to 5 [76.2 to 127], excl	3500 [24]
5 [127] and over	4500 [31]

TABLE 8
STRAIGHTNESS TOLERANCES

Specified OD (in.)	Specified wall thickness (in.)	Maximum curvature in any 3 ft (in.)	Maximum curvature in total length (in.)
Up to 5.0, incl.	Over 3% OD to 0.5, incl.	0.030	0.010 × length, ft
Over 5.0 to 8.0, incl.	Over 4% OD to 0.75, incl.	0.045	0.015 × length, ft
Over 8.0 to 12.75, incl.	Over 4% OD to 1.0, incl.	0.060	0.020 × length, ft

TABLE 6
FLANGE REQUIREMENTS

Outside Diameter of Tube, in. [mm]	Width of Flange
To 2½ [63.5], incl	15% of OD
Over 2½ to 3¾ [63.5 to 95.2], incl	12½% of OD
Over 3¾ to 8 [95.2 to 203.2], incl	10% of OD

2010 ASME Boiler and Pressure Vessel Code

AN INTERNATIONAL CODE

The ASME Boiler and Pressure Vessel Code (BPVC) is "An International Historic Mechanical Engineering Landmark," widely recognized as a model for codes and standards worldwide. Its development process remains open and transparent throughout, yielding "living documents" that have improved public safety and facilitated trade across global markets and jurisdictions for nearly a century.

ASME also provides BPVC users with integrated suites of related offerings:

- referenced standards
- related standards and guidelines
- conformity assessment programs
- training courses
- ASME press books and journals
- conferences and proceedings

You gain unrivalled insight direct from the BPVC source, along with the professional quality and real-world solutions you have come to expect from ASME.

Ferrous Material Specifications (SA-451 to End)

MATERIALS

ASME Boiler and Pressure Vessel Committee on Materials

Three Park Avenue • New York, NY • 10016 USA

Date of Issuance: July 1, 2010
(Includes all Addenda dated July 2009 and earlier)

This international code or standard was developed under procedures accredited as meeting the criteria for American National Standards and it is an American National Standard. The Standards Committee that approved the code or standard was balanced to assure that individuals from competent and concerned interests have had an opportunity to participate. The proposed code or standard was made available for public review and comment that provides an opportunity for additional public input from industry, academia, regulatory agencies, and the public-at-large.

ASME does not “approve,” “rate,” or “endorse” any item, construction, proprietary device, or activity.

ASME does not take any position with respect to the validity of any patent rights asserted in connection with any items mentioned in this document, and does not undertake to insure anyone utilizing a standard against liability for infringement of any applicable letters patent, nor assume any such liability. Users of a code or standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, is entirely their own responsibility.

Participation by federal agency representative(s) or person(s) affiliated with industry is not to be interpreted as government or industry endorsement of this code or standard.

ASME accepts responsibility for only those interpretations of this document issued in accordance with the established ASME procedures and policies, which precludes the issuance of interpretations by individuals.

The footnotes in this document are part of this American National Standard.

ASME collective membership mark

The above ASME symbols are registered in the U.S. Patent Office.

Specifications

SA-6/SA-6M	General Requirements for Rolled Structural Steel Bars, Plates, Shapes, and Sheet Piling.....	1
SA-20/SA-20M	General Requirements for Steel Plates for Pressure Vessels	83
SA-29/SA-29M	Steel Bars, Carbon and Alloy, Hot-Wrought, General Requirements for	125
SA-31	Steel Rivets and Bars for Rivets, Pressure Vessels	143
SA-36/SA-36M	Carbon Structural Steel.....	147
SA-47/SA-47M	Ferritic Malleable Iron Castings.....	153
SA-53/SA-53M	Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless....	161
SA-105/SA-105M	Carbon Steel Forgings for Piping Applications.....	189
SA-106/SA-106M	Seamless Carbon Steel Pipe for High-Temperature Service	195
SA-134	Pipe, Steel, Electric-Fusion (Arc)-Welded (Sizes NPS 16 and Over)	207
SA-135	Electric-Resistance-Welded Steel Pipe	213
SA-178/SA-178M	Electric-Resistance-Welded Carbon Steel and Carbon-Manganese Steel Boiler and Superheater Tubes.....	223
SA-179/SA-179M	Seamless Cold-Drawn Low-Carbon Steel Heat-Exchanger and Condenser Tubes	229
SA-181/SA-181M	Carbon Steel Forgings, for General-Purpose Piping	233
SA-182/SA-182M	Forged or Rolled Alloy and Stainless Steel Pipe Flanges, Forged Fittings, and Valves and Parts for High-Temperature Service	237
SA-192/SA-192M	Seamless Carbon Steel Boiler Tubes for High-Pressure Service.....	257
SA-193/SA-193M	Alloy-Steel and Stainless Steel Bolting Materials for High-Temperature or High Pressure Service and Other Special Purpose Applications.....	261
SA-194/SA-194M	Carbon and Alloy Steel Nuts for Bolts for High Pressure or High Temperature Service, or Both.....	277
SA-202/SA-202M	Pressure Vessel Plates, Alloy Steel, Chromium-Manganese-Silicon	293
SA-203/SA-203M	Pressure Vessel Plates, Alloy Steel, Nickel.....	297
SA-204/SA-204M	Pressure Vessel Plates, Alloy Steel, Molybdenum.....	301
SA-209/SA-209M	Seamless Carbon-Molybdenum Alloy-Steel Boiler and Superheater Tubes	305
SA-210/SA-210M	Seamless Medium-Carbon Steel Boiler and Superheater Tubes	311
SA-213/SA-213M	Seamless Ferritic and Austenitic Alloy-Steel Boiler, Superheater, and Heat-Exchanger Tubes	315
SA-214/SA-214M	Electric-Resistance-Welded Carbon Steel Heat-Exchanger and Condenser Tubes	329
SA-216/SA-216M	Steel Castings, Carbon, Suitable for Fusion Welding for High-Temperature Service	331
SA-217/SA-217M	Steel Castings, Martensitic Stainless and Alloy, for Pressure-Containing Parts, Suitable for High-Temperature Service.....	335

SA-225/SA-225M	Pressure Vessel Plates, Alloy Steel, Manganese-Vanadium-Nickel	341
SA-231/SA-231M	Chromium-Vanadium Alloy Steel Spring Wire	345
SA-232/SA-232M	Chromium-Vanadium Alloy Steel Valve Spring Quality Wire	351
SA-234/SA-234M	Piping Fittings of Wrought Carbon Steel and Alloy Steel for Moderate and High-Temperature Service	355
SA-240/SA-240M	Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels and for General Applications	365
SA-249/SA-249M	Welded Austenitic Steel Boiler, Superheater, Heat-Exchanger, and Condenser Tubes	377
SA-250/SA-250M	Electric-Resistance-Welded Ferritic Alloy-Steel Boiler and Superheater Tubes	387
SA-263	Stainless Chromium Steel-Clad Plate	393
SA-264	Stainless Chromium-Nickel Steel-Clad Plate	401
SA-265	Nickel and Nickel-Base Alloy-Clad Steel Plate	409
SA-266/SA-266M	Carbon Steel Forgings for Pressure Vessel Components	417
SA-268/SA-268M	Seamless and Welded Ferritic and Martensitic Stainless Steel Tubing for General Service	423
SA-275/SA-275M	Magnetic Particle Examination of Steel Forgings	433
SA-276	Stainless Steel Bars and Shapes	441
SA-278/SA-278M	Gray Iron Castings for Pressure-Containing Parts for Temperatures Up to 650°F (350°C)	451
SA-283/SA-283M	Low and Intermediate Tensile Strength Carbon Steel Plates	457
SA-285/SA-285M	Pressure Vessel Plates, Carbon Steel, Low- and Intermediate-Tensile Strength	461
SA-299/SA-299M	Pressure Vessel Plates, Carbon Steel, Manganese-Silicon	465
SA-302/SA-302M	Pressure Vessel Plates, Alloy Steel, Manganese-Molybdenum and Manganese-Molybdenum-Nickel	469
SA-307	Carbon Steel Bolts and Studs, 60 000 psi Tensile Strength	473
SA-311/SA-311M	Cold-Drawn, Stress-Relieved Carbon Steel Bars Subject to Mechanical Property Requirements	481
SA-312/SA-312M	Seamless and Welded Austenitic Stainless Steel Pipes	487
SA-320/SA-320M	Alloy Steel and Stainless Steel Bolting Materials for Low-Temperature Service	499
SA-325	Structural Bolts, Steel, Heat Treated, 120/105 ksi Minimum Tensile Strength	509
SA-333/SA-333M	Seamless and Welded Steel Pipe for Low-Temperature Service	519
SA-334/SA-334M	Seamless and Welded Carbon and Alloy-Steel Tubes for Low-Temperature Service	531
SA-335/SA-335M	Seamless Ferritic Alloy-Steel Pipe for High-Temperature Service	541
SA-336/SA-336M	Alloy Steel Forgings for Pressure and High-Temperature Parts	555
SA-350/SA-350M	Carbon and Low-Alloy Steel Forgings, Requiring Notch Toughness Testing for Piping Components	563
SA-351/SA-351M	Castings, Austenitic, Austenitic-Ferritic (Duplex), for Pressure-Containing Parts	575
SA-352/SA-352M	Steel Castings, Ferritic and Martensitic, for Pressure Containing Parts, Suitable for Low Temperature Service	583
SA-353/SA-353M	Pressure Vessel Plates, Alloy Steel, 9 Percent Nickel, Double-Normalized and Tempered	591
SA-354	Quenched and Tempered Alloy Steel Bolts, Studs, and Other Externally Threaded Fasteners	597
SA-358/SA-358M	Electric-Fusion-Welded Austenitic Chromium-Nickel Alloy Steel Pipe for High-Temperature Service	605
SA-369/SA-369M	Carbon and Ferritic Alloy Steel Forged and Bored Pipe for High-Temperature Service	615

SA-370	Test Methods and Definitions for Mechanical Testing of Steel Products . . .	621
SA-372/SA-372M	Carbon and Alloy Steel Forgings for Thin-Walled Pressure Vessels	679
SA-376/SA-376M	Seamless Austenitic Steel Pipe for High-Temperature Central-Station Service	685
SA-387/SA-387M	Pressure Vessel Plates, Alloy Steel, Chromium-Molybdenum	695
SA-388/SA-388M	Ultrasonic Examination of Heavy Steel Forgings	703
SA-395/SA-395M	Ferritic Ductile Iron Pressure-Retaining Castings for Use at Elevated Temperatures	713
SA-403/SA-403M	Wrought Austenitic Stainless Steel Piping Fittings	725
SA-409/SA-409M	Welded Large Diameter Austenitic Steel Pipe for Corrosive or High- Temperature Service	735
SA-414/SA-414M	Steel, Sheet, Carbon, for Pressure Vessels	745
SA-420/SA-420M	Piping Fittings of Wrought Carbon Steel and Alloy Steel for Low- Temperature Service	749
SA-423/SA-423M	Seamless and Electric-Welded Low-Alloy Steel Tubes	759
SA-426/SA-426M	Centrifugally Cast Ferritic Alloy Steel Pipe for High-Temperature Service	765
SA-435/SA-435M	Straight-Beam Ultrasonic Examination of Steel Plates	771
SA-437/SA-437M	Alloy Steel Turbine-Type Bolting Material Specially Heat Treated for High-Temperature Service	775
SA-449	Hex Cap Screws, Bolts and Studs, Steel, Heat Treated, 120/105/90 ksi Minimum Tensile Strength, General Use	781
SA-450/SA-450M	General Requirements for Carbon, Ferritic Alloy, and Austenitic Alloy Steel Tubes	793
SA-451/SA-451M	Centrifugally Cast Austenitic Steel Pipe for High-Temperature Service	805
SA-453/SA-453M	High-Temperature Bolting Materials With Expansion Coefficients Comparable to Austenitic Steels	811
SA-455/SA-455M	Pressure Vessel Plates, Carbon Steel, High-Strength Manganese	821
SA-476/SA-476M	Ductile Iron Castings for Paper Mill Dryer Rolls	825
SA-479/SA-479M	Stainless Steel Bars and Shapes for Use in Boilers and Other Pressure Vessels	831
SA-480/SA-480M	General Requirements for Flat-Rolled Stainless and Heat-Resisting Steel Plate, Sheet, and Strip	843
SA-484/SA-484M	General Requirements for Stainless Steel Bars, Billets, and Forgings	871
SA-487/SA-487M	Steel Castings Suitable for Pressure Service	887
SA-494/SA-494M	Castings, Nickel and Nickel Alloy	895
SA-508/SA-508M	Quenched and Tempered Vacuum-Treated Carbon and Alloy Steel Forgings for Pressure Vessels	897
SA-513	Electric-Resistance-Welded Carbon and Alloy Steel Mechanical Tubing . . .	907
SA-515/SA-515M	Pressure Vessel Plates, Carbon Steel, for Intermediate- and Higher- Temperature Service	933
SA-516/SA-516M	Pressure Vessel Plates, Carbon Steel, for Moderate- and Lower- Temperature Service	937
SA-517/SA-517M	Pressure Vessel Plates, Alloy Steel, High Strength, Quenched and Tempered	943
SA-522/SA-522M	Forged or Rolled 8 and 9% Nickel Alloy Steel Flanges, Fittings, Valves, and Parts for Low-Temperature Service	947
SA-524	Seamless Carbon Steel Pipe for Atmospheric and Lower Temperatures . . .	953
SA-530/SA-530M	General Requirements for Specialized Carbon and Alloy Steel Pipe	963
SA-533/SA-533M	Pressure Vessel Plates, Alloy Steel, Quenched and Tempered, Manganese-Molybdenum and Manganese-Molybdenum-Nickel	973
SA-537/SA-537M	Pressure Vessel Plates, Heat-Treated, Carbon-Manganese-Silicon Steel . . .	979
SA-540/SA-540M	Alloy Steel Bolting Materials for Special Applications	985

SA-541/SA-541M	Quenched and Tempered Carbon and Alloy Steel Forgings for Pressure Vessel Components.....	995
SA-542/SA-542M	Pressure Vessel Plates, Alloy Steel, Quenched-and-Tempered, Chromium-Molybdenum and Chromium-Molybdenum-Vanadium	1003
SA-543/SA-543M	Pressure Vessel Plates, Alloy Steel, Quenched and Tempered, Nickel-Chromium-Molybdenum	1009
SA-553/SA-553M	Pressure Vessel Plates, Alloy Steel, Quenched and Tempered 8 and 9% Nickel.....	1013
SA-556/SA-556M	Seamless Cold-Drawn Carbon Steel Feedwater Heater Tubes	1019
SA-557/SA-557M	Electric-Resistance-Welded Carbon Steel Feedwater Heater Tubes.....	1025
SA-562/SA-562M	Pressure Vessel Plates, Carbon Steel, Manganese-Titanium for Glass or Diffused Metallic Coatings	1031
SA-563	Carbon and Alloy Steel Nuts	1035
SA-564/SA-564M	Hot-Rolled and Cold-Finished Age-Hardening Stainless Steel Bars and Shapes	1047
SA-568/SA-568M	Steel, Sheet, Carbon, Structural, and High-Strength, Low-Alloy, Hot-Rolled and Cold-Rolled, General Requirements for	1057
SA-572/SA-572M	High-Strength Low-Alloy Columbium-Vanadium Structural Steel.....	1091
SA-574	Alloy Steel Socket-Head Cap Screws	1097
SA-577/SA-577M	Ultrasonic Angle-Beam Examination of Steel Plates.....	1105
SA-578/SA-578M	Straight-Beam Ultrasonic Examination of Rolled Steel Plates for Special Applications	1109
SA-587	Electric-Resistance-Welded Low-Carbon Steel Pipe for the Chemical Industry	1115
SA-592/SA-592M	High-Strength Quenched and Tempered Low-Alloy Steel Forged Fittings and Parts for Pressure Vessels.....	1123
SA-609/SA-609M	Castings, Carbon, Low-Alloy, and Martensitic Stainless Steel, Ultrasonic Examination Thereof.....	1127
SA-612/SA-612M	Pressure Vessel Plates, Carbon Steel, High Strength, for Moderate and Lower Temperature Service	1139
SA-638/SA-638M	Precipitation Hardening Iron Base Superalloy Bars, Forgings, and Forging Stock for High-Temperature Service.....	1143
SA-645/SA-645M	Pressure Vessel Plates, 5% and 5½% Nickel Alloy Steels, Specially Heat Treated.....	1147
SA-649/SA-649M	Forged Steel Rolls Used for Corrugating Paper Machinery.....	1153
SA-656/SA-656M	Hot-Rolled Structural Steel, High-Strength Low-Alloy Plate With Improved Formability	1159
SA-660	Centrifugally Cast Carbon Steel Pipe for High-Temperature Service	1161
SA-662/SA-662M	Pressure Vessel Plates, Carbon-Manganese-Silicon Steel, for Moderate and Lower Temperature Service	1167
SA-666	Annealed or Cold-Worked Austenitic Stainless Steel Sheet, Strip, Plate, and Flat Bar	1173
SA-667/SA-667M	Centrifugally Cast Dual Metal (Gray and White Cast Iron) Cylinders	1183
SA-671	Electric-Fusion-Welded Steel Pipe for Atmospheric and Lower Temperatures	1185
SA-672	Electric-Fusion-Welded Steel Pipe for High-Pressure Service at Moderate Temperatures	1195
SA-675/SA-675M	Steel Bars, Carbon, Hot-Wrought, Special Quality, Mechanical Properties.....	1203
SA-688/SA-688M	Welded Austenitic Stainless Steel Feedwater Heater Tubes	1209
SA-691	Carbon and Alloy Steel Pipe, Electric-Fusion-Welded for High-Pressure Service at High Temperatures	1219
SA-693	Precipitation-Hardening Stainless and Heat-Resisting Steel Plate, Sheet, and Strip	1227

SA-695	Steel Bars, Carbon, Hot-Wrought, Special Quality, for Fluid Power Applications	1235
SA-696	Steel Bars, Carbon, Hot-Wrought or Cold-Finished, Special Quality, for Pressure Piping Components	1239
SA-703/SA-703M	Steel Castings, General Requirements, for Pressure-Containing Parts	1243
SA-705/SA-705M	Age-Hardening Stainless Steel Forgings	1263
SA-723/SA-723M	Alloy Steel Forgings for High-Strength Pressure Component Application	1271
SA-724/SA-724M	Pressure Vessel Plates, Carbon-Manganese-Silicon Steel, Quenched and Tempered, for Welded Layered Pressure Vessels	1277
SA-727/SA-727M	Carbon Steel Forgings for Piping Components With Inherent Notch Toughness	1281
SA-731/SA-731M	Seamless, Welded Ferritic, and Martensitic Stainless Steel Pipe	1287
SA-736/SA-736M	Pressure Vessel Plates, Low-Carbon Age-Hardening Nickel-Copper-Chromium-Molybdenum-Columbium and Nickel-Copper-Manganese-Molybdenum-Columbium Alloy Steel	1293
SA-737/SA-737M	Pressure Vessel Plates, High-Strength, Low-Alloy Steel	1299
SA-738/SA-738M	Pressure Vessel Plates, Heat-Treated, Carbon-Manganese-Silicon Steel, for Moderate and Lower Temperature Service	1303
SA-739	Steel Bars, Alloy, Hot-Wrought, for Elevated Temperature or Pressure-Containing Parts, or Both	1309
SA-745/SA-745M	Ultrasonic Examination of Austenitic Steel Forgings	1313
SA-747/SA-747M	Steel Castings, Stainless, Precipitation Hardening	1319
SA-748/SA-748M	Statically Cast Chilled White Iron-Gray Iron Dual Metal Rolls for Pressure Vessel Use	1325
SA-749/SA-749M	Steel, Strip, Carbon and High-Strength, Low-Alloy, Hot-Rolled, General Requirements for	1327
SA-751	Test Methods, Practices, and Terminology for Chemical Analysis of Steel Products	1337
SA-765/SA-765M	Carbon Steel and Low-Alloy Steel Pressure-Vessel-Component Forgings With Mandatory Toughness Requirements	1345
SA-770/SA-770M	Through-Thickness Tension Testing of Steel Plates for Special Applications	1353
SA-781/SA-781M	Castings, Steel and Alloy, Common Requirements, for General Industrial Use	1361
SA-788/SA-788M	Steel Forgings, General Requirements	1379
SA-789/SA-789M	Seamless and Welded Ferritic/Austenitic Stainless Steel Tubing for General Service	1395
SA-790/SA-790M	Seamless and Welded Ferritic/Austenitic Stainless Steel Pipe	1403
SA-803/SA-803M	Welded Ferritic Stainless Steel Feedwater Heater Tubes	1415
SA-813/SA-813M	Single- or Double-Welded Austenitic Stainless Steel Pipe	1427
SA-814/SA-814M	Cold-Worked Welded Austenitic Stainless Steel Pipe	1437
SA-815/SA-815M	Wrought Ferritic, Ferritic/Austenitic, and Martensitic Stainless Steel Piping Fittings	1445
SA-832/SA-832M	Pressure Vessel Plates, Alloy Steel, Chromium-Molybdenum-Vanadium	1455
SA-834	Common Requirements for Iron Castings for General Industrial Use	1461
SA-836/SA-836M	Titanium-Stabilized Carbon Steel Forgings for Glass-Lined Piping and Pressure Vessel Service	1465
SA-841/SA-841M	Steel Plates for Pressure Vessels, Produced by Thermo-Mechanical Control Process (TMCP)	1469
SA-905	Steel Wire, Pressure Vessel Winding	1479
SA-941	Terminology Relating to Steel, Stainless Steel, Related Alloys, and Ferroalloys	1485

SA-960/SA-960M	Common Requirements for Wrought Steel Piping Fittings	1493
SA-961/SA-961M	Common Requirements for Steel Flanges, Forged Fittings, Valves and Parts for Piping Applications	1505
SA-962/SA-962M	Common Requirements for Steel Fasteners or Fastener Materials, or Both, Intended for Use at Any Temperature From Cryogenic to the Creep Range	1517
SA-965/SA-965M	Steel Forgings, Austenitic, for Pressure and High Temperature Parts	1531
SA-985/SA-985M	Steel Investment Castings General Requirements, for Pressure-Containing Parts	1539
SA-995	Castings, Austenitic-Ferritic (Duplex) Stainless Steel, for Pressure- Containing Parts	1559
SA-999/SA-999M	General Requirements for Alloy and Stainless Steel Pipe	1563
SA-1008/SA-1008M	Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy With Improved Formability	1577
SA-1010/SA-1010M	Higher-Strength Martensitic Stainless Steel Plate, Sheet, and Strip	1587
SA-1011/SA-1011M	Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy With Improved Formability, and Ultra-High Strength	1591
SA-1016/SA-1016M	General Requirements for Ferritic Alloy Steel, Austenitic Alloy Steel, and Stainless Steel Tubes	1601
SA-1017/SA-1017M	Pressure Vessel Plates, Alloy Steel, Chromium-Molybdenum-Tungsten	1617
SF-568M	Carbon and Alloy Steel Externally Threaded Metric Fasteners	1623
SA/AS 1548	Steel Plates for Pressure Equipment	1635
SA/CSA-G40.21	Structural Quality Steels	1637
SA/EN 10028-2	Flat Products Made of Steels for Pressure Purposes Part 2: Non-Alloy and Alloy Steels With Specified Elevated Temperature Properties	1639
SA/EN 10028-3	Flat Products Made of Steels for Pressure Purposes Part 3: Weldable Fine Grain Steels, Normalized	1641
SA/EN 10028-7	Flat Products Made of Steels for Pressure Purposes Part 7: Stainless Steels	1643
SA/GB 6654	Steel Plates for Pressure Vessels	1645
SA/JIS G3118	Carbon Steel Plates for Pressure Vessels for Intermediate and Moderate Temperature Service	1647
SA/JIS G4303	Stainless Steel Bars	1649

MANDATORY APPENDIX

I	Standard Units for Use in Equations	1651
---	---	------

NONMANDATORY APPENDIX

A	Sources of Standards	1653
---	----------------------------	------

SPECIFICATIONS LISTED BY MATERIALS

Steel Plate, Sheets and Strip

SA-568/SA-568M	Steel, Sheet, Carbon Structural, and High-Strength, Low-Alloy, Hot-Rolled and Cold-Rolled, General Requirements for	1057
SA-749/SA-749M	Steel, Strip, Carbon and High-Strength, Low-Alloy, Hot-Rolled General Requirements for	1327

Steel Pipe

SA-53/SA-53M	Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless	161
SA-106/SA-106M	Seamless Carbon Steel Pipe for High-Temperature Service	195
SA-134	Pipe, Steel, Electric-Fusion (Arc)-Welded (Sizes NPS 16 and Over)	207
SA-135	Electric-Resistance-Welded Steel Pipe	213
SA-312/SA-312M	Seamless and Welded Austenitic Stainless Steel Pipes	487
SA-333/SA-333M	Seamless and Welded Steel Pipe for Low-Temperature Service	519
SA-335/SA-335M	Seamless Ferritic Alloy-Steel Pipe for High-Temperature Service	541
SA-358/SA-358M	Electric-Fusion-Welded Austenitic Chromium-Nickel Alloy Steel Pipe for High-Temperature Service	605
SA-369/SA-369M	Carbon and Ferritic Alloy Steel Forged and Bored Pipe for High-Temperature Service	615
SA-376/SA-376M	Seamless Austenitic Steel Pipe for High-Temperature Central-Station Service	685
SA-409/SA-409M	Welded Large Diameter Austenitic Steel Pipe for Corrosive or High-Temperature Service	735
SA-426/SA-426M	Centrifugally Cast Ferritic Alloy Steel Pipe for High-Temperature Service	765
SA-451/SA-451M	Centrifugally Cast Austenitic Steel Pipe for High-Temperature Service	805
SA-524	Seamless Carbon Steel Pipe for Atmospheric and Lower Temperatures	953
SA-530/SA-530M	General Requirements for Specialized Carbon and Alloy Steel Pipe	963
SA-587	Electric-Resistance-Welded Low-Carbon Steel Pipe for the Chemical Industry	1115
SA-660	Centrifugally Cast Carbon Steel Pipe for High-Temperature Service	1161
SA-671	Electric-Fusion-Welded Steel Pipe for Atmospheric and Lower Temperatures	1185
SA-672	Electric-Fusion-Welded Steel Pipe for High-Pressure Service at Moderate Temperatures	1195
SA-691	Carbon and Alloy Steel Pipe, Electric-Fusion-Welded for High-Pressure Service at High Temperatures	1219
SA-727/SA-727M	Carbon Steel Forgings for Piping Components With Inherent Notch Toughness	1281
SA-731/SA-731M	Seamless, Welded Ferritic, and Martensitic Stainless Steel Pipe	1287
SA-790/SA-790M	Seamless and Welded Ferritic/Austenitic Stainless Steel Pipe	1403
SA-813/SA-813M	Single- or Double-Welded Austenitic Stainless Steel Pipe	1427
SA-814/SA-814M	Cold-Worked Welded Austenitic Stainless Steel Pipe	1437
SA-941	Terminology Relating to Steel, Stainless Steel, Related Alloys, and Ferroalloys	1485

SA-961/SA-961M	Common Requirements for Steel Flanges, Forged Fittings, Valves and Parts for Piping Applications	1563
SA-999/SA-999M	General Requirements for Alloy and Stainless Steel Pipe	1563

Steel Tubes

SA-178/SA-178M	Electric-Resistance-Welded Carbon Steel and Carbon-Manganese Steel Boiler and Superheater Tubes.....	223
SA-179/SA-179M	Seamless Cold-Drawn Low-Carbon Steel Heat-Exchanger and Condenser Tubes	229
SA-192/SA-192M	Seamless Carbon Steel Boiler Tubes for High-Pressure Service.....	257
SA-209/SA-209M	Seamless Carbon-Molybdenum Alloy-Steel Boiler and Superheater Tubes	305
SA-210/SA-210M	Seamless Medium-Carbon Steel Boiler and Superheater Tubes	311
SA-213/SA-213M	Seamless Ferritic and Austenitic Alloy-Steel Boiler, Superheater, and Heat-Exchanger Tubes	315
SA-214/SA-214M	Electric-Resistance-Welded Carbon Steel Heat-Exchanger and Condenser Tubes	329
SA-249/SA-249M	Welded Austenitic Steel Boiler, Superheater, Heat-Exchanger, and Condenser Tubes	377
SA-250/SA-250M	Electric-Resistance-Welded Ferritic Alloy-Steel Boiler and Superheater Tubes	387
SA-268/SA-268M	Seamless and Welded Ferritic and Martensitic Stainless Steel Tubing for General Service	423
SA-334/SA-334M	Seamless and Welded Carbon and Alloy-Steel Tubes for Low-Temperature Service	531
SA-423/SA-423M	Seamless and Electric, Welded Low-Alloy Steel Tubes	759
SA-450/SA-450M	General Requirements for Carbon, Ferritic Alloy, and Austenitic Alloy Steel Tubes	793
SA-513	Electric-Resistance-Welded Carbon and Alloy Steel Mechanical Tubing....	907
SA-556/SA-556M	Seamless Cold-Drawn Carbon Steel Feedwater Heater Tubes	1019
SA-557/SA-557M	Electric-Resistance-Welded Carbon Steel Feedwater Heater Tubes.....	1025
SA-688/SA-688M	Welded Austenitic Stainless Steel Feedwater Heater Tubes	1209
SA-789/SA-789M	Seamless and Welded Ferritic/Austenitic Stainless Steel Tubing for General Service	1395
SA-803/SA-803M	Welded Ferritic Stainless Steel Feedwater Heater Tubes	1415
SA-941	Terminology Relating to Steel, Stainless Steel, Related Alloys, and Ferroalloys.....	1485
SA-1016/SA-1016M	General Requirements for Ferritic Alloy Steel, Austenitic Alloy Steel, and Stainless Steel Tubes	1601

Steel Flanges, Fittings, Valves, and Parts

SA-105/SA-105M	Carbon Steel Forgings, for Piping Applications	189
SA-181/SA-181M	Carbon Steel Forgings, for General-Purpose Piping	233
SA-182/SA-182M	Forged or Rolled Alloy and Stainless Steel Pipe Flanges, Forged Fittings, and Valves and Parts for High-Temperature Service	237
SA-216/SA-216M	Steel Castings, Carbon, Suitable for Fusion Welding for High-Temperature Service	331
SA-217/SA-217M	Steel Castings, Martensitic Stainless and Alloy, for Pressure-Containing Parts, Suitable for High-Temperature Service.....	335
SA-231/SA-231M	Chromium-Vanadium Alloy Steel Spring Wire	345
SA-232/SA-232M	Chromium-Vanadium Alloy Steel Valve Spring Quality Wire	351
SA-234/SA-234M	Piping Fittings of Wrought Carbon Steel and Alloy Steel for Moderate and High-Temperature Service.....	355

SA-350/SA-350M	Carbon and Low-Alloy Steel Forgings, Requiring Notch Toughness Testing for Piping Components	563
SA-351/SA-351M	Castings, Austenitic, Austenitic-Ferritic (Duplex), for Pressure-Containing Parts	575
SA-352/SA-352M	Steel Castings, Ferritic and Martensitic, for Pressure Containing Parts, Suitable for Low-Temperature Service	583
SA-403/SA-403M	Wrought Austenitic Stainless Steel Piping Fittings	725
SA-420/SA-420M	Piping Fittings of Wrought Carbon Steel and Alloy Steel for Low-Temperature Service	749
SA-522/SA-522M	Forged or Rolled 8 and 9% Nickel Alloy Steel Flanges, Fittings, Valves, and Parts for Low-Temperature Service	947
SA-592/SA-592M	High-Strength Quenched and Tempered Low-Alloy Steel Forged Fittings and Parts for Pressure Vessels	1123
SA-815/SA-815M	Wrought Ferritic, Ferritic/Austenitic, and Martensitic Stainless Steel Piping Fittings	1145
SA-905	Steel Wire, Pressure Vessel Winding	1479
SA-960/SA-960M	Common Requirements for Wrought Steel Piping Fittings	1493
SA-961/SA-961M	Common Requirements for Steel Flanges, Forged Fittings, Valves and Parts for Piping Applications	1505
SA-985/SA-985M	Steel Investment Castings General Requirements for Pressure-Containing Parts	1539
SA-995	Castings, Austenitic-Ferritic (Duplex) Stainless Steel, for Pressure-Containing Parts	1559

Steel Plates, Sheets, and Strip for Pressure Vessels

SA-20/SA-20M	General Requirements for Steel Plates for Pressure Vessels	83
SA-202/SA-202M	Pressure Vessel Plates, Alloy Steel, Chromium-Manganese-Silicon	293
SA-203/SA-203M	Pressure Vessel Plates, Alloy Steel, Nickel	297
SA-204/SA-204M	Pressure Vessel Plates, Alloy Steel, Molybdenum	301
SA-225/SA-225M	Pressure Vessel Plates, Alloy Steel, Manganese-Vanadium-Nickel	341
SA-240/SA-240M	Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels and for General Applications	365
SA-263	Stainless Chromium Steel-Clad Plate	393
SA-264	Stainless Chromium-Nickel Steel-Clad Plate	401
SA-265	Nickel and Nickel-Base Alloy-Clad Steel Plate	409
SA-285/SA-285M	Pressure Vessel Plates, Carbon Steel, Low- and Intermediate-Tensile Strength	461
SA-299/SA-299M	Pressure Vessel Plates, Carbon Steel, Manganese-Silicon	465
SA-302/SA-302M	Pressure Vessel Plates, Alloy Steel, Manganese-Molybdenum and Manganese-Molybdenum-Nickel	469
SA-353/SA-353M	Pressure Vessel Plates, Alloy Steel, 9 Percent Nickel, Double-Normalized and Tempered	591
SA-387/SA-387M	Pressure Vessel Plates, Alloy Steel, Chromium-Molybdenum	645
SA-414/SA-414M	Steel, Sheet, Carbon, for Pressure Vessels	745
SA-455/SA-455M	Pressure Vessel Plates, Carbon Steel, High-Strength Manganese	821
SA-480/SA-480M	General Requirements for Flat-Rolled Stainless and Heat-Resisting Steel Plate, Sheet, and Strip	843
SA-515/SA-515M	Pressure Vessel Plates, Carbon Steel, for Intermediate- and Higher-Temperature Service	933
SA-516/SA-516M	Pressure Vessel Plates, Carbon Steel, for Moderate- and Lower-Temperature Service	937
SA-517/SA-517M	Pressure Vessel Plates, Alloy Steel, High Strength, Quenched and Tempered	943

SA-533/SA-533M	Pressure Vessel Plates, Alloy Steel, Quenched and Tempered, Manganese-Molybdenum and Manganese-Molybdenum-Nickel.....	973
SA-537/SA-537M	Pressure Vessel Plates, Heat-Treated, Carbon-Manganese-Silicon Steel.....	979
SA-542/SA-542M	Pressure Vessel Plates, Alloy Steel, Quenched-and-Tempered, Chromium-Molybdenum and Chromium-Molybdenum-Vanadium	1003
SA-543/SA-543M	Pressure Vessel Plates, Alloy Steel, Quenched and Tempered, Nickel- Chromium-Molybdenum	1009
SA-553/SA-553M	Pressure Vessel Plates, Alloy Steel, Quenched and Tempered, 8 and 9% Nickel.....	1013
SA-562/SA-562M	Pressure Vessel Plates, Carbon Steel, Manganese-Titanium for Glass or Diffused Metallic Coatings	1031
SA-612/SA-612M	Pressure Vessel Plates, Carbon Steel, High Strength, for Moderate and Lower Temperature Service	1139
SA-645/SA-645M	Pressure Vessel Plates, 5% and 5 ¹ / ₂ % Nickel Alloy Steels, Specially Heat Treated.....	1147
SA-662/SA-662M	Pressure Vessel Plates, Carbon-Manganese-Silicon Steel, for Moderate and Lower Temperature Service	1167
SA-666	Annealed or Cold-Worked Austenitic Stainless Steel Sheet, Strip, Plate and Flat Bar	1173
SA-693	Precipitation-Hardening Stainless and Heat-Resisting Steel Plate, Sheet, and Strip	1227
SA-724/SA-724M	Pressure Vessel Plates, Carbon-Manganese-Silicon Steel, Quenched and Tempered, for Welded Pressure Vessels	1277
SA-736/SA-736M	Pressure Vessel Plates, Low-Carbon Age-Hardening Nickel-Copper- Chromium-Molybdenum-Columbium and Nickel-Copper- Manganese-Molybdenum-Columbium Alloy Steel	1293
SA-737/SA-737M	Pressure Vessel Plates, High-Strength, Low-Alloy Steel	1299
SA-738/SA-738M	Pressure Vessel Plates, Heat-Treated, Carbon-Manganese-Silicon Steel, for Moderate and Lower Temperature Service.....	1303
SA-770/SA-770M	Through-Thickness Tension Testing of Steel Plates for Special Applications	1353
SA-832/SA-832M	Pressure Vessel Plates, Alloy Steel, Chromium-Molybdenum- Vanadium	1455
SA-841/SA-841M	Steel Plates for Pressure Vessels, Produced by the Thermo-Mechanical Control Process (TMCP)	1469
SA-1010/SA-1010M	Higher-Strength Martensitic Stainless Steel Plate, Sheet, and Strip.....	1587
SA-1017/SA-1017M	Pressure Vessel Plates, Alloy-Steel, Chromium-Molybdenum-Tungsten	1617
SA/AS 1548	Steel Plates for Pressure Equipment	1635
SA/EN 10028-2	Flat Products Made of Steels for Pressure Purposes Part 2: Non-Alloy and Alloy Steels With Specified Elevated Temperature Properties	1639
SA/EN 10028-3	Flat Products Made of Steels for Pressure Purposes Part 3: Weldable Fine Grain Steels, Normalized	1641
SA/EN 10028-7	Flat Products Made of Steels for Pressure Purposes Part 7: Stainless Steels	1643
SA/GB 6654	Steel Plates for Pressure Vessels	1645
SA/JIS G3118	Carbon Steel Plates for Pressure Vessels for Intermediate and Moderate Temperature Service.....	1647

Structural Steel

SA-6/SA-6M	General Requirements for Rolled Structural Steel Bars, Plates, Shapes, and Sheet Piling.....	1
SA-36/SA-36M	Carbon Structural Steel.....	147
SA-283/SA-283M	Low and Intermediate Tensile Strength Carbon Steel Plates.....	457

SA-572/SA-572M	High-Strength Low-Alloy Columbium-Vanadium Structural Steel.....	1091
SA-656/SA-656M	Hot-Rolled Structural Steel, High-Strength Low-Alloy Plate With Improved Formability.....	1159
SA-1008/SA-1008M	Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy With Improved Formability.....	1577
SA-1011/SA-1011M	Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy With Improved Formability, and Ultra-High-Strength.....	1591
SA/CSA-G40.21	Structural Quality Steels.....	1637

Steel Bars

SA-6/SA-6M	General Requirements for Rolled Structural Steel Bars, Plates, Shapes, and Sheet Piling.....	1
SA-29/SA-29M	Steel Bars, Carbon and Alloy, Hot-Wrought, General Requirements for....	125
SA-31	Steel Rivets and Bars for Rivets, Pressure Vessels.....	143
SA-276	Stainless Steel Bars and Shapes.....	441
SA-311/SA-311M	Cold-Drawn, Stress-Relieved Carbon Steel Bars Subject to Mechanical Property Requirements.....	481
SA-479/SA-479M	Stainless Steel Bars and Shapes for Use in Boilers and Other Pressure Vessels.....	831
SA-484/SA-484M	General Requirements for Stainless and Steel Bars, Billets, and Forgings.....	871
SA-564/SA-564M	Hot-Rolled and Cold-Finished Age-Hardening Stainless Steel Bars and Shapes.....	1047
SA-638/SA-638M	Precipitation Hardening Iron Base Superalloy Bars, Forgings, and Forging Stock for High-Temperature Service.....	1143
SA-675/SA-675M	Steel Bars, Carbon, Hot-Wrought, Special Quality, Mechanical Properties.....	1203
SA-695	Steel Bars, Carbon, Hot-Wrought, Special Quality, for Fluid Power Applications.....	1235
SA-696	Steel Bars, Carbon, Hot-Wrought or Cold-Finished, Special Quality, for Pressure Piping Components.....	1239
SA-739	Steel Bars, Alloy, Hot-Wrought, for Elevated Temperature or Pressure- Containing Parts, or Both.....	1309
SA/JIS G4303	Stainless Steel Bars.....	1649

Steel Bolting Materials

SA-193/SA-193M	Alloy-Steel and Stainless Steel Bolting Materials for High-Temperature or High Pressure Service and Other Special Purpose Applications.....	261
SA-194/SA-194M	Carbon and Alloy Steel Nuts for Bolts for High-Pressure or High- Temperature Service, or Both.....	277
SA-307	Carbon Steel Bolts and Studs, 60 000 psi Tensile Strength.....	473
SA-320/SA-320M	Alloy Steel and Stainless Steel Bolting Materials for Low-Temperature Service.....	499
SA-325	Structural Bolts, Steel, Heat Treated, 120/105 ksi Minimum Tensile Strength.....	509
SA-354	Quenched and Tempered Alloy Steel Bolts, Studs, and Other Externally Threaded Fasteners.....	597
SA-437/SA-437M	Alloy-Steel Turbine-Type Bolting Material Specially Heat Treated for High-Temperature Service.....	775
SA-449	Hex Cap Screws, Bolts and Studs, Steel, Heat Treated, 120/105/90 ksi Minimum Tensile Strength, General Use.....	781
SA-453/SA-453M	High-Temperature Bolting Materials, With Expansion Coefficients Comparable to Austenitic Steel.....	811

SA-540/SA-540M	Alloy Steel Bolting Materials for Special Applications	985
SA-563	Carbon and Alloy Steel Nuts	1035
SA-574	Alloy Steel Socket-Head Cap Screws	1097
SA-962/SA-962M	Common Requirements for Steel Fasteners or Fastener Materials, or Both, Intended for Use at Any Temperature From Cryogenic to the Creep Range	1517
SF-568M	Carbon and Alloy Steel Externally Threaded Metric Fasteners.....	1623

Steel Billets and Forgings

SA-105/SA-105M	Carbon Steel Forgings, for Piping Applications	189
SA-181/SA-181M	Carbon Steel Forgings, for General-Purpose Piping	233

SPECIFICATION REMOVAL

(10)

From time to time, it becomes necessary to remove specifications from this Part of Section II. This occurs because the sponsoring society (e.g., ASTM, AWS, CEN) has notified ASME that the specification has either been replaced with another specification, or that there is no known use and production of a material. Removal of a specification from this Section also results in concurrent removal of the same specification from Section IX and from all of the ASME Boiler and Pressure Vessel Construction Codes that reference the material. This action effectively prohibits further use of the material in ASME Boiler and Pressure Vessel construction.

The following specifications will be dropped from this Section in the next Addenda (if applicable), unless information concerning current production and use of the material is received before December 1 of this year:

SA-557/SA-557M-90a (discontinued by ASTM in 1995, replaced by A 178/A 178M)¹

SA-731/SA-731M-91 (discontinued by ASTM in 1995, replaced by A 268/A 268M)¹

If you are currently using and purchasing new material to this specification for ASME Boiler and Pressure Vessel Code construction, and if discontinuance of this specification would present a hardship, please notify the Secretary of the ASME Boiler and Pressure Vessel Committee, at the address shown below:

Secretary
ASME Boiler and Pressure Vessel Committee
Three Park Avenue
New York, NY 10016-5990
Tel: (212) 591-8533
Fax: (212) 591-8501

¹ The replacement specifications are currently in Section II, Part A.

INTENTIONALLY LEFT BLANK

GUIDELINE ON ACCEPTABLE ASTM EDITIONS

All materials, originating from an ASTM specification, allowed by the various Code Sections and used for construction within the scope of their rules shall be furnished in accordance with the Material Specifications contained within Section II and this guideline except where otherwise provided in Code Cases or in the applicable Section of the Code. Materials covered by these Specifications are acceptable for use in items covered by the Code Sections only to the degree indicated in the applicable Section. Materials for Code use should preferably be ordered, produced, and documented on this basis; however, material produced under an ASTM Specification listed in Table

ED-1 may be used in lieu of the corresponding ASME Specification as listed in this guideline. Material produced to an ASME or ASTM Specification with requirements different from the requirements of the corresponding Specification may also be used in accordance with the above, provided the material manufacturer or vessel manufacturer certifies with evidence acceptable to the Authorized Inspector that the corresponding Specification requirements have been met. This guideline lists the Specifications, originating from ASTM, and their acceptable dates of issue as well as the Book sections of the ASME Boiler Code in which the specification is approved for use.

NOTE:

- (1) SA-350/SA-350M Grade LF2 forgings, made to revisions earlier than the 2001 ASME Boiler and Pressure Vessel Code, or to ASTM Specification A 350/A 350M with year dates from 1987 through 1997 are acceptable for either Class 1 or Class 2 applications, unless Supplementary Requirement S4 was used to test forgings at a higher test temperature.

GUIDELINE ON ACCEPTABLE NON-ASTM EDITIONS

All materials originating from a non-ASTM Specification allowed by the various Code Sections and used for construction within the scope of their rules shall be furnished in accordance with the Material Specifications contained within Section II and this guideline except where otherwise provided in Code Cases or in the applicable Section of the Code. Materials covered by these Specifications are acceptable for use in items covered by the Code Sections only to the degree indicated in the applicable Section. Materials for Code use should preferably be ordered, produced, and documented on this basis; however, material produced under a non-ASTM Specification listed in Table ED-2 may be used in lieu of the corresponding

ASME Specification as listed in this Appendix. Material produced to an ASME or a non-ASTM Specification with requirements different from the requirements of the corresponding Specification may also be used in accordance with the above, provided the material manufacturer or vessel manufacturer certifies with evidence acceptable to the Authorized Inspector that the corresponding Specification requirements have been met. This guideline lists the non-ASTM Specifications, originating not from ASTM and their acceptable dates of issue as well as the Book sections of the ASME Boiler Code in which the specification is approved for use.

(10)

GENERAL NOTE: The date of publication of the European standards considered in this Guideline is the year of approval of the standard by CEN. This date appears in the body of the standard on the page starting with EN; dates appearing on the front page of an XX EN standard (e.g., XX = BS or NF or DIN) correspond only to the date of adoption by each member country.

SUMMARY OF CHANGES

The 2010 Edition of this Code contains revisions in addition to the 2007 Edition with 2008 and 2009 Addenda. The revisions are identified with the designation **(10)** in the margin and, as described in the Foreword, become mandatory 6 months after the publication date of the 2010 Edition. To invoke these revisions before their mandatory date, use the designation “2010 Edition” in documentation required by this Code. If you choose not to invoke these revisions before their mandatory date, use the designation “2007 Edition through the 2009 Addenda” in documentation required by this Code.

The Record Numbers listed below are explained in more detail in “List of Changes in Record Number Order” following this Summary of Changes.

Changes given below are identified on the pages by a margin note, **(10)**, placed next to the affected area.

<i>Page</i>	<i>Location</i>	<i>Change (Record Number)</i>
xxxix	Specification Removal	Second paragraph editorially revised
xix–xxviii	Table ED-1	Updated to reflect 2010 Edition
xxix	Table ED-2	Updated to reflect 2010 Edition
195–206	SA-106/SA-106M	Revised in its entirety (02-2457)
229	SA-179/SA-179M	Paragraph 4.1.1 corrected by errata (09-591)
315–328	SA-213/SA-213M	Revised in its entirety (08-1151)
473–480	SA-307	Revised in its entirety (08-1154)

1403–1414	SA-790/SA-790M	Revised in its entirety (08-1160)
1641	SA/EN 10028-3	Revised in its entirety (06-267)

NOTE:

Volume 60 of the Interpretations to Section II, Part A, of the ASME Boiler and Pressure Vessel Code follows the last page of this Addenda to Section II, Part A.

LIST OF CHANGES IN RECORD NUMBER ORDER

Record Number	Change
02-2457	Revised SA-106 to be identical to the 08 ASTM Edition of A 106, including, in particular, permitting NDE as an alternative to hydrostatic testing at the option of the manufacturer, prohibiting supply of pipe that has failed either the hydrostatic test or the NDE test when NH pipe has been ordered, and adding a Supplementary Requirement for tighter chemistry and heat treatment requirements for pipe for HF Acid Alkylation Service at the request of the petro-chemical industry.
05-1302	Section II, Part A; ASME SA-449 updated to the 2007b version of ASTM A 449 including the requirements that all mating fastener components be coated by the same zinc-coating process in 5.1.4 and deletion of private label distributor in 16.1 and 16.3.2, and the addition of the studs and cap screws to paragraph 6.4.
06-267	(1) Section II, Part A: Revised SA/EN 10028-3-2003 cover sheet. (2) Section II, Part A: Revised acceptable edition for SA/EN 10028-3 (2003) in Table ED-2.
07-912	ASME SA-540/SA-540M updated to 2006 version of ASTM A 540/A 540M.
07-1103	ASME SA-568/SA-568M updated to 2007a version of ASTM A 568/A 568M.
08-1151	ASME SA-213/SA-213M updated to 2008 version of ASTM A 213/A 213M with the addition of H Grade heat treatment requirements in para. 6.2 and the editorial correction of "TZZ" to "T36" in Table 5.
08-1154	ASME SA-307 updated to 2007b version of ASTM A 307 with the deletion of the term "private label distributor" in para. 13.1.1.
08-1160	ASME SA-790/SA-790M updated to 2008 version of ASTM A 790/A 790M with the correction of the sulfur content for UNS S32808 in Table 2.
09-377	ASME SA-414/SA-414M updated to 2007 version of ASTM A 414/A 414M.
09-580	Revised ASME SA-320 para. 6.2.1.1 to clarify that Charpy Impact Testing is not required for carbide solution treated austenitic stainless grades. Revised the subtitle and the "identity" statement in Table ED-1 to reflect the editorial clarification of para. 6.2.1.1.
09-591	Errata to correct para. 4.1.1 of SA-179/SA-179M.
09-597	Errata to correct unit designation in Table 4 of SA-556/SA-556M.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR CENTRIFUGALLY CAST AUSTENITIC STEEL PIPE FOR HIGH-TEMPERATURE SERVICE

SA-451/SA-451M

(Identical with ASTM Specification A 451/A 451M-06 except for editorial differences in 15.1.)

1. Scope

1.1 This specification covers austenitic alloy steel pipe for use in high-temperature, corrosive, or nuclear pressure service.

1.2 Several grades of austenitic stainless steel are covered as indicated in Table 1.

1.3 Optional supplementary requirements are provided when additional testing may be required.

1.4 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exactly equivalents; therefore, each system must be used independently of each other. Combining values from the two systems may result in nonconformance with the specification.

NOTE 1 — This specification is not intended to cover centrifugal pipe made from alloys containing more than 0.20% carbon, such as are covered by Specification A 297.

E 446 Reference Radiographs for Steel Castings Up to 2 in. [51 mm] in Thickness

2.2 ANSI Standard:

B46.1 Surface Texture

3. Ordering Information

3.1 Orders for material to this specification shall include the following, as required, to describe the desired material adequately:

3.1.1 Quantity (feet, metres, or number of lengths),

3.1.2 Name of material (centrifugally cast pipe),

3.1.3 Grade (Table 1),

3.1.4 Size (outside or inside diameter and minimum wall thickness in inches or millimetres),

3.1.5 Length (specific or random, Specification A 999/A 999M),

3.1.6 End Finish of Specification A 999/A 999M,

3.1.7 Optional Requirements (9.4 and Supplementary Requirements S1 through S7),

3.1.8 Test Report Required (Section 14), and

3.1.9 Special Requirements or Additions to Specification.

4. Materials and Manufacture

4.1 Heat-Treatment — The pipe shall receive a heat-treatment at the temperature and time specified in Table 2, followed by a quench in water or rapid cool by other means.

4.2 Machining — The pipe shall be machined on the inner and outer surfaces to a roughness value no greater than 250 $\mu\text{in.}$ [6.35 μm] arithmetical average deviation (AA) from the mean line, as defined in American National Standard B46.1.

5. Chemical Analysis

5.1 Heat Analysis — An analysis of each heat shall be made by the manufacturer to determine the percentages of elements specified in Table 1. The analysis shall be made on a test sample taken preferably during the pouring of the heat. The chemical composition thus determined shall conform to the requirements specified in Table 1.

5.2 Product Analysis — A product analysis may be made by the purchaser. The sample for analysis shall be selected so as to be thoroughly representative of the pipe being analyzed. The chemical composition thus determined shall conform to the requirements specified in Table 1.

5.3 To determine conformance with the chemical analysis requirements, an observed value or calculated value shall be rounded in accordance with Practice E 29 to the nearest unit in the last right-hand place of values listed in Table 1.

6. Tensile Requirements

6.1 Test Specimens:

6.1.1 Test specimens shall be prepared in accordance with Test Methods and Definitions A 370. Test bars shall be poured in special blocks from the same heat as the castings represented. Test bars shall be supplied in sufficient number to furnish all specimens required in 6.2 and 6.3 (see Table 3).

6.1.2 Test specimens may be cut from heat-treated castings instead of from test bars when agreed upon between the manufacturer and the purchaser.

6.1.3 Tension test specimens shall be machined to the form and dimensions of the standard round 2 in. [50 mm] gage length specimens shown in Fig. 6 of Test Methods and Definitions A 370.

6.2 Number of Tests:

6.2.1 One tension test shall be made from each heat. The bar from which the test specimen is taken shall be heat-treated in the same manner as the castings represented.

6.2.2 If a specimen is machined improperly or flaws are revealed by machining or during testing, the specimen may be discarded and another substituted from the same heat.

6.3 Retests — If the results of the mechanical tests for any heat do not conform to the requirements specified, the

castings may be reheat-treated and retested, but may not be solution-treated more than twice.

7. Hydrostatic Test

7.1 Each length of pipe shall be hydrostatically tested in accordance with Specification A 999/A 999M.

7.2 It is realized that the foundry may be unable to perform the hydrostatic test prior to shipment, or that the purchaser may wish to defer testing until additional work has been performed on the casting. In such cases, the foundry is responsible for the satisfactory performance of the casting when it is tested.

8. Quality

8.1 The surface of the casting shall be examined visually and shall be free from cracks and hot tears. Other surface defects shall be judged in accordance with visual acceptance criteria which may be specified in the order.

9. Rework and Retreatment

9.1 Defects as defined in Section 8 shall be removed and their removal verified by visual inspection of the resultant cavities. Defects which are located by inspecting with Supplementary Requirement S6 or S7, or both, shall be removed or reduced to an acceptable size.

9.2 If removal of the defect does not infringe upon the minimum wall thickness, the depression may be blended uniformly into the surrounding surface.

9.3 If the cavity resulting from defect removal infringes upon the minimum wall thickness, weld repair is permitted subject to the purchasers' approval. The composition of the weld rod used shall be suitable for the composition of the metal being welded.

9.3.1 Only operators and procedures qualified in accordance with ASME Boiler and Pressure Vessel Code, Section IX, shall be used. All repair welds will be inspected to the same quality standards used to inspect the casting.

9.4 Postweld heat-treatment of the repaired casting is neither required nor prohibited.

10. Permissible Variations in Dimensions

10.1 Thickness — The wall thickness shall not vary over that specified by more than $\frac{1}{8}$ in. (3 mm). There shall be no variation under the specified wall thickness.

11. General Requirements

11.1 Material furnished under this specification shall conform to the applicable requirements of the current edition of Specification A 999/A 999M, unless otherwise provided herein.

12. Rejection

12.1 Each length of pipe received from the manufacturer may be inspected by the purchaser and, if it does not meet the requirements of the specification based on the inspection and test method as outlined in the specification, the pipe may be rejected and the manufacturer shall be notified. Disposition of rejected pipe shall be a matter of agreement between the manufacturer and the purchaser.

13. Rehearing

13.1 Samples that represent rejected material shall be preserved for 2 weeks from the date of transmission of the test report. In case of dissatisfaction with the results of the tests, the manufacturer may make claim for a rehearing within that time.

14. Certification

14.1 Upon request of the purchaser in the contract or order, a manufacturer's certification that the material was

manufactured and tested in accordance with this specification, together with a report of the test results, shall be furnished at the time of shipment.

15. Product Marking

15.1 Each length of pipe shall be legibly marked with the manufacturer's name or brand, the specification number, and grade. In addition, heat numbers, or serial numbers that are traceable to heat numbers, shall be marked on each length of pipe.

16. Keywords

16.1 austenitic; centrifugally cast; height; high-temperature service; stainless steel; steel castings

^A Grades CPF10MC and CPF8C may have a columbium plus tantalum content maximum of 1.35%.

^B No designation as yet assigned by ASTM International or Steel Founders Society of America.

^C By agreement between the manufacturer and the purchaser, the carbon content of Grade CPH20 may be restricted to 0.10% max. When so agreed, the grade designation shall be CPH10.

⁴ The properties shown are obtained by adjusting the composition within the limits shown in Table 1 to obtain a ferrite-austenite ratio that will result in the higher ultimate and yield strengths indicated. A lowering of impact values may develop in these materials when exposed to service temperature above 800°F [425°C].

SUPPLEMENTARY REQUIREMENTS

Supplementary requirements shall be applied only when specified by the purchaser. Details of the supplementary requirements shall be agreed upon by the manufacturer and purchaser. The specified tests shall be performed by the manufacturer prior to shipment of the castings.

S1. Additional Tension Tests

S1.1 Additional tension tests shall be made at a temperature to be specified by the customer, and the properties to be met are a matter of agreement between purchaser and manufacturer.

S2. Flattening Test

S2.1 The flattening test shall be made on specimens from one or both ends of each length of pipe. If the specimen from any end of any length fails to conform to the requirements of Specification A 999/A 999M, that length shall be rejected.

S3. Photomicrographs

S3.1 The manufacturer shall furnish one photomicrograph at 100 diameters from one specimen of as-finished pipe from each heat in each heat-treatment lot. Such photomicrographs shall be suitably identified as to pipe size, wall thickness, and heat. Such photomicrographs are for information only, to show the actual metal structure of the pipe as furnished. No photomicrographs for the individual pieces purchased shall be required except as specified in Supplementary Requirement S4.

S4. Photomicrographs for Individual Pieces

S4.1 The manufacturer shall furnish photomicrographs from one or both ends of each pipe. All photomicrographs required shall be properly identified as to heat number, size, and wall thickness of pipe from which the section was taken. Photomicrographs shall be further identified to permit association of each photomicrograph with the individual length of pipe it represents.

S5. Metal Structure and Etching Tests

S5.1 Etching tests (Note S1) shall be made on transverse sections from the pipe and shall reveal the macrostructure of the material. Such tests are for information only.

NOTE S1 — Pending development of etching methods applicable to the product covered by this specification, it is recommended that the Recommended Practice for a Standard Macroetch Test for Routine Inspection of Iron and Steel be followed.

S6. Radiographic Examination

S6.1 The castings shall be examined for internal defects by means of X rays or gamma rays. The inspection procedure shall be in accordance with Guide E 94 and the types and degrees of discontinuities considered shall be judged by Reference Radiographs E 446, E 186, or E 280. The extent of examination and the basis for acceptance shall be subject to agreement between the manufacturer and the purchaser.

S7. Liquid Penetrant Examination

S7.1 The castings shall be examined for surface discontinuities by means of liquid penetrant inspection. The method of performing the liquid penetrant test shall be in accordance with Test Method E 165. The areas to be inspected, the methods and types of liquid penetrants to be used, the developing procedure, and the basis for acceptance shall be as specified on the inquiry or invitation to bid and on the purchase order or contract or both, or as agreed upon between the manufacturer and the purchaser.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR HIGH-TEMPERATURE BOLTING MATERIALS WITH EXPANSION COEFFICIENTS COMPARABLE TO AUSTENITIC STEELS

SA-453/SA-453M

(Identical with ASTM Specification A 453/A 453M-99 except for the addition of Table 10 on threading and the editorial revision of 5.2.2 on threading. Editorial revision of 13 Certification section to clarify that the bolting Grade, Class, and Type must be included.)

1. Scope

1.1 This specification covers four grades of bolting materials with nine classes of yield strength ranging from 50 to 120 ksi [345 to 827 MPa] for use in high-temperature service such as fasteners for pressure vessel and valve flanges. The material requires special processing and is not intended for general purpose applications. The term “bolting material,” as used in this specification, covers rolled, forged, or hot-extruded bars; bolts, nuts, screws, washers, studs, and stud bolts. Headed bolts and rolled threads may be supplied.

NOTE 1 — Other bolting materials are covered by Specification A 193/A 193M and Specification A 437/A 437M.

1.2 Supplementary Requirement S1 of an optional nature is provided. This shall apply only when specified by the purchaser in the order.

1.3 This specification is expressed in both inch-pound units and in SI units. However, unless the order specifies the applicable “M” specification designation (SI units), the material shall be furnished to inch-pound units.

1.4 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification.

3. Terminology

3.1 Definitions of Terms Specific to This Standard:

3.1.1 bolting material — this covers rolled, forged, or hot-extruded bars; bolts, nuts, screws, washers, studs, and stud bolts; and also includes those manufactured by upset heading or roll threading techniques.

3.1.2 heat-treatment charge — one heat of material heat treated in one batch. If a continuous operation is used, the weight processed as a heat-treatment charge shall not exceed the weights in Table 1.

3.1.3 lot — a lot shall consist of the quantities shown in Table 2.

4. Ordering Information

4.1 The inquiry and order shall indicate the following:

- 4.1.1 Quantity (weight or number of pieces),
- 4.1.2 Type of material (bars, bolts, nuts, etc.),
- 4.1.3 Grade and class,
- 4.1.4 Method of finishing (see 5.2),
- 4.1.5 Type of thread desired (see 5.2.2),
- 4.1.6 Alternative test method option (see 7.2.4.3),
- 4.1.7 Bolt shape option, if any (see 8.2),
- 4.1.8 Thread option, if any (see 8.3),
- 4.1.9 Test method for surface quality, if any (see 10),
- 4.1.10 Test location option, if any (see 11),
- 4.1.11 Rejection option, if any (see 12.1), and
- 4.1.12 If stress-rupture testing is not required (see 7.2.1).

5. Materials and Manufacture

5.1 *Melting Process:*

5.1.1 The material shall be made by one or more of the following processes: electric-furnace, induction furnace, or consumable-electrode practice.

5.1.2 Vacuum, protective atmospheres, or protective slags may be used during melting or pouring of the heat.

5.2 *Finishing Process:*

5.2.1 The product shall be hot finished or cold finished (ground, rough turned or cold drawn) as specified on the purchase order.

5.2.2 Threading shall be performed in accordance with Table 10. When not specified by the purchaser, the type supplied shall be the option of the manufacturer.

5.3 *Heat Treatment* — Each grade and class shall be heat treated as prescribed in Table 3.

6. Chemical Composition

6.1 *Heat Analysis* — An analysis of each heat of steel shall be made by the manufacturer to determine the percentages of the elements specified in Table 4. This analysis shall be made from a test sample taken during the pouring of the heat. The chemical composition thus determined shall be reported to the purchaser or his representative and shall conform to the requirements specified in Table 4.

6.1.1 Steels with added lead shall not be used.

6.2 *Product Analysis:*

6.2.1 A product analysis may be made by the purchaser from tension samples representing the bolting material.

6.2.2 Samples for chemical analysis, except for spectro-chemical analysis, shall be taken in accordance with Practice E 59. The chemical composition thus determined shall conform to the requirements for product analysis variation as specified in Table 4.

6.2.3 A product analysis shall be made by the manufacturer of bar stock made from vacuum-arc remelted steel.

6.3 *Methods of Analysis* — For referee purposes, Test Methods E 30 shall be used.

7. Mechanical Properties

7.1 *Tension Test:*

7.1.1 *Requirements* — The material shall conform to the room-temperature tensile in each heat-treatment charge (see 3.1.2).

7.1.2 *Number of Specimens:*

7.1.2.1 *Heat-Treated Bars* — When not more than two sizes of bars are heat treated in the same load, one tension test shall be made from each size in each heat of material in the heat-treatment charge (see 3.1.2). When more than two sizes of bars are treated in the same charge, one tension test shall be made from one bar of each of the two largest diameters from each heat of material in the heat-treating charge.

7.1.2.2 *Finished Parts* — One tension test shall be made if the lot consists of parts of the same nominal diameter. If the lot consists of parts of more than one nominal diameter, one tension test shall be made from each nominal diameter of each heat involved in the lot (see Section 3).

7.1.2.3 The diameter range shall be in increments of $\frac{1}{2}$ in. [12.5 mm].

7.1.2.4 Tension tests are not required on finished parts that are fabricated from heat-treated bars furnished in accordance with the requirements of this specification and tested in accordance with 7.1.2.1, provided they are not given a subsequent heat treatment.

7.1.3 *Test Location and Orientation* — Specimens shall be taken in accordance with Test Methods and Definitions A 370, Annex A1, from the bar stock used to make the product.

7.1.4 *Test Methods:*

7.1.4.1 The tension test specimen shall be machined to the form and dimensions prescribed in the latest issue of Test Methods and Definitions A 370.

7.1.4.2 The yield strength shall be determined by the offset method as described in the latest issue of Test Methods and Definitions A 370.

7.2 *Stress-Rupture Test:*

7.2.1 *Requirements* — The material shall conform to the stress-rupture requirements prescribed in Table 5 for

design temperatures above 800°F [427°C]. Material not stress-rupture tested shall be permanently stamped NR.

7.2.2 The number of specimens shall be the same as the required number of tension test specimens.

7.2.3 The test location and orientation shall be the same as that required for the tension test specimens.

7.2.4 Test Method:

7.2.4.1 The rupture test shall be performed in accordance with Practice E 139.

7.2.4.2 A combination smooth and notched test specimen, machined to the dimensions prescribed in Fig. 1 and Table 6, shall be tested in accordance with the stress-rupture requirements prescribed in Table 5. The test shall be continued to rupture. The rupture shall occur in the smooth section of the bar.

7.2.4.3 As an alternative procedure and, when specifically approved by the purchaser, separate smooth and notched test specimens, machined from adjacent sections of the same piece, with gage sections conforming to the respective dimensions of Table 6, may be tested under the above conditions. The notched specimen need not be tested to rupture but shall not rupture in less time than the companion smooth specimen.

7.2.4.4 When the minimum specified time to rupture in Table 5 has been achieved, incremental loading may be used to accelerate the time to rupture. At intervals of 8 to 16 h, preferably 8 to 10 h, the stress shall be increased in increments of 5000 psi [34.5 MPa]. Rupture location and elongation requirements shall be as prescribed in Table 5, 7.2.4.2, and 7.2.4.3.

7.3 Hardness Test:

7.3.1 Requirements — The material shall conform to the room temperature hardness requirements prescribed in Table 7.

7.3.2 Number of Tests:

7.3.2.1 Bars 2 in. [50 mm] and Over — One test on each mill-treated length.

7.3.2.2 Bars under 2 in. [50 mm] — One test on at least 10% of the mill-treated lengths.

7.3.3 Test Locations — The hardness test shall be made at the center of the cross section for bars up to 1 in. [25 mm] in diameter, and at the midradius on bars 1 in. [25 mm] and larger in diameter.

7.3.4 Test Method — The test shall be performed in accordance with Test Methods and Definitions A 370.

8. Dimensions and Permissible Variations

8.1 Standard permissible variations in sizes of bars shall be as set forth in Table 8 for hot-rolled bars and in Table 9 for cold-finished bars.

8.2 Headed bolts shall be semi-finished, hexagonal in shape, and in accordance with the dimensions of ANSI B18.2.1. Nuts shall be hexagonal in shape, and in accordance with the dimensions of ANSI B18.2.2. Unless otherwise specified, the ANSI Standard heavy bolt and nut series shall be used. If socket head fasteners are required, the dimensions shall be in accordance with ANSI B18.3, as specified by the purchaser.

8.3 All bolts, stud bolts, and accompanying nuts, unless otherwise specified by the purchaser, shall be threaded in accordance with ANSI B1.1, Class 2A to 2B fit, or British Whitworth threads when specified.

8.4 Bolts, screws, studs and stud bolts shall be pointed. Points shall be flat and chamfered or rounded at option of the manufacturer. Length of point on studs and stud bolts shall be one to two complete threads as measured from the extreme end parallel to the axis. Length of studs and stud bolts shall be the threaded length and shall be measured from first thread to first thread.

9. Workmanship, Finish and Appearance

9.1 Finished parts shall have a workmanlike finish, maximum 63μin. [1.6μm] AA on the threads, body underhead fillet, and bearing area.

10. Workmanship and Quality Level Requirements

10.1 The material shall be uniform in quality and free of defects that would be detrimental to the intended service. Such defects may be determined by conventional test methods, as specified on the purchase order.

11. Inspection

11.1 The manufacturer shall afford the purchaser's inspector all reasonable facilities necessary to satisfy him that the material is being furnished in accordance with the specification. Mill inspection by the purchaser shall not interfere unnecessarily with the manufacturer's operations. All tests and inspections shall be made at the place of manufacture, unless otherwise agreed to.

12. Rejection and Rehearing

12.1 Rejection — Unless otherwise specified, any rejection based on tests made in accordance with this specification shall be reported to the manufacturer within 60 days from the receipt of the material by the purchaser. Material that shows injurious defects subsequent to its acceptance at the manufacturer's work will be rejected and the manufacturer shall be notified.

12.2 Rehearing — Specimens tested in accordance with this specification that represent rejected material shall be preserved for 2 months from the date of the test report. In case of dissatisfaction with the results of the test, the manufacturer may make claim for a rehearing within that time.

13. Certification

13.1 The producer's certification shall include the bolting Grade, Class, and Type and shall state that the material was manufactured and tested in accordance with this specification.

13.2 A report of the test results shall be included with the certification at the time of shipment. The specification designation included on any test reports shall include the appropriate year of issue and revision letter, if any.

14. Product Marking

14.1 Bars — Each lift, bundle, or box shall be properly tagged with durable tags (metal, plastic, or equivalent), showing the heat number, type, condition, specification designation, and size. The specification number marked on the material need not include specification year of issue and revision letter.

14.2 Bolts, Nuts, Studs, and Stud Bolts — Grade, class, and manufacturer's identification symbols shall be applied

to one end of studs $\frac{3}{8}$ in. [10 mm] in diameter and larger and to the heads of bolts $\frac{1}{4}$ in. [6 mm] in diameter and larger. If the available area is inadequate, the grade and class symbols may be marked on one end and the manufacturer's identification symbol marked on the other end. The type designation also shall appear with the grade and class symbols on all bolting material.

14.3 For purposes of identification marking, the manufacturer is considered the organization that certifies the fastener was manufactured, sampled, tested, and inspected in accordance with the specification and the results have been determined to meet the requirements of this specification.

14.4 Bar Coding — In addition to the requirements in 14.1, 14.2, and 14.3, bar coding is acceptable as a supplementary identification method. Bar coding should be consistent with AIAG Standard B-5 02.00. If used on small items, the bar code may be applied to the box or a substantially applied tag.

15. Keywords

15.1 bolts—steel; fasteners—steel; marking; nuts—steel; precipitation hardening steels; pressure vessel service; revision letter; steel bars—alloy; steel bolting material; steel flanges; steel valves; temperature service applications—high; year date

Over 165 to 191, incl	4.0	0	2.2

TABLE 9
PERMISSIBLE VARIATIONS IN SIZE OF
COLD-FINISHED BARS

Specified Size, in. [mm]	Permissible Variations from Specified Size, in. [mm] ^A	
	Over	Under
Over $\frac{1}{2}$ to 1 [13 to 25], excl	0.002 [0.05]	0.002 [0.05]
1 to $1\frac{1}{2}$ [25 to 38], excl	0.0025 [0.06]	0.0025 [0.06]
$1\frac{1}{2}$ to 4 [38 to 100], incl ^B	0.003 [0.08]	0.003 [0.08]

^A When it is necessary to heat treat or heat treat and pickle after cold finishing, because of special hardness or mechanical property requirements, the permissible variations are generally double those shown in the table.

^B For size tolerances of sizes over 4 in. [100 mm], the manufacturer should be consulted.

TABLE 10
THREAD TYPES

Type	Operation	Heat Treatment Status
M1	Machine cut	Post-precipitation hardening
M2	Machine cut	Post-solution anneal and pre-precipitation hardening
R1	Rolled	Post-precipitation hardening
R2	Rolled	Post-solution anneal and pre-precipitation hardening

SUPPLEMENTARY REQUIREMENT

The following supplementary requirement shall apply only when specified by the purchaser in the inquiry, contract, and order.

S1. Marking

S1.1 Grade and manufacturer's identification symbols shall be applied to one end of studs and to the heads of bolts of all sizes. (If the available area is inadequate, the grade symbol may be marked on one end and the manufacturer's identification symbol marked on the other end.) For bolts and studs smaller than $\frac{1}{4}$ in. [6 mm] in diameter and for $\frac{1}{4}$ in. [6 mm] studs requiring more than a total of three symbols, the marking shall be a matter of agreement between the purchaser and the manufacturer.

SPECIFICATION FOR PRESSURE VESSEL PLATES, CARBON STEEL, HIGH-STRENGTH MANGANESE

SA-455/SA-455M

[Identical with ASTM Specification A 455/A 455M-03(R07).]

1. Scope

1.1 This specification covers high-tensile strength carbon-manganese steel plates intended for welded pressure vessels.

1.2 This steel is usually made to a semi-killed or capped deoxidation practice; however, at the purchaser's or the steel producer's option, the steel may be made silicon-killed or aluminum-killed.

1.3 The maximum thickness of plates furnished under this specification shall be $\frac{3}{4}$ in. [20 mm].

1.4 For plates produced from coil and furnished without heat treatment or with stress relieving only, the additional requirements, including additional testing requirements and the reporting of additional test results, of Specification A 20/A 20M apply.

1.5 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification.

2. Referenced Documents

2.1 ASTM Standards:

A 20/A 20M Specification for General Requirements for Steel Plates for Pressure Vessels

3. General Requirements and Ordering Information

3.1 Plates supplied to this product specification shall conform to Specification A 20/A 20M, which outlines the testing and retesting methods and procedures, permissible

variations in dimensions and mass, quality and repair of defects, marking, loading, etc.

3.2 Specification A 20/A 20M also establishes the rules for ordering information that should be complied with when purchasing plates to this specification.

3.3 In addition to the basic requirements of this specification, certain supplementary requirements are available where additional control, testing, or examination is required to meet end use requirements.

3.4 The purchaser is referred to the listed supplementary requirements in this specification and to the detailed requirements in Specification A 20/A 20M.

3.5 Coils are excluded from qualification to this specification until they are processed into finished plates. Plates produced from coil means plates that have been cut to individual lengths from coil. The processor directly controls, or is responsible for, the operations involved in the processing of coils into finished plates. Such operations include decoiling, leveling, cutting to length, testing, inspection, conditioning, heat treatment (if applicable), packaging, marking, loading for shipment, and certification.

NOTE 1 — For plates produced from coil and furnished without heat treatment or with stress relieving only, three test results are reported for each qualifying coil. Additional requirements regarding plates from coil are described in Specification A 20/A 20M.

3.6 If the requirements of this specification are in conflict with the requirements of Specification A 20/A 20M, the requirements of this specification shall prevail.

4. Heat Treatment

4.1 Plates are normally supplied in the as-rolled condition. The plates may be ordered normalized or stress relieved, or both.

5. Chemical Composition

5.1 The steel shall conform to the chemical requirements given in Table 1.

6. Mechanical Properties

6.1 Tension Test —The plates, as represented by the tension test specimens, shall conform to the requirements given in Table 2.

TABLE 1
CHEMICAL REQUIREMENTS

Elements	Composition, %
Carbon, max (A), (B)	0.33
Manganese:	
Heat analysis	0.85–1.20
Product analysis	0.79–1.30
Phosphorus, max (A)	0.035
Sulfur, max (A)	0.035
Silicon: (C)	0.10 max
Heat analysis	
Product analysis	0.13 max

NOTES:

(A) Applies to both heat and product analyses.

(B) When the silicon is higher than 0.10%, the carbon maximum shall be 0.28%.

(C) At the purchaser's or the producer's option, silicon may be 0.40% max on heat analysis, 0.45% max on product analysis.

TABLE 2
TENSILE REQUIREMENTS

	Thickness		
	Up to 0.375 in. [9.5 mm]	Over 0.375 to 0.580 in. [15 mm]	Over 0.580 to 0.750 in. [20 mm]
Tensile strength, ksi [MPa]	75–95 [515–655]	73–93 [505–640]	70–90 [485–620]
Yield strength, min, ksi [MPa]	38 [260]	37 [255]	35 [240]
Elongation in 8 in. [200 mm], min, % (A)	15	15	15
Elongation in 2 in. [50 mm], min, % (A)	22	22	22

NOTE:

(A) See Specification A 20/A20M for elongation adjustments.

SUPPLEMENTARY REQUIREMENTS

Supplementary requirements shall not apply unless specified in the purchase order. A list of standardized supplementary requirements for use at the option of the purchaser is included in Specification A 20/A 20M. Those that are considered suitable for use with this specification are listed below by title.

S3. Simulated Post-Weld Heat Treatment of Mechanical Test Coupons

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR DUCTILE IRON CASTINGS FOR PAPER MILL DRYER ROLLS

SA-476/SA-476M

[Identical with ASTM Specification A 476/A 476M-00(R05) except for editorial changes in 4.1.6 and 13.1 to make certification mandatory.]

1. Scope

1.1 This specification covers ductile iron castings for use in pressure containing paper mill dryer rolls at temperatures up to 450°F [230°C].

1.2 No precise quantitative relationship can be stated between the properties of the iron in various locations of the same casting or between the properties of a casting and those of a test specimen cast from the same iron (see Appendix X1).

1.3 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system shall be used independently of the other. Combining values from the two systems may result in nonconformance with the specification.

2. Referenced Documents

2.1 ASTM Standards:

A 644 Terminology Relating to Iron Castings
E 8 Test Methods for Tension Testing of Metallic Materials
E 10 Test Method for Brinell Hardness of Metallic Materials
E 94 Guide for Radiographic Testing
E 446 Reference Radiographs for Steel Castings Up to 2 in. (51 mm) in Thickness

3. Terminology

3.1 Definitions for many terms common to iron castings are found in Terminology A 644.

4. Ordering Information

4.1 Orders for material purchased to the requirements of this specification should include the following information:

4.1.1 Quantity,

4.1.2 Specification number and date of issue,

4.1.3 Description of casting by pattern number or drawing,

4.1.4 Heat treatment, if required (see 5.1),

4.1.5 Type of test coupon (see 9.2),

4.1.6 Certification, is required (see 13.1),

4.1.7 Marking location (see 14.1), and

4.1.8 Additional requirements.

5. Heat Treatment

5.1 The castings may be stress relieved at a temperature not to exceed 1200°F [650°C].

6. Chemical Requirements

6.1 The castings shall conform to the following chemical requirements:

Total carbon, min, %	3.0
Silicon, max, %	3.0
Phosphorus, max, %	0.08
Sulfur, max, %	0.05

6.2 The castings shall have a carbon equivalent of 3.8 to 4.5 inclusive.

NOTE 1 — The carbon content equivalent is calculated as follows:
Total carbon + 0.3 (silicon + phosphorus)

6.3 The chemical analysis for total carbon shall be made on either chilled cast pencil-type specimens or on thin wafers approximately $\frac{1}{32}$ in. [0.8 mm] thick, cut from test coupons. Drillings shall not be used due to attendant loss of graphite.

7. Mechanical Properties

7.1 The iron represented by test coupons shall conform to tensile requirements prescribed in Table 1.

7.2 The yield strength prescribed in Table 1 may be determined by any of the approved procedures described in 7.3 of Test Methods E 8.

7.3 The Brinell hardness of the material shall be a minimum of 201 HB. Hardness tests shall be conducted in accordance with Test Method E 10, using a 3000 kgf load. The test may be made on either the casting or on a test coupon representing the casting.

8. Workmanship, Finish, and Appearance

8.1 The castings shall conform to the dimensions on the drawings furnished by the purchaser, or if no drawing has been provided, to the dimensions predicated by the pattern supplied by the purchaser. Surfaces of the castings shall be free of adhering sand. Runners, risers, fins, and other extraneous metal shall be removed.

9. Sampling

9.1 Test coupons shall be poured from the same iron as the castings represented.

9.2 Test coupons shall be cast either to the “Y” block size and shape shown in Fig. 1 or to the dimensions of the 1 in. [25-mm] keel block shown in Fig. 2. The type of test coupon and, when selected, the size of the “Y” block shall be specified by the purchaser.

9.3 The test coupons shall be cast in open molds made of suitable core sand with a minimum 1½ in. [38 mm] of sand for the 1 in. [25 mm] size and 3 in. [75 mm] of sand for the 3 in. [75 mm] size. The coupons shall be left in the mold until black.

9.4 Table 2 shows the equivalent geometrical shapes with various dimensions and the equivalent “Y” block, based on cooling rates, and may be used as a guide for selection of the proper “Y” block to be specified to represent the casting.

9.5 When the castings are heat treated, the test coupons shall be heat treated with the castings they represent.

10. Tension Test

10.1 Tension test specimens shall be obtained from test coupons shown in either Fig. 1 or Fig. 2, and machined to the dimensions shown in Fig. 3. Test coupons cast as “Y” blocks (Fig. 1) shall be sectioned as shown in Fig. 4.

10.2 One tension test shall be performed for each casting.

10.3 If any specimen shows defective machining or flaws, it may be discarded and another substituted from the same casting represented.

10.4 If an apparently sound test specimen fails to conform to the tensile requirements, two retests may be made. If either retest fails to conform to the requirements specified, the castings shall be rejected.

11. Repairs

11.1 Castings made to this specification that leak on subsequent hydrostatic testing may be repaired by using threaded plugs provided the following requirements are met.

11.1.1 No welding or brazing shall be permitted.

11.1.2 The diameter of the plug shall not exceed the diameter of a standard 2 in. [ISO R2] iron pipe size pipe plug.

11.1.3 The plugs, where practical, shall conform in all dimensions to the standard iron pipe size pipe plugs. In addition, they shall have full thread engagement corresponding to the thickness of the repaired section. Where a tapered plug is impractical because of the excess wall thickness in terms of plug diameter and coincident thread engagement, other types of plugs may be used provided both full thread engagement and effective sealing against pressure are obtained. Where possible the ends of the plugs should be ground smooth after installation to conform to the inside and outside contours of the cylinder.

11.1.4 The material from which the plug is manufactured shall conform in all respects to this specification.

11.1.5 The area adjacent to the drilled hole should be examined radiographically in accordance with Guide E 94. The area examined shall meet the requirements of Severity Level 3 of Reference Radiographs E 446.

11.1.6 The thickness of any repaired section in relation to the size of plug used shall be not less than that given in Table 3.

11.1.7 The minimum radius of curvature of the repaired section of the cylinder in relation to the size of plug used shall be not less than that given in Table 4.

11.1.8 A repaired area may consist of a maximum of three plugs with a spacing such that the distance between adjacent plugs shall not be less than those listed in Table 5. Adjacent areas of repair, in which each contains more than one plug, shall be separated by at least twice the distance required in Table 5 for the two nearest plugs separating the two areas.

11.2 Surface imperfections not exceeding 20% of the thickness of the section and other minor defects may be repaired by plugging provided the diameter of the plug does not exceed its length.

12. Inspection

12.1 The manufacturer shall afford the purchaser's inspector all reasonable facilities necessary to satisfy that the material is being produced and furnished in accordance with this specification. Foundry inspection by the purchaser shall not interfere unnecessarily with the manufacturer's operations. All tests and inspections shall be made at the place of manufacture unless otherwise agreed.

13. Certification

13.1 The manufacturer's certification shall be furnished stating that the material was manufactured, sampled, tested,

and inspected in accordance with the requirements of this specification and was found to meet the requirements. In addition to the certification, a test report shall be furnished showing the results of all tests performed.

14. Product Marking

14.1 Castings made in accordance with this specification shall have the name of the manufacturer or his recognized trade mark and this specification number cast on or indelibly stamped on a surface designated by the purchaser.

FIG. 1 "Y" BLOCKS FOR TEST COUPONS

FIG. 2 KEEL BLOCK FOR TEST COUPONS

NOTE 1 — The length of keel block shall be 6 in. [150 mm].

FIG. 3 STANDARD ROUND TENSION TEST SPECIMEN WITH 2-IN. [50 MM] GAGE LENGTH

NOTE 1 — The gage length and fillets shall be as shown, but the ends may be of any shape to fit the holder of the testing machine in such a way that the load shall be axial. The reduced section shall have a gradual taper from the ends toward the center, with the ends 0.003 to 0.005 in. [0.08–0.13 mm] larger in diameter than the center.

FIG. 4 SECTIONING PROCEDURE FOR "Y" BLOCKS

(a) 1 in. [25 mm] "Y" Block — Two blanks for 0.50 in. [12.5 mm] diameter tension test specimens.

(b) 3 in. [75 mm] "Y" Block — Four blanks for 0.50 in. [12.5 mm] diameter tension test specimens.

TABLE 5
MINIMUM DISTANCE BETWEEN PLUG CENTERS
(Based on Ligament Efficiency of 80%)⁴

Adjacent Plug Diameters, in. [ISO Pipe Plug Size]	Minimum Distance Between Plug Centers, in. [mm]			
	$\frac{1}{8}$ [R $\frac{1}{8}$], $\frac{1}{4}$ [R $\frac{1}{4}$], $\frac{3}{8}$ [R $\frac{3}{8}$]	$\frac{1}{2}$ [R $\frac{1}{2}$], $\frac{3}{4}$ [R $\frac{3}{4}$]	1 [R1], $1\frac{1}{4}$ [R1 $\frac{1}{4}$]	$1\frac{1}{2}$ [R1 $\frac{1}{2}$], 2 [R2]
$\frac{1}{8}$ [R $\frac{1}{8}$], $\frac{1}{4}$ [R $\frac{1}{4}$], $\frac{3}{8}$ [R $\frac{3}{8}$]	$2\frac{5}{8}$ [67]	$4\frac{1}{8}$ [105]	$6\frac{5}{8}$ [169]	$9\frac{1}{2}$ [242]
$\frac{1}{2}$ [R $\frac{1}{2}$], $\frac{3}{4}$ [R $\frac{3}{4}$]	$4\frac{1}{8}$ [105]	$4\frac{1}{8}$ [105]	$6\frac{5}{8}$ [169]	$9\frac{1}{2}$ [242]
1 [R1], $1\frac{1}{4}$ [R1 $\frac{1}{4}$]	$6\frac{5}{8}$ [169]	$6\frac{5}{8}$ [169]	$6\frac{5}{8}$ [169]	$9\frac{1}{2}$ [242]
$1\frac{1}{2}$ [R1 $\frac{1}{2}$], 2 [R2]	$9\frac{1}{2}$ [242]	$9\frac{1}{2}$ [242]	$9\frac{1}{2}$ [242]	$9\frac{1}{2}$ [242]

⁴Example — Assume three plugs are required for repair, one $\frac{1}{8}$ in. [R $\frac{1}{8}$], one $\frac{3}{8}$ in. [R $\frac{3}{8}$], and one $1\frac{1}{2}$ in. The minimum distance permitted is as follows.

Ligament distance between $\frac{1}{8}$ [R $\frac{1}{8}$] and $\frac{3}{8}$ in. [R $\frac{3}{8}$] plugs = $2\frac{5}{8}$ in. [67 mm]

Ligament distance between $\frac{1}{8}$ [R $\frac{1}{8}$] and $1\frac{1}{2}$ in. [R1 $\frac{1}{2}$] plugs = $9\frac{1}{2}$ in. [242 mm]

Ligament distance between $\frac{3}{8}$ [R $\frac{3}{8}$] and $1\frac{1}{2}$ in. [R1 $\frac{1}{2}$] plugs = $9\frac{1}{2}$ in. [242 mm]

APPENDIX

(Nonmandatory Information)

X1. MECHANICAL PROPERTIES OF CASTINGS

X1.1 The mechanical properties of iron castings are influenced by the cooling rate during and after solidification, by chemical composition, by heat treatment, by the design of the casting, by the design and nature of the mold, by the location and effectiveness of gates and risers, and by certain other factors.

X1.2 The cooling rate in the mold and, therefore, the properties developed in any particular section are influenced by the presence of cores, chills and chaplets, changes in section thickness, and the existence of bosses, projections, and intersections, such as junctions of ribs and

bosses. Because of the complexity of the interactions of these factors, no precise quantitative relationship can be stated between the properties of the iron in various locations of the same casting or between the properties of a casting and those of a test specimen cast from the same iron. When such a relationship is important and must be known for a specific application, it may be more closely ascertained by appropriate experimentation.

X1.3 When reliable information is unavailable on the relationship between properties in a casting and those in a separately cast test specimen, and where experimentation would be unfeasible, the size of the test casting should be so selected as to approximate the thickness of the main or controlling section of the casting.

SPECIFICATION FOR STAINLESS STEEL BARS AND SHAPES FOR USE IN BOILERS AND OTHER PRESSURE VESSELS

SA-479/SA-479M

(Identical with ASTM Specification A 479/A 479M-04 except for editorial corrections.)

1. Scope

1.1 This specification covers hot- and cold-finished bars of stainless steel, including rounds, squares, and hexagons, and hot-rolled or extruded shapes such as angles, tees, and channels for use in boiler and pressure vessel construction.

NOTE 1: There are standards covering high nickel, chromium, austenitic corrosion, and heat-resisting alloy materials. These standards are under the jurisdiction of ASTM Subcommittee B02.07 and may be found in *Annual Book of ASTM Standards*, Vol 02.04.

1.2 The values stated in either inch-pound units or SI (metric) units are to be regarded separately as standards; within the text and tables, the SI units are shown in [brackets]. The values stated in each system are not exact equivalents; therefore, each system must be used independent of the other. Combining values from the two systems may result in nonconformance with the specification.

1.3 Unless the order specifies the applicable “M” specification designation, the material shall be furnished to the inch-pound units.

- E 527 Practice for Numbering Metals and Alloys (UNS)

2.2 Other Document:

SAE J1086 Recommended Practice for Numbering Metals and Alloys

3. Ordering Information

3.1 It is the responsibility of the purchaser to specify all requirements that are necessary for material ordered under this specification. Such requirements may include, but are not limited to, the following:

3.1.1 Quantity (weight or number of pieces);

3.1.2 Dimensions, including diameter or thickness (and width), shape or form, applicable prints or sketches, length, etc.;

3.1.3 Type or UNS designation (Table 1);

3.1.4 ASTM designation and edition year if other than latest edition;

3.1.5 Heat treated condition (Section 4);

3.1.6 Finish (see Manufacture section of Specification A 484/A 484M);

3.1.7 Supplementary Requirements invoked for special services (described at the end of this specification);

3.1.8 Whether bars are to be rolled as bars or cut from strip or plate;

3.1.9 Preparation for delivery (see Preparation for Delivery section of Specification A 484/A 484M);

3.1.10 Marking requirements (see Marking section of Specification A 484/A 484M);

3.1.11 Surface preparation of shapes (see Manufacture section of Specification A 484/A 484M); and

3.1.12 The intended use of the material, if the purchaser considers this useful information.

NOTE 2: A typical ordering description is as follows: 5000 lb [2000 kg]; 1.000 in. [25 mm] round bar by 10 to 12 ft [3 to 4 m]; Type 304 or UNS S30400; to Specification A 479 [A 479M]; annealed; centerless ground; plus any optional supplementary requirements, such as, for example, special marking instructions.

4. Heat Treatment

4.1 Austenitic Grades:

4.1.1 Except for the strain-hardened grade (see 4.1.3) and the hot-rolled grade (see 4.1.4), all austenitic grades of stainless steel shall be furnished in the solution-annealed condition, with subsequent light cold drawing and straightening permitted. (See Supplementary Requirement S5 if annealing must be the final operation.) Solution annealing for all grades, except the H grades (see 4.1.2), N08367 (see 4.1.8), S31254 (see 4.1.5), S32050 (see 4.1.5), S33228 (see 4.1.7), S34565 (see 4.1.6), and S35315 (see 4.1.9), shall consist of (1) heating the material to a temperature of 1900°F [1040°C] minimum so that grain boundary carbides enter into solution, and cooling rapidly to prevent grain boundary carbide precipitation; or alternatively (2) (except for the columbium and titanium stabilized grades 309Cb, 310Cb, 316Cb, 316Ti, 321, 347, and 348) immediately following hot working while the temperature is above 1750°F [955°C] so that grain boundary carbides are in solution, cooling rapidly to prevent grain boundary carbide precipitation. When Supplementary Requirement S2 is invoked, all austenitic grades except S30815 shall pass the intergranular corrosion test requirements described in S2.

4.1.2 For H grades, the minimum solution annealing temperatures shall be as follows:

4.1.2.1 When hot finished, 1900°F [1040°C] for Types 304H, 309H, 310H, and 316H; 1925°F [1050°C] for Types 321H, 347H, and 348H,

4.1.2.2 When cold worked prior to solution annealing, 1900°F [1040°C] for Types 304H, 309H, 310H, and 316H; 2000°F [1095°C] for Types 321H, 347H, and 348H.

NOTE 3: Solution annealing temperatures above 1950°F [1065°C] may impair the resistance to intergranular corrosion after subsequent exposure to sensitizing conditions in the stabilized grades, Types 321, 321H, 347, 347H, 348 and 348H. When intergranular corrosion is of concern, the purchaser should specify the corrosion test of S2 (to be conducted on sensitized specimens). The manufacturer may, if necessary, use a lower temperature resolution anneal or a stabilization anneal after a high temperature solution anneal in order to meet corrosion test requirements. Consideration should be given to the corrosive media before using a stabilization anneal at less than 1800°F [980°C], as such a treatment may not be fully effective for all media.

NOTE 4: Grain size requirements for the H grades are described in Section 7.

4.1.3 Strain-Hardened Austenitic Type 316—When Type 316 is desired with increased mechanical properties,

the strain-hardened condition may be specified and is produced by solution annealing, as described in 4.1.1, followed by strain hardening sufficient to meet the required mechanical properties. Solution-annealed and strain-hardened material shall be capable of meeting the intergranular corrosion test of Supplementary Requirement S2.

4.1.3.1 Two strain hardened conditions have been established for different applications: Level 1 and Level 2 (see Table 2).

4.1.4 High tensile Type XM-19 shall be in the hot-rolled or strain-hardened condition and shall be capable of meeting the mechanical property requirements of Table 2 and passing the intergranular corrosion test prescribed in S2. The strain hardened condition is achieved by solution annealing followed by cold working sufficient to develop the required mechanical properties.

4.1.5 Solution annealing of S31254, S32050, and S32654 shall consist of heating the material to a temperature of 2100°F [1150°C] minimum for an appropriate time, followed by water quenching or rapidly cooling by other means.

4.1.6 Solution annealing of S34565 shall consist of heating the material in the range of temperature from 2050°F [1120°C] to 2140°F [1170°C] for an appropriate time, followed by water quenching or rapidly cooling by other means.

4.1.7 Solution annealing of S33228 shall consist of heating the material in the temperature range 2050 to 2160°F [1120 to 1180°C] for an appropriate time, followed by water quenching or rapid cooling by other means.

4.1.8 Solution annealing of N08367 shall consist of heating the material to a temperature of 2025°F [1105°C] minimum for an appropriate time, followed by water quenching or rapidly cooling by other means.

4.1.9 Solution annealing of S35315 shall consist of heating the material to a temperature of 2100°F [1150°C] minimum for an appropriate time, followed by water quenching or rapidly cooling by other means.

4.2 Austenitic-Ferritic Grades:

4.2.1 S31803, S32205, and S32550 shall be furnished in the annealed condition with subsequent straightening permitted. The annealing treatment of S31803 and S32550 shall consist of heating the material to a temperature of 1900°F [1040°C] minimum for an appropriate time followed by water quenching or rapid cooling by other means. The annealing treatment for S32205 shall consist of heating the material to a temperature of 1900°F [1040°C] minimum for an appropriate time, followed by water quenching.

4.2.2 S32101 shall be annealed by heating the material to a temperature of 1870°F [1020°C] minimum for an

appropriate time followed by water quenching or rapid cooling by other means.

4.2.3 S32950 shall be annealed by heating the material to a temperature of 1825°F [995°C] to 1875°F [1025°C] for an appropriate time, followed by water quenching or rapid cooling by other means.

4.2.4 S32750 shall be annealed by heating the material to a temperature of 1880°F [1025°C] to 2060°F [1125°C] for an appropriate time, followed by water quenching or rapid cooling by other means. Subsequent straightening shall be permitted.

4.2.5 S32760 shall be annealed by heating the material to a temperature of 2010°F [1100°C] to 2085°F [1140°C] for an appropriate time, followed by water quenching or rapid cooling by other means.

4.2.6 UNS S32906 shall be annealed by heating the material to a temperature of 1900°F (1040°C) to 1980°F (1080°C) for an appropriate time followed by rapid cooling in air or water. Subsequent straightening shall be permitted.

4.2.7 S39277 shall be annealed by heating the material to 1940°F [1060°C] to 2060°F [1125°C] for an appropriate time, followed by water quenching or rapid cooling by other means. Subsequent straightening shall be permitted.

4.3 Ferritic Grades—Ferritic grades shall be annealed to meet the requirements of Table 2.

4.4 Martensitic Grades:

4.4.1 All grades of martensitic steels shall be supplied in either the annealed condition or in the tempered condition as specified by the purchaser (see 3.1.3). Tempered material shall be normalized, or shall be liquid quenched from 1700°F [925°C] minimum, followed by tempering in accordance with 4.4.2, 4.4.3, or 4.4.5.

4.4.2 Types 403 and 410 tempered material shall be held at tempering temperature for at least 1 h/in. [25.4 mm] of cross section as follows:

4.4.2.1 Condition 1—1250°F [675°C] minimum, 1400°F [760°C] maximum.

4.4.2.2 Condition 2—1100°F [595°C] minimum, 1400°F [760°C] maximum.

4.4.2.3 Condition 3—1050°F [565°C] minimum, 1400°F [760°C] maximum.

4.4.3 Types XM-30, 414, and 431 tempered materials shall be held at 1100°F [595°C] minimum for at least 1 h/in. [25 mm] of cross section. Maximum tempering temperature shall be 1400°F [760°C].

4.4.4 For S41425, heat to 1700°F [925°C] minimum and hold for 1 h at temperature minimum. Air cool to below 90°F [32°C] and temper at 1100°F [595°C] minimum of 1 h per inch of cross-sectional thickness minimum.

4.4.5 For S41500 heat to 1750°F [955°C] minimum, air cool to 200°F [95°C] or lower prior to any optional intermediate temper and prior to the final temper. The final temper shall be between 1050°F [565°C] and 1150°F [620°C].

4.4.6 When the purchaser elects to perform the hardening and tempering heat treatment, martensitic materials shall be supplied by the manufacturer in the annealed condition (see 4.4.1). In this case it shall be the purchaser's responsibility to apply the proper heat treatment and to conduct the tests he deems necessary to assure that the required properties are obtained.

5. General Requirements

5.1 In addition to the requirements of this specification, all requirements of the current editions of Specification A 484/A 484M shall apply. Failure to comply with the general requirements of Specification A 484/A 484M constitutes nonconformance with this specification.

6. Chemical Composition

6.1 Chemical composition shall be reported to the purchaser, or his representative, and shall conform to the requirements specified in Table 1.

6.2 When a product analysis is performed or requested by the purchaser, the tolerance limits as described in Specification A 484/A 484M apply unless Supplementary Requirement S3 is invoked.

6.3 Methods and practices relating to chemical analysis required by this specification shall be in accordance with Test Methods, Practices, and Terminology A 751.

7. Grain Size for Austenitic Grades

7.1 All austenitic grades shall be tested for average grain size by Test Methods E 112.

7.2 The H grades shall conform to an average grain size as follows:

7.2.1 ASTM No. 6 or coarser for Types 304H, 309H, 310H, and 316H,

7.2.2 ASTM No. 7 or coarser for Types 321H, 347H, and 348H.

7.3 For S32615, the grain size as determined in accordance with Test Methods E 112, comparison method, Plate 11, shall be No. 3 or finer.

7.4 Supplementary Requirement S1 shall be invoked when non-H grade austenitic stainless steels are ordered for ASME Code applications for service above 1000°F [540°C].

8. Mechanical Properties Requirements

8.1 The material shall conform to the mechanical property requirements specified in Table 2 for the grade ordered. At least one room-temperature test shall be performed by the manufacturer on a sample from at least one bar or shape from each lot of material.

8.2 The yield strength shall be determined by the offset (0.2%) method as prescribed in Test Methods and Definitions A 370.

8.3 Martensitic material supplied in the annealed condition shall be capable of meeting the hardened and tempered mechanical properties when heat treated in accordance with the requirements of 4.4.

8.4 Hardness measurements, when required, shall be made at a location midway between the surface and the center of the cross section.

8.5 Martensitic grades shall be capable of meeting the hardness requirements after heat treating as specified in Table 3.

9. Corrosion Testing

9.1 Austenitic stainless steels solution annealed by the alternative method (see (2) in 4.1.1) shall be tested and pass the intergranular corrosion test requirements described in S2.

10. Certification

10.1 The material manufacturer's certificate of compliance certifying that the material was manufactured and tested in accordance with this specification, together with a report of the results required by this specification and the purchase order, shall be furnished at the time of shipment. The certification shall be positively relatable to the lot of material represented.

11. Product Marking

11.1 In addition to the marking requirements of Specification A 484/A 484M, materials that have been heat

treated in accordance with 4.1, 4.2, 4.3, 4.4 or have been strain hardened in accordance with 4.1.3 shall be identified by placement of the following symbols after the grade designation:

11.1.1 Austenitic Grades:

11.1.1.1 All grades in the annealed condition—A,

11.1.1.2 Strain hardened Type 316, Level 1—S1,

11.1.1.3 Strain hardened Type 316, Level 2—S2,

11.1.1.4 Hot-rolled Type XM-19—H,

11.1.1.5 Strain hardened Type XM-19—S,

11.1.1.6 Material meeting Supplementary Requirement S1—ELT (unnecessary for H grades).

11.1.1.7 In addition to all other marking requirements of this specification, when S1 is invoked, all grades in the direct quenched condition (heat treated in accordance with 4.1.1 (2)) shall be marked "D".

11.1.2 Austenitic-Ferritic Grades—All grades in the annealed condition—A.

11.1.3 Ferritic Grades—All grades in the annealed condition—A.

11.1.4 Martensitic Grades:

11.1.4.1 All grades in the annealed condition—A.

11.1.4.2 Types 403 and 410—COND 1, COND 2, or COND 3 as appropriate for the tempering temperature employed.

11.1.4.3 Type 414, S41500, and Type XM-30 tempered materials—T.

12. Keywords

12.1 austenitic stainless steel; austenitic-ferritic duplex stainless steel; ferritic stainless steel; martensitic stainless steel; pressure-containing parts; pressure vessel service; stainless steel bars; stainless steel shapes; temperature service applications—high

NOTES:

(A) Designations established in accordance with Practice E 527 and SAE J 1086 published jointly by ASTM and SAE. See ASTM DS-56I, available from ASTM Headquarters.

(B) Maximum unless otherwise indicated.

(C) Except as required for specific alloy type, molybdenum, titanium, nickel, cobalt, tantalum, nitrogen, and copper need not be reported but shall not be present in other than residual amounts, the intent being to prohibit substitution of one alloy type for another due to absence of control of the above named elements in certain alloys.

(D) American Welding Society designation.

(E) See Supplementary Requirement S1.

(F) Nitrogen content is to be reported for this grade.

(G) % Cr + 3.3 × % Mo + 16 × % N ≥ 40.

(H) Product analysis tolerance over the maximum limit for carbon and nitrogen to be 0.002%.

(I) Wrought version of CA6NM.

NOTES:

(A) See Section 8.

(B) Reduction of area does not apply on flat bars $\frac{3}{16}$ in. [4.80 mm] and under in thickness, as this determination is not generally made in this product size.

(C) The material shall be capable of meeting the required reduction of area where listed, but actual measurement and reporting of the reduction of area are not required unless specified in the purchase order.

(D) American Welding Society designation.

(E) Tensile strength 70 ksi [485 MPa] min permitted for extruded shapes.

(F) For bars greater than 2 in. [50 mm], a cross section, 60 ksi [415 MPa] min, shall be permitted.

(G) For sections over 2 in. [50 mm] in thickness, the minimum tensile strength shall be 106 ksi [730 MPa]; the minimum yield strength shall be 75 ksi [515 MPa].

(H) Elongation in 2 in. or 50 mm of 12 % min and reduction of area of 35 % min permitted for cold-finished bars.

(I) Elongation in 2 in. of 12 % min and reduction of area of 35 % min permitted for cold-drawn or cold-rolled bars.

(J) Annealed bars shall be capable of meeting the tempered condition requirements when heat treated in accordance with 4.4.3.

TABLE 3
RESPONSE TO HEAT TREATMENT

Type ^A	Heat Treatment Temperature ^B °F (°C), min	Quenchant	Hardness HRC, min
403	1750 [955]	Air	35
410	1750 [955]	Air	35
414	1750 [955]	Oil	42

NOTES:

(A) Samples for testing shall be in the form of a section not exceeding $\frac{3}{8}$ in. [9.50 mm] in thickness.

(B) Temperature tolerance is $\pm 25^{\circ}\text{F}$ [15°C].

SUPPLEMENTARY REQUIREMENTS

The following may be made requirements when the purchaser specifies them to be applicable.

S1. Materials for High-Temperature Service

S1.1 Unless an H grade has been ordered, this supplementary requirement shall be specified for ASME Code applications for service above 1000°F [540°C].

S1.2 The user is permitted to use an austenitic stainless steel as the corresponding H grade when the material meets all requirements of the H grade including chemistry, annealing temperature, and grain size (see Section 7).

S1.3 The user is permitted to use an L grade austenitic stainless steel for service above 1000°F [540°C], subject to the applicable allowable stress table of the ASME Code, when the material meets all requirements of this specification and the grain size is ASTM No. 7 or coarser as determined in accordance with Test Method E 112. The grain size shall be reported on a Certified Test Report.

S2. Corrosion Tests

S2.1 Intergranular corrosion tests shall be performed by the manufacturer on sensitized specimens of Types 304L, 316L, 321, 347, and 348, and for the other austenitic grades, on specimens representative of the as-shipped condition. All austenitic stainless steels shall be capable of passing intergranular corrosion tests in the as-shipped condition. Tests shall be performed in accordance with Practice E of Practices A 262.

S3. Product Analysis

S3.1 An analysis shall be made by the manufacturer on a sample from one bar in each lot as defined in Specification A 484/A 484M. The analysis shall meet the requirements of Table 1. In the event of failure, the lot represented shall be rejected except that, at the option of the manufacturer, each bar in the lot may be tested for acceptance. Product analysis tolerance provisions do not apply.

S4. Material for High Cycle Fatigue Service

S4.1 The mechanical properties of bars furnished in lengths under 20 ft [6 m] shall be determined by testing one end of each bar. Bars furnished in lengths of 20 ft [6 m] and over shall be tested at each end.

S5. Material for Optimum Resistance to Stress Corrosion Cracking

S5.1 This supplementary requirement is to be referenced when austenitic stainless steels are to be purchased in accordance with 4.1.1 with solution-annealing as the final operation and with no subsequent cold drawing permitted. Straightening is permitted as a final operation to meet the straightness requirements of Specification A 484/A 484M unless specifically prohibited by the purchaser.

APPENDIX

(Nonmandatory Information)

X1. RATIONALE REGARDING DEFINITION OF SOLUTION ANNEALING IN 4.1.1

X1.1 It is generally recognized that austenitic stainless steels are solution annealed by heating to a temperature that dissolves (takes into solution) chromium carbides and quenching rapidly so that the chromium carbides will not participate in the grain boundaries, which could cause susceptibility to intergranular corrosion in a critically corrosive environment. Thus, solution annealing also can be accomplished for non-stabilized grades by taking advantage of hot rolling temperatures (which always exceed solution annealing temperature requirements), maintaining hot rolling finishing temperatures well above minimum solution annealing requirements, and immediately quenching integral with hot rolling. Stabilized grades (with columbium or titanium added) cannot be handled this way, since they would become destabilized due to columbium or titanium carbide solution, without subsequent reheating.

X1.2 For Boiler Code applications involving temperatures at which optimum resistance to creep is desired, the larger grain size of material solution annealed by reheating is generally desired. For that reason, a minimum grain size has been required of the H grades (created for optimum elevated temperature properties), and a mandatory grain size test and report has been added for the non-H grades so that the information is available for those desiring to reclassify a non-H grade to H grade.

X1.3 To satisfy the concerns of inadvertent assignment of fine grained material to elevated temperature applications, special marking has been added for material that meets the requirements of Supplementary Requirement S1.

X1.4 A mandatory test for susceptibility to intergranular corrosion has been added for material solution annealed by the alternative method [see (2) in 4.1.1] so that a history of data can be accumulated, as has been done in the past for material solution annealed by reheating.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR GENERAL REQUIREMENTS FOR FLAT-ROLLED STAINLESS AND HEAT-RESISTING STEEL PLATE, SHEET, AND STRIP

SA-480/SA-480M

(Identical with ASTM Specification A 480/A 480M-03c.)

1. Scope

1.1 This specification covers a group of general requirements that, unless otherwise specified in the purchase order or in an individual specification, shall apply to rolled steel plate, sheet, and strip, under each of the following specifications issued by ASTM: Specifications A 167, A 176, A 240/A 240M, A 263, A 264, A 265, A 666, A 693, A 793, and A 895.

1.2 In case of conflict between a requirement of a product specification and a requirement of this specification, the product specification shall prevail. In the case of conflict between a requirement of the product specification or a requirement of this specification and a more stringent requirement of the purchase order, the purchase order shall prevail. The purchase order requirements shall not take precedence if they, in any way, violate the requirements of the product specification or this specification; for example, by waving a test requirement or by making a test requirement less stringent.

1.3 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets, except that when A 480M is specified, Annex A3 shall apply for the dimensional tolerances and not the bracketed SI values in Annex A2. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification.

1.4 This specification and the applicable material specifications are expressed in both inch-pound and SI units. However, unless the order specifies the applicable "M" specification designation [SI units], the material shall be furnished in inch-pound units.

2.5 ANSI Standard:

Accredited Standards Committee X12, (ANSI ASC X12)

3. Terminology

3.1 Definitions:

3.1.1 Plate, sheet, strip, and cold work as used in this specification apply to the following:

3.1.2 *plate* — material $\frac{3}{16}$ in. [5.00 mm] and over in thickness and over 10 in. [250 mm] in width. Finishes for *plate* are actually shown in Section 13.

3.1.3 *sheet* — material under $\frac{3}{16}$ in. [5.00 mm] in thickness and 24 in. [600 mm] and over in width. Finishes for *sheet* are actually shown in Section 11.

3.1.4 *strip* — cold-rolled material under $\frac{3}{16}$ in. [5.00 mm] in thickness and under 24 in. [600 mm] in width. Finishes are detailed in Section 12 for *strip*, and strip edges in Section 14 for Cold-Rolled Strip.

3.1.5 *cold work* — the changing of mechanical properties by work hardening.

4. Ordering Information

4.1 It is the responsibility of the purchaser to specify all requirements that are necessary for material ordered under this specification. Such requirements may include, but are not limited to, the following:

4.1.1 Quantity (weight and number of pieces),

4.1.2 Name of material (stainless steel),

4.1.3 Condition (hot-rolled, cold-rolled, annealed, heat-treated),

4.1.4 Finish (see Section 11 for Sheet, Section 12 for Strip, and Section 13 for Plates). In the case of polished finishes, specify whether one or both sides are to be polished,

4.1.5 Temper (if the applicable material specification requires this detail),

4.1.6 Form (plate, sheet, or strip),

4.1.7 Dimensions (thickness, width, length),

4.1.7.1 Thickness shall be ordered to decimal or fractional thickness. The use of the gage number is discouraged as being an archaic term of limited usefulness not having general agreement on meaning. The gage number shall not be a basis for rejection.

4.1.7.2 Thickness, width, and length, when applicable, should be ordered in the same units, for example, 0.060 in. by 48 in. by 120 in. [1.52 mm by 1219 mm by 3048 mm].

4.1.8 Edge, strip only (see Section 14 for Cold-Rolled Strip),

4.1.9 Type or UNS designation, refer to the applicable material specification,

4.1.10 Specification designation and date of issue,

4.1.11 Additions to specification or special requirements,

4.1.12 Restrictions (if desired) on methods for determining yield strength (see appropriate footnote to mechanical properties table of the basic material specification),

4.1.13 Marking requirements (see Section 25),

4.1.14 Preparation for delivery (see Section 25), and

4.1.15 Magnetic permeability test (when required). Refer to Section 19.

NOTE 1 — A typical ordering description is as follows: 200 pieces, stainless steel sheets, 0.060 in. by 48 in. by 120 in., Type 410 No. 2B finish, ASTM A 176-XX.

5. Process

5.1 The steel shall be manufactured/produced by the following or as specified in the applicable material specification.

5.1.1 The steel shall be made by one of the following processes: electric-arc, electric-induction, or other suitable processes.

5.1.2 If a specific type of melting is required by the purchaser, it shall be so specified on the purchase order.

6. Heat Analysis

6.1 An analysis of each heat shall be made by the steel producer to determine the percentages of the elements

specified in the applicable material specification. This analysis shall be made from a test sample taken during the pouring of the melt, or from the in-process product later in the manufacturing flow. The chemical composition thus determined shall conform to the applicable material specification.

6.2 Methods and practices relating to chemical analysis shall be in accordance with Test Methods, Practices, and Terminology A 751.

6.3 The steel shall not contain an unspecified element for the ordered grade to the extent that the steel conforms to the requirements of another grade for which that element is a specified element having a required minimum content. For this requirement, a grade is defined as an alloy described individually and identified by its own UNS designation in a table of chemical requirements within this specification or any specification listed within the scope as being covered by the specification.

6.4 The producer is not permitted to certify that material is in compliance with an ASTM product specification when the purchase order has required that the material contain as a minimum or range an element that is neither a specified element nor an intentionally added unspecified element for the ordered grade in accordance with the definitions of Test Methods, Practices, and Terminology A 751.

7. Product Analysis

7.1 The purchaser is permitted to perform a product analysis (formerly check analysis) to verify the identity of the finished material representing each heat or lot. Such analysis shall be made by any of the commonly accepted methods that will positively identify the material.

7.2 The chemical composition determined in accordance with 7.1 shall conform to the limits of the material specification within the tolerances of Table A1.1, unless otherwise specified in the applicable material specification or the purchase order. The allowable variation of a particular element in a single sample for product analysis is permitted to be either above or below the specified range. However, percentages must exhibit the same tendencies in all samples; that is, the several determinations of any individual element in a heat shall not vary both above and below the specified range.

8. Material Test Report and Certification

8.1 A report of the results of all tests required by the product specification shall be supplied to the purchaser. This material test report shall reference the product specification designation and year date indicating that the material was manufactured, sampled, tested, and inspected in

accordance with requirements of the product specification and has been found to meet those requirements. The material test report shall report the melting process when the purchase order requires either a specific type of melting or requires that the melting process used is to be reported.

8.1.1 The report shall indicate the type of steel. If certifying that the material conforms to the requirements for more than one type of steel, the manufacturer may indicate each type of steel on the report, or may issue a separate report for each type of steel.

8.2 A signature is not required on the report. However, the document shall clearly identify the organization submitting the report. Notwithstanding the absence of a signature, the organization submitting the document is responsible for its content.

8.3 A material test report, certificate of inspection, or similar document printed from or used in electronic form from an electronic data interchange (EDI) transmission shall be regarded as having the same validity as a counterpart printed in the certifiers' facility. The content of the EDI transmitted document must meet the requirements of the invoked ASTM standard(s) and conform to any existing EDI agreement between the purchaser and the supplier. Notwithstanding the absence of a signature, the organization submitting the EDI transmission is responsible for the content of the report.

8.4 When finished material is supplied to a purchase order specifying the product specification, the organization supplying that material shall provide the purchaser with a copy of the original manufacturer's test report.

NOTE 2 — Notwithstanding the absence of a signature, the organization submitting the report is responsible for the content of the report.

NOTE 3 — The industry definition as invoked here is: EDI is the computer-to-computer exchange of business information in a standard format such as ANSI ASC X 12.

8.4.1 When the original manufacturer's test report was provided by EDI to the organization supplying the finished material to the purchaser, the organization supplying the finished material shall provide to the purchaser a printed form of the original test report or shall retransmit the test report by EDI to the purchaser. In either case, the test report shall be complete with the full identification of the original manufacturer and with all data provided on the test report of the original manufacturer.

9. Permitted Variations in Dimensions and Weight

9.1 Sheet, strip, and plate shall conform to the permitted variations in thickness, width, length and flatness, and other properties when specified, as listed in Annex A2 and Annex A3, for A 480 and A 480M respectively, for the ordered

product form, or as agreed upon by seller and user and specified in the purchase order.

10. Workmanship

10.1 The material shall be of uniform quality consistent with good manufacturing and inspection practices. The steel shall have no imperfections of a nature or degree, for the type and quality ordered, that will adversely affect the stamping, forming, machining, or fabrication of finished parts.

10.2 Sheet, Strip, and Plate — For sheet, and strip with No. 1 finish and plate with hot-roll anneal or hot-roll anneal and pickle finish it is permitted to grind to remove surface imperfections, provided such grinding does not reduce the thickness or width at any point beyond the permissible variations in dimensions. An iron free abrasive wheel shall be used for such grinding and shall be operated at a speed ample to ensure that defective areas are cleanly cut out.

11. Finish for Sheet

11.1 The types of finish available on sheet products are:

11.1.1 No. 1 Finish — Hot-rolled, annealed, and descaled.

11.1.2 No. 2D Finish — Cold-rolled, dull finish.

11.1.3 No. 2B Finish — Cold-rolled, bright finish.

11.1.3.1 Bright Annealed Finish — A bright cold-rolled finish retained by final annealing in a controlled atmosphere furnace.

11.1.4 No. 3 Finish — Intermediate polished finish, one or both sides.

11.1.5 No. 4 Finish — General purpose polished finish, one or both sides.

11.1.6 No. 6 Finish — Dull satin finish, Tampico brushed, one or both sides.

11.1.7 No. 7 Finish — High luster finish.

11.1.8 No. 8 Finish — Mirror finish.

11.1.9 TR Finish — Cold-worked to obtain specified properties.

NOTE 4 — *Explanation of Sheet Finishes:*

No. 1 — Commonly referred to as hot-rolled annealed and pickled or descaled. This is a dull, nonreflective finish.

No. 2D — A smooth, nonreflective cold-rolled annealed and pickled or descaled finish. This nondirectional finish is favorable for retention of lubricants in deep drawing applications.

No. 2B — A smooth, moderately reflective cold-rolled annealed and pickled or descaled finish typically produced by imparting a final light cold-rolled pass using polished rolls. This general-purpose finish is more readily polished than No. 1 or 2D finishes. Product with 2B finish is

normally supplied in the annealed plus lightly cold-rolled condition unless a tensile-rolled product is specified.

Bright Annealed Finish — A smooth, bright, reflective finish typically produced by cold-rolling followed by annealing in a protective atmosphere so as to prevent oxidation and scaling during annealing.

No. 3 — A linearly textured finish that may be produced by either mechanical polishing or rolling. Average surface roughness (R_a) may generally be up to 40 micro-inches. A skilled operator can generally blend this finish. Surface roughness measurements differ with different instruments, laboratories, and operators. There may also be overlap in measurements of surface roughness for both No. 3 and No. 4 finishes.

No. 4 — A linearly textured finish that may be produced by either mechanical polishing or rolling. Average surface roughness (R_a) may generally be up to 25 micro-inches. A skilled operator can generally blend this finish. Surface roughness measurements differ with different instruments, laboratories, and operators. There may also be overlap in measurements of surface roughness for both No. 3 and No. 4 finishes.

No. 6 — This finish has a soft, satin appearance typically produced by tampico brushing a No. 4 finish.

No. 7 — Has a high degree of reflectivity. It is produced by buffing a finely ground surface, but the grit lines are not removed. It is chiefly used for architectural or ornamental purposes.

No. 8 — This is a highly reflective, smooth finish typically produced by polishing with successively finer grit abrasives, then buffing. Typically, very faint buff of polish lines may still be visible on the final product. Blending after part assembly may be done with buffing.

TR Finish — The finish resulting from the cold-rolling of an annealed and descaled or bright annealed product to obtain mechanical properties higher than that of the annealed condition. Appearance will vary depending upon the starting finish, amount of cold work, and the alloy.

Architectural Finishes — Sometimes described as a No. 5 finish, these are a separate category and may be negotiated between buyer and seller, as there are many techniques and finish variations available throughout the world.

11.1.10 Architectural finish, No. 5, or other proprietary names are special finishes.

11.1.11 Note 4 is not meant to be restrictive or to be used as a basis for rejection but is intended to give general guidelines. Various production methods may be used to obtain these finishes.

11.1.12 Sheets can be produced with one or two sides polished. When polished on one side only, it is permitted to rough grind the other side in order to obtain the necessary flatness.

12. Finish for Strip

12.1 The various types of finish procurable on cold-rolled strip products are:

12.1.1 No. 1 Finish — Cold-rolled to specified thickness, annealed, and descaled.

12.1.2 No. 2 Finish — Same as No. 1 Finish, followed by a final light cold-roll pass, generally on highly polished rolls.

12.1.3 Bright Annealed Finish — A bright cold-rolled finish retained by final annealing in a controlled atmosphere furnace.

12.1.4 TR Finish — Cold-worked to obtain specified properties.

12.1.5 Polished Finish — Stainless steel strip is also available in polished finishes such as No. 3 and No. 4, which are explained in Note 4.

NOTE 5 — *Explanation of Strip Finishes:*

No. 1 — Appearance of this finish varies from dull gray matte finish to a fairly reflective surface, depending largely upon composition. This finish is used for severely drawn or formed parts, as well as for applications where the brighter No. 2 Finish is not required, such as parts for heat resistance.

No. 2 — This finish has a smoother and more reflective surface, the appearance of which varies with composition. This is a general purpose finish, widely used for household and automotive trim, tableware, utensils, trays, etc.

Bright Annealed Finish — See Note 4.

TR Finish — See Note 4.

13. Finish for Plates

13.1 The types of finish available on plates are:

13.1.1 Hot-Rolled or Cold-Rolled, and Annealed or Heat Treated — Scale not removed, an intermediate finish. Use of plates in this condition is generally confined to heat-resisting applications. Scale impairs corrosion resistance.

13.1.2 Hot-Rolled or Cold-Rolled, and Annealed or Heat Treated, and Blast Cleaned or Pickled — Condition and finish commonly preferred for corrosion-resisting and most heat-resisting applications, essentially a No. 1 Finish.

13.1.3 Hot-Rolled or Cold-Rolled, and Annealed or Heat Treated, and Surface Cleaned and Polished — Polish finish is generally No. 4 Finish.

13.1.4 Hot-Rolled or Cold-Rolled, and Annealed or Heat Treated, and Descaled, and Temper Passed — Smoother finish for specialized applications.

13.1.5 Hot-Rolled or Cold-Rolled, and Annealed or Heat Treated, and Descaled; and Cold-Rolled, and Annealed or Heat Treated, and Descaled, and Optionally Temper Passed — Smooth finish with greater freedom from surface imperfections than in 13.1.4.

14. Edges for Cold-Rolled Strip

14.1 The types of edges available on strip products are:

14.1.1 No. 1 Edge — A rolled edge, either round or square as specified.

14.1.2 No. 3 Edge — An edge produced by slitting.

14.1.3 No. 5 Edge — An approximately square edge produced by rolling or filing after slitting.

15. Heat Treatment

15.1 The heat treatments shown in this section are to be followed unless otherwise specified in the applicable material specification. Heat treatment thermal cycles shall be separate from other thermal processing cycles; for example, in-process thermal cycles are not permitted as a substitute for the separate annealing cycle.

15.2 Austenitic Types:

15.2.1 The material shall be solution annealed to meet the mechanical property requirements of the applicable material specification unless otherwise stated in the material specification.

15.2.2 Except as indicated in Table A1.2, Series 300, XM-15, N08800, S30415, S30815, S31725, S31726, and S32615 austenitic chromium-nickel steels, when specified on the purchase order, shall be capable of meeting the test for resistance to intergranular corrosion specified in 18.2.

15.2.3 For grades stabilized with titanium or columbium, refer to Note 6.

NOTE 6 — Solution-annealing temperatures above 1950°F [1066°C] can impair the resistance to intergranular corrosion after subsequent exposure to sensitizing conditions in the stabilized grades, Types 309Cb, 309HCb, 310Cb, 310HCb, 316Ti, 316Cb, 321, 321H, 347, 347H, 348, 348H, and S35135. When intergranular corrosion is of concern, the purchaser should specify the corrosion test of 18.2 (to be conducted on sensitized specimens). The manufacturer is permitted, if necessary, use a lower temperature resolution anneal or a stabilization anneal after a high temperature solution anneal in order to meet corrosion test requirements. Consideration should be given to the corrosive media before using a stabilization anneal at less than 1800°F [982°C], as such treatment is not equally effective for all media.

15.2.4 For the stabilized H types, it is noted that the heat treatment requirements shown in Table A1.2 differ as a function of whether the material was cold worked or hot finished.

15.2.5 The chromium-manganese-nickel types (201, 202, S20103, S20400, S20153, S21800, XM-17, XM-18, XM-19, XM-29, and XM-31) shall be solution annealed to meet the mechanical property requirements of the applicable material specification and, to exhibit adequate resistance to intergranular corrosion (see 18.2). For S20161, the heat treatment is specified in Table A1.2.

15.2.5.1 Note that some of these types contain high carbon content that can adversely affect resistance to intergranular corrosion.

15.3 Duplex Types — The duplex types shall be solution annealed in accordance with Table A1.2.

15.4 Martensitic and Ferritic Types:

15.4.1 The chromium steels (S32803, 400 Series, S40945, S41045, S41050, S41500, S43932, S44400, S44635, S44660, S44700, S44735, S44800, XM-27, and XM-33) shall be heat treated in such a manner as to satisfy all the requirements for mechanical and bending properties specified in the applicable material specification and (except for 400 series, S41050, and S41500) to provide for adequate resistance to intergranular attack.

15.4.2 For S41500, heat to 1750°F [955°C] minimum, air cool to 200°F [93°C] or lower prior to any optional intermediate temper and prior to the final temper. The final temper shall be between 1050°F [566°C] and 1150°F [621°C].

16. Number of Tests

16.1 Unless otherwise specified by the applicable material specification or by agreement between the seller and the purchaser to perform a greater number of tests, the following number of tests are to be performed.

16.1.1 In the case of plate, sheet, and strip produced in coil form, two or more hardness tests (one from each end of the coil); one bend test, when required; one permeability test, when required; and one or more tension tests shall be made on specimens taken from each coil. If the hardness difference between the two ends of the coil exceeds 5 HRB, or equivalent, or if the material is temper rolled, tensile properties must be determined on both coil ends.

16.1.2 In the case of plate, sheet, or strip produced in cut lengths, one tension test; two tension tests if the material is temper rolled (one tension test for single piece lots); one bend test when required, and one or more hardness tests shall be made on each 100 or less pieces of the same heat and nominal thickness rolled separately or continuously and heat treated within the same operating period, either as a lot or continuously.

NOTE 7 — The term continuously, as applied to heat treatment, is meant to describe a heat-treating operation in which one cut length follows another through the furnace. Interspersement of different melts is permissible if they are of approximately the same nominal thickness and are heat treated in the same operating period and under the same conditions (time and temperature).

16.1.3 One intergranular corrosion test, when required, shall be selected from each heat and thickness subjected to the same heat treatment practice. It is permitted to obtain such specimens from specimens selected for mechanical testing.

17. Test Specimens

17.1 Tension Test:

17.1.1 Tension test specimens shall be taken from finished material and shall be selected in either or both

longitudinal and transverse direction. The tension test specimen shall conform to the appropriate sections of Test Methods and Definitions A 370, unless otherwise specified in the applicable material specification or agreed upon by the seller and the purchaser.

17.1.2 The testing speed between the yield strength and the fracture of the specimen, shall be conducted at a constant strain rate between $\frac{1}{8}$ in. [3.18 mm] and $\frac{1}{2}$ in. [12.70 mm] inclusive, per inch [25.40 mm] of gage length per minute, or at a crosshead speed that will give a strain rate within this range. For the purposes of this specification, the rate of strain shall be determined by a strain-rate pacer, indicator, or controller, or by dividing the unit elongation by the elapsed time from yield strength to fracture.

17.2 Hardness Test —It is permitted to perform hardness tests on the grip ends of the tension specimens before they are subjected to the tension test.

17.3 Bend Test:

17.3.1 Bend test specimens (when required) shall be taken from finished material and shall be selected in the transverse direction or as indicated in the applicable material specification or as agreed upon by the seller and the purchaser. In the case of transverse bend test specimens, the axis of bend shall be parallel to the direction of rolling.

17.3.2 Bend test specimens from sheet and strip product shall be the full thickness of the material and approximately 1 in. [25.4 mm] in width. It is permitted to round the edges of the test specimen to a radius equal to one half the specimen thickness.

17.3.3 The width of strip for which bend tests can be made is subject to practical limitations on the length of the bend test specimen. For narrow strip, the following widths can be tested:

Strip Thickness, in. [mm]	Minimum Strip Width and Minimum Specimen Length for Bend Tests, in. [mm]
0.100 [2.5] and under	$\frac{1}{2}$ [12.7]
Over 0.100 [2.5] to 0.140 [3.5], excl.	1 [25.4]
0.140 [3.5] and over	$1\frac{1}{2}$ [38.1]

Bend test specimens shall be of any suitable length over the specified minimum length.

17.3.4 Bend test specimens taken from plates shall be in full thickness of the material up to and including $\frac{1}{2}$ in. [12.7 mm] in thickness, of suitable length, and between 1 and 2 in. [25.4 and 50.8 mm] in width. It is permitted to remove the sheared edges to a depth of at least $\frac{1}{8}$ in. [3.2 mm] and it is permitted to smooth the sides with a file. It is permitted to break the corners of the cross section of the specimen with a file, but no appreciable rounding of the corners is permitted.

17.3.5 In the case of plates over $\frac{1}{2}$ in. [12.7 mm] in thickness, it is permitted to use bend test specimens, machined to 1 in. [25.4 mm] nominal width by $\frac{1}{2}$ in. [12.7 mm] nominal thickness and at least 6 in. [152.4 mm] in length. One surface, to be the outside surface in bending, shall be the original surface of the plate; however, surface preparation by light grinding is permitted. It is permitted to round the edges to a $\frac{1}{16}$ in. [1.6 mm] radius. When agreed by the seller and the purchaser, it is permitted to modify the cross section to $\frac{1}{2}$ in. [12.7 mm] nominal square.

17.3.6 In the case of plates over 1 in. [25.4 mm] in thickness, bend tests must be agreed upon between the seller and the purchaser.

17.3.7 The bend test specimen shall withstand cold bending through the angle specified in the applicable material specification without cracking on the outside of the bent portion.

17.4 The bend shall be made over a diameter equal to the number of thicknesses of flat stock shown in the applicable material specification or over a single piece of flat stock equal to the number of thicknesses shown in the applicable material specification; or as follows:

17.4.1 Material up to and including $\frac{3}{8}$ in. [9.5 mm] in thickness shall be bent over a piece (or pieces) of flat stock that has the same nominal thickness of the material being tested (1T), allowing the test material to form its natural curvature.

17.4.2 Material over $\frac{3}{8}$ in. [9.5 mm] and up to and including 1 in. [25.4 mm] in thickness shall be bent over a piece (or pieces) of flat stock equalling two times the thickness of the material being tested (2T), allowing the test material to form its natural curvature.

18. Special Tests

18.1 If other tests are required, the methods and acceptance criteria shall be agreed upon between the seller and the purchaser and specified on the purchase order.

18.2 Resistance to Intergranular Corrosion:

18.2.1 The intergranular corrosion test, Practice E of Practices A 262, is not required unless it is specified on the purchase order. All austenitic chromium-nickel types except the H types are expected to be capable of passing this test. However, it is not necessary to actually run the test unless it is specified on the purchase order. Note that Practices A 262 require the test to be performed on sensitized specimens in the low-carbon and stabilized types and on specimens representative of the as-shipped condition for other types. In the case of low-carbon types containing 3% or more molybdenum in their specified composition, the applicability of the sensitizing treatment prior to testing

shall be a matter for negotiation between the seller and the purchaser. When specified, all flat rolled products of the chromium-nickel series (300 series) in thickness up to and including 2 in. [50.8 mm] nominal size shall be capable of passing the intergranular corrosion test in the as-shipped condition. In the case of heavier plates of types other than 304L, 304LN, 309Cb, 310Cb, 316Cb, 316L, 316LN, 316Ti, 317L, 321, 347, 348, S31725, and S31726, the applicability of this test shall be a matter for negotiation between the seller and the purchaser.

18.2.2 The H types are not normally subject to intergranular corrosion tests. However, it is permitted to specify Practice E of Practices A 262 for Type 321H when intergranular corrosion is of concern. In this case, the purchaser shall inform the seller and agree upon the requirements and these requirements shall be so stated on the purchase order.

18.2.3 Austenitic chromium-manganese-nickel types (201, 202, XM-17, XM-18, XM-19, XM-29, XM-31, S20400, and S21800) are to be heat treated for intergranular corrosion resistance. When intergranular corrosion tests are required, they shall be as agreed upon between the seller and the purchaser.

18.2.4 N08800 shall be heat treated for intergranular corrosion resistance. When intergranular corrosion tests are required, they shall be as agreed upon between the seller and purchaser.

18.2.5 Corrosion tests are not normally required for the 400 series types. Lower-carbon corrosion-resistant types (S44400, S44635, S44660, S44700, S44800, S44735, XM-27, and XM-33) are heat treated for resistance to corrosion. For S44400, S44635, S44660, S44700, S44800, S44735, XM-27, and XM-33, intergranular corrosion testing of Practices A 763, Practice X, Y, or Z shall be specified as agreed upon between the seller and the purchaser.

18.3 Detrimental Intermetallic Phases in Duplex Stainless Steels — The tests for detrimental intermetallic phases in wrought duplex stainless steels, Methods A, B, or C of Test Methods A 923, are not required unless it is specified on the purchase order. All duplex (austenitic-ferritic) types that are listed in Test Methods A 923 are expected to be capable of passing these tests. However, it is not necessary to actually run the tests unless specified on the purchase order. The applicability of these tests to duplex stainless steels not listed in Test Methods A 923 shall be a matter for negotiation between the seller and the purchaser.

19. Test Methods

19.1 The properties enumerated in applicable specifications shall be determined in accordance with the following ASTM standards.

19.1.1 Tension Tests — Test Methods and Definitions A 370.

19.1.2 Brinell Tests — Test Methods and Definitions A 370.

19.1.3 Rockwell Hardness — Test Methods and Definitions A 370.

19.1.4 Hardness Equivalents — Tables E 140.

19.1.5 Intergranular Corrosion (when specified) — Practices A 262, Practices A 763.

19.1.6 Permeability Test (when required) — Test Methods A 342.

19.1.7 Charpy Impact Testing (when required) — Test Methods and Definitions A 370.

19.1.8 Intermetallic Phases (when specified) — Test Methods A 923.

20. Retests and Retreatment

20.1 Retests are permitted in accordance with the provisions of Test Methods and Definitions A 370.

20.2 If any test specimen shows defective machining or develops flaws, it is permitted to discard the flawed specimen and substitute another specimen.

20.2.1 If the percentage of elongation of any tension specimen is less than that specified and any part of the fracture is more than $\frac{3}{4}$ in. [19.1 mm] from the center of the gage length of the 2 in. [50.8 mm] specimen or is outside the middle half of the gage length of an 8 in. [203.2 mm] specimen, as indicated by scribe marks placed on the specimen before testing, a retest shall be allowed.

20.3 If a bend test specimen fails, due to conditions of bending more severe than required by the specification, a retest shall be permitted, either on a duplicate specimen or on a remaining portion of the failed specimen.

20.4 If the results of any test lot are not in conformance with the requirements of the applicable material specification, the producer is permitted the option of retreating such lots. The material shall be accepted if the results of retests on retreated material are within the specified requirements.

20.5 If any specimens selected to represent any heat fail to meet any of the test requirements as specified in the applicable material specification, it is permitted to reheat treat the material represented and resubmit it for testing.

20.6 If the product analysis fails to conform to the specified limits, analysis shall be made on a new sample. The results of this retest shall be within the specified requirements.

21. Repair of Plate by Welding

21.1 Repair of surface defects of plate, by welding, is permitted unless prohibited by other specifications or purchase order requirements.

21.2 Defect depth shall not exceed $\frac{1}{3}$ of the nominal thickness, and the total area shall not exceed 1% of the plate surface area, unless prior approval from the purchaser is obtained.

21.3 Unacceptable imperfections shall be suitably prepared for welding by grinding or machining. Open clean defects, such as pits or impressions, will not necessarily require preparation.

21.4 The welding procedure and the welders or welding operators shall be qualified in accordance with Section IX of the ASME Code.

21.5 The welding consumables shall be suitable with the plate.

21.6 After repair welding, the welded area shall be ground smooth and blended uniformly to the surrounding surface.

22. Inspection

22.1 Inspection of the material by the purchaser's representative at the producing plant shall be made as agreed upon between the purchaser and the seller as part of the purchase order.

22.2 Unless otherwise specified in the contract or purchase order: (1) the seller is responsible for the performance of all the inspection and test requirements in this specification, (2) the seller is permitted to use his own or other suitable facilities for the performance of the inspection and testing, and (3) the purchaser shall have the right to perform any of the inspection and tests set forth in this specification. The manufacturer shall afford the purchaser's inspector all reasonable facilities necessary to satisfy the inspector that the material is being furnished in accordance with the specification. Inspection by the purchaser shall not interfere unnecessarily with the manufacturer.

23. Rejection

23.1 Unless otherwise specified, any rejection based on tests made in accordance with this specification shall be reported to the seller within 60 working days from the receipt of the material by the purchaser.

23.2 Material that shows injurious imperfections as described in Section 10 subsequent to its acceptance at the purchaser's works will be rejected and the seller shall be notified.

24. Rehearing

24.1 Samples tested in accordance with this specification that represent rejected material shall be retained for

three weeks from the date of the notification to the seller of the rejection. In case of dissatisfaction with the results of the test, the seller is permitted to make claim for a rehearing within that time.

25. Packaging, Marking, and Loading

25.1 *For Commercial Procurement:*

25.1.1 Marking — Unless otherwise specified in the applicable material specification or the purchase order, marking shall be conducted as follows:

25.1.1.1 Sheet, strip, and plate shall be marked on one face, in the location indicated below with the specification designation number, type of steel (type or UNS designation), material identification number, and the name or mark of the manufacturer. For sheet, strip, and plate whose length and width dimensions are both less than 24 in., each piece shall be marked with the type of steel and material identification number. The specification and designation number, and name or mark of the manufacturer shall be marked on the piece(s) or attached to the item or bundle. The characters shall be of such size as to be clearly legible. The marking shall be sufficiently stable to withstand normal handling. Unless otherwise specified by the purchaser, the marking, at the producer's option, is permitted to be done with (a) marking fluid (if a specific maximum impurity limit of designated elements in the marking fluid is required by the purchaser, it shall be so stated on the purchase order), (b) low-stress blunt-nosed continuous or low-stress blunt-nosed-interrupted-dot die stamp, (c) a vibratory tool with a minimum tip radius of 0.005 in. [0.1 mm], or (d) electro-chemical etching.

25.1.1.2 Flat sheet, strip in cut lengths, and plate shall be marked in two places near the ends or shall be continuously line marked along one edge. For flat sheet, strip in cut lengths, and plate whose length and width dimensions are both less than 48 in., it is permitted to mark such pieces in only one place.

25.1.1.3 Sheet, strip, and plate in coil form shall be marked near the outside end of the coil. The inside of the coil shall also be marked or shall have a tag or label attached and marked with the information of 25.1.1.1.

25.1.1.4 Material less than $\frac{1}{4}$ in. [6.4 mm] in thickness shall not be marked with die stamps.

25.1.1.5 The manufacturer's test identification number shall be legibly stamped on each test specimen, if to be shipped to the customer.

25.1.1.6 Material that conforms completely with the requirements of two types of steel within the ordering specification is permitted to be marked as both types of steel provided that the manufacturer is certifying the material as meeting the requirements of each of the types of steel. Such marking, if used, shall be part of the same marking as used for a single type of steel, or shall be a separate but similar marking immediately adjacent to the marking used for a single type of steel.

25.1.1.7 The AIAG primary metals identification tag (AIAG B-5) is permitted to be used as an auxiliary method of identification in cases where a bar-coded identification tag is desired. Use of this method shall be by agreement between purchaser and supplier.

25.1.2 Packaging and Loading — Unless otherwise specified in the applicable material specification or the purchase order, packaging and loading shall be in accordance with the procedures recommended by Practices A 700.

25.2 *For U.S. Government Procurement:*

25.2.1 When specified in the contract or order, and for direct procurement by or direct shipment to the government, marking for shipment shall be in accordance with Fed. Std. No. 123 for civil agencies and MIL-STD-129 for military agencies.

25.2.2 When specified in the contract or order, material shall be preserved, packaged, and packed in accordance with the requirements of MIL-STD-163. The applicable levels shall be as specified in the contract or order.

ANNEXES

(Mandatory Information)

A1. PRODUCT ANALYSIS TOLERANCES AND HEAT TREATMENT REQUIREMENTS

A1.1 Listed in Annex A1 are tables showing the permitted variations of composition for product analysis relative to specified chemical requirements (Table A1.1) and the heat treatment requirements for types of stainless steel covered by product specifications that reference Specification A 480/A 480M (Table A1.2).

A2. PERMITTED VARIATIONS IN DIMENSIONS, ETC. — INCH-POUND UNITS

A2.1 Listed in Annex A2 are tables showing the permissible variations in dimensions expressed in inch-pound units of measurement. These requirements, including the SI units shown in brackets within Annex A2, shall apply to A 480, but shall not apply to A 480M. Requirements for A 480M are given in Annex A3.

A2.1.1 The dimensional tolerances are grouped by production method (hot rolling or cold rolling, with or without coiling), product width (narrow (< 24 in. [610 mm]) or wide ($\geq$ 24 in. [610 mm])), and by product dimension addressed.

A2.2 *Cold-Rolled Narrow (< 24 in. [610 mm] width) Coil-Processed Product* — For thickness, width, length, and flatness tolerance tables, refer to Tables A2.1–A2.4.

A2.3 *Cold-Rolled Wide ($\geq$ 24 in. [610 mm] width) Coil-Processed Product* — For thickness, width, length, and flatness tolerance tables, refer to Tables A2.5–A2.8.

A2.4 *Hot-Rolled Narrow (< 24 in. [610 mm] width) Coil-Processed Product* — For thickness, width, length, and flatness tolerance tables, refer to Tables A2.9–A2.12.

A2.5 *Hot-Rolled Wide ($\geq$ 24 in. [610 mm] width) Coil-Processed Product* — For thickness, width, length, and flatness tolerance tables, refer to Tables A2.13–A2.16.

A2.6 *Hot-Rolled Product Processed Without Coiling* — For thickness, width, length, and flatness tolerance tables, refer to Tables A2.17–A2.20.

A2.7 *Cold-Rolled Product Processed Without Coiling* — For thickness, width, length, and flatness tolerance tables, refer to Table A2.21.

A2.8 *Tolerances for Other Dimensional Characteristics* — For other tolerance tables, refer to Tables A2.22–A2.30.

A3. PERMITTED VARIATIONS IN DIMENSIONS, ETC. — SI UNITS

A3.1 Listed in Annex A3 are tables showing the permitted variations in dimensions expressed in SI units of measurement. These requirements shall apply to A 480M but shall not apply to A 480. Requirements for A 480 are given in Annex A2.

A3.1.1 The dimensional tolerances are grouped by production method (hot rolling or cold rolling, with or without coiling), product width (narrow (< 600 mm) or wide ($\geq$ 600 mm)), and by product dimension addressed.

A3.2 *Cold-Rolled Narrow (< 600 mm width) Coil-Processed Product* — For thickness, width, length, and flatness tolerance tables, refer to Tables A3.1–A3.4.

A3.3 *Cold-Rolled Wide ($\geq$ 600 mm width) Coil-Processed Product* — For thickness, width, length, and flatness tolerance tables, refer to Tables A3.5–A3.8.

A3.4 *Hot-Rolled Narrow (< 600 mm width) Coil-Processed Product* — For thickness, width, length, and flatness tolerance tables, refer to Tables A3.9–A3.12.

A3.5 *Hot-Rolled Wide ($\geq$ 600 mm width) Coil-Processed Product* — For thickness, width, length, and flatness tolerance tables, refer to Tables A3.13–A3.16.

A3.6 *Hot-Rolled Product Processed Without Coiling* — For thickness, width, length, and flatness tolerance tables, refer to Tables A3.17–A3.20.

A3.7 *Cold-Rolled Product Processed Without Coiling* — For thickness, width, length, and flatness tolerance tables, refer to Table A3.21.

A3.8 *Tolerances for Other Dimensional Characteristics* — For other tolerance tables, refer to Tables A2.31–A3.29.

A4. REQUIREMENTS FOR THE INTRODUCTION OF NEW MATERIALS

A4.1 New materials may be proposed for inclusion in specifications referencing this specification subject to the following conditions:

A4.1.1 Application for the addition of a new grade to a specification shall be made to the Chairman of the subcommittee which has jurisdiction over that specification.

A4.1.2 The application shall be accompanied by a statement from at least one user indicating that there is a need for the new grade to be included in the applicable specification.

A4.1.3 The application shall be accompanied by test data as required by the applicable specification. Test data

from a minimum of three test lots, as defined by the specification, each from a different heat, shall be furnished.

A4.1.4 The application shall provide recommendations for all requirements appearing in the applicable specification.

A4.1.5 The application shall state whether the new grade is covered by patent.

TABLE A1.1
CHEMICAL REQUIREMENTS (PRODUCT ANALYSIS TOLERANCES)^A

Elements	Limit or Maximum of Specified Range, %	Tolerance Over the Maximum Limit or Under the Minimum Limit	Elements	Limit or Maximum of Specified Range, %	Tolerance Over the Maximum Limit or Under the Minimum Limit
Carbon	to 0.010, incl over 0.010 to 0.030, incl over 0.030 to 0.20, incl over 0.20 to 0.60, incl over 0.60 to 1.20, incl	0.002 0.005 0.01 0.02 0.03	Titanium	to 1.00, incl over 1.00 to 3.00, incl	0.05 0.07
Manganese	to 1.00, incl over 1.00 to 3.00, incl over 3.00 to 6.00, incl over 6.00 to 10.00, incl over 10.00 to 15.00, incl over 15.00 to 20.00, incl	0.03 0.04 0.05 0.06 0.10 0.15	Cobalt	over 0.05 to 0.50, incl over 0.50 to 2.00, incl over 2.00 to 5.00, incl	0.01 ^B 0.02 0.05
Phosphorus	to 0.040, incl over 0.040 to 0.20, incl	0.005 0.010	Columbium plus tantalum	to 1.50, incl	0.05
Sulfur	to 0.040, incl over 0.040 to 0.20, incl over 0.20 to 0.50, incl	0.005 0.010 0.020	Tantalum	to 0.10, incl	0.02

0.120 [3.00]	...	0.010 [0.25]	0.016 [0.40]	0.024 [0.60]
0.160 [4.00]	...	0.016 [0.40]	0.016 [0.40]	0.024 [0.60]
0.200 [4.99]	...	0.030 [0.80]	0.030 [0.80]	0.030 [0.80]

^A For tolerances applicable to narrow product with Edge No. 1 or No. 5, see Table A2.22.

^B For specified thickness other than those shown, the tolerances for the next higher thickness shall apply.

TABLE A2.3
PERMITTED VARIATIONS IN LENGTH FOR
COLD-ROLLED, NARROW, COIL-PROCESSED PRODUCT
AS CUT LENGTHS

Specified Length, ft [mm]	Tolerances, in. [mm]
6 [1830]	+ $\frac{1}{8}$ [3], -0
> 6 [1830] to 12 [3660]	+ 0.2 [5], -0
> 12 [3069] to 20 [6096]	+ 0.3 [8], -0

TABLE A2.4
PERMITTED VARIATIONS IN FLATNESS OF
COLD-ROLLED, NARROW, COIL-PROCESSED PRODUCT
AS CUT LENGTHS

Tolerances for variations of flatness of cold-rolled products, narrow, coil-processed product as cut lengths shall be identical to the tolerances for cold-rolled, wide, coil-processed product as listed in Table A2.8 unless otherwise agreed upon by seller and purchaser and specified in the purchase order.

TABLE A2.5
PERMITTED VARIATIONS IN THICKNESS OF COLD-ROLLED, WIDE, COIL-PROCESSED PRODUCT AS COIL AND
CUT LENGTHS

Specified Thickness, ^{A,B} in. (mm)	Permitted Variations Over and Under in. [mm], for Specified Width (<i>w</i>), <i>w</i> in in.		
	<i>w</i> ≤ 40 [1000]	40 [1000] < <i>w</i> ≤ 50 [1300]	50 [1300] < <i>w</i> ≤ 84 [2100]

^A For specified thicknesses and other than those shown, the tolerances for the next higher thickness shall apply.

TABLE A2.7
PERMITTED VARIATIONS IN LENGTH FOR COLD-ROLLED, WIDE, COIL-PROCESSED PRODUCT AS CUT LENGTHS NOT RESQUARED

Specified Length (L), ft [mm]	Tolerances, in. [mm]	
	Over	Under
Up to 6 [1830], incl	$\frac{3}{16}$ [4.8]	0
Over 6 [1830]	$0.03 \times L$ [$0.0025 \times L$]	0

TABLE A2.8
PERMITTED VARIATIONS IN FLATNESS OF COLD-ROLLED, WIDE, COIL-PROCESSED PRODUCT AS CUT LENGTHS

Not Specified to Stretcher-Leveled Standard of Flatness ^A			
Specified Thickness, in. [mm]	Width, in. [mm]		Flatness Tolerance, ^B in. [mm]
<0.062 [1.57]	≤60 [1524]		0.40 [10]
	>60 [1524]		0.50 [12]
≥0.062 [1.57]	≤60 [1524]		0.40 [10]
	≥60 [1524]		0.50 [12]
Stretcher-Leveled Standard of Flatness ^C			
Specified Thickness, in. [mm]	Width, in. [mm]	Length, in. [mm]	Flatness Tolerance, ^B in. [mm]
< 3⁄16 [4.76]	< 48 [1219]	< 96 [2438]	1⁄8 [3.2]
	< 48 [1219]	≥ 96 [2438]	1⁄4 [6.4]
< 3⁄16 [4.76]	≥ 48 [1219]	< 96 [2438]	1⁄4 [6.4]
	≥ 48 [1219]	≤ 96 [2438]	1⁄4 [6.4]
2xx and 3xx Series Specified to 1⁄4 and 1⁄2 Hard Tempers			
Specified Thickness, in. [mm]	Width, in. [mm]	Flatness Tolerance, ^B in. [mm]	
		1⁄4 Hard	1⁄2 Hard
<0.016 [0.41] 0.016 [0.41] to 0.030 [0.76] > 0.030 [0.76]	24 [610] to <36 [914]	1⁄2 [12.70]	3⁄4 [19.05]
		5⁄8 [15.88]	7⁄8 [22.22]
		3⁄4 [19.05]	7⁄8 [22.22]
≤0.016 [0.41] >0.016 [0.41] to 0.030 [0.76] >0.030 [0.76]	36 [914] to < 48 [1219]	5⁄8 [15.88]	1 [25.40]
		3⁄4 [19.05]	1
			1⁄8 [28.58]
		1 [25.40]	1
			1⁄8 [28.58]

^ANot specified to stretcher-leveled standard of flatness, and not including hard tempers of 2xx and 3xx Series, dead-soft sheets, and deep-drawing sheets.

^BMaximum deviation from a horizontal flat surface.

^CNot including hard tempers of 2xx and 3xx Series, dead-soft sheets, and deep-drawing sheets.

TABLE A2.9
PERMITTED VARIATIONS IN THICKNESS OF
HOT-ROLLED, NARROW, FLAT-ROLLED,
COIL-PROCESSED PRODUCT AS CUT
LENGTHS AND COIL

Tolerances for variations of thickness of hot-rolled, narrow, coil-processed product as cut lengths and coil shall be identical to the tolerances for hot-rolled, wide, coil-processed product as listed in A2.13, unless otherwise agreed upon by seller and purchaser and specified in the purchase order.

TABLE A2.10
PERMITTED VARIATIONS IN WIDTH OF HOT-ROLLED,
NARROW, FLAT-ROLLED, COIL-PROCESSED PRODUCT
AS CUT
LENGTHS AND COIL

Tolerances for variations of width of hot-rolled, narrow, coil-processed product as cut lengths and coil shall be identical to the tolerances for hot-rolled, wide, coil-processed product as listed in A2.14 unless otherwise agreed upon by seller and purchaser and specified in the purchase order.

TABLE A2.11
PERMITTED VARIATIONS IN LENGTH OF
HOT-ROLLED, NARROW, COIL-PROCESSED PRODUCT
AS CUT LENGTHS

Tolerances for variations of length of hot-rolled, narrow, coil-processed product as cut lengths shall be identical to the tolerances for hot-rolled, wide, coil-processed product as listed in A2.15 unless otherwise agreed upon by seller and purchaser and specified in the purchase order.

TABLE A2.12
PERMITTED VARIATIONS IN FLATNESS OF
HOT-ROLLED, NARROW, COIL-PROCESSED PRODUCT
AS CUT LENGTHS

Tolerances for variations of flatness of hot-rolled, narrow, coil-processed product as cut lengths shall be identical to the tolerances for hot-rolled, wide, coil-processed product as listed in A2.16 unless otherwise agreed upon by seller and purchaser and specified in the purchase order.

TABLE A2.13
PERMITTED VARIATIONS IN THICKNESS OF HOT-ROLLED, WIDE, COIL-PROCESSED
PRODUCT AS COIL AND CUT LENGTHS

Specified Thickness, ⁴ in. [mm]	Permitted Variations, in. [mm], Over and Under for Specified Width (<i>w</i>) in. [mm]	
	<i>w</i> ≤ 60 [1525]	<i>w</i> > 60 [1525]
0.072 [1.83]	0.006 [0.15]	0.009 [0.22]
>0.072 [1.83] to 0.083 [2.11]	0.007 [0.18]	0.010 [0.25]
>0.083 [2.11] to 0.098 [2.49]	0.008 [0.20]	0.011 [0.27]
>0.098 [2.49] to 0.114 [2.90]	0.009 [0.23]	0.012 [0.30]
>0.114 [2.90] to 0.130 [3.30]	0.011 [0.27]	0.013 [0.33]
>0.130 [3.30] to 0.145 [3.68]	0.012 [0.30]	0.013 [0.33]
>0.145 [3.68] to 0.1875 [4.76]	0.013 [0.34]	0.014 [0.35]
>0.1875 [4.76] to 0.250 [6.35]	0.015 [0.38]	0.015 [0.38]
>0.250 [6.35] to 0.3125 [7.94]	0.016 [0.40]	0.016 [0.40]
>0.3125 [7.94]	0.020 [0.50]	0.020 [0.60]

⁴ Thickness measurements are taken at least $\frac{3}{8}$ in. [9.52 mm] from the edge of the sheet.

TABLE A2.14
PERMITTED VARIATIONS IN WIDTH OF HOT-ROLLED,
WIDE, COIL-PROCESSED PRODUCT AS CUT LENGTHS
(NOT RESQUARED) AND COIL

Specified Thickness, t , in. [mm]	Width (w), in. [mm]	Tolerances on Width, in. [mm], for Trimmed Edges
$t < \frac{3}{16}$ [4.76]	$w < 48$ [1219]	$+\frac{1}{16}, -0$
	$w \geq 48$ [1219]	$+\frac{1}{8}, -0$
$\frac{3}{16}$ [4.76] $\leq t < \frac{3}{8}$ [9.5]	$w < 48$ [1219]	$+\frac{5}{32}, -0$
	$w \geq 48$ [1219]	$+\frac{7}{32}, -0$
$t \geq \frac{3}{8}$ [9.5]	$w < 48$ [1219]	$+\frac{1}{4}, -0$
	$w \geq 48$ [1219]	$+\frac{13}{32}, -0$

TABLE A2.15
PERMITTED VARIATIONS IN LENGTH OF
HOT-ROLLED, WIDE, COIL-PROCESSED PRODUCT AS
CUT LENGTHS NOT RESQUARED

Length (L), ft [mm]	Tolerances, in. [mm], Over and Under
$L \leq 10$ [3048]	$+\frac{1}{4}$ [6.35], -0
10 [3048] $< L \leq 20$ [6096]	$+\frac{1}{2}$ [12.70], -0

PERMITTED VARIATIONS IN FLATNESS OF HOT-ROLLED, WIDE, COIL-PROCESSED
PRODUCT AS CUT LENGTHS

Not Specified to Stretcher-Leveled Standard of Flatness			
Specified Thickness (t), in. [mm]	Width (w), in. [mm]	Flatness Tolerance, ⁴ in. [mm]	
$t < \frac{3}{16}$ [4.76]	$w \leq 36$ [914]	0.50 [12.7]	
	36 [914] $< w \leq 60$ [1524]	0.75 [19.1]	
	$w > 60$ [1524]	1.00 [25.4]	
$t \geq \frac{3}{16}$ [4.76]	$w \leq 60$ [1524]	0.90 [23]	
	60 [1524] $< w \leq 72$ [1829]	1.20 [30]	
	$w > 72$ [1829]	1.50 [38]	
Stretcher-Leveled Standard of Flatness			
Specified Thickness, (t) in. [mm]	Specified Width (w) in. [mm]	Specified Length (L) in. [mm]	Flatness Tolerance, ⁴ in. [mm]
$t < \frac{3}{16}$ [4.76]	$w < 48$ [1219]	$L \leq 96$ [2438]	$\frac{1}{8}$ [3.18]
	$w \leq 48$ [1219]	$L > 96$ [2438]	$\frac{1}{4}$ [6.35]
$t < \frac{3}{16}$ [4.76]	$w > 48$ [1219]	$L \leq 96$ [2438]	$\frac{1}{4}$ [6.35]
	$w > 48$ [1219]	$L > 96$ [2438]	$\frac{1}{4}$ [6.35]

⁴ Maximum deviation from a horizontal flat surface.

TABLE A2.17
PERMITTED VARIATIONS IN THICKNESS OF HOT-ROLLED MILL PLATE (QUARTO PLATE)^{A, B}

Specified Thickness (<i>t</i>), in. [mm]	Width, (<i>w</i>) in. [mm]			
	<i>w</i> ≤ 84 [2134]	84 [2134] < <i>w</i> ≤ 120 [3048]	120 (3048) < <i>w</i> ≤ 144 [3658]	<i>w</i> > 144 [3658]
	Tolerance Over Specified Thickness, ^C in. [mm]			
$t < \frac{3}{16}$ [4.76]	0.055 [1.35]	0.070 [1.78]	...	...
$\frac{3}{16}$ [4.76] ≤ $t < \frac{3}{8}$ [9.52]	0.045 [1.14]	0.050 [1.27]	0.085 [2.16]	...
$\frac{3}{8}$ [9.52] ≤ $t < \frac{3}{4}$ [19.05]	0.055 [1.40]	0.060 [1.52]	0.085 [2.16]	0.090 [2.29]
$\frac{3}{4}$ ([19.05] ≤ $t < 1$ [25.40])	0.060 [1.52]	0.065 [1.65]	0.085 [2.16]	0.100 [2.54]
1 [25.40] ≤ $t < 2$ [50.80]	0.070 [1.78]	0.075 [1.90]	0.095 [2.41]	0.115 [2.92]
2 [50.80] ≤ $t < 3$ [76.20]	0.125 [3.20]	0.150 [3.80]	0.175 [4.45]	0.200 [5.08]
3 [76.20] ≤ $t < 4$ [101.6]	0.150 [3.81]	0.160 [4.06]	0.200 [5.08]	0.225 [5.72]
4 [101.6] ≤ $t < 6$ [152.4]	0.180 [4.57]	0.200 [5.08]	0.335 [8.50]	0.355 [9.02]
6 [152.4] ≤ $t < 8$ [203.2]	0.235 [6.00]	0.255 [6.48]	0.355 [9.02]	0.435 [11.0]
8 [203.2] ≤ $t < 10$ [254.0]	0.315 [8.00]	0.335 [8.50]	0.435 [11.0]	0.550 [14.0]

^A Thickness is measured along the longitudinal edges of the plate at least $\frac{3}{8}$ in. [9.52 mm], but not more than 3 in. [76.20 mm], from the edge.

^B For plates up to 10 in. [254.0 mm], excl, in thickness, the tolerance under the specified thickness is 0.010 in. [0.25 mm].

^C For circles, the over thickness tolerances in this table apply to the diameter of the circle corresponding to the width ranges shown. For plates of irregular shape, the over thickness tolerances apply to the greatest width corresponding to the width ranges shown.

TABLE A2.18
PERMITTED VARIATIONS IN WIDTH FOR HOT-ROLLED
RECTANGULAR SHEARED PLATE MILL PLATES
(QUARTO PLATES)

Specified Width, (<i>w</i>), in. [mm]	Tolerances, Over Specified Width, in. [mm] ^A
$w \leq 84$ [2135]	$\frac{5}{8}$ [15.9]
84 [2135] < $w \leq 108$ [2745]	$\frac{3}{4}$ [19.1]
$w > 108$ [2745]	1 [25.4]

^A The tolerance under specified width is $\frac{1}{4}$ in. [6.35 mm].

TABLE A2.20
PERMITTED VARIATIONS IN FLATNESS OF PLATE
MILL PLATE (QUARTO PLATE)

Specified Thickness (<i>t</i>), in. [mm]	Flatness Tolerance for Thicknesses Given, in. [mm]
$t < \frac{1}{4}$ [6.35]	$\frac{7}{16}$ [11]
$\frac{1}{4}$ [6.35] ≤ $t < \frac{3}{8}$ [9.52]	$\frac{3}{8}$ [9.5]
$\frac{3}{8}$ [9.52] ≤ $t < \frac{1}{2}$ [12.70]	$\frac{5}{16}$ [7.9]
$\frac{1}{2}$ [12.70] ≤ $t < \frac{3}{4}$ [19.05]	$\frac{5}{16}$ [7.9]
$\frac{3}{4}$ [19.05] ≤ $t < 1$ [25.40]	$\frac{5}{16}$ [7.9]
1 [25.40] ≤ $t < 1\frac{1}{2}$ [38.10]	$\frac{1}{4}$ [6.4]
$1\frac{1}{2}$ [38.10] ≤ $t < 4$ [101.60]	$\frac{1}{4}$ [6.4]
$t \geq 4$ [101.60]	$\frac{1}{4}$ [6.4]

NOTE 1 — Tolerances in this table apply to any length, not necessarily the rolling direction, up to 36 in. [914 mm] and to any 36 in. [914 mm] of longer lengths in the plate of the plate measured while the plate rests on a flat surface with the concavity of the curvature upward.

NOTE 2 — If the longer dimension is under 36 in. [914 mm], the tolerance is not greater than $\frac{1}{4}$ in. [6.4 mm].

NOTE 3 — For plates with specified minimum yield strengths of 35 ksi [240 MPa] or more, the permitted variations are increased to $1\frac{1}{2}$ times the amounts shown.

TABLE A2.19
PERMITTED VARIATIONS IN LENGTH FOR
HOT-ROLLED SHEARED RECTANGULAR PLATE MILL
PLATES (QUARTO PLATES)

Nominal Length (<i>L</i>), in. [mm]	Tolerances, Over and Under, in. [mm] ^A
$L < 160$ [4064]	$\frac{3}{4}$ [19.1]
160 [4064] ≤ $L < 240$ [6096]	$1\frac{1}{4}$ [31.8]
240 [6096] ≤ $L < 315$ [8000]	$1\frac{5}{8}$ [41.3]
315 [8000] ≤ $L < 394$ [10 008]	2 [50.8]
394 [10 008] ≤ $L < 590$ [15 000]	$2\frac{1}{4}$ [57.2]
590 [15 000] ≤ $L < 790$ [20 066]	$2\frac{1}{4}$ [57.2]

^A The tolerance under specified length is $\frac{1}{4}$ in. [6.35 mm].

TABLE A2.21
COLD-ROLLED PRODUCTS, PROCESSED WITHOUT COILING

Tolerances for cold-rolled products processed without coiling shall be identical to the tolerances for hot-rolled products processed without coiling as listed in A2.17, A2.18, A2.19, and A2.20 unless otherwise agreed upon by seller and purchaser and specified in the purchase order.

TABLE A2.22
PERMITTED VARIATIONS IN WIDTH FOR COLD-ROLLED NARROW, COIL-PROCESSED PRODUCT IN COILS AND CUT LENGTHS FOR EDGE NO. 1 OR 5

Specified Edge No.	Width, in. [mm]	Thickness, in. [mm]	Width Tolerance for Thickness and Width Given, in. [mm]	
			Over	Under
1 and 5	$\frac{9}{32}$ [7.14] and under	$\frac{1}{16}$ [1.59] and under	0.005 [0.13]	0.005 [0.13]
1 and 5	over $\frac{9}{32}$ [7.14] to $\frac{3}{4}$ [19.05], incl	$\frac{3}{32}$ [2.38] and under	0.005 [0.13]	0.005 [0.13]
1 and 5	over $\frac{3}{4}$ [19.05] to 5 [127.00], incl	$\frac{1}{8}$ [3.18] and under	0.005 [0.13]	0.005 [0.13]
5	over 5 [127.00] to 9 [228.60], incl	0.008 [0.20] to $\frac{1}{8}$ [3.18], incl	0.010 [0.25]	0.010 [0.25]
5	over 9 [228.60] to 20 [508.00], incl	0.015 [0.38] to 0.105 [2.67]	0.010 [0.25]	0.010 [0.25]
5	over 20 [508.00] to 24 [610], excl	0.023 [0.58] to 0.080 [2.03]	0.015 [0.38]	0.015 [0.38]

TABLE A2.23
PERMITTED VARIATIONS IN WIDTH AND LENGTH FOR HOT-ROLLED AND COLD-ROLLED RESQUARED COIL-PROCESSED PRODUCT (STRETCHER LEVELED STANDARD OF FLATNESS)

Specified Dimensions, in. (mm)	Tolerances		
	Over		Under
	in.	mm	
For thicknesses under 0.131 [3.33]:			
Widths up to 48 [1219], excl	$\frac{1}{16}$	1.59	0
Widths 48 [1219] and over	$\frac{1}{8}$	3.18	0
Lengths up to 120 [3048], excl	$\frac{1}{16}$	1.59	0
Lengths 120 [3048] and over	$\frac{1}{8}$	3.18	0
For thicknesses 0.131 [3.33] up to $\frac{3}{16}$, excl:			
All widths and lengths	$\frac{1}{4}$	6.35	0

TABLE A2.24
PERMITTED VARIATIONS IN WIDTH AND LENGTH FOR HOT-ROLLED PRODUCT BY ABRASIVE CUTTING

Specified Thickness, in. [mm]	Tolerance over Specified Width and Length ^A	
	Width	Length
Up to 1 [25.40], incl	$\frac{1}{8}$ [3.18]	$\frac{1}{8}$ [3.18]
1 [25.40] to 2 [50.80], incl	$\frac{3}{16}$ [4.76]	$\frac{3}{16}$ [4.76]
2 [50.80] to 3 [76.20], incl	$\frac{1}{4}$ [6.35]	$\frac{1}{4}$ [6.35]
3 [76.20] to 4 [101.6], incl ^B	$\frac{5}{16}$ [7.94]	$\frac{5}{16}$ [7.94]

^A The tolerances under specified width and length are $\frac{1}{8}$ in. [3.18 mm].

^B Width and length tolerances for abrasive cut plates over 4 in. [101.6 mm] thick are not included in the table; consult producer.

TABLE A2.25
PERMITTED VARIATIONS IN DIAMETER FOR HOT-ROLLED AND COLD-ROLLED
COIL-PROCESSED PRODUCT AS SHEARED CIRCLES

Specified Thickness, in. [mm]	Tolerance Over Specified Diameter (No Tolerance Under), in. [mm]		
	Diameters Under 30 in. [762]	Diameters 30 [762] to 48 in. [1219]	Diameters Over 48 in. [1219]
Up to 0.0567 [1.45], incl	$\frac{1}{16}$ [1.59]	$\frac{1}{8}$ [3.18]	$\frac{3}{16}$ [4.76]
0.0568 [1.45] to 0.0971 [2.46], incl	$\frac{3}{32}$ [2.38]	$\frac{5}{32}$ [3.97]	$\frac{7}{32}$ [5.56]
0.0972 [2.46] up to $\frac{3}{16}$ [4.76], excl	$\frac{1}{8}$ [3.18]	$\frac{3}{16}$ [4.76]	$\frac{1}{4}$ [6.35]

TABLE A2.26
PERMITTED VARIATIONS IN DIAMETER FOR
CIRCULAR PLATES TAKEN FROM HOT-ROLLED
PRODUCT PROCESSED WITH OR WITHOUT COILING

Specified Diameter, in. [mm]	Tolerance Over Specified Diameter for Given Diameter and Thickness, ^A in. [mm]		
	To $\frac{3}{8}$ [9.52] in., excl, in Thickness	$\frac{3}{8}$ [9.52] to $\frac{5}{8}$ [15.88] in., excl, in Thickness	$\frac{5}{8}$ [15.88] in. and Over in Thickness ^B
To 60 [1524], excl	$\frac{1}{4}$ [6.35]	$\frac{3}{8}$ [9.52]	$\frac{1}{2}$ [12.70]
60 [1524] to 84 [2134], excl	$\frac{5}{16}$ [7.94]	$\frac{7}{16}$ [11.11]	$\frac{9}{16}$ [14.29]
84 [2134] to 108 [2743], excl	$\frac{3}{8}$ [9.52]	$\frac{1}{2}$ [12.70]	$\frac{5}{8}$ [15.88]
108 [2743] to 180 [4572], excl	$\frac{7}{16}$ [11.11]	$\frac{9}{16}$ [14.29]	$1\frac{1}{16}$ [17.46]

^A No tolerance under.

^B Circular and sketch plates over $\frac{5}{8}$ in. [15.88 mm] in thickness are not commonly sheared but are machined or flame cut.

TABLE A2.27
TORCH CUTTING TOLERANCES^A AND RECOMMENDED
CLEANUP ALLOWANCE
FOR RECTANGULAR PLATES,
CIRCLES, RINGS, AND SKETCHES

Specified Thickness, in.	Tolerance, in.		Cleanup Allowance ^B per Edge, in.
	Outside Dimension	Inside Dimension	
2 and under	$+\frac{3}{8}$ -0	$-\frac{3}{8}$ +0	$\pm\frac{1}{4}$
Over 2 to 3, incl	$+\frac{1}{2}$ -0	$-\frac{1}{2}$ +0	$\pm\frac{3}{8}$
Over 3 to 6, incl	$+\frac{3}{4}$ -0	$-\frac{3}{4}$ +0	$\pm\frac{1}{2}$

^A Tolerances to apply unless otherwise agreed. Note that for some applications user may wish to specify minus rather than plus tolerance or vice versa.

^B Recommended cleanup allowance which, unless otherwise specified, will be applied by supplier to purchasers ordered size.

TABLE A2.28
PERMITTED VARIATIONS IN WEIGHT FOR
HOT-ROLLED OR COLD-ROLLED COIL-PROCESSED
PRODUCT WITH THICKNESS
LESS THAN $\frac{3}{16}$ in. [4.76 mm]

Any item of five sheets or less, or any item estimated to weigh 200 lb [90.72 kg] or less, may actually weigh as much as 10% over the theoretical weight	weigh 200 lb [90.72 kg] or less
Any item of more than five sheets and estimated to weigh more than 200 lb [90.72 kg], may actually weigh as much as 7½% over the theoretical weight	weigh more than 200 lb [90.72 kg]
Chromium-manganese-nickel	40.7 lb/ft² · in. thickness [7.82 kg/m² · mm thick]
Chromium-nickel	42.0 lb/ft² · in. thickness [8.07 kg/m² · mm thick]
Chromium	41.2 lb/ft² · in. thickness [7.92 kg/m² · mm thick]

TABLE A2.29
PERMITTED VARIATIONS IN CAMBER FOR
COLD-ROLLED COIL-PROCESSED PRODUCT IN COILS
AND CUT LENGTHS^A

Specified Width, in. [mm]	Tolerance per Unit Length of Any 8 ft [2438 mm], in. [mm]
To 1½ [38.10], incl	½ [12.70]
Over 1½ [38.10] to 24 [609.60], excl	¼ [6.35]

^A Camber is the deviation of a side edge from a straight line and measurement is taken by placing an 8 ft [2438 mm] straightedge on the concave side and measuring the greatest distance between the strip edge and the straightedge.

TABLE A2.30
PERMITTED VARIATIONS IN CAMBER FOR SHEARED
MILL AND UNIVERSAL MILL PLATES^A

Maximum camber = ⅛ in. in any 5 ft = 3.18 mm in any 1.524 m
--

^A Camber is the deviation of a side edge from a straight line, and measurement is taken by placing a 5 ft straightedge on the concave side and measuring the greatest distance between the plate and the straightedge.

TABLE A3.1
PERMITTED VARIATIONS IN THICKNESS OF
COLD-ROLLED, NARROW, COIL-PROCESSED PRODUCT
AS COIL AND CUT LENGTHS

Specified Thickness, mm	Thickness Tolerances, for the Thickness and Widths Given, Over and Under, mm		
	Width, (w), mm		
	50 to 150, incl w ≤ 125	Over 150 to 300, incl 125 < w ≤ 250	Over 300 to 600, excl 250 < w < 600

Specified Thickness, mm	Thickness Tolerances ^A			
	10%	10%	10%	10%

4.99	0.13 0.12	0.13 0.12	0.15 0.15	0.15 0.15

NOTE 1 — Thickness measurements are taken at least 10 mm in from the edge of the product, except that on widths less than 26 mm, the tolerances are applicable for measurements at all locations.

NOTE 2 — The tolerances in this table include crown tolerances.

NOTE 3 — For specified thicknesses other than those shown, the tolerances for the next higher thickness shall apply.

^A Thickness tolerances given in mm unless otherwise indicated.

TABLE A3.2
PERMITTED VARIATIONS IN WIDTH OF COLD-ROLLED, NARROW, COIL-PROCESSED
PRODUCT IN COILS AND CUT LENGTHS FOR EDGE NO. 3^A

Specified Thickness, ^B mm	Width Tolerance, Over and Under, for Thickness and Width Given, mm			
	w ≤ 40	40 < w ≤ 125	125 < w ≤ 250	250 < w ≤ 600
0.25	0.085	0.10	0.125	0.50
0.50	0.10	0.125	0.15	0.50
1.00	0.125	0.125	0.20	0.50
1.50	0.125	0.15	0.25	0.50
2.50	...	0.20	0.30	0.50
3.00	...	0.25	0.30	0.60
4.00	...	0.25	0.40	0.60
4.99	...	0.40	0.50	0.80

^A For tolerances applicable to narrow product with Edge No. 1 or No. 5, see Table A2.31.

^B For specified thickness other than those shown, the tolerances for the next higher thickness shall apply.

TABLE A3.3
PERMITTED VARIATIONS IN LENGTH OF
COLD-ROLLED, NARROW, COIL-PROCESSED PRODUCTS
AS CUT LENGTHS

Specified Length, mm	Tolerances, mm
1500	+3, -0
>1500, ≤ 4000	+5, -0
>4000, ≤ 6000	+8, -0

TABLE A3.4
PERMITTED VARIATIONS IN FLATNESS OF
COLD-ROLLED, NARROW, COIL-PROCESSED PRODUCT
AS CUT LENGTHS

Tolerances for variations of flatness of cold-rolled products, narrow, coil-processed product as cut lengths shall be identical to the tolerances for cold-rolled, wide, coil-processed product as listed in Table A3.8, unless otherwise agreed upon by seller and purchaser and specified in the purchase order.
--

TABLE A3.5
PERMITTED VARIATIONS IN THICKNESS OF COLD-ROLLED, WIDE, COIL-
PROCESSED PRODUCT AS COIL AND CUT LENGTHS

Specified Thickness, mm	Permissible Variation, Over and Under, mm, for Specified Width (<i>w</i>), <i>w</i> in mm		
	<i>w</i> ≤ 1000	100 < <i>w</i> ≤ 1300	1300 < <i>w</i> ≤ 2100
0.30	0.03	...	...
0.40	0.04	0.04	...
0.50	0.045	0.05	...
0.60	0.05	0.05	...
0.80	0.05	0.05	...
1.00	0.055	0.06	0.07
1.20	0.08	0.08	0.08
1.50	0.08	0.08	0.10
2.00	0.10	0.10	0.11
2.50	0.10	0.11	0.13
3.00	0.13	0.13	0.15
4.00	0.17	0.17	0.17
5.00	0.17	0.17	0.19
6.00	0.17	0.20	0.23
8.00	0.17	0.22	0.25

NOTE 1 — Thickness measurements are taken at least 15 mm from the edge of the product in the case of slit edges and at least 25 mm from the edge of the product in the case of mill edges.

NOTE 2 — Cold-rolled sheets in cut lengths and coils are produced in some type numbers and some widths and thicknesses to tolerances less than those shown in the table.

NOTE 3 — For specified thicknesses other than those shown, the tolerance for the next higher thickness shall apply.

TABLE A3.6
PERMITTED VARIATIONS IN WIDTH FOR COLD-ROLLED, WIDE, COIL-PROCESSED PRODUCT AS CUT LENGTHS
(NOT RESQUARED) AND COIL

Specified Thickness, mm ^A	Permitted Variation in Width, mm, for Specified Width (<i>w</i>), mm				
	<i>w</i> ≤ 125	125 < <i>w</i> ≤ 250	250 < <i>w</i> ≤ 600	600 < <i>w</i> ≤ 1000	1000 < <i>w</i> ≤ 2100
1.00	+0.5, -0	+0.5, -0	+0.7, -0	+1.5, -0	+2.0, +0
1.50	+0.7, -0	+0.7, -0	+1.0, -0	+1.5, -0	+2.0, +0

>0.04 to ≤0.80		19
>0.80		
		16

^A Not specified to stretcher-leveled standard of flatness, and not including hard tempers of 2xx and 3xx series, dead-soft sheets, and deep-drawing sheets.

^B Maximum deviation from a horizontal flat surface.

^C Not including hard tempers of 2xx and 3xx series, dead-soft sheets, and deep-drawing sheets.

TABLE A3.9
PERMITTED VARIATIONS IN THICKNESS OF
HOT-ROLLED, NARROW, FLAT-ROLLED,
COIL-PROCESSED PRODUCT AS CUT
LENGTHS AND COIL

Tolerances for variations of thickness of hot-rolled, narrow, coil-processed product as cut lengths and coil shall be identical to the tolerances for hot-rolled, wide, coil-processed product as listed in A3.13, unless otherwise agreed upon by seller and purchaser and specified in the purchase order.

TABLE A3.10
PERMITTED VARIATIONS IN WIDTH OF HOT-ROLLED,
NARROW, FLAT-ROLLED, COIL-PROCESSED PRODUCT
AS CUT LENGTHS AND COIL

Tolerances for variations of width of hot-rolled, narrow, coil-processed product as cut lengths and coil shall be identical to the tolerances for hot-rolled, wide, coil-processed product as listed in Table A3.14, unless otherwise agreed upon by seller and purchaser and specified in the purchase order.

TABLE A3.11
PERMITTED VARIATIONS IN LENGTH OF
HOT-ROLLED, NARROW, COIL-PROCESSED PRODUCT
AS CUT LENGTHS

Tolerances for variations of length of hot-rolled, narrow, coil-processed product as cut lengths shall be identical to the tolerances for hot-rolled, wide, coil-processed product as listed in Table A3.15, unless otherwise agreed upon by seller and purchaser and specified in the purchase order.

TABLE A3.12
PERMITTED VARIATIONS IN FLATNESS OF
HOT-ROLLED, NARROW, FLAT-ROLLED,
COIL-PROCESSED PRODUCT AS CUT LENGTHS

Tolerances for variations of flatness of hot-rolled, narrow, coil-processed product as cut lengths shall be identical to the tolerances for hot-rolled, wide, coil-processed product as listed in Table A3.16, unless otherwise agreed upon by seller and purchaser and specified in the purchase order.

TABLE A3.13
PERMITTED VARIATIONS IN THICKNESS OF
HOT-ROLLED, WIDE, COIL-PROCESSED PRODUCT AS
COIL AND CUT LENGTHS

Specified Thickness, mm	Permitted Variations of Thickness, mm, Over and Under, for Specified Width (<i>w</i>)	
	<i>w</i> ≤ 1500	<i>w</i> > 1500
2.0	0.18	0.18
2.25	0.20	0.27
2.5	0.23	0.30
3.0	0.25	0.33
3.5	0.30	0.33
5.0	0.36	0.38
6.0	0.38	0.38
8.0	0.50	0.50

NOTE 1—Thickness measurements are taken at least 10 mm from the edge of the product.

NOTE 2—For specified thicknesses other than those shown, the tolerances for the next higher thickness shall apply.

TABLE A3.14
PERMITTED VARIATIONS IN WIDTH OF HOT-ROLLED,
WIDE, COIL-PROCESSED PRODUCT AS CUT LENGTHS
(NOT RESQUARED) AND COIL

Specified Dimension, mm		Tolerance on Width, mm, for Trimmed Edges	
		Over	Under
Thickness (<i>t</i>), mm	Width (<i>w</i>), mm		
<5.00	<i>w</i> < 1200	2	0
	<i>w</i> ≥ 1200	4	0
	<i>w</i> < 1200	4	0
	<i>w</i> ≥ 1200	5	0
5.00 < <i>t</i> ≤ 10.00	<i>w</i> < 1200	6	0
	<i>w</i> ≥ 1200	10	0

TABLE A3.15
PERMITTED VARIATIONS IN LENGTH OF HOT-ROLLED, WIDE, COIL-PROCESSED PRODUCT AS CUT LENGTHS NOT RESQUARED

Specified Length (L), mm	Tolerance, mm	
	Over	Under
$L < 3000$	7	0
$3000 \leq L \leq 6000$	$(0.005 \times L)$	0

TABLE A3.16
PERMITTED VARIATIONS IN FLATNESS OF HOT-ROLLED, WIDE, COIL-PROCESSED PRODUCT AS CUT LENGTHS

Not Specified to Stretcher-Leveled Standard of Flatness			
Specified Thickness (<i>t</i>), mm	Specified Width (<i>w</i>), mm	Flatness Tolerance, ^A mm	
<i>t</i> < 5	<i>w</i> < 900	13	
	<i>w</i> ≥ 900	19	
<i>t</i> ≥ 5	<i>w</i> ≥ 1500	26	
	<i>w</i> < 1500	23	
	1500 ≤ <i>w</i> < 1800	30	
	<i>w</i> ≥ 1800	38	
Stretcher-Leveled Standard of Flatness			
Specified Thickness (<i>t</i>), mm	Specified Width (<i>w</i>), mm	Specified Length (<i>L</i>), mm	Flatness Tolerance, ^A mm
<i>t</i> ≤ 13	<i>w</i> < 1200	<i>L</i> < 2400	4
		<i>L</i> ≥ 2400	7
	<i>w</i> ≥ 1200	<i>L</i> < 2400	7
		<i>L</i> ≥ 2400	7

^A Maximum deviation from a horizontal flat surface.

TABLE A3.17
PERMITTED VARIATIONS IN THICKNESS OF HOT-ROLLED MILL PLATE (QUARTO PLATE)^{A, B}

Specified Thickness mm	Width (w), mm			
	$2100 \leq w < 3000$		$3000 \leq w < 3600$	
	$w < 2100$	3000	3600	$w \geq 3600$
Tolerance Over Specified Thickness, mm				
5	1.35	1.75	...	...
8	1.15	1.30	2.15	...
10	1.15	1.30	2.15	...
20	1.40	1.55	2.15	2.30
25	1.55	1.65	2.15	2.55
50	1.80	1.90	2.40	2.95
75	3.20	3.80	4.45	5.10
100	3.75	4.00	5.00	5.70
150	4.50	5.00	8.50	9.00
200	6.00	6.50	9.00	11.0
250	8.00	8.50	11.0	14.0

NOTE 1 — For specified thicknesses other than those shown, the tolerances for the next higher thickness shall apply.

^A Thickness is measured along the longitudinal edges of the plate at least 10 mm, but not more than 75 mm, from the edge.

^B For circles, the over thickness tolerances in this table apply to the diameter of the circle corresponding to the width ranges shown. For plates of irregular shape, the over thickness tolerances apply to the greatest width corresponding to the width ranges shown. For plates up to 250 mm, incl, in thickness, the tolerance under the specified thickness is 0.30 mm.

TABLE A3.18
PERMITTED VARIATIONS IN WIDTH FOR HOT-ROLLED RECTANGULAR SHEARED PLATE MILL PLATES (QUARTO PLATES)

Specified Width (w), mm	Tolerances, Over and Under, mm
$w < 2000$	+15, -0
$2000 \leq w < 3000$	+20, -0
$w \geq 3000$	+25, -0

TABLE A3.19
PERMITTED VARIATIONS IN LENGTH FOR HOT-ROLLED SHEARED RECTANGULAR PLATE MILL PLATES (QUARTO PLATES)

Nominal Length (L), mm	Tolerances, Over and Under, mm
$L < 4000$	+20, -0
$4000 \leq L < 6000$	+30, -0
$6000 \leq L < 8000$	+40, -0
$8000 \leq L < 10\ 000$	+50, -0
$10\ 000 \leq L < 15\ 000$	+75, -0
$15\ 000 \leq L < 20\ 000$	+100, -0

TABLE A3.20
PERMITTED VARIATIONS IN FLATNESS OF PLATE
MILL PLATE (QUARTO PLATE)

Specified Thickness (<i>t</i>), in. [mm]	Flatness Tolerance for Thicknesses Given, in. [mm]	
5	0.40	[10]
10	$\frac{3}{8}$	[9.5]
15	$\frac{5}{16}$	[7.9]
20	$\frac{5}{16}$	[7.9]
25	$\frac{5}{16}$	[7.9]
50	$\frac{1}{4}$	[6.4]
150	$\frac{1}{4}$	[6.4]
>150	$\frac{1}{4}$	[6.4]

NOTE 1 — Tolerance in this table apply to any length, not necessarily the rolling direction, up to 36 in. [914 mm] and to any 36 in. [914 mm] of longer lengths in the plane of the plate measured while the plate rests on a flat surface with the concavity of the curvature upward.

NOTE 2 — If the longer dimension is under 36 in. [914 mm], the tolerance is not greater than $\frac{1}{4}$ in. [6.4 mm].

NOTE 3 — For plates with specified minimum yield strengths of 35 ksi [240 MPa] or more, the permitted variations are increased to $1\frac{1}{2}$ times the amounts shown.

NOTE 4 — For specified thicknesses other than those shown, the tolerances for the next higher thickness shall apply.

TABLE A3.21
COLD-ROLLED PRODUCTS, PROCESSED WITHOUT
COILING

Tolerances for cold-rolled products processed without coiling shall be identical to the tolerances for hot-rolled products processed without coiling as listed in Table A3.17, unless otherwise agreed upon by seller and purchaser and specified in the purchase order.

TABLE A3.22
PERMITTED VARIATIONS IN WIDTH AND LENGTH
FOR HOT-ROLLED AND COLD-ROLLED RESQUARED
COIL-PROCESSED PRODUCT
(STRETCHER-LEVELED STANDARD OF FLATNESS)

Specified Dimensions, mm			Width and Length Tolerance, mm	
Thickness	Width	Length	Over	Under
Under 3.30	Up to 1200	Up to 3000	2	0
	1200 and over	3000 and over	3	0
3.30 and over	All	All	7	0

NOTE 1 — Polished sheets with Finishes No. 4 and higher are produced to tolerances given in this table.

TABLE A3.23
PERMITTED VARIATIONS IN ABRASIVE CUTTING
WIDTH AND LENGTH FOR PLATES

Specified Thickness, mm	Tolerance Over Specified Width and Length, ^A mm	
	Width	Length
Up to 25, incl	3.2	3.2
25 to 50, incl	4.8	4.8
50 to 75, incl	6.4	6.4
75 to 100, incl ^B	7.9	7.9

^A The tolerances under specified width and length are 3.2 mm.

^B Width and length tolerances for abrasive cut plates over 100 mm thick are not included in the table; consult producer.

TABLE A3.24
PERMITTED VARIATIONS IN DIAMETER FOR
HOT-ROLLED AND COLD-ROLLED COIL-PROCESSED
PRODUCT AS SHEARED CIRCLES

Specified Thickness, mm	Tolerance Over Specified Diameter (No Tolerance Under), mm		
	Diameters Under 600	Diameters 600 to 1200, incl	Diameters Over 1200
Under 1.50	2	3	5
1.50 to 2.50, excl	3	4	6
2.50 and thicker	4	5	7

TABLE A3.25
PERMITTED VARIATIONS IN DIAMETER FOR
CIRCULAR PLATES TAKEN FROM HOT-ROLLED
PRODUCT PROCESSED WITH OR WITHOUT COILING

Specified Diameter, mm	Tolerance Over Specified Diameter for Given Diameter and Thickness, ^A mm		
	Thickness of Plate		
	To 10, excl	10 to 15, excl	15 and over
1500 and under	7	10	13
2100	8	13	16
2700	10	11	15
4500	11	15	18

NOTE 1 — For specific diameters other than those shown, the tolerance for the next higher diameter shall apply.

^A No tolerance under.

TABLE A3.26
TORCH CUTTING TOLERANCES^A AND RECOMMENDED
CLEANUP ALLOWANCE FOR RECTANGULAR PLATES,
CIRCLES, RINGS, AND SKETCHES

Specified Thickness, mm	Tolerance, mm		Cleanup Allowance ^B
	Outside Diameter	Inside Diameter	Per Edge, mm
51 and under	+10, -0	-10, +0	± 6
Over 51 to 76, incl	+13, -0	-13, +0	±10
Over 76 to 152, incl	+19, -0	-19, +0	±13

^A Tolerances to apply unless otherwise agreed. Note that for some applications user may wish to specify minus rather than plus tolerance or vice versa.

^B Recommended cleanup allowance which, unless otherwise specified, will be applied by supplier to purchaser's ordered size.

TABLE A3.27
PERMITTED VARIATIONS IN WEIGHT FOR HOT-
ROLLED AND COLD-ROLLED SHEETS

Any item of five sheets or less, and estimated to weigh 100 kg or less, may actually weigh 10% over the theoretical weight	weigh 100 kg or less
Any item of more than five sheets and estimated to weigh more than 100 kg, may actually weigh 7½% over the theoretical weight	weigh more than 100 kg
Chromium-manganese-nickel	7.82 kg/m ² /mm thick
Chromium-nickel	8.07 kg/m ² /mm thick
Chromium	7.92 kg/m ² /mm thick

TABLE A3.28
PERMITTED VARIATIONS IN CAMBER FOR
COLD-ROLLED, NARROW COIL-PROCESSED PRODUCT
IN COILS AND CUT LENGTHS^A

Specified Width, mm	Tolerance Per Unit Length Of Any 2400 mm
To 40, incl	13
Over 40 to 600, incl	7

^A Camber is the deviation of a side edge from a straight line and measurement is taken by placing a 2400 mm straightedge on the concave side and measuring the greatest distance between the strip edge and the straightedge.

TABLE A3.29
PERMITTED VARIATIONS IN CAMBER FOR
HOT-ROLLED AND COLD-ROLLED WIDE
COIL-PROCESSED PRODUCT AS CUT LENGTHS NOT
RESQUARED AND COLD-ROLLED WIDE
COIL-PROCESSED PRODUCT AS COILS^A

Specified Width, mm	Tolerance per Unit Length of Any 2400 mm, mm
600 to 900, excl	4
900 and over	3

^A Camber is the greatest deviation of a side edge from a straight line and measurement is taken by placing an 8 ft [2438 mm] straightedge on the concave side and measuring the greatest distance between the sheet edge and the straightedge.

SUMMARY OF CHANGES

The Committee has identified the location of selected changes to this specification since the last issue, that may impact the use of this specification.

(1) Added UNS S31060 to Table A1.2.

(2) Added UNS S31277 to Table A1.2.

(3) Added UNS S32906 and UNS S32101 to Table A1.2.

(4) Revised Sections 1.3, 9.1, A2.1, and A3.1 to require use of Annex A3 for A 480M when specified.

(5) Added heat treatment requirements for S32003 in Table A1.2.

SPECIFICATION FOR GENERAL REQUIREMENTS FOR STAINLESS STEEL BARS, BILLETS, AND FORGINGS

SA-484/SA-484M

(Identical with ASTM Specification A 484/A 484M-98.)

1. Scope

1.1 This specification covers general requirements that shall apply to stainless wrought steel bars, shapes, forgings, and billets or other semi-finished material (except wire) for forging, under the latest revision of each of the following ASTM specifications: Specifications A 276, A 314, A 458, A 473, A 477, A 479/A 479M, A 564/A 564M, A 565, A 582/A 582M, A 638/A 638M, A 705/A 705M, and A 831/A 831M.

1.2 In case of conflicting requirements, the individual material specification requirements take precedence.

1.3 The requirements for introduction of new materials in specifications referencing this Specification of General Requirements are given in Annex A1.

1.4 General requirements for flat products other than bar are covered in Specification A 480/A 480M.

1.5 General requirements for wire products in coils are covered in Specification A 555/A 555M.

1.6 The values stated in either inch-pound units or SI (metric) units are to be regarded separately as the standard; within the text and tables, the SI units are shown in [brackets]. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification.

1.7 Unless the order specifies an “M” designation, the material shall be furnished to inch-pound units.

E 112 Test Methods for Determining the Average Grain Size

E 139 Practice for Conducting Creep, Creep-Rupture, and Stress-Rupture Tests of Metallic Materials

2.2 Federal Standards:

Fed. Std. No. 123 Marking for Shipment (Civil Agencies)

Fed. Std. No. 183 Continuous Marking of Iron and Steel Products

2.3 Military Standards:

MIL-STD-129 Marking for Shipment and Storage

MIL-STD-163 Preservation of Steel Products for Shipment (Storage and Overseas Shipment)

2.4 Other Standard:

Primary Metals Bar Code Standard

3. Terminology

3.1 Descriptions of Terms Specific to This Standard:

3.1.1 Bars, shapes, forgings, and billets or other semi-finished material as used in this specification are defined as follows:

3.1.2 Bars — Straight lengths that are produced by: hot rolling, forging, extruding, etc. Also included are small shapes with all dimensions under 5 in. [125 mm] and hot-rolled flats up to 10 in. [250 mm] inclusive in width and 0.125 in. [3.00 mm] and over in thickness. Cold-finished bars may be cold drawn, turned, ground or polished and are produced from straight length bars or from straightened and cut rod or wire. Also, bars may be produced by cutting from strip or plate, provided that the long direction of cut bars is parallel to the final rolling direction of the strip or plate.

NOTE — All cold-reduced flat material under 0.1875 in. [5.00 mm] thick is classified as strip if 0.375 in. [9.50 mm] and over in width.

3.1.3 Forgings — Parts produced by hot, mechanical shaping of such products as bars and billets, or other semi-finished materials, with hammers, presses, and forging machines.

3.1.4 Billets — A semi-finished product (produced on mills or by forging or continuous casting machines) that requires subsequent hot rolling or hot forging. Sizes are generally up to 36 in.² (230 cm²) in cross section as squares or rectangles with width less than twice the thickness.

3.1.5 Blooms — A semi-finished product (produced on mills or by continuous casting machines) that requires subsequent hot rolling or hot forging. Sizes are generally over 36 in.² (230 cm²) in square or rectangular cross sections with width less than twice the thickness. Rectangles with width twice the thickness or greater are classed as slabs or sheet bars.

3.1.6 Slabs or Sheet Bars — The products of a primary mill such as blooming, slabbing or sheet bar mills, or continuous or pressure casting machines, which are shipped without further work other than cutting to length or surface conditioning used only for re-rolling into sheet, strip or plate.

3.2 The terms random lengths, multiple lengths, and dead or exact lengths are defined as follows:

3.2.1 Random Lengths — A length range of not less than 24 in. [1 m]; for example, 10 to 12 ft [3 to 4 m], 14 to 17 ft [4 to 5 m], or 15 to 20 ft [5 to 6 m].

3.2.2 Multiple Lengths — Frequently, fabricating operations will require small unit bar lengths. When such is the case, a single bar containing a predetermined number of such units may be specified. Such a bar is described as a multiple-length bar, and it is common to include in the specified length an allowance of ¼ in. [6.5 mm] per unit to ensure cutting the required number of pieces.

3.2.3 Dead or Exact Length — Bars specified to dead or exact lengths may be either hot sheared or hot sawed. When greater accuracy in length or freedom from end distortion is required, bars can be machine-cut after machine-straightening. The permissible variations in length for dead or exact length bars are shown in tables at the end of this specification.

4. Identification of Material

4.1 For Civilian Procurement:

4.1.1 Bars and shapes shall be properly marked or tagged with the name of manufacturer, purchaser's name and order number, ASTM specification number, heat number, grade or type, condition, and where appropriate the size, length, and weight. Unless otherwise specified, the method of marking is at the option of the manufacturer, and may be made by hot stamping, cold stamping, painting, or marking tags attached to the bundles, lifts, or boxes.

4.1.2 Forgings shall be legibly die stamped with the manufacturer's symbol or name, material specification number, type, and heat identification. When die stamping is not permitted by the purchaser, electric pencil or electro-etching may be used.

4.2 For Government Procurement:

4.2.1 When specified in the contract or order, and for direct procurement by or direct shipment to the Government, marking for shipment, in addition to any requirements specified in the contract or order, shall be in accordance with MIL-STD-129 for military agencies and in accordance with Fed. Std. No. 123 for civil agencies.

4.2.2 For Government procurement by the Defense Supply Agency, bars and shapes shall be continuously

marked for identification in accordance with Fed. Std. No. 183.

5. Materials and Manufacture

5.1 The material may be furnished in one of the conditions detailed in the applicable material specification, that is, hot-worked, extruded or forged, forged and machined, annealed, cold-worked or heat-treated (normalized and tempered, or quenched and tempered), etc.

5.2 The types of finish procurable are as follows:

5.2.1 Hot-Finished Bars — Hot-finished bars are commonly produced by hot rolling, forging, pressing, extruding, etc. ingots, blooms or billets to final dimensions. Hot-finished bars may be subject to various operations including annealing or other heat treating, cleaning by pickling, blast cleaning or other methods of descaling, rough turning and machine straightening. At the option of the producer, hot-finished bar may be subject to centerless grinding, polishing, etc., to provide closer tolerances or improved surface condition.

5.2.2 Bars Cut from Strip or Plate — Two surfaces descaled or pickled, two cut surfaces, except when heat treated after cutting, in which case, all surfaces will be descaled or pickled.

5.2.3 Cold-Finished Bars — Cold-finished bars are produced from hot-finished bars by means of additional operations, for example, cold drawing, centerless grinding, polishing, etc., to provide closer tolerances, improved surface condition or higher strength levels.

5.2.4 Bars and Billets or Other Semi-Finished Material for Reforging — Material may be conditioned to remove injurious surface defects provided the depth of conditioning does not exceed that which affects the surface condition or dimensions of the article to be forged from the bar on billet.

5.2.5 Shapes — Descaled by machining, grinding, or pickling.

5.2.5.1 Shapes may be subjected to either Class A or Class C surface preparation as specified on the purchase order. Class A consists of grinding for the removal of imperfections of a hazardous nature such as fins, tears, and jagged edges, provided the underweight tolerance is not exceeded and the maximum depth of grinding at any one point does not exceed 10% of the thickness of the section. Class C consists of grinding for the removal of all visible surface imperfections, provided the underweight tolerance is not exceeded and the maximum depth of grinding at any one point does not exceed 10% of the thickness of the section.

5.2.6 Forgings — Descaled by machining, blasting or pickling, unless otherwise specified.

6. Chemical Composition

6.1 Heat or Cast Analysis — The chemical analysis of each heat shall be determined in accordance with the applicable material specification and Test Methods, Practices, and Terminology A 751.

6.2 Product Analysis — When required, a product analysis shall be determined in accordance with Test Methods, Practices, and Terminology A 751. The chemical composition thus determined shall conform to the tolerances shown in Table 1.

6.3 The steel shall not contain an unspecified element for the ordered grade to the extent that the steel conforms to the requirements of another grade in the referencing product specification, and any of the product specifications within the scope of this general specification, for which that element has a specified minimum.

7. Permissible Variations in Dimensions

7.1 Unless otherwise specified on the purchase order, the material shall conform to the permissible variations in dimensions as specified in the following:

7.1.1 Bars — Tables 2 through 11.

7.1.2 Shapes — Tables 12 through 18 and Figs. 1 and 2.

7.1.3 Forgings — As specified in the purchase order, or in prints or sketches accompanying the purchase order.

7.1.4 Billets or Other Semi-Finished Material for Reforging — Billets and bars shall conform to the shape and dimensions specified by the purchaser within a permissible variation of $\pm 5\%$.

8. Workmanship, Finish, and Appearance

8.1 The material shall be of uniform quality consistent with good manufacturing and inspection practices. Imperfections that may be present shall be of such a nature or degree for the type and quality ordered, that they will not adversely affect the forming, machining, or fabrication of finished parts.

9. Lot Size

9.1 A lot for product analysis shall consist of all bars, shapes, and forgings made from the same heat.

9.2 For other tests required by the product specification, a lot shall consist of all bar products of the same size, or forgings weighing less than 1000 lb [500 kg] each, from the same heat, and produced under the same processing conditions. All austenitic, ferritic, and free-machining stainless steels, as well as martensitic grades when annealed

to Condition A and precipitation or age-hardening grades when solution treated, may be heat treated in more than one charge in the same furnace or in several furnaces, utilizing controlled processing and equipment. (See Appendix.) However, when heat treating martensitic stainless steels to Condition T or H and when age hardening the precipitation hardening stainless steels, a lot shall consist of the same size, same heat, and the same heat treat charge in a batch-type furnace or under the same conditions in a continuous furnace.

9.2.1 For forgings weighing from 1000 lb [500 kg] to 5000 lb [2500 kg] each, a lot shall consist of one size classification from each heat and each heat-treating charge. Where continuous heat-treating furnaces are used, a lot shall consist of one size classification from each heat, heat treated in an 8-h (or less) period.

9.2.2 For all classes of forgings weighing from 5000 to 7000 lb [2300 to 3200 kg], each unit shall be considered a lot.

9.2.3 For all classes of forgings weighing more than 7000 lb [3200 kg], each unit shall be considered a double lot, and two tension tests shall be required, one from each end of each forging. In the case of ring forgings, the tension test specimens shall be removed from each of two locations on the periphery, approximately 180° apart, or insofar as practicable from opposite ends of the forging.

10. Number of Tests and Retests

10.1 Unless specified otherwise in the product specification, one sample per heat shall be selected for chemical analysis and one mechanical test sample shall be selected from each lot of bars and shapes and from each lot of forgings. Tension tests of bars and shapes shall be made in the longitudinal direction. Hardness tests on bars shall be conducted midway between the center and surface of the product. Tension tests on forgings shall be prepared from suitable prolongations, or at the option of the supplier, excess forgings may be provided for test. All tests shall conform to the chemical and mechanical requirements of the material specification.

10.2 One intergranular corrosion test, when required, and one grain size test, when required, shall be made from each lot. It is often convenient to obtain test material from the specimen selected for mechanical testing.

10.3 If any test specimen shows defective machining or flaws, it may be discarded and another specimen substituted.

10.4 If the results of any test lot are not in conformance with the requirements of this specification and the applicable product specification, a retest sample of two specimens

may be tested to replace each failed specimen of the original sample. If one of the retest specimens fails, the lot shall be rejected.

11. Retreatment

11.1 Where failure of any lot is due to inadequate heat treatment, the material may be reheat-treated and resubmitted for test.

12. Test Methods

12.1 The properties enumerated in applicable specifications shall be determined in accordance with the following ASTM methods:

12.1.1 *Chemical Analysis* — Test Methods, Practices, and Terminology A 751.

12.1.2 *Tension Tests* — Test Methods and Definitions A 370. When identified as such, transverse testing is permitted.

12.1.3 *Stress Rupture* — Practice E 139.

12.1.4 *Brinell Hardness* — Test Methods and Definitions A 370.

12.1.5 *Rockwell Hardness* — Test Methods and Definitions A 370.

12.1.6 *Intergranular Corrosion* (when required) — Practice E of Practices A 262.

12.1.7 *Grain Size* (when required) — Test Methods E 112.

12.1.8 *Charpy V-Notch Impact Test* — Test Methods and Definitions A 370.

13. Inspection

13.1 *For Civilian Procurement* — Inspection of the material shall be as agreed upon between the purchaser and the supplier as part of the purchase contract.

13.2 *For Government Procurement* — Unless otherwise specified in the contract or purchase order: (1) the seller is responsible for the performance of all inspection and test requirements in this specification, (2) the seller may use his own or other suitable facilities for the performance of the inspection and testing, and (3) the purchaser shall have the right to perform any of the inspection and tests set forth in this specification. The manufacturer shall afford the purchaser's inspector all reasonable facilities necessary to satisfy him that the material is being furnished in accordance with the specification. Inspection by the purchaser shall not interfere unnecessarily with the manufacturer.

14. Rejection and Rehearing

14.1 Material that fails to conform to the requirements of this specification may be rejected. Rejection should be reported to the producer or supplier promptly, preferably in writing. In case of dissatisfaction with the results of the test, the producer or supplier may make claim for a rehearing.

15. Certification

15.1 A certified report of the test results shall be furnished at the time of shipment. The report shall include the ASTM designation, year date and revision letter, if any.

15.2 A document printed from or used in electronic form from an electronic data interchange (EDI) transmission shall be regarded as having the same validity as a counterpart printed in the certifier's facility. The content of the EDI transmitted document shall meet the requirements of the invoked ASTM standard(s) and conform to

any existing EDI agreement between the purchaser and the supplier. Notwithstanding the absence of a signature, the organization submitting the EDI transmission is responsible for the content of the report.

16. Preparation for Delivery

16.1 Unless otherwise specified, the bars and shapes shall be packaged and loaded in accordance with Practices A 700.

16.2 When specified in the contract or order, and for direct procurement by or direct shipment to the Government, when Level A is specified, preservation, packaging, and packing shall be in accordance with the Level A requirements of MIL-STD-163.

17. Keywords

17.1 general delivery requirements; stainless steel bars; stainless steel billets; stainless steel forgings

FIG. 1 CAMBER OR BOW TOLERANCES

GENERAL NOTE: Camber or bow tolerances shall not exceed 0.025 in. (0.60 mm) X length in ft (m/3). Camber tolerances for hot finished or extruded shapes camber (or bow) is the greatest deviation of a side from a straight line. Measurement is taken on the concave side of the shapes with a straight edge.

FIG. 2 TRANSVERSE FLATNESS TOLERANCES

GENERAL NOTES:

- (a) Allowance deviation from flat is max 0.010 in. (0.25 mm) per 1 in. (25 mm) of width. Maximum deviation on dimensions of less than 1 in. (25 mm) is 0.010 in. (0.250 mm).
- (b) The transverse flatness tolerance is the maximum deviation from a reference base across any cross-section flat surface.

TABLE 1
PRODUCT ANALYSIS TOLERANCES

Element	Upper Limit or Maximum of Specified Range, %	Tolerances over the Maximum (Upper Limit) or Under the Minimum (Lower Limit)	Element	Upper Limit or Maximum of Specified Range, %	Tolerances over the Maximum (Upper Limit) or Under the Minimum (Lower Limit)
Carbon	to 0.010, incl	0.002	Cobalt	over 0.05 to 0.50, incl	0.01

Titanium	to 1.00, incl	0.05			
	over 1.00 to 3.00, incl	0.07			
	over 3.00	0.10			

NOTE — This table specifies tolerances over the maximum limits or under the minimum limits of the chemical requirements of the applicable material specification (see 1.1); it does not apply to heat analysis.

TABLE 2
PERMISSIBLE VARIATIONS IN SIZE OF HOT-FINISHED ROUND, TURNED,^A AND SQUARE BARS

Specified Size, in. [mm]	Permissible Variations from Specified Size, in. [mm]		Out-of-Round ^B or Out-of-Square, ^C in. [mm]
	Over	Under	
$\frac{5}{16}$ to $\frac{7}{16}$ [8.00 to 11.00], incl ^D	0.006 [0.15]	0.006 [0.15]	0.009 [0.23]
Over $\frac{7}{16}$ to $\frac{5}{8}$ [11.00 to 15.50], incl ^D	0.007 [0.18]	0.007 [0.18]	0.010 [0.26]
Over $\frac{5}{8}$ to $\frac{7}{8}$ [15.50 to 22.00], incl	0.008 [0.20]	0.008 [0.20]	0.012 [0.30]
Over $\frac{7}{8}$ to 1 [22.00 to 25.00], incl	0.009 [0.23]	0.009 [0.23]	0.013 [0.34]
Over 1 to $1\frac{1}{8}$ [25.00 to 28.00], incl	0.010 [0.25]	0.010 [0.25]	0.015 [0.38]
Over $1\frac{1}{8}$ to $1\frac{1}{4}$ [28.00 to 31.50], incl	0.011 [0.28]	0.011 [0.28]	0.016 [0.42]
Over $1\frac{1}{4}$ to $1\frac{3}{8}$ [31.50 to 34.50], incl	0.012 [0.30]	0.012 [0.30]	0.018 [0.46]
Over $1\frac{3}{8}$ to $1\frac{1}{2}$ [34.50 to 38.00], incl	0.014 [0.35]	0.014 [0.35]	0.021 [0.53]
Over $1\frac{1}{2}$ to 2 [38.00 to 50.00], incl	$\frac{1}{64}$ [0.40]	$\frac{1}{64}$ [0.40]	0.023 [0.60]
Over 2 to $2\frac{1}{2}$ [50.00 to 63.00], incl	$\frac{1}{32}$ [0.80]	0	0.023 [0.60]
Over $2\frac{1}{2}$ to $3\frac{1}{2}$ [63.00 to 90.00], incl	$\frac{3}{64}$ [1.20]	0	0.035 [0.90]
Over $3\frac{1}{2}$ to $4\frac{1}{2}$ [90.00 to 115.00], incl	$\frac{1}{16}$ [1.60]	0	0.046 [1.20]
Over $4\frac{1}{2}$ to $5\frac{1}{2}$ [115.00 to 140.00], incl	$\frac{5}{64}$ [2.00]	0	0.058 [1.50]
Over $5\frac{1}{2}$ to $6\frac{1}{2}$ [140.00 to 165.00], incl	$\frac{1}{8}$ [3.00]	0	0.070 [1.80]
Over $6\frac{1}{2}$ to 8 [165.00 to 200.00], incl	$\frac{5}{32}$ [4.00]	0	0.085 [2.20]
Over 8 to 12 [200.00 to 300.00], incl ^A	$\frac{3}{16}$ [4.80]	0	$\frac{3}{32}$ [2.40]
Over 12 to 15 [300.00 to 400.00], incl ^A	$\frac{7}{32}$ [5.50]	0	$\frac{7}{64}$ [2.80]
Over 15 to 25 [400.00 to 625.00], incl ^A	$\frac{1}{4}$ [6.50]	0	$\frac{1}{8}$ [3.20]

^A Turned bars are generally available from 2 to 25 in. [50 to 625 mm] in diameter, over 8 in. [200 mm] only turned bars are available.

^B Out-of-round is the difference between the maximum and minimum diameters of the bar measured at the same cross section.

^C Out-of-square section is the difference in the two dimensions at the same cross section of a square bar, each dimension being the distance between opposite faces.

^D Size tolerances have not been evolved for round sections in the size range of $\frac{5}{16}$ in. [8.00 mm] to approximately $\frac{5}{8}$ in. [15.5 mm] in diameter which are produced on rod mills in coils.

TABLE 3
PERMISSIBLE VARIATIONS IN SIZE OF HOT-FINISHED HEXAGONAL AND OCTAGONAL BAR

Specified Sizes Measured Between Opposite Sides, in. [mm]	Permissible Variations from Specified Size, in. [mm]		Maximum Difference in 3 Measurements for Hexagons Only, in. [mm]
	Over	Under	
$\frac{1}{4}$ to $\frac{1}{2}$ [6.50 to 13.00], incl	0.007 [0.18]	0.007 [0.18]	0.011 [0.28]
Over $\frac{1}{2}$ to 1 [13.00 to 25.00], incl	0.010 [0.25]	0.010 [0.25]	0.015 [0.38]
Over 1 to $1\frac{1}{2}$ [25.00 to 38.00], incl	0.021 [0.53]	0.021 [0.53]	0.025 [0.64]

⁴ By agreement between purchaser and seller, tolerances can be shifted as desired to any combination of plus-minus tolerance between all minus and all plus.

⁵ Not applicable when bars are ordered random length.

TABLE 6
 PERMISSIBLE VARIATIONS IN SIZE OF COLD-FINISHED ROUND BARS

Specified Size, in. [mm]	Permissible Variations from Specified Size, in. [mm] ^{A,B}	
	Over	Under
$\frac{1}{16}$ to $\frac{5}{16}$ [1.50 to 8.00], excl	0.001 [0.03]	0.001 [0.03]
$\frac{5}{16}$ to $\frac{1}{2}$ [8.00 to 13.00], excl	0.0015 [0.04]	0.0015 [0.04]
$\frac{1}{2}$ to 1 [13.00 to 25.00], excl	0.002 [0.05]	0.002 [0.05]
1 to $1\frac{1}{2}$ [25.00 to 38.00], excl	0.0025 [0.06]	0.0025 [0.06]
$1\frac{1}{2}$ to 4 [38.00 to 100.00], incl ^C	0.003 [0.08]	0.003 [0.08]

^A Unless otherwise specified, size tolerances are over and under as shown in the above table. When required, however, they may be specified all over and nothing under, or all under and nothing over, or any combination of over and under, if the total spread in size tolerance for a specified size is not less than the total spread shown in the table.

^B When it is necessary to heat treat or heat treat and pickle after cold finishing, size tolerances are double those shown in the table.

^C Cold-finished bars over 4 in. [100 mm] in diameter are produced; size tolerances for such bars are not included herein.

TABLE 7
 PERMISSIBLE VARIATIONS IN SIZE OF
 COLD FINISHED HEXAGONAL, OCTAGONAL, AND SQUARE BARS

PERMISSIBLE VARIATIONS IN
WIDTH AND THICKNESS OF COLD-FINISHED FLAT BARS

Width, in. [mm]	Permissible Variations in Width, Over and Under, in. [mm] ⁴	
	For Thicknesses 1/4 in. [6.5] and Under	For Thicknesses Over 1/4 in. [6.5]
1/16 to 3/8 [1.50 to 9.50], incl	0.005 [0.12]	0.005 [0.12]
Over 3/8 to 1 [9.50 to 25.00], incl	0.004 [0.10]	0.004 [0.10]
Over 1 to 2 [25.00 to 50.00], incl	0.006 [0.15]	0.004 [0.10]
Over 2 to 3 [50.00 to 75.00], incl	0.008 [0.20]	0.004 [0.10]
Over 3 to 4 1/2 [75.00 to 115.00], incl	0.010 [0.25]	0.005 [0.13]

Thickness, in. [mm]	Permissible Variations in Thickness, Over and Under, in. [mm] ⁴	
	Over	Under
Up to .029 [0.70], incl	0.001 [0.03]	
Over .029 to .035 [0.70 to 1.00], incl	0.0015 [0.04]	
Over .035 to 1 [1.00 to 25.00], incl	0.002 [0.05]	
Over 1 to 2 [25.00 to 50.00], incl	0.003 [0.08]	
Over 2 to 3 [50.00 to 75.00], incl	0.004 [0.10]	
Over 3 to 4 1/2 [75.00 to 115.00], incl ^B	0.005 [0.13]	

⁴ When it is necessary to heat treat or heat treat and pickle after cold finishing, size tolerances are double those shown in the table.

^B Cold-finished flat bars over 4 1/2 in. [115 mm] wide or thick are produced; width and thickness tolerances for such bars are not included herein.

TABLE 9
PERMISSIBLE VARIATIONS IN
LENGTH OF HOT-FINISHED OR COLD-FINISHED BARS

Specified Size of Rounds, Squares, Hexagons, Octagons, and Widths of Flats, ^A in. [mm]	Permissible Variations in Length, in. [mm] ^B			
	For Lengths up to 12 ft ^C [4 m], incl		For Lengths Over 12 to 25 ft [4 to 8 m], incl	
	Over	Under	Over	Under
Up to .500 [13.00], incl	1/16 [1.5]	0	1/8 [3.0]	0
Over .500 to 2 [13.00 to 50.00], incl	1/2 [13]	0	3/4 [19.0]	0
Over 2 to 4 [50.00 to 100.00], incl	3/4 [19]	0	1 [25.00]	0
Over 4 to 6 [100.00 to 150.00], incl	1 [25]	0	1 1/4 [31.50]	0
Over 6 to 9 [150.00 to 225.00], incl	1 1/4 [31.5]	0	1 1/2 [38.00]	0
Over 9 to 12 [225.00 to 300.00], incl	1 1/2 [38]	0	2 [50.00]	0

^A The maximum width of bar flats is 10 in. [250 mm].

^B Random Lengths — When ordered as random lengths, permissible variation is 2 ft [0.6 m] over and under the specified length. When ordered as random lengths subject to a minimum length requirement, permissible variation is 2 ft [0.6 m] over and nothing under the specified length.

^C For lengths under 3 ft [1 m] and sizes up to 1/2 in. [13.00 mm] incl., the permissible variation in length is 1/32 in. [0.80 mm] over and nothing under.

TABLE 10
PERMISSIBLE VARIATIONS IN LENGTH OF HOT-FINISHED OR
COLD-FINISHED BARS MACHINE CUT AFTER MACHINE STRAIGHTENING

Specified Size of Rounds, Squares, Hexagons, Octagons, and Width of Flats, ⁴ in. [mm]	Permissible Variations in Length, in. [mm]			
	For Lengths up to 12 ft [4 m], incl		For Lengths Over 12 to 25 ft [4 to 8 m], incl	
	Over	Under	Over	Under
To 3 [75], incl	$\frac{1}{8}$ [3.0]	0	$\frac{3}{16}$ [4.8]	0
Over 3 to 6 [75 to 150], incl	$\frac{3}{16}$ [4.8]	0	$\frac{1}{4}$ [6.5]	0
Over 6 to 9 [150 to 225], incl	$\frac{1}{4}$ [6.5]	0	$\frac{5}{16}$ [8.0]	0
Over 9 to 12 [225 to 300], incl	$\frac{1}{2}$ [13.0]	0	$\frac{1}{2}$ [13.0]	0

NOTE 1 — These tolerances are not applicable when bars are ordered random length.

⁴ The maximum width of bar flats is 10 in. [250 mm].

TABLE 11
PERMISSIBLE VARIATIONS IN
STRAIGHTNESS OF MACHINE STRAIGHTENED
HOT-FINISHED OR COLD-FINISHED BARS⁴

Measurement is taken on the concave side of the bar with a straightedge. Unless otherwise specified, hot-finished or cold-finished bars for machining purposes are furnished machine straightened to the following tolerances:

Hot finished:

$\frac{1}{8}$ in. [3.00 mm] in any 5 ft [1.50 m]; but may not exceed
 $\frac{1}{8}$ in. [3.00 mm] $\times$ (length in ft/5) [m/1.50]

Cold finished:

$\frac{1}{16}$ in. [1.5 mm] in any 5 ft [1.5 m]; but may not exceed
 $\frac{1}{16}$ in. [1.5 mm] $\times$ (length in ft/5) [m/1.50]

⁴ Straightness tolerances have not been established for sizes less than $\frac{1}{2}$ in. [6.50 m].

TABLE 12
PERMISSIBLE VARIATIONS
FOR HOT-FINISHED ANGLES

Weight:^A

For angles of 6 lb/ft [9.0 kg/m] or less, the weight tolerances shall not exceed $\pm 7\frac{1}{2}\%$. For angles over 6 lb/ft [9 kg/m], the weight tolerance shall not exceed $\pm 4\frac{1}{2}\%$.

Length of Legs:

For angles having legs or flanges up to 6 in. [150 mm], incl, the length tolerance shall not exceed $\pm \frac{1}{8}$ in. [3.00 mm]. For angles having legs or flanges over 6 in., the length tolerance shall not exceed $+\frac{3}{16}$ in. [5.00 mm] and $-\frac{1}{8}$ in.

Squareness of Legs:

The tolerance for the right angle between the legs is $\pm 2^\circ$.

NOTE 1 — For unequal leg angles, the longer leg determines the tolerance for the length of each leg.

^A For equal leg angles, the theoretical weight per foot is:

$$\text{Weight/foot} = (24 W \times t - 12 t^2) (0.2871 \text{ lb/ft})$$

where W is the specified length of the leg, and t is the specified thickness, both in inches.

For unequal leg angles, the theoretical weight per foot is:

$$\text{Weight/foot} = [12 W1 \times t + 12 W2 \times t - 12 t^2] (0.2871 \text{ lb/ft})$$

where $W1$ and $W2$ are the specified leg lengths, and t is the specified leg thickness, all in inches.

TABLE 13
PERMISSIBLE VARIATIONS IN SIZE OF HOT-FINISHED CHANNELS

Specified Size of Channel, in. [mm]	Depth of Section ⁴	Width of Flanges	Size Tolerances, Over and Under, in. [mm]		Out-of-Square ^B of Either Flange, in./in. [mm/mm] of Flange Width
			Thickness of Web for Thickness Given		
			To ³ / ₁₆ incl [5.00 mm]	Over ³ / ₁₆ [5.00 mm]	
To 1 ¹ / ₂ [38.00], incl	³ / ₆₄ [1.20]	³ / ₆₄ [1.20]	0.015 [0.41]	0.023 [0.60]	³ / ₆₄ [1.20]
Over 1 ¹ / ₂ to 3 [38.00 to 75.00], excl	³ / ₃₂ [2.40]	³ / ₃₂ [2.40]	0.023 [0.60]	0.030 [0.80]	³ / ₆₄ [1.20]

^A Channel depth is measured at back of web.

^B For channels $\frac{5}{8}$ in. [15.50 mm] and under in depth, the out-of-square tolerance is $\frac{5}{64}$ in./in. [2.00 mm/mm] of depth. Out-of-squareness is determined by placing a square against the bottom surface of the web and measuring the amount of toe-in or toe-out of either flange. Measurements for depth of section and width of flanges are over-all.

TABLE 14
PERMISSIBLE VARIATIONS IN SIZE OF HOT-FINISHED TEES

Specified Size of Tee, in. [mm] ^A	Width or Depth, in. ^B		Thickness of Flange, in. [mm]		Thickness of Stem, in. [mm]		Stem Out-of-Square ^C in. [mm]
	Over	Under	Over	Under	Over	Under	
To $1\frac{1}{2}$ [38.00], incl	$\frac{5}{64}$ [2.00]	$\frac{5}{64}$ [2.00]	0.015 [0.38]	0.015 [0.38]	0.008 [0.20]	0.030 [0.75]	$\frac{3}{64}$ [1.20]
Over $1\frac{1}{2}$ to 2 [38.00 to 50.00], incl	$\frac{3}{32}$ [2.40]	$\frac{3}{32}$ [2.40]	0.018 [0.46]	0.018 [0.46]	0.015 [0.38]	0.030 [0.75]	$\frac{3}{32}$ [2.40]
Over 2 to 3 [50.00 to 75.00], excl	$\frac{9}{64}$ [3.60]	$\frac{9}{64}$ [3.60]	0.023 [0.60]	0.023 [0.60]	0.023 [0.60]	0.030 [0.75]	$\frac{9}{64}$ [3.60]

^A The longer member of an unequal tee determines the size for tolerances.

^B Measurements for both width and depth are over-all.

^C Stem out-of-square is the variation from its true position of the center line of stem measured at the point.

TABLE 15
PERMISSIBLE VARIATIONS IN
SIZE OF HOT-EXTRUDED SHAPES

Specified Size, in. [mm]	Section Tolerances, in. [mm]	
	Over	Under
Dimensions under 1 [25]	0.020 [0.50]	0.020 [0.50]
Dimensions 1 to 3 [25 to 75], excl	0.031 [0.80]	0.031 [0.80]
Dimensions 3 to 4 [75 to 100], incl.	0.046 [1.20]	0.046 [1.20]
Over 4 [100]	0.062 [1.60]	0.062 [1.60]

TABLE 16
ANGULARITY TOLERANCE FOR EXTRUDED SHAPES

Plus and minus max 2 deg

TABLE 17
 LENGTH TOLERANCES FOR EXTRUDED SHAPE LENGTH^{A,B}

Specified Size	For Lengths up to 12 ft [4 m], incl.		For Lengths over 12 ft [4 m]	
	Over	Under	Over	Under
Up to 3 in. [75 mm], excl	$\frac{3}{16}$ in. [4.8 mm]	0	$\frac{1}{4}$ in. [6.5 mm]	0

^A Multiple Lengths — Unless otherwise specified, $\frac{1}{4}$ in. [6.5 mm] is added to the total length of each piece for each multiple contained.

^B Random Lengths — When ordered as random lengths, permissible variation is 2 ft [0.6 m] over and under the specified length. When ordered as random lengths subject to a minimum length requirement, permissible variation is 2 ft [0.6 m] over and nothing under the specified length.

TABLE 18
 TWIST TOLERANCES

GENERAL NOTES:

- The amount of spiraling in an extruded shape is called twist. It can be measured by the height of the high corner from a flat reference base (established rise).
- Using the following calculation the twist tolerance must not exceed what is shown in the table.

$$\text{Rise in 5 ft.} = \frac{\text{established rise} \times \text{number of ft. in length}}{5}$$

Section Width	Rise in 5 ft
$\frac{1}{2}$ in. (13 mm) to $1\frac{1}{2}$ in. (39 mm)	0.125 in. (3.00 mm)
Over $1\frac{1}{2}$ in. (39 mm) to 4 in. (100 mm)	0.188 in. (4.80 mm)
Over 4 in. (100 mm)	0.250 in. (6.50 mm)

ANNEX

(Mandatory Information)

A1. REQUIREMENTS FOR THE INTRODUCTION OF NEW MATERIALS

A1.1 New materials may be proposed for inclusion in specifications referencing this Specification of General Requirements, subject to the following conditions:

A1.1.1 The application for the addition of a new grade to a specification shall be made to the chairman of the subcommittee which has jurisdiction over that specification.

A1.1.2 The application shall be accompanied by a statement from at least one user indicating that there is a

need for the new grade to be included in the applicable specification.

A1.1.3 The application shall be accompanied by test data as required by the applicable specification. Test data from a minimum of three test lots, as defined by the specification, each from a different heat, shall be furnished.

A1.1.4 The application shall provide recommendations for all requirements appearing in the applicable specification.

A1.1.5 The application shall state whether the new grade is covered by patent.

APPENDICES

(Nonmandatory Information)

X1. RATIONALE REGARDING DEFINITION OF LOT FOR MECHANICAL PROPERTIES AND CORROSION TESTING

X1.1 It is generally recognized that material described as a lot must be “produced under the same processing conditions,” which means the same manufacturing order number, same size, same heat, same heat-treating procedure, and same subsequent processing. Under those conditions, single samples can be selected to be representative of the total lot, with at least one sample for each 20 000 pounds of material.

X1.2 Following the principle described in X1.1 generally requires that the producer control each of several furnace loads constituting the same lot so that:

X1.2.1 Set point temperature and process tolerance match,

X1.2.2 Time at temperature for all thermal treatment shall match within 10%,

X1.2.3 All furnaces used be similar in size and meet the uniformity requirements of a documented furnace quality assurance program and,

X1.2.4 The quench systems are the same with respect to volume, type of quenchant, and circulation rate.

X1.2.5 Further, it would be expected that grouped loads be handled within a relatively short time period, and that hardness testing be performed on at least one sample per charge.

X1.3 The old definition of a lot for mechanical testing based on simply the words “same size, heat, and heat treatment charge in a batch furnace” assumes that heat treating is the only process affecting properties. This kind of definition ignores the effects of other processing, prior to and subsequent to heat treating. Moreover, it assumes that each heat-treated batch will be uniform and unique rather than reproducible. In reality, heat treating is a process which can be controlled easily throughout a batch and from batch to batch, with the net result that multiple batches can be considered part of a single lot if equipment and processing parameters meet the mandates of X1.1 and X1.2.

X1.4 The sampling specified for mechanical properties is not a statistical sampling plan. Therefore, it provides only typical data. Assurance of uniformity within the lot can be obtained only by the producer adequately controlling the processing parameters.

X2. BAR CODING

X2.1 Bar coding to identify steel is not specifically addressed in Committee A-1 specifications. Committee A-1 endorses the AIAG bar code standard for primary metals for steel products and proposes that this bar coding standard be considered as a possible auxiliary method of identification.

SPECIFICATION FOR STEEL CASTINGS SUITABLE FOR PRESSURE SERVICE

SA-487/SA-487M

[Identical with ASTM Specification A 487/A 487M-93(R07).]

1. Scope

1.1 This specification covers low-alloy steels and martensitic stainless steels in the normalized and tempered, or quenched and tempered, condition suitable for pressure-containing parts. The weldability of the classes in this specification varies from readily weldable to weldable only with adequate precautions, and the weldability of each class should be considered prior to assembly by fusion welding.

1.2 Selection will depend on design, mechanical, and service conditions. Users should note that hardenability of some of the grades mentioned may restrict the maximum size at which the required mechanical properties are obtained.

1.3 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification. Inch-pound units are applicable for material ordered to Specification A 487 and SI units for material ordered to Specification A 487M.

2. Referenced Documents

2.1 ASTM Standards:

A 370 Test Methods and Definitions for Mechanical Testing of Steel Products
A 488/A 488M Practice for Steel Castings, Welding, Qualifications of Procedures and Personnel
A 703/A 703M Specification for Steel Castings, General Requirements, for Pressure-Containing Parts
E 165 Practice for Liquid Penetrant Method
E 709 Practice for Magnetic Particle Examination

2.2 *American Society of Mechanical Engineers:*
ASME Boiler and Pressure Vessel Code, Section IX

2.3 *Manufacturers Standardization Society of the Valve and Fittings Industry Standards:*

SP-55 Quality Standard for Steel Castings — Visual Method

3. General Conditions for Delivery

3.1 Material furnished to this specification shall conform to the applicable requirements of Specification A 703/A 703M, including the supplementary requirements that are indicated on the purchase order. Failure to comply with the general requirements of Specification A 703/A 703M constitutes nonconformance with this specification. In case of conflict between the requirements of this specification and Specification A 703/A 703M, this specification shall prevail.

4. Ordering Information

4.1 The inquiry and order should include or indicate the following:

4.1.1 A description of the casting by pattern number or drawing (dimensional tolerances shall be included on the casting drawing),

4.1.2 ASTM designation and year of issue,

4.1.3 Grade and class of steel,

4.1.4 Options in the specification, and

4.1.5 The supplementary requirements desired including the standard of acceptance.

5. Heat Treatment

5.1 All castings shall receive a heat treatment indicated in Table 1. Preliminary heat treatment prior to final heat treatment as well as multiple tempering is permitted.

5.2 Heat treatment shall be performed after the castings have been allowed to cool below the transformation range.

5.3 The furnace temperature for heat treating shall be effectively controlled by use of recording-type pyrometers.

6. Chemical Composition

6.1 The steel shall conform to the requirements as to chemical composition prescribed in Table 2. Product analysis tolerance shall conform to the product analysis tolerance shown in Specification A 703/A 703M. Product analysis tolerances for stainless grades are not presently applicable pending development of these limits.

7. Tensile Requirements

7.1 Tensile properties of steel used for the castings shall conform to the requirements prescribed in Table 3.

8. Quality

8.1 The surface of the casting shall be free of adhering sand, scale, cracks, and hot tears as determined by visual examination. Other surface discontinuities shall meet the visual acceptance standards specified in the order. Visual Method SP-55 or other visual standards may be used to define acceptable surface discontinuities and finish. Unacceptable visual surface discontinuities shall be removed and their removal verified by visual examination of the resultant cavities. When methods involving high temperatures are used in the removal and repair of discontinuities, the casting shall be preheated to at least the minimum temperature in Table 4.

8.2 The castings shall not be peened, plugged, or impregnated to stop leaks.

9. Repair By Welding

9.1 For castings, other than those intended for use under ASME Boiler and Pressure Vessel Code, repairs shall be made using procedures and welders qualified under Practice A 488/A 488M.

9.2 On castings intended for use under the ASME Boiler and Pressure Vessel Code, repairs shall be made by procedures and welders qualified under Section IX of that code.

9.3 After repair welding, all castings shall be postweld heat treated in accordance with Table 4 or reheat treated in accordance with Table 1.

9.4 Weld repairs shall be inspected using the same quality standards as are used to inspect the castings. Re-examination of the weld repair by radiography when Supplementary Requirement S5 has been specified will not be necessary when an applicable surface inspection method was used to locate the discontinuity except for the following:

9.4.1 Weld repairs on castings which have leaked on hydrostatic test.

9.4.2 Weld repairs on castings in which the depth of any cavity prepared for repair welding is more than 20% of the wall thickness or 1 in. [25 mm], whichever is smaller.

9.4.3 Weld repairs on castings in which any cavity prepared for welding is greater than approximately 10 in.² [65 cm²].

10. Product Marking

10.1 Castings shall be marked for material identification with the grade and class symbols (1-A, 4-C, CA15-A).

TABLE 4
MINIMUM PRE-HEAT AND POST WELD HEAT TREAT REQUIREMENTS

Grade	Class	Minimum Pre-Heat Temperature, °F [°C]	Post Weld Heat Treat, °F [°C]
1	A, B	200 [95]	1100 [595] ^A minimum
1	C	200 [95]	1150 [620] ^A minimum
2	A, B	200 [95]	1100 [595] ^A minimum
2	C	200 [95]	1150 [620] ^A minimum
4	A, B, E	200 [95]	1100 [595] ^A minimum
4	C, D	200 [95]	1150 [620] ^A minimum
6	A, B	300 [150]	1100 [595] ^A minimum
7	A	300 [150]	1100 [595] ^A minimum
8	A, B, C	300 [150]	1250 [675] ^A minimum
9	A, B, E	300 [150]	1100 [595] ^A minimum
9	C, D	300 [150]	1150 [620] ^A minimum
10	A, B	300 [150]	1100 [595] ^A minimum
11	A, B	300 [150]	1100 [595] ^A minimum
12	A, B	300 [150]	1100 [595] ^A minimum
13	A, B	400 [205]	1100 [595] ^A minimum
14	A	400 [205]	1100 [595] ^A minimum
16	A	50 [10]	1100 [595] ^A minimum
CA15	A	400 [205]	1750 [955] air cool or liquid quench below 400°F [205°C] temper at 900°F [480°C] minimum
CA15	B	400 [205]	1100 [595] ^A minimum
CA15	C, D	400 [205]	1150 [620] ^A minimum
CA15M	A	400 [205]	1100 [595] ^A minimum
CA6NM	A	50 [10]	Final temper between 1050 [565] and 1150 [620]
CA6NM	B	50 [10]	Intermediate PWHT between 1225 [665] and 1275 [690] Final temper PWHT 1050 [565] and 1150 [620] ^B

^A Post weld heat treat temperature must be at or below the final tempering temperature.

^B The intermediate and final PWHT temperatures shall be the same as the intermediate and final tempering temperatures, respectively, as the original heat treatment of the castings. Cool to below 200°F (95°C) between the intermediate and final PWHT.

SUPPLEMENTARY REQUIREMENTS

The following supplementary requirements shall not apply unless specified in the purchase order.

A list of standardized supplementary requirements for use at the option of the purchaser is included in Specification A 703/A 703M. Those which are ordinarily considered suitable for use with this specification are given below. Others enumerated in Specification A 703/A 703M may be used with this specification upon agreement between the manufacturer and purchaser.

S1. Unspecified Elements

S4. Magnetic Particle Inspection

S5. Radiographic Inspection

S8. Charpy Impact Test

S8.1 In addition to the requirements listed in S8 of Specification A 703/A 703M, the following specific requirements apply to this specification:

S8.1.1 When S8 is specified for Grades 1B, 2B, 4B, 6B, 7A, 8B, 9B, or 10B, impact properties shall be determined by performing a Charpy V-notch impact test at -50°F [-46°C] with a specific minimum average value of 15 ft-lb [20 J] and a specified minimum single value of 10 ft-lb [14 J]. Other temperatures may be used upon agreement between the manufacturer and the purchaser, in which case S8.1.3 shall apply. Other higher specified minimum average and single values may be used upon agreement between the manufacturer and the purchaser.

S8.1.2 Impact requirements for grades other than 1B, 2B, 4B, 6B, 7A, 8B, 9B, and 10B shall be agreed upon between the manufacturer and the purchaser.

S8.1.3 When an impact test temperature other than -50°F [-46°C] is used for those grades listed in S8.1.1, the lowest test temperature at which the material meets the impact requirements shall be stamped with low stress stamps immediately ahead of the material symbol on the raised pad (for example, 25 10B for $+25^{\circ}\text{F}$ [-4°C] and 025 10B for -25°F [-32°C]).

S10. Examination of Weld Preparation

S10.1 The method of performing the magnetic particle or liquid penetrant test shall be in accordance with Practice E 709 or Practice E 165.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR CASTINGS, NICKEL AND NICKEL ALLOY

SA-494/SA-494M

(Identical with Section II, Part B, SA-494/SA-494M-05 except that Certification has been made mandatory, marking requires ASME designation.)

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR QUENCHED AND TEMPERED VACUUM-TREATED CARBON AND ALLOY STEEL FORGINGS FOR PRESSURE VESSELS

SA-508/SA-508M

(Identical with ASTM Specification A 508/A 508M-05b)

1. Scope

1.1 This specification covers quenched and tempered vacuum-treated carbon and alloy steel forgings for pressure vessels such as those used in reactor systems. Specifically, it covers forgings for vessel closures, shells, flanges, tube sheets, rings, heads, and similar parts.

1.2 All grades are considered weldable under proper conditions. Welding technique is of fundamental importance, and it is presupposed that welding procedure and inspection will be in accordance with approved methods for the grade of material used.

1.3 The values stated in either SI units or inch-pound units are to be regarded separately as standard. The values stated in each system may not be exact equivalents; therefore, each system shall be used independently of the other. Combining values from the two systems may result in nonconformance with the standard.

1.4 Unless the order specifies the applicable “M” specification designation, the material shall be furnished to the inch-pound units.

NOTE 1: Grades 1 and 1A are composed of different chemistries but have the same mechanical requirements.

NOTE 2: Designations have been changed as follows:

Current	Formerly
Grade 1	Class 1
Grade 1A	Class 1A
Grade 2 Class 1	Class 2
Grade 2 Class 2	Class 2A
Grade 3 Class 1	Class 3
Grade 3 Class 2	Class 3A
Grade 4N Class 1	Class 4
Grade 4N Class 2	Class 4A
Grade 4N Class 3	Class 4B
Grade 5 Class 1	Class 5
Grade 5 Class 2	Class 5A
Grade 22 Class 3	Class 22B
Grade 22 Classes 4, 5, 6, and 7	
Grade 3V	Class 3V

1.5 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

Boiler and Pressure Vessel Code—Section III, Articles NB 2300, NC 2300, ND 2300, NE 2300, NF 2300, NG 2300

3. Ordering Information

3.1 Purchase Order—In addition to the ordering information required by Specification A 788/A 788M, the purchaser shall include with the inquiry and order a detailed drawing that locates the areas of significant loading in the forging (when required), the method of selecting test locations (see 6.1.5 and 6.1.6), and purchase options (see

4.2.2, 6.2, and 10.1) and any supplementary requirements desired.

3.2 Forging Drawing—Each forging shall be manufactured in accordance with a purchaser-approved drawing showing the prequenched dimensions, the finished dimensions, the surfaces that will be subjected to significant loading, and the locations of mechanical test specimens.

3.3 Material supplied to this specification shall conform to the requirements of Specification A 788/A 788M, which outlines additional ordering information, manufacturing requirements, testing and retesting methods and procedures, marking, certification, product analysis variations, and additional supplementary requirements.

3.3.1 When specified by the purchaser, it is permissible to perform Magnetic particle examination using the AC yoke in accordance with Test Method A 966/A 966M instead of using Test Method A 275/A 275M (see 8.2.1).

3.4 The optional minimum silicon content as expressed in Footnote B to Table 1, if required.

3.5 If the requirements of this specification are in conflict with the requirements of Specification A 788/A 788M, the requirements of this specification shall prevail.

4. Materials and Manufacture

4.1 Melting Process:

4.1.1 The steel shall be made by the basic electric-furnace process except when secondary ladle refining or the remelting process is employed, in which case the melting processes of Specification A 788/A 788M are permitted.

4.1.2 The molten steel shall be vacuum treated in accordance with the methods described in Specification A 788/A 788M, prior to or during the pouring of the ingot, in order to remove objectionable gases, particularly hydrogen.

Grade 22 Classes 4, 5, 6, and 7 liquid steel shall be produced to a fine grain melting practice which has been shown to result in a prior austenitic grain size of five or finer.

4.1.3 Discard—Sufficient discard shall be made from each ingot to secure freedom from piping and excessive segregation.

4.2 Heat Treatment:

4.2.1 Preliminary Heat Treatment—After forging and before reheating, the forgings shall be cooled to provide substantially complete transformation of austenite. Preliminary heat treatment may be applied to improve machinability and to enhance subsequent heat treatments.

4.2.2 Heat Treatment for Mechanical Properties—The forgings shall be heated to a temperature which produces an austenitic structure and then quenched in a suitable liquid medium by spraying or immersion. For Grade

4N, Classes 1 and 3, the austenitizing temperature shall be 1540°F [840°C] min to 1640°F [895°C] max. Quenching shall be followed by tempering at a subcritical temperature and holding at this temperature for a minimum time of one-half hour per inch of maximum section thickness. Except when Supplementary Requirement S13 is specified for Grades 2 and 3, the minimum tempering temperatures shall be as follows:

Grades 1, 1A, 2 Class 2, and 3 Class 2	1150°F [620°C]
Grades 2 Class 1 and 3 Class 1	1200°F [650°C]
Grades 4N Classes 1 and 2, and 5	1100°F [595°C]
Classes 1 and 2	
Grade 4N Class 3	1125°F [605°C]
Grades 3V and 3VCb	1250°F [675°C]
Grade 22, Class 3	1200°F [650°C]
Grade 22, Classes 4, 5, 6, and 7	1100°F [593°C]

Specific cooling rates from the tempering temperature shall be applied if Supplementary Requirement S14 is specified.

4.3 For Grades 1, 1A, 2, 2A, 3, or 3A, a multiple stage austenitizing procedure may be used whereby the forging is first fully austenitized and liquid quenched, followed by reheating within the intercritical temperature range to partially reaustenitize and again liquid quenched. On completion of the austenitizing/quenching cycles, the forgings shall be tempered at a subcritical temperature as described in 4.2.2.

5. Chemical Composition

5.1 Heat Analysis—The heat analysis obtained from sampling in accordance with Specification A 788/A 788M shall comply with Table 1 except that the additional features of Supplementary Requirements S7, S8, S9, and S11 shall also apply as individually specified in the ordering information.

5.2 Product Analysis—The manufacturer shall use the product analysis provision of Specification A 788/A 788M to obtain a product analysis from a forging representing each heat or multiple heat. The permissible variations provided in the table on Permissible Variations in Product Analysis for Killed Steel in Specification A 788/A 788M apply for manganese, nickel, chromium, molybdenum, and vanadium only. Boron is not subject to product analysis. The purchaser may also make this determination in accordance with Specification A 788/A 788M.

6. Mechanical Properties

6.1 Tension Test:

6.1.1 The steel shall conform to the requirements of Table 2.

6.1.2 The location and number of tension test specimens for each forging or multiple forging shall be as follows:

6.1.2.1 *Multiple Forgings Separated into Identical Individual Forgings with Rough Machined Weights not Exceeding 1000 lb [455 kg] Prior to Quenching and Tempering Treatment*—At least one individual forging from each multiple forging in each heat-treating lot shall be tested using the test specimen locations of 6.1.5 or 6.1.6 as specified on the purchase orders, except that test specimens located at midlength may be closer to the ends of the production forging than the specified distance to the second surfaces. All forgings shall be quenched and tempered in the same furnace charge. All forgings from the multiple shall be Brinell hardness tested after heat treatment and forgings not tested for mechanical properties shall have a Brinell Hardness within 20 points of the Brinell Hardness of the forging that has been tested for mechanical properties.

6.1.2.2 *Forgings or Multiple Forgings (Note 3) with Rough Machined Weights Less than 10 000 lb [4540 kg] and Having a Heat-Treated Length (Exclusive of Test Prolongation) of 80 in. [2032 mm] or Less*—A test prolongation (Note 4) shall be located at one end. One tension test specimen shall be taken from the test prolongation.

6.1.2.3 *Forgings or Multiple Forgings with Rough Machined Weights Less than 10 000 lb [4540 kg] and Having a Heat-Treated Length (Exclusive of Test Prolongations) Exceeding 80 in. [2032 mm]*—A test prolongation shall be located at each end. One tension test specimen shall be taken from each test prolongation. An orientation of 180° shall be established between the two tension test specimens.

6.1.2.4 *Forgings or Multiple Forgings with Rough Machined Weights Over 10 000 lb [4540 kg] and Having a Heat-Treated Length (Exclusive of Test Prolongation) of 80 in. [2032 mm] or Less*—A test prolongation shall be located at one end. Two tension test specimens shall be taken from the test prolongation and shall be oriented 180° apart.

6.1.2.5 *Forgings or Multiple Forgings with Rough Machined Weights Over 10 000 lb [4540 kg] and Having a Heat-Treated Length (Exclusive of Test Prolongations) Exceeding 80 in. [2032 mm]*—A test prolongation shall be located at each end. The tension test specimens oriented 180° apart from each other shall be taken from each test prolongation. The two tension specimens located in one test prolongation shall be oriented 90° in relation to the two tension specimens located in the other test prolongation.

NOTE 3: Multiple forgings in 6.1.2.2 through 6.1.2.5 are those which will be separated after the quench and temper treatment.

NOTE 4: A test prolongation is defined as that integral test metal located at an end of the forging or forging multiples.

6.1.3 Samples for mechanical test specimen shall be removed from forgings after the quenching and tempering heat treatment. The sample material shall be subjected to a simulated post weld heat treatment if Supplementary Requirement S1 is specified.

6.1.4 For upset disk forgings, the longitudinal axis of the test specimens shall be in the tangential direction. For all other parts, the longitudinal axis of the specimens shall be parallel to the direction of major working of the forging.

6.1.5 Each forging shall be manufactured in accordance with a purchaser-approved drawing, showing the prequenched dimensions, the finished dimensions, the surfaces that will be subjected to critical stresses, and the location of mechanical test specimens.

6.1.6 The tension test specimens shall be positioned so that the longitudinal axis and mid-length is in accordance with one of the following methods:

6.1.6.1 *Method 1*— t by $2t$, where t is the distance from the area of significant loading (see 3.1) to the nearest quenched surface. However, they shall not be nearer to one quenched surface than $\frac{3}{4}$ in. [20 mm] and to the second quenched surface than $1\frac{1}{2}$ in. [40 mm].

6.1.6.2 *Method 2*— $\frac{1}{4}T$ by T , where T is the maximum thickness of the forging as heat treated. Where this method of testing is employed, the following limitations for as-treated thickness shall generally apply:

Grades 1 and 1a	3 in. [75 mm], max
Grades 2 Class 2 and 3 Class 2	6 in. [150 mm], max
Grades 2 Class 1 and 3 Class 1	8 in. [205 mm], max
Grade 4N Class 2 and 5 Class 2	16 in. [405 mm], max
Grade 4N Class 1 and 5 Class 1	30 in. [760 mm], max
Grade 4N Class 3	40 in. [1015 mm], max
Grades 3V and 3VCb	20 in. [510 mm], max
Grade 22 Class 3	20 in. [510 mm], max
Grade 22 Classes 4, 5, 6, and 7	12 in. [305 mm], max

6.1.6.3 *Method 3*—Test specimens shall be taken from a representative separate test forging made from the same heat of steel and shall receive substantially the same reduction and type of hot working as the production forgings that it represents and shall be of the same nominal thickness as the as-quenched production forgings. The separate test forging shall be heat treated in the same furnace charge and under the same conditions as the production forgings. Test specimens shall be removed from the region midway between the mid-thickness and the surface, and not closer than T to a second heat treated surface with the same limitation on forging thickness as in 6.1.6.2. This method shall be limited to forgings with a rough machined weight of not more than 1000 lb [455 kg].

6.1.6.4 Method 4—A thermal buffer ring, at least T by T in cross section, or segments of such a ring at least $3T$ in length, shall be welded to the test end of a forging prior to heat treatment for mechanical properties. The buffer material may be any weldable carbon or low-alloy steel and shall be joined to the forging with a partial-penetration type weld which completely seals the buffered surface. The test coupons shall be removed from the forging in the region buffered by the ring or ring segments. If ring segments are used, the test coupons shall be removed from the forging in the area under the buffer ring segment at a minimum distance of T from each end of that segment. In either case, the test specimens shall be located at a minimum distance of $\frac{1}{2}$ in. [13 mm] from the buffered surface of the forging, and at least $\frac{1}{4} T$ from a quenched surface of the forging.

NOTE 5: For forgings with a maximum thickness of 2 in. [50 mm], the specimens shall be taken at midthickness and at least 2 in. from a second surface. This provision is applicable to all four methods in 6.1.6.

6.1.7 Tension specimens shall be the standard 0.5 in. [12.5 mm] round by 2 in. [50 mm] gauge length, as shown in Test Methods and Definitions A 370.

6.2 Impact Test—The steel shall conform to the requirements of Table 3, or Supplementary Requirement S10 may be specified instead of these requirements.

6.2.1 Number, Location, and Orientation of Specimens:

6.2.1.1 One set of three Charpy V-notch specimens shall be taken from each tensile specimen location required in 6.1.2. Orientation shall be the same as in 6.1.4. When S10 is specified, the required number of tests shall be governed by NB, NC, ND, NE, NF, or NG 2300, as applicable.

6.2.1.2 The requirements of 6.1.3 also apply to impact specimens.

6.2.1.3 The longitudinal axis and mid-length of the impact specimen shall be located similarly to the longitudinal axis of the tension test specimens as defined in 6.1.6. The axis of the notch shall be normal to the nearest heat-treated surface of the forging. When S10 is specified the orientation shall be governed by NB, NC, ND, NE, NF, or NG 2300.

6.2.2 Impact specimens shall be Charpy V-notch as shown in Test Methods and Definitions A 370.

7. Workmanship and Quality Level Requirements

7.1 See requirements in 8.1, 8.2.2, 8.3.1.1, and 8.3.2.2.

8. Nondestructive Inspection Requirements

8.1 General Requirements—Dimensional and visual inspections, and magnetic particle and ultrasonic inspection

shall be conducted by the manufacturer. Forgings shall be free of cracks, thermal ruptures, or other injurious indications.

8.2 Magnetic Particle Inspection:

8.2.1 Following final machining by the manufacturer all accessible surfaces of each forging shall be examined by the continuous current magnetic particle method. This examination shall be in accordance with Test Method A 275/A 275M unless the purchaser has required the use of the AC yoke in accordance with Test Method A 966/A 966M instead (see 3.3.1).

8.2.2 The following conditions are subject to rejection or removal:

8.2.2.1 Indications with major dimension exceeding $\frac{3}{16}$ in. [4.8 mm].

8.2.2.2 Four or more indications exceeding $\frac{1}{16}$ in. [1.6 mm] in major dimensions that are aligned and separated by $\frac{1}{16}$ in. [1.6 mm] or less end to end.

8.2.2.3 Ten or more indications exceeding $\frac{1}{16}$ in. [1.6 mm] in major dimensions contained in any 6 in.² [39 cm²] of surface, with the major dimension of this area not to exceed 6 in. [150 mm]. The area shall be taken in the most unfavorable location relative to the indications being evaluated.

8.3 Ultrasonic Inspection—Forgings shall be ultrasonically inspected in accordance with the procedures of Practice A 388/A 388M.

8.3.1 Longitudinal Wave Inspection:

8.3.1.1 Unless otherwise specified by Supplementary Requirement S2, the back reflection method of tuning shall be used in accordance with 7.2.2.1 of Practice A 388/A 388M. In addition to the reportable conditions in Section 7 of Practice A 388/A 388M, indications exceeding the resultant back reflection shall be recorded. The following conditions are considered rejectable:

8.3.1.2 Complete loss of back reflection not associated with forging configuration or surface and accompanied by an indication of a discontinuity. For this purpose, a back reflection less than 5% of full screen height shall be considered complete loss of back reflection.

8.3.1.3 Indications whose amplitude equals or exceeds that of the back reflection established in an indication-free area of the forging.

8.3.2 Angle Beam Inspection:

8.3.2.1 Calibration notches shall be cut into the inside- and outside-diameter surfaces with a depth equal to 3% of the nominal section thickness (or $\frac{3}{8}$ in. [9.5 mm], max), a length of approximately 1 in. [25 mm], and a width not greater than twice its depth. Adjust instrument controls to obtain an indication from the inside-diameter notch

approximately 75% of full screen height. Measure the amplitude of indication from the outside-diameter notch. Draw a straight line on the shield in front of the cathode ray tube from this peak to that of the inside-diameter notch and continue it as a horizontal line to the initial pulse. This line constitutes the angle beam reference line.

8.3.2.2 A forging containing a discontinuity which results in an indication exceeding the amplitude of the reference line is subject to rejection.

NOTE 6: Signals from discontinuities within approximately $\frac{1}{4}$ in. [6.4 mm] of inside and outside surfaces are reinforced by wave trapping during angle beam inspection; they are therefore amplified in respect to internal discontinuities.

8.3.3 The report of the ultrasonic inspection shall be in compliance with Section 8 of Practice A 388/A 388M.

8.3.4 Additional nondestructive inspection or trepanning may be employed to resolve questions of interpretation of ultrasonic indications. The manufacturer shall accept responsibility for injurious indications which will not be removed in final machining.

9. Repair Welding

9.1 Repair welding of forgings may be permitted, but only at the option of the purchaser.

9.2 If repair welding is performed, welders and weld procedures shall be qualified in accordance with Section IX of the ASME Boiler and Pressure Vessel Code.

10. Certification and Reports

10.1 In addition to items to be reported by Specification A 788/A 788M, the following items shall also be reported:

10.1.1 Product chemical analysis,

10.1.2 The method used for locating test specimens, and

10.1.3 Sketches showing the locations of all recordable indications in the report of all nondestructive examinations.

10.1.3.1 If Test Method A 966/A 966M has been used, this also shall be recorded in the certification.

10.1.4 Details of the heat treatment cycle, as listed in Specification A 788/A 788M.

11. Product Marking

11.1 The purchaser may specify additional identification marking and the location of the stamping. The type of stamps to be used when impression stamping is performed shall be round-nosed or "interrupted-dot" die stamps having a minimum radius of $\frac{1}{32}$ in. [0.8 mm].

12. Keywords

12.1 chromium-molybdenum steel; nickel-chromium-molybdenum alloy steels; pressure vessel service; quenched and tempered steels; steel forgings—alloy; steel forgings—carbon; vacuum-treated steels

NOTES:

(A) For Grade 22 Classes 5, 6, and 7 with section thickness at heat treat of 8 in. or greater, the carbon and manganese shall be held to 0.13 to 0.15 and 0.50 to 0.60, respectively.

(B) When required by the purchaser a minimum silicon content of 0.15% shall apply for Grades 1, 1A, 2, 3, and 4N.

(C) Aluminum content reported shall be the combined total soluble and insoluble aluminum.

TABLE 2
TENSILE REQUIREMENTS

[illegible]

TABLE 3
CHARPY IMPACT REQUIREMENTS

	Grades 1 and 1a at +40°F [4.4°C]	Grades 2 Class 1 and 3 Class 1 at +40°F [4.4°C]	Grades 2 Class 2 and 3 Class 2 at +70°F [21°C]	Grades 4N (all classes) and 5 (all classes) at -20°F [-29°C]	Grade 22, Class 3, and Grades 3V and 3VCb at 0°F [-18°C]	Grade 6 Classes 1, 2, 3, and 4 at -75°F [-59°C]	Grade 22 Classes 4, 5, 6, and 7 at -75°F [-60°C]
Minimum average value of set of three specimens, ft•lbf (J) (A)	15 [20]	30 [41]	35 [48]	35 [48]	40 [54]	20 [27]	40 [55]
Minimum value of one specimen, ft lbf (J)	10 [14]	25 [34]	30 [41]	30 [41]	35 [50]	15 [20]	35 [50]

NOTE:

(A) Not more than one specimen from a set may be below this value.

SUPPLEMENTARY REQUIREMENTS

One or more of the following supplementary requirements shall apply only when specified by the purchaser in the inquiry or order. Details of these supplementary requirements shall be agreed upon between the manufacturer and the purchaser.

S1. Simulated Post-Weld Heat Treatment of Mechanical Test Samples

S1.1 All test coupons shall be subjected to single or multiple heat treatments at subcritical temperatures prior to testing. Such treatments are intended to simulate post-weld or other treatments to which the forgings will be subjected during subsequent fabrication. The purchaser shall furnish the manufacturer with details of the desired heat treatment for the test coupons, including temperatures, timers, and cooling rates.

S2. Ultrasonic Testing-Reference Block Calibration (for examining sections 24 in. [610 mm] thick or less)

S2.1 Reference blocks of acoustically similar metal shall be used for calibration. Blocks shall meet one of the following requirements:

S2.1.1 A comparison of the back reflections between equivalent thicknesses of the reference block material and the actual forging to be tested, without change in instrument setting shall not show a variation in excess of 25%.

S2.1.2 The reference blocks shall be manufactured from steel that is similar in chemistry and processing history to the production forging being tested. The reference blocks shall be fabricated in accordance with the procedures of Practice E 428.

S2.2 For test sections up to 12 in. [305 mm] thick, the reference blocks shall contain a $\frac{1}{4}$ in. [6.4 mm] diameter flat-bottom hole; for over 12 to 18 in. [305 to 457 mm], the hole diameter shall be $\frac{3}{8}$ in. [9.5 mm]; and for over 18 to 24 in. [457 to 610 mm], it shall be $\frac{1}{2}$ in. [13 mm].

S2.3 A distance-amplitude correction curve shall be established for the proper grade of steel and specified hole size.

S2.4 A forging containing one or more indications equal in amplitude to that of the applicable reference hole, when properly corrected for distance, is subject to rejection.

S3. Charpy V-Notch Impact Transition Curve

S3.1 Sufficient impact tests shall be made from the forging test material to establish a temperature-absorbed

energy curve. The test-temperature range shall be wide enough to establish the upper and lower shelf foot-pound energies, with sufficient testing at intermediate temperatures to permit plotting a reasonably smooth curve.

S4. Additional Charpy Data

S4.1 The percent shear fracture and mils of lateral expansion, defined in Test Methods and Definitions A 370, shall be reported for each Charpy specimen tested.

S4.2 Acceptance values for percent shear fracture and/or lateral expansion values shall be as specified by the purchaser.

S5. Alternative Impact Test

S5.1 Charpy impact tests shall be made in accordance with the provisions of 6.2 of the specification except that the test temperature shall be lower than specified in Table 3. This test shall be instead of that specified in 6.2.

S6. Drop-Weight Test

S6.1 Drop-weight tests shall be conducted in accordance with the requirements of Test Method E 208. The fracture plane of the specimens shall coincide with the location required for other mechanical test specimens as specified by the purchaser in accordance with 6.1.6. However, since the drop weight specimen can be taken in any orientation, the fracture plane of the specimen when tested to Method 1 (6.1.6.1) shall be a minimum distance of $\frac{7}{16}$ in. [11 mm] from the nearest quenched surface, and $1\frac{1}{2}$ in. [38 mm] from any second surface. The purchaser may specify either duplicate no-break performance when tested 10°F [6°C] warmer than a specified temperature or request a determination of the NDT temperature.

S7. Restrictive Chemistry for Grades 4N and 5

S7.1 Phosphorus and sulfur limits for Grades 4N and 5 shall be 0.015% maximum heat and 0.018% maximum product.

S8. Additional Vanadium

S8.1 The vanadium content for Grade 5 forgings shall be 0.05 to 0.15%.

S9. Restrictive Chemistry for Grades 2, 3, or 4N

S9.1 Grades 2, 3, or 4N shall be specified with restricted phosphorus and copper limits, as follows:

S9.1.1 P 0.012 maximum heat and 0.015 maximum product; Cu 0.10 maximum heat and product, or

S9.1.2 P 0.015 maximum heat and 0.018 maximum product; Cu 0.15 maximum heat and product.

S9.2 Grades 2, 3, 4N shall be specified with restricted sulfur of 0.015 heat and 0.018 product.

S10. Alternative Fracture Toughness Requirements

S10.1 The fracture toughness requirements (drop weight and Charpy impact tests) for materials of the ASME Boiler and Pressure Vessel Code, Section III, Articles NB-2300, NC-2300, ND-2300, NE-2300, NF-2300, or NG-2300, as specified, shall be used instead of the Charpy impact test requirements of this specification.

S11. Vacuum Carbon-Deoxidized Steels

S11.1 Material made to Grades 1, 1a, 2, 3, 4N, or 5 shall be vacuum carbon-deoxidized, in which case the silicon content shall be 0.10% max. The test report shall indicate that the steel was vacuum carbon-deoxidized.

S12. Vacuum-Treated Basic Oxygen Furnace Steels

S12.1 For Grades 1, 1a, 2, or 3 material, vacuum-treated basic oxygen furnace steel shall be used.

S13. Minimum Tempering Temperature

S13.1 For Grades 2 Class 1 and 3 Class 1 the minimum tempering temperature shall be 1175°F [635°C] and the simulated post weld heat treatment temperature shall not exceed 1150°F [620°C] when S1 is required.

S14. Cooling from the Tempering Temperature

S14.1 The purchaser shall provide specific cooling rates from the tempering temperature.

S15. Product Analysis

S15.1 More than one forging per heat shall be subject to product analysis by either the manufacturer or purchaser. The purchaser shall indicate in the ordering information the number of forgings to be tested, and whether the manufacturer, purchaser, or both shall perform the additional analyses.

S16. Silicon Content

S16.1 The silicon content shall be 0.05 to 0.15% as a result of ladle refining with aluminum as the deoxidizer. Use of Vacuum Ladle Degassing is optional.

SPECIFICATION FOR ELECTRIC-RESISTANCE-WELDED CARBON AND ALLOY STEEL MECHANICAL TUBING

SA-513

(Identical with ASTM Specification A 513-00 except that Supplementary Requirements S6 and either S7 or S8 at the manufacturer's option are mandatory.)

1. Scope

1.1 This specification covers electric-resistance-welded carbon and alloy steel tubing for use as mechanical tubing.

1.2 This specification covers mechanical tubing made from hot- or cold-rolled steel.

1.3 This specification covers round, square, rectangular, and special shape tubing.

Type	Size Range (Round Tubing)
Electric-Resistance- Welded Tubing from Hot-Rolled Steel	outside diameter from $\frac{1}{2}$ to 15 in. (19.0 to 381.0 mm) wall from 0.065 to 0.650 in. (1.65 to 16.50 mm)
Electric-Resistance- Welded Tubing from Cold-Rolled Steel	outside diameter from $\frac{3}{8}$ to 12 in. (9.92 to 304.8 mm) wall from 0.022 to 0.134 in. (0.71 to 3.40 mm)

1.4 Optional supplementary requirements are provided and when desired, shall be so stated in the order.

1.5 The values stated in inch-pound units are to be regarded as the standard.

2. Referenced Documents

2.2 ANSI Standard:

B 46.1 Surface Texture

2.3 Military Standards:

MIL-STD-129 Marking for Shipment and Storage

MIL-STD-163 Steel Mill Products Preparation for Shipment and Storage

2.4 Federal Standard:

Fed. Std. No. 123 Marking for Shipments (Civil Agencies)

3. Ordering Information

3.1 Orders for material under this specification should include the following as required to adequately describe the desired material:

3.1.1 Quantity (feet or number of lengths),

3.1.2 Name of material (electric resistance-welded carbon or alloy steel mechanical tubing),

3.1.3 Type, description and code letters, (Section 1 and 12.1),

3.1.4 Thermal condition, (12.2),

3.1.5 Flash condition, (12.3),

3.1.6 Grade designation, if required, (Section 5),

3.1.7 Report chemical analysis and product analysis, if required (Sections 6 and 7),

3.1.8 Individual supplementary requirements, if required (S1 to S10, inclusive),

3.1.9 Cross section (round, square, rectangular and special shapes),

3.1.10 Dimensions, round, outside and inside and wall thickness (see 8.1 and 8.2) or square and rectangular, outside dimension and wall thickness and corner radii, if required (see 9.1 and 9.2),

3.1.11 Surface finish (see 11.2),

3.1.12 Length, round, mill lengths or definite cut length (see 8.3), square and rectangular, specified length (see 9.4),

3.1.13 Squareness of cut, round tubing, if required, (see 8.4),

3.1.14 Burrs removed, if required (see 11.3),

3.1.15 Protective coating (see 14.1),

3.1.16 Special packaging (see 17.1),

3.1.17 Specification designation,

3.1.18 End use,

3.1.19 Special requirements,

3.1.20 Special marking (Section 16), and

3.1.21 Straightness Test Method (see 8.5 and 9.6).

4. Materials and Manufacture

4.1 The steel may be made by any process.

4.2 If a specific type of melting is required by the purchaser, it shall be as stated on the purchase order.

4.3 The primary melting may incorporate separate degassing or refining, and may be followed by secondary melting, such as electroslag or vacuum-arc remelting. If secondary melting is employed, the heat shall be defined as all of the ingots remelted from a single primary heat.

4.4 Steel may be cast in ingots or may be strand cast. When steel of different grades is sequentially strand cast, identification of the resultant transition material is required. The producer shall remove the transition material by an established procedure that positively separates the grades.

4.5 Tubes shall be made by the electric-resistance-welded process and shall be made from hot- or cold-rolled steel as specified.

5. Chemical Composition

5.1 The steel shall conform to the requirements as to chemical composition prescribed in Tables 1 and 2. If no grade is specified, Grades MT 1010 to MT 1020 may be furnished. Analyses of steels other than those listed are available. To determine their availability, the purchaser should contact the producer.

5.2 When a carbon steel grade is ordered under this specification, supplying an alloy grade that specifically requires the addition of any element other than those listed for the ordered grade in Tables 1 and 2 is not permitted.

6. Heat Analysis

6.1 An analysis of each heat of steel shall be made by the steel manufacturer to determine the percentages of the elements specified; if secondary melting processes are employed, the heat analysis shall be obtained from one remelted ingot or the product of one remelted ingot of each primary melt. The heat analysis shall conform to the requirements specified, except that where the heat identity has not been maintained or where the analysis is not sufficiently complete to permit conformance to be determined, the chemical composition determined from a product analysis made by the tubular manufacturer shall conform to the requirements specified for heat analysis. When requested in the order or contract, a report of such analysis shall be furnished to the purchaser.

7. Product Analysis

7.1 When requested on the purchase order, a product analysis shall be made by the supplier. The number and source of samples for such product analysis shall be based on the individual heat or lot identity of one of the following forms of material:

7.1.1 Heat Identity Maintained—One product analysis per heat shall be made on either the flat-rolled stock or tube.

7.1.2 Heat Identity Not Maintained—A product from one tube per 2000 ft (610 m) or less for sizes over 3 in. (76.2 mm), and one tube per 5000 ft (150 m) or less for sizes 3 in. and under.

7.2 Samples for product analysis except for spectrochemical analysis shall be taken in accordance with Practice E 1806. The composition thus determined shall correspond to the requirements of Tables 1-3.

7.3 If the original test for product analysis fails, retests of two additional lengths of flat-rolled stock or tubes shall be made. Both retests for the elements in question shall meet the requirements of the specification; otherwise, all remaining material in the heat or lot shall be rejected or, at the option of the producer, each length of flat-rolled stock or tube may be individually tested for acceptance. Lengths of flat-rolled stock or tubes which do not meet the requirements of the specification shall be rejected.

8. Permissible Variations in Dimensions for Round Tubing

8.1 Diameter and Wall Thickness (Hot-Rolled Steel)—Variations from specified outside diameter for “as-welded”

and “as-welded and annealed” tubing made from hot-rolled steel shall not exceed the amounts prescribed in Table 4. Permissible variations in outside diameter for tubing that has been sink-drawn for closer tolerance on outside diameter are shown in Table 5. Permissible variations in wall thickness for tubing that has been sink-drawn for closer tolerances on outside diameters are $\pm 10\%$ of the nominal wall or ± 0.010 in. (0.25 mm), whichever is greater. Permissible variations in wall thickness for tubing made from hot-rolled steel are shown in Table 6. Permissible variation in outside and inside diameter for tubing made from hot-rolled steel that has been mandrel drawn for closer tolerances are shown in Table 5 with wall tolerances shown in Table 7.

8.2 Diameter and Wall Thickness (Cold-Rolled Steel)—Variations in outside diameter and inside diameter of “as-welded” and “as-welded and annealed” tubing made from cold-rolled steel are shown in Table 8. Outside diameter tolerances for cold-rolled steel tubing, sink drawn and mandrel drawn, are shown in Table 5. Wall thickness tolerances for “as-welded” tubing made from cold-rolled steel are shown in Table 9. Permissible variations in wall thickness for round tubing, mandrel drawn for closer tolerances, are shown in Table 7. Permissible variations in wall thickness for tubing that has been sink-drawn for closer tolerances on outside diameter are $\pm 10\%$ of the nominal wall or ± 0.010 in. (0.25 mm), whichever is greater.

8.3 Length (Hot- and Cold-Rolled Steel)—Mechanical tubing is commonly furnished in mill lengths 5 ft (1.5 m) and over. Definite cut lengths are furnished when specified by the purchaser. Tolerances for definite cut lengths round tubing shall be as given in Tables 10 and 11.

8.4 Squareness of Cut (Hot- and Cold-Rolled Steel)—When specified, tolerance for squareness of cut of round tubing shall be as given in Table 12. Measurements are made with use of an “L” square and feeler gage. Side leg of square to be equal to tube diameter except minimum length of 1 in. (25.4 mm) and maximum length of 4 in. (101.6 mm). Outside diameter burr to be removed for measurement.

8.5 Straightness—The straightness tolerance for round tubing is 0.030 in./3 ft (0.76 mm/1 m) lengths to 8.000 in. (203 mm) outside diameter. For 8.000 in. outside diameter and above, straightness tolerance is 0.060 in./3 ft (1.52 mm/1 m) lengths. For lengths under 1 ft the straightness tolerance shall be agreed upon between the purchaser and producer. The test method for straightness measurement is at the manufacturer’s option, unless a specific test method is specified in the purchase order.

8.6 Ovality (Hot- and Cold-Rolled Steel)—The ovality shall be within the tolerances except when the wall thickness is less than 3% of the outside diameter.

8.6.1 In such cases for Types 1 and 2 (A.W.H.R. and A.W.C.R.) the ovality may be 50% greater than the outside tolerances but the mean outside diameter shall be within the specified tolerance.

8.6.2 For Types 3, 4, 5, and 6 (S.D.H.R., S.D.C.R., M.D., and S.S.I.D.) the additional ovality shall be as follows but the mean outside diameter shall be within the specified tolerance:

Outside Diameter, in. (mm)	Additional Ovality Tolerance, in. (mm)
Up to 2 (50.8), incl.	0.010 (0.25)
Over 2 to 3 (50.8 to 76.2), incl.	0.015 (0.38)
Over 3 to 4 (76.2 to 101.6), incl.	0.020 (0.51)
Over 4 to 5 (101.6 to 127.0), incl.	0.025 (0.64)
Over 5 to 6 (127.0 to 152.4), incl.	0.030 (0.76)
Over 6 to 7 (152.4 to 177.8), incl.	0.035 (0.89)
Over 7 to 8 (177.8 to 203.2), incl.	0.040 (1.02)
Over 8 to 9 (203.2 to 228.6), incl.	0.045 (1.14)
Over 9 to 10 (228.6 to 254.0), incl.	0.050 (1.27)
Over 10 to 11 (254.0 to 279.4), incl.	0.055 (1.40)
Over 11 to 12 (279.4 to 304.8), incl.	0.060 (1.52)
Over 12 to 12.500 (304.8 to 317.5), incl.	0.065 (1.65)

9. Permissible Variations in Dimensions of Square and Rectangular Tubing

9.1 Diameter and Wall Thickness—Permissible variations in outside dimensions for square and rectangular tubing shall be as given in Table 13. The wall thickness tolerance is $\pm 10\%$ of the nominal wall thickness.

9.2 Corner Radii—Unless otherwise specified, the corners of square and rectangular tubing shall be slightly rounded inside and outside, consistent with wall thickness. The outside corners may be slightly flattened. The radii of corners shall be as given in Table 14.

9.3 Squareness—Permissible variations for squareness shall be determined by the following equation:

$$\pm b = c \times 0.006 \text{ in.}$$

where:

- b = tolerance for out-of-square, and
- c = largest external dimension across flats

The squareness of sides is commonly determined by one of the following methods.

9.3.1 A square with two adjustable contact points on each arm, is placed on two sides. A fixed feeler gage is then used to measure the maximum distance between the free contact point and the surface of the tubing.

9.3.2 A square equipped with a direct reading vernier, may be used to determine the angular deviation which, in turn, may be related to distance in inches.

9.4 Length—Variations from the specified length shall not exceed the amount prescribed in Table 15.

9.5 Twist —Twist tolerances are shown in Table 16. The twist in square and rectangular tubing may be measured by holding one end of the tubing on a surface plate and noting the height of either corner of the opposite end of same side above the surface plate. Twist may also be measured by the use of a beveled protractor equipped with a level, and noting the angular deviation on opposite ends, or at any point throughout the length.

9.6 Straightness —The straightness tolerance is $\frac{1}{16}$ in./3 ft (1.7 mm/1 m). The test method for straightness measurement is at the manufacturer's option, unless a specific test method is specified in the purchase order.

10. Tubing Sections Other Than Square and Rectangular

10.1 In addition to square and rectangular tubing, many producers supply a variety of special sections, such as oval, streamlined, hexagonal, octagonal, round inside and hexagonal or octagonal outside, ribbed inside or out, triangular, rounded rectangular and D shapes. Manufacturing practices limit the size range and section available from the various producers. These special sections may be made through turkshead rolls or through a die with or without use of a mandrel. Since the sections are special, dies and other tools are not held available. Therefore, when inquiring for shapes other than square and rectangular, it is essential to give full details as to dimensions and finish.

11. Workmanship, Finish, and Appearance

11.1 The tubing shall be free of injurious defects and shall have a workmanlike finish.

11.2 Unless otherwise specified in the purchase order, the tubing shall be free of scale. In the case of thermally treated tubing a slight amount of color will not be considered cause for rejection.

11.3 When burrs must be removed from one or both ends, it shall be specified in the purchase order.

12. Condition

12.1 The types and conditions of tubing covered by this specification are:

Type Number	Code Letters	Description
1	A.W.H.R.	"as-welded" from hot-rolled steel
2	A.W.C.R.	"as-welded" from cold-rolled steel
3	S.D.H.R.	"sink-drawn" hot-rolled steel
4	S.D.C.R.	"sink-drawn," cold-rolled steel
5	M.D.	mandrel drawn
6	S.S.I.D.	special smooth inside diameter

12.2 Thermal conditions under which tubing may be furnished are: no final thermal treatment, stress relieved, and annealed or normalized.

12.3 Flash conditions under which tubing may be furnished are as follows. The flash shall be removed from the outside diameter of tubing covered by this specification. Tubing furnished to this specification may have the following conditions of welding flash on the inside diameter.

12.3.1 Flash-In —Tubing in which the inside diameter welding flash does not exceed the wall thickness or $\frac{3}{32}$ in. (2.4 mm), whichever is less. This condition is available in Types 1, 2, 3, and 4.

12.3.2 Flash Controlled to 0.010 in. (0.25 mm), Maximum —Tubing in which the height of the remaining weld-ing flash is controlled so as not to exceed 0.010 in. This condition is available in Types 1 and 2 over $1\frac{1}{8}$ in. (28.5 mm) outside diameter and Types 3 and 4.

12.3.3 Flash Controlled to 0.005 in. (0.13 mm), Maximum —Tubing produced to outside diameter and wall thickness, inside diameter and wall thickness, or outside diameter and inside diameter tolerances which are so controlled that the height of the remaining inside diameter flash does not exceed 0.005 in. Any remaining inside diameter flash is part of the applicable inside diameter tolerance. This condition is available in Types 1, 2, 3, and 4.

12.3.4 No Flash —Tubing further processed for closer tolerances with mandrel tubing produced to outside diameter and wall thickness, inside diameter and wall thickness, or outside diameter and inside diameter to tolerances with no dimensional indication of inside diameter flash. This condition is available in Types 5 and 6.

12.4 Tubes shall be furnished in the following shapes, as specified by the purchaser: round, square, rectangular, or special shapes (as negotiated).

13. Surface Finish

13.1 Tubes shall have a surface finish compatible with the conditions (Section 12) to which they are ordered (see Appendix X1).

14. Coating

14.1 When specified, tubing shall be coated with a film of oil before shipping to retard rust. Should the order specify that tubing be shipped without rust retarding oil, the film of oils incidental to manufacture will remain on the surface. If the order specifies no oil, the purchaser assumes responsibility for rust in transit.

14.2 Special surface preparations as may be required for specific applications are not within the scope of this section. Such requirements shall be considered under the

supplementary or basis of purchase provisions of this specification and details shall be provided in the purchase order.

15. Rejection

15.1 Tubes that fail to meet the requirements of this specification shall be set aside and the producer shall be notified.

16. Product and Package Marking

16.1 Civilian Procurement —Each box, bundle, lift, or piece shall be identified by a tag or stencil with manufacturer's name or brand, specified size, type, purchaser's order number, and this specification number. Bar coding is acceptable as a supplementary identification method. Bar coding should be consistent with the Automotive Industry Action Group (AIAG) standard prepared by the Primary Metals Subcommittee of the AIAG Bar Code Project Team.

16.2 Government Procurement —When specified in the contract or order, and for direct procurement by or direct shipment to the Government, marking for shipment, in addition to requirements specified in the contract or order, shall be in accordance with MIL-STD-129 for Military agencies and in accordance with Fed. Std. No. 123 for civil agencies.

16.3 Bar Coding —In addition to the requirements in 16.1 and 16.2, bar coding is acceptable as a supplemental identification method. The purchaser may specify in the order a specific bar coding system to be used.

17. Packaging

17.1 Civilian Procurement —On tubing 16 gage (1.29 mm) and lighter, the producer will determine whether or not the tubing will be boxed, crated, cartoned, packaged in secured lifts, or bundled to ensure safe delivery unless otherwise instructed. Tubing heavier than 16 gage will normally be shipped loose, bundled, or in secured lifts. Special packaging requiring extra operations other than those normally used by a producer must be specified on the order.

17.2 Government Procurement —When specified in the contract or order, and for direct procurement by or direct shipment to the Government when Level A is specified, preservation, packaging, and packing shall be in accordance with the Level A requirements of MIL-STD-163.

18. Keywords

18.1 alloy steel tube; carbon steel tube; mechanical tubing; resistance welded steel tube; steel tube; welded steel tube

TABLE 1
CHEMICAL REQUIREMENTS FOR STANDARD
LOW-CARBON STEELS ^A

Grade Designation	Chemical Composition Limits, %			
	Carbon	Manganese	Phosphorus, Max.	Sulfur, Max.
MT ^B 1010	0.05–0.15	0.30–0.60	0.035	0.035
MT 1015	0.10–0.20	0.30–0.60	0.035	0.035
MT X 1015	0.10–0.20	0.60–0.90	0.035	0.035
MT 1020	0.15–0.25	0.30–0.60	0.035	0.035
MT X 1020	0.15–0.25	0.70–1.00	0.035	0.035

NOTE 1—Chemistry represents heat analysis. Product analysis, except for rimmed or capped steel, is to be in accordance with usual practice as shown in Table 3.

NOTES:

^A Rimmed or capped steels which may be used for the above grades are characterized by a lack of uniformity in their chemical composition, and for this reason product analysis is not technologically appropriate unless misapplication is clearly indicated.

^B The letters MT under grade designation indicate Mechanical Tubing.

Over 8 to 10, incl.	9 to 5	0.148 to 0.220	0.030	0.030	0.030	0.045
Over 8 to 10, incl.	4 to 3	0.238 to 0.259	0.030	0.030	0.030	0.059
Over 8 to 10, incl.	2 to 0.500	0.248 to 0.500	0.030	0.030	0.030	0.063
Over 10 to 12, incl.	14 to 12	0.083 to 0.109	0.035	0.035	0.035	0.041
Over 10 to 12, incl.	11 to 10	0.120 to 0.134	0.035	0.035	0.035	0.043
Over 10 to 12, incl.	9 to 5	0.148 to 0.220	0.035	0.035	0.035	0.045
Over 10 to 12, incl.	4 to 3	0.238 to 0.259	0.035	0.035	0.035	0.059
Over 10 to 12, incl.	2 to 0.500	0.284 to 0.500	0.035	0.035	0.035	0.063

NOTE 1—Measurements for diameter are to be taken at least 2 in. from the ends of the tubes.

NOTES:

^A 1 in. = 25.4 mm.^B Flash-In-Tubing is produced only to outside diameter tolerances and wall thickness tolerances and the inside diameter welding flash does not exceed the wall thickness or 3/32 in., whichever is less.^C Flash Controlled to 0.010 in. maximum tubing consists of tubing which is commonly produced only to outside diameter tolerances and wall thickness tolerances, in which the height of the remaining welding flash is controlled not to exceed 0.010 in.^D No Flash tubing is further processed for closer tolerances with mandrel-tubing produced to outside diameter and wall, inside diameter and wall, or outside diameter and inside diameter to tolerances with no dimensional indication of inside diameter flash. This condition is available in Types 5 and 6.^E Flash Controlled to 0.005 in. maximum tubing is produced to outside diameters and wall thickness tolerance, inside diameter and wall thickness tolerances, or outside diameters and inside diameter tolerances, in which the height of the remaining flash is controlled not to exceed 0.005 in. Any remaining flash is considered to be part of the applicable inside diameter tolerances.^F Birmingham Wire Gage.^G The ovality shall be within the above tolerances except when the wall thickness is less than 3% of the outside diameter, in such cases see 8.6.1.

NOTES:

^A Tubing, flash in or flash controlled which is further processed without mandrel to obtain tolerances closer than those shown in Tables 4 and 8.

^B The ovality shall be within the above tolerances except when the wall thickness is less than 3% of the outside diameter, in such cases see 8.6.2.

^C Tubing produced to outside diameter and wall thickness, or inside diameter and wall thickness, or outside diameter and inside diameter, with mandrel to obtain tolerances closer than those shown in Tables 4 and 8 and no dimensional indication of inside diameter flash.

^D Where the ellipsis (. . .) appears in this table, the tolerance is not addressed.

NOTE 1 — Measurements for diameter are to be taken at least 2 in. from the ends of the tubes.^A

NOTES:

^A 1 in. = 25.4 mm.^B Flash-In-Tubing is produced to outside diameter tolerances and wall thickness tolerances only, and the height of the inside welding flash does not exceed the wall thickness or $\frac{3}{32}$ in., whichever is less.^C Flash Controlled to 0.010 in. maximum tubing consists of tubing over $\frac{5}{8}$ in. outside diameter which is commonly produced to outside diameter tolerances and wall thickness tolerances only, in which the height of the remaining inside welding flash is controlled not to exceed 0.010 in.^D Flash Controlled to 0.005 in. maximum tubing is produced to outside diameter tolerances and wall thickness tolerances, inside diameter tolerances and wall thickness tolerances, or outside diameter tolerances and inside diameter tolerances, in which the height of the remaining inside welding flash is controlled not to exceed 0.005 in. Any remaining flash is considered to be part of the applicable inside diameter tolerances.^E Birmingham Wire Gage.^F The ovality shall be within the above tolerances except when the wall thickness is less than 3 % of the outside diameter, in such cases see 8.6.1.^G Where the ellipsis (. . .) appears in this table, the tolerance is not addressed.

Over 4 to 6, incl.	12 (0.109)	$\frac{3}{16}$ to $\frac{5}{16}$
$1\frac{1}{4}$ to 4, incl.	11 (0.120)	$\frac{1}{8}$ to $\frac{7}{32}$
Over 4 to 6, incl.	11 (0.120)	$\frac{7}{32}$ to $\frac{7}{16}$
2 to 4, incl.	10 (0.134)	$\frac{5}{32}$ to $\frac{9}{32}$
Over 4 to 6, incl.	10 (0.134)	$\frac{7}{32}$ to $\frac{7}{16}$
2 to 4, incl.	9 (0.148)	$\frac{3}{16}$ to $\frac{5}{16}$
Over 4 to 8, incl.	9 (0.148)	$\frac{7}{32}$ to $\frac{7}{16}$
2 to 8, incl.	8 (0.165)	$\frac{1}{4}$ to $\frac{1}{2}$
2 to 8, incl.	7 (0.180)	$\frac{1}{4}$ to $\frac{1}{2}$
$2\frac{1}{2}$ to 4, incl.	6 (0.203)	$\frac{5}{16}$ to $\frac{9}{16}$
Over 4 to 8, incl.	6 (0.203)	$\frac{5}{16}$ to $\frac{9}{16}$
$2\frac{1}{2}$ to 8, incl.	5 (0.220)	$\frac{3}{8}$ to $\frac{5}{8}$
$2\frac{1}{2}$ to 8, incl.	4 (0.238)	$\frac{3}{8}$ to $\frac{5}{8}$
$2\frac{1}{2}$ to 8, incl.	3 (0.259)	$\frac{3}{8}$ to $\frac{5}{8}$

NOTES:

^A This table establishes a standard radius. The purchaser and producer may negotiate special radii.

Slight radius flattening is more pronounced in heavier wall tubing.

^B 1 in. = 25 mm.

^C These radius tolerances apply to grades of steel covered in Table 1. The purchaser and producer may negotiate tolerances on other grades of steel.

TABLE 15
LENGTH TOLERANCES—SQUARE AND
RECTANGULAR TUBING

Lengths, ft. ^A	Tolerances, in. ^B

Over 4 to 6, incl.	0.087
Over 6 to 8, incl.	0.100

NOTES:

^A 1 in. = 25.4 mm.

^B 3 ft = 0.9 m.

SUPPLEMENTARY REQUIREMENTS

One or more of the following supplementary requirements may become a part of the specification when specified in the inquiry or invitation to bid, and purchase order or contract. These requirements shall not be considered, unless specified in the order and the necessary tests shall be made at the mill. Mechanical tests shall be performed in accordance with the applicable portions of Test Methods and Definitions A 370. Supplementary Requirement S6 and either S7 or S8 at the manufacturer's option are mandatory.

S1. Tubes for Cylinders

S1.1 Round tubing, mandrel drawn for cylinder applications with inside diameter cleanup allowances is considered to be cylinder tubing. Table S1.1 shows the minimum inside diameter allowance for removal of inside surface imperfections by a honing operation.

S2. Cleanup by Centerless Grinding

S2.1 Round tubing, mandrel drawn for applications with outside diameter allowances is considered to be special smooth outside surface tubing. Table S2.1 shows the minimum outside diameter stock allowance for removal of outside surface imperfections by centerless grinding.

S3. Cleanup by Machining

S3.1 Cleanup is permitted on round tubing, mandrel drawn for applications where machining is required to remove surface imperfections. Table S3.1 shows the minimum stock allowance for removal of surface imperfections from either or both the outside and inside surfaces by machining.

S4. Special Smooth Inside Surface

S4.1 Round tubing, special smooth inside diameter for cylinder applications with microinch finish and inside diameter cleanup allowances is considered to be special smooth inside surface tubing. Table S4.1 shows the maximum average microinch readings on the inside surface. Table S4.2 shows the minimum wall depth allowance for inside surface imperfections.

S5. Hardness and Tensile Requirements

S5.1 When hardness properties are specified on the order, round tubing shall conform to the hardness limits specified in Table S5.1 unless "Tensile Properties Required" is specified in the purchase order. When "Tensile Properties Required" is specified in the purchase order, round tubing shall conform to the tensile requirements and

not necessarily the hardness limits shown in Table S5.1. For grades of round tubing not shown in Table S5.1, and for all square and rectangular tubing, tensile or hardness limits shall be upon agreement between the manufacturer and the purchaser.

S5.2 Number of tests and retests shall be as follows: one tension test per lot shall be made (Note S1) and 1% of all tubes per lot but in no case less than 5 tubes shall be tested for hardness. If the results of the mechanical tests do not conform to the requirements shown in the table, retests shall be made on additional tubes double the original number selected, each of which shall conform to the specified requirements.

NOTE S1—A lot shall consist of all tubes, before cutting to length, of the same size and wall thickness which are produced from the same heat of steel and, when heat treated, subjected to the same finishing treatment in a continuous furnace. When final heat treatment is done in a batch-type furnace, the lot shall include all those tubes which are heat treated in the same furnace charge.

S5.3 The yield strength corresponding to a permanent offset of 0.2% of the gage length of the specimen or to a total extension of 0.5% of the gage length under load shall be determined.

S6. Destructive Weld Tests

S6.1 Round tubing and tubing to be formed into other shapes when in the round form shall meet the following destructive weld tests.

S6.2 Flattening Test —A test 4 to 6 in. (101.6 to 152.4 mm) in length shall be flattened between parallel plates with the weld 90° from the direction of applied force (at the point of maximum bending) until opposite walls of the tubing meet. Except as allowed in S6.2.1, no opening in the weld shall take place until the distance between the plates is less than two thirds of the original outside diameter of the tubing. No cracks or breaks in the base metal shall occur until the distance between the plates is less than one third of the original outside diameter of the tubing, but in no case less than five times the thickness of the tubing wall. Evidence of lamination or burnt material shall not

develop during the flattening process, and the weld shall not show injurious defects.

S6.2.1 When low D-to-t ratio tubing is tested, because the strain imposed due to geometry is unreasonably high on the inside surface at the six and twelve o'clock locations, cracks at these locations shall not be cause for rejection if the D-to-t ratio is less than 10.

S6.3 Flaring Test —A section of tube approximately 4 in. (101.6 mm) in length shall stand being flared with a tool having a 60° included angle until the tube at the mouth of the flare has been expanded 15% of the inside diameter, without cracking or showing flaws.

S6.4 In order to properly evaluate weld quality, the producer at his option may normalize the test specimen prior to testing.

S6.5 Number of tests and retests: two flattening and two flaring tests shall be made from each lot (Note S1).

S7. Hydrostatic Test Round Tubing

S7.1 All tubing will be given a hydrostatic test calculated as follows:

$$P = \frac{2St}{D}$$

where:

- P = hydrostatic test pressure, psi or MPa
- S = allowable fiber stress of 14,000 psi or 96.5 MPa
- t = specified wall thickness, in. or mm, and
- D = specified outside diameter, in. or mm

S8. Nondestructive Electric Test

S8.1 Each tube shall be tested with a nondestructive electric test in accordance with Practice E 213, Practice E 273, Practice E 309, or Practice E 570. It is the intent of this test to reject tubes containing injurious defects.

S8.2 For eddy-current testing, the calibration tube shall contain, at the option of the producer, any one of the following discontinuities to establish a minimum sensitivity level for rejection. For welded tubing, they shall be placed in the weld if visible.

S8.2.1 Drilled Hole —A hole not larger than 0.031 in. (0.79 mm) in diameter shall be drilled radially and completely through the tube wall, care being taken to avoid distortion of the tube while drilling.

S8.2.2 Transverse Tangential Notch —Using a round tool or file with a $\frac{1}{4}$ in. (6.4 mm) diameter, a notch shall be filed or milled tangential to the surface and transverse to the longitudinal axis of the tube. Said notch shall have a depth not exceeding 12½% of the specified wall thickness

of the tube or 0.004 in. (0.102 mm), whichever is greater.

S8.2.3 Longitudinal Notch —A notch 0.031 in. (0.79 mm) or less in width shall be machined in a radial plane parallel to the tube axis on the outside surface of the tube, to have a depth not exceeding 12½% of the specified wall thickness of the tube or 0.004 in. (0.102 mm), whichever is greater. The length of the notch shall be compatible with the testing method.

S8.3 For ultrasonic testing, the longitudinal calibration reference notches shall be at the option of the producer, any one of the three common notch shapes shown in Practice E 213 or Practice E 273. The depth of notch shall not exceed 12½% of the specified wall thickness of the tube or 0.004 in. (0.102 mm), whichever is greater. For welded tubing the notch shall be placed in the weld, if visible.

S8.4 For flux leakage testing, each of the longitudinal calibration notches shall be a straight sided notch not over 12½% of the wall thickness in depth and not over 1.0 in. (25 mm) in length. Both outside diameter and inside diameter notches shall be placed in the tube located sufficiently apart to enable separation and identification of the signals.

S8.5 Tubing producing a signal equal to or greater than the calibration defect shall be subject to rejection. The area producing the signal may be examined.

S8.5.1 Test signals produced by imperfections which cannot be identified, or produced by cracks or crack-like defects shall result in rejection of the tube subject to rework and retest.

S8.5.2 Test signals produced by imperfections such as those listed below may be judged as injurious or noninjurious depending on visual observation of their severity or the type of signal they produce on the testing equipment used, or both:

- S8.5.2.1** Dinges,
- S8.5.2.2** Straightener marks,
- S8.5.2.3** Loose inside diameter bead and cutting chips,
- S8.5.2.4** Scratches,
- S8.5.2.5** Steel die stamps,
- S8.5.2.6** Chattered flash trim,
- S8.5.2.7** Stop marks, or
- S8.5.2.8** Tube reducer ripple.

S8.5.3 Any imperfection of the above type exceeding 0.004 in. (0.102 mm) or 12½% of the specified wall thickness (whichever is greater) in depth shall be considered injurious.

S8.5.3.1 If the imperfection is judged as injurious, the tubes shall be rejected but may be reconditioned and retested providing the dimensional requirements are met.

S8.5.3.2 If the imperfection is explored to the extent that it can be identified as noninjurious, the tubes may be accepted without further test providing the imperfection does not encroach on the minimum wall thickness, after due allowance for cleanup in mandrel drawn tubes.

S9. Certification for Government Orders

S9.1 A producer's or supplier's certification shall be furnished to the Government that the material was manufactured, sampled, tested, and inspected in accordance with this specification and has been found to meet the requirements. This certificate shall include a report of heat analysis (product analysis when requested in the purchase order), and when specified in the purchase order or contract, a report of test results shall be furnished.

S10. Rejection Provisions for Government Orders

S10.1 Each length of tubing received from the manufacturer may be inspected by the purchaser and, if it does not meet the requirements of the specification based on the inspection and test method as outlined in the specification, the tube may be rejected and the manufacturer shall be notified. Disposition of rejected tubing shall be a matter of agreement between the manufacturer and the purchaser.

S10.2 Material that fails in any of the forming operations or in the process of installation and is found to be defective shall be set aside and the manufacturer shall be notified for mutual evaluation of the material's suitability. Disposition of such material shall be a matter for agreement.

TABLE S1.1
MINIMUM INSIDE DIAMETER STOCK ALLOWANCE ON DIAMETER^A FOR REMOVAL OF INSIDE-SURFACE
IMPERFECTIONS BY HONING OPERATION (MANDREL-DRAWN TUBING)

4140	95 (655)	105 (724)	10	90	

NOTES:

- (1) These values are based on normal mill stress relieving temperatures. For particular applications, properties may be adjusted by negotiation between purchaser and producer.
- (2) For longitudinal strip tests, the width of the gage section shall be 1 in. (25.4 mm) and a deduction of 0.5 percentage points from the basic minimum elongation for each $\frac{1}{32}$ in. (0.8 mm) decrease in wall thickness under $\frac{5}{16}$ in. (7.9 mm) in wall thickness shall be permitted.

APPENDIX

(Nonmandatory Information)

X1. MEASURING MICROINCH FINISH

X1.1 The procedure for making microinch readings on interior surfaces of cold worked tubing (not polished or ground) $\frac{1}{2}$ in. (12.7 mm) inside diameter and larger is as follows:

X1.1.1 Measurements on tubing with longitudinal or no predominant lay should be circumferential on the inside surface of the straight tube, prior to any fabrication, on a plane approximately perpendicular to the tube axis. Measurements on tubing with circumferential lay should be longitudinal.

X1.1.2 Measurements should be made not less than 1 in. (25.4 mm) from the end.

X1.1.3 Measurements should be made at four positions approximately 90° apart or over a complete circumference if the trace should otherwise overlap.

X1.1.4 The length of trace should be in accordance with the latest revision of Section 4.5 of ANSI B 46.1 (not less than 0.600 in. (15.24 mm) long).

X1.1.5 A minimum of three such measurements should be made spaced not less than $\frac{1}{4}$ in. (6.4 mm) apart along the longitudinal axis.

X1.1.6 The numerical rating shall be the arithmetical average microinch of all readings taken. Each reading to be averaged should be the mean position of the indicator during the trace; any momentary meter excursions occupying less than 10% of the total trace should be ignored.

X1.1.7 A deviation in numerical rating in various parts of a tube may be expected. Experience to date indicates that a variation of about $\pm 35\%$ is normal.

X1.2 Instruments should meet the specifications given in the latest revision of ANSI B 46.1.

X1.3 Mechanical tracing is preferred. If hand tracing is used, the speed of trace should not vary by more than $\pm 20\%$ from the required to give the appropriate cutoff. The 0.030 in. roughness width cutoff should be used.

X1.4 Microinch determinations only refer to roughness of areas that do not contain a defect, injurious or otherwise. Such defects as seams, slivers, pits, laps, etc., are subject to ordinary visual inspection in accordance with applicable specifications or trade customs, and have no relationship to roughness.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR PRESSURE VESSEL PLATES, CARBON STEEL, FOR INTERMEDIATE- AND HIGHER- TEMPERATURE SERVICE

SA-515/SA-515M

[Identical with ASTM Specification A 515/A 515M-03(R07)]

1. Scope

1.1 This specification covers carbon-silicon steel plates primarily for intermediate- and higher-temperature service in welded boilers and other pressure vessels.

1.2 Plates under this specification are available in three grades having different strength levels as follows:

Grade U.S. [SI]	Tensile Strength, ksi [MPa]
60 [415]	60–80 [415–550]
65 [450]	65–85 [450–585]
70 [485]	70–90 [485–620]

1.3 The maximum thickness of plates is limited only by the capacity of the composition to meet the specified mechanical property requirements; however, current practice normally limits the maximum thickness of plates furnished under this specification as follows:

Grade U.S. [SI]	Maximum Thickness, in. [mm]
60 [415]	8 [200]
65 [450]	8 [200]
70 [485]	8 [200]

1.4 For plates produced from coil and furnished without heat treatment or with stress relieving only, the additional requirements, including additional testing requirements and the reporting of additional test results, of Specification A 20/A 20M apply.

1.5 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification.

2. Referenced Documents

2.1 ASTM Standards:

A 20/A 20M Specification for General Requirements for Steel Plates for Pressure Vessels

3. General Requirements and Ordering Information

3.1 Plates supplied to this product specification shall conform to Specification A 20/A 20M, which outlines the testing and retesting methods and procedures, permissible variations in dimensions and mass, quality and repair of defects, marking, loading, and so forth.

3.2 Specification A 20/A 20M also establishes the rules for ordering information that should be complied with when purchasing plates to this specification.

3.3 In addition to the basic requirements of this specification, certain supplementary requirements are available where additional control, testing, or examination is required to meet end use requirements.

3.4 The purchaser is referred to the listed supplementary requirements in this specification and to the detailed requirements in Specification A 20/A 20M.

3.5 Coils are excluded from qualification to this specification until they are processed into finished plates. Plates produced from coil means plates that have been cut to individual lengths from coil. The processor directly controls, or is responsible for, the operations involved in the processing of coils into finished plates. Such operations include decoiling, leveling, cutting to length, testing, inspection, conditioning, heat treatment (if applicable), packaging, marking, loading for shipment, and certification.

NOTE 1: For plates produced from coil and furnished without heat treatment or with stress relieving only, three test results are reported for each qualifying coil. Additional requirements regarding plate produced from coil are described in Specification A 20/A 20M.

3.6 If the requirements of this specification are in conflict with the requirements of Specification A 20/A 20M, the requirements of this specification shall prevail.

4. Materials and Manufacture

4.1 *Steelmaking Practice*—The steel shall be killed and made to a coarse austenitic grain size practice.

5. Heat Treatment

5.1 Plates 2 in. [50 mm] and under in thickness are normally supplied in the as-rolled condition. The plates

may be ordered normalized or stress relieved, or both.

5.2 Plates over 2 in. [50 mm] in thickness shall be normalized.

6. Chemical Composition

6.1 The steel shall conform to the chemical requirements given in Table 1 unless otherwise modified in accordance with Supplementary Requirement S17, Vacuum Carbon-Deoxidized Steel, in Specification A 20/A 20M.

7. Mechanical Properties

7.1 *Tension Test*—The plates, as represented by the tension test specimens, shall conform to the requirements given in Table 2.

TABLE 1
CHEMICAL REQUIREMENTS

Elongation in 2 in. [50 mm], min, % (A)	25	23	21

NOTE:

(A) See Specification A 20/A20M for elongation adjustment.

SUPPLEMENTARY REQUIREMENTS

Supplementary requirements shall not apply unless specified in the purchase order.

A list of standardized supplementary requirements for use at the option of the purchaser is included in Specification A 20/A 20M. Those that are considered suitable for use with this specification are listed below by title.

- | | |
|---|---|
| <p>S1. Vacuum Treatment,</p> <p>S2. Product Analysis,</p> <p>S3. Simulated Post-Weld Heat Treatment of Mechanical Test Coupons,</p> <p> S4.1 Additional Tension Test,</p> <p>S5. Charpy V-Notch Impact Test,</p> <p>S6. Drop-Weight Test,</p> <p>S7. High-Temperature Tension Test,</p> | <p>S8. Ultrasonic Examination in accordance with Specification A 435/A 435M,</p> <p>S9. Magnetic Particle Examination,</p> <p>S11. Ultrasonic Examination in accordance with Specification A 577/A 577M,</p> <p>S12. Ultrasonic Examination in accordance with Specification A 578/A 578M, and</p> <p>S17. Vacuum Carbon-Deoxidized Steel.</p> |
|---|---|

ADDITIONAL SUPPLEMENTARY REQUIREMENTS

Also listed below is an additional optional supplementary requirement suitable for this specification:

S61. Austenitic Grain Size

S61.1 The material shall have a carburized austenitic grain size of 1 to 5.

SPECIFICATION FOR PRESSURE VESSEL PLATES, CARBON STEEL, FOR MODERATE- AND LOWER- TEMPERATURE SERVICE

SA-516/SA-516M

(Identical with ASTM Specification A 516/A 516M-06)

1. Scope

1.1 This specification covers carbon steel plates intended primarily for service in welded pressure vessels where improved notch toughness is important.

1.2 Plates under this specification are available in four grades having different strength levels as follows:

Grade U.S. [SI]	Tensile Strength, ksi [MPa]
55 [380]	55–75 [380–515]
60 [415]	60–80 [415–550]
65 [450]	65–85 [450–585]
70 [485]	70–90 [485–620]

1.3 The maximum thickness of plates is limited only by the capacity of the composition to meet the specified mechanical property requirements; however, current practice normally limits the maximum thickness of plates furnished under this specification as follows:

Grade U.S. [SI]	Maximum Thickness, in. [mm]
55 [380]	12 [305]
60 [415]	8 [205]
65 [450]	8 [205]
70 [485]	8 [205]

1.4 For plates produced from coil and furnished without heat treatment or with stress relieving only, the additional requirements, including additional testing requirements and the reporting of additional test results of Specification A 20/A 20M apply.

1.5 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining

values from the two systems may result in nonconformance with the specification.

2. Referenced Documents

2.1 ASTM Standards:

- A 20/A 20M Specification for General Requirements for Steel Plates for Pressure Vessels
- A 435/A 435M Specification for Straight-Beam Ultrasonic Examination of Steel Plates
- A 577/A 577M Specification for Ultrasonic Angle-Beam Examination of Steel Plates
- A 578/A 578M Specification for Straight-Beam Ultrasonic Examination of Plain and Clad Steel Plates for Special Applications

3. General Requirements and Ordering Information

3.1 Plates supplied to this product specification shall conform to Specification A 20/A 20M, which outlines the testing and retesting methods and procedures, permissible variations in dimensions and mass, quality and repair of defects, marking, loading, and so forth.

3.2 Specification A 20/A 20M also establishes the rules for ordering information that should be complied with when purchasing plates to this specification.

3.3 In addition to the basic requirements of this specification, certain supplementary requirements are available where additional control, testing, or examination is required to meet end use requirements.

3.4 The purchaser is referred to the listed supplementary requirements in this specification and to the detailed requirements in Specification A 20/A 20M.

3.5 Coils are excluded from qualification to this specification until they are processed into finished plates. Plates produced from coil means plates that have been cut to individual lengths from coil. The processor directly controls, or is responsible for, the operations involved in the processing of coils into finished plates. Such operations include decoiling, leveling, cutting to length, testing, inspection, conditioning, heat treatment (if applicable), packaging, marking, loading for shipment, and certification.

NOTE 1: For plates produced from coil and furnished without heat treatment or with stress relieving only, three test results are reported for each qualifying coil. Additional requirements regarding plate produced from coil are described in Specification A 20/A 20M.

3.6 If the requirements of this specification are in conflict with the requirements of Specification A 20/A 20M, the requirements of this specification shall prevail.

4. Materials and Manufacture

4.1 *Steelmaking Practice*—The steel shall be killed and shall conform to the fine austenitic grain size requirement of Specification A 20/A 20M.

5. Heat Treatment

5.1 Plates 1.50 in. [40 mm] and under in thickness are normally supplied in the as-rolled condition. The plates may be ordered normalized or stress relieved, or both.

5.2 Plates over 1.50 in. [40 mm] in thickness shall be normalized.

5.3 When notch-toughness tests are required on plates $1\frac{1}{2}$ in. [40 mm] and under in thickness, the plates shall be normalized unless otherwise specified by the purchaser.

5.4 If approved by the purchaser, cooling rates faster than those obtained by cooling in air are permissible for improvement of the toughness, provided the plates are subsequently tempered in the temperature range 1100 to 1300°F [595 to 705°C].

6. Chemical Composition

6.1 The steel shall conform to the chemical requirements given in Table 1 unless otherwise modified in accordance with Supplementary Requirement S17, Vacuum Carbon-Deoxidized Steel, in Specification A 20/A 20M.

7. Mechanical Properties

7.1 *Tension Test*—The plates, as represented by the tension test specimens, shall conform to the requirements given in Table 2.

8. Keywords

8.1 carbon steel; carbon steel plate; pressure containing parts; pressure vessel steels; steel plates for pressure vessels

Elongation in 2 in. [50 mm], min, % (B)	27	25	23	21

NOTES:

(A) Determined by either the 0.2% offset method or the 0.5% extension-under-load method.

(B) See Specification A 20/A 20M for elongation adjustment.

SUPPLEMENTARY REQUIREMENTS

Supplementary requirements shall not apply unless specified in the purchase order.

A list of standardized supplementary requirements for use at the option of the purchaser is included in ASTM Specification A 20/A 20M. Those that are considered suitable for use with this specification are listed below by title.

- | | |
|---|---|
| S1. Vacuum Treatment, | S7. High-Temperature Tension Test, |
| S2. Product Analysis, | S8. Ultrasonic Examination in accordance with
Specification A 435/A 435M, |
| S3. Simulated Post-Weld Heat Treatment of
Mechanical Test Coupons, | S9. Magnetic Particle Examination, |
| S4.1 Additional Tension Test, | S11. Ultrasonic Examination in accordance with
Specification A 577/A 577M, |
| S5. Charpy V-Notch Impact Test, | S12. Ultrasonic Examination in accordance with
Specification A 578/A 578M, and |
| S6. Drop Weight Test (for Material 0.625 in.
[16 mm] and over in Thickness), | S17. Vacuum Carbon-Deoxidized Steel. |

ADDITIONAL SUPPLEMENTARY REQUIREMENTS

In addition, the following supplementary requirement is suitable for this application.

S54. Requirements for Carbon Steel Plate for Hydrofluoric Acid Alkylation Service

S54.1 Plates shall be provided in the normalized heat-treated condition.

S54.2 The maximum carbon equivalent shall be as follows:

Plate thickness less than or equal to 1 in. [25 mm]: CE maximum = 0.43

Plate thickness greater than 1 in. [25 mm]: CE maximum = 0.45

S54.3 Determine the carbon equivalent (CE) as follows:

$$CE = C + Mn/6 + (Cr + Mo + V)/5 + (Ni + Cu)/15$$

S54.4 Vanadium and niobium maximum content based on heat analysis shall be:

Maximum vanadium = 0.02%

Maximum niobium = 0.02%

Maximum vanadium plus niobium = 0.03%

(Note: niobium = columbium)

S54.5 The maximum composition based on heat analysis of Ni + Cu shall be 0.15%.

S54.6 The minimum C content based on heat analysis shall be 0.18%. The maximum C content shall be as specified for the ordered grade.

S54.7 Welding consumables for repair welds shall be of the low-hydrogen type. E60XX electrodes shall not be used and the resulting weld chemistry shall meet the same chemistry requirements as the base metal.

S54.8 In addition to the requirements for product marking in the specification, an “HF-N” stamp or marking shall be provided on each plate to identify that the plate complies with this supplementary requirement.

SUMMARY OF CHANGES

The Committee has identified the location of selected changes to this standard that may impact the use of this standard.

(1) Footnote C was added to Table 1.

SPECIFICATION FOR PRESSURE VESSEL PLATES, ALLOY STEEL, HIGH-STRENGTH, QUENCHED AND TEMPERED

SA-517/SA-517M

(Identical with ASTM Specification A 517/A 517M-06.)

1. Scope

1.1 This specification covers high-strength quenched and tempered alloy steel plates intended for use in fusion welded boilers and other pressure vessels.

1.2 This specification includes a number of grades as manufactured by different producers, but all having the same mechanical properties and general characteristics.

1.3 The maximum thickness of plates furnished under this specification shall be as follows:

Grade	Thickness
A, B	1.25 in. [32 mm]
H, S	2 in. [50 mm]
P	4 in. [100 mm]
F	2.50 in. [65 mm]
E, Q	6 in. [150 mm]

1.4 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system is to be used independently of the other without combining values in any way.

2. Referenced Documents

- 2.1** ASTM Standards:
- A 20/A 20M Specification for General Requirements for Steel Plates for Pressure Vessels
 - A 435/A 435M Specification for Straight-Beam Ultrasonic Examination of Steel Plates
 - A 577/A 577M Specification for Ultrasonic Angle-Beam Examination of Steel Plates
 - A 578/A 578M Specification for Straight-Beam Ultrasonic Examination of Plain and Clad Steel Plates for Special Applications

3. General Requirements and Ordering Information

3.1 Plates furnished to this material specification shall conform to Specification A 20/A 20M. These requirements outline the testing and retesting methods and procedures, permissible variations in dimensions, and mass, quality and repair of defects, marking, loading, etc.

3.2 Specification A 20/A 20M also establishes the rules for the ordering information which should be complied with when purchasing material to this specification.

3.3 In addition to the basic requirements of this specification, certain supplementary requirements are available when additional control, testing, or examination is required to meet end use requirements. These include:

- 3.3.1** Vacuum treatment,
- 3.3.2** Additional or special tension testing,
- 3.3.3** Impact testing, and
- 3.3.4** Nondestructive examination.

3.4 The purchaser is referred to the listed supplementary requirements in this specification and to the detailed requirements in Specification A 20/A 20M.

3.5 If the requirements of this specification are in conflict with the requirements of Specification A 20/A 20M, the requirements of this specification shall prevail.

4. Manufacture

4.1 *Steelmaking Practice* — The steel shall be killed and shall conform to the fine austenitic grain size requirement of Specification A 20/A 20M.

5. Heat Treatment

5.1 Except as allowed by section 5.2, the plates shall be heat treated by heating to not less than 1650°F [900°C],

quenching in water or oil and tempering at not less than 1150°F [620°C].

5.2 Plates ordered without the heat treatment specified in section 5.1 shall be stress relieved by the manufacturer, and subsequent heat treatment of the plates to conform to section 5.1 shall be the responsibility of the purchaser.

6. Chemical Requirements

6.1 The steel shall conform to the chemical requirements shown in Table 1 unless otherwise modified in accordance with Supplementary Requirement S17, Vacuum Carbon-Deoxidized Steel, in Specification A 20/A 20M for grades other than Grade A.

7. Mechanical Requirements

7.1 Tension Tests:

7.1.1 Requirements — The plates as represented by the tension-test specimens shall conform to the requirements given in Table 2.

7.1.2 Test Methods:

7.1.2.1 The yield strength may be determined by the 0.2% offset method or by the total extension under load of 0.5% method.

7.1.2.2 For plates $\frac{3}{4}$ in. [20 mm] and under in thickness, the test specimen shall be the $1\frac{1}{2}$ in. [40 mm] wide rectangular-test specimen.

7.1.2.3 For plates over $\frac{3}{4}$ in. [20 mm], either the full thickness rectangular-test specimen or the $\frac{1}{2}$ in. [12.5 mm] round-test specimen may be used.

7.1.2.4 When the $1\frac{1}{2}$ in. [40 mm] wide rectangular-test specimen is used, the elongation is measured in a 2 in. or [50 mm] gage length which includes the fracture.

7.2 Impact Properties Requirements:

7.2.1 Transverse Charpy V-notch impact test specimens shall have a lateral expansion opposite the notch of not less than 0.015 in. [0.38 mm].

7.2.2 The test temperature shall be agreed upon between the manufacturer and the purchaser, but shall not be higher than 32°F [0°C].

8. Keywords

8.1 alloy steel; boilers; high-strength; impact tested; plates; pressure vessels; quenched; tempered

SPECIFICATION FOR FORGED OR ROLLED 8 AND 9% NICKEL ALLOY STEEL FLANGES, FITTINGS, VALVES, AND PARTS FOR LOW-TEMPERATURE SERVICE

SA-522/SA-522M

(Identical with ASTM Specification A 522/A 522M-07.)

1. Scope

1.1 This specification covers 8 and 9% nickel-alloy steel forged or rolled flanges, fittings, valves, and parts intended for use in welded pressure vessels for low-temperature service. The specification is applicable to forgings with maximum section thickness of 3 in. [75 mm] in the double normalized and tempered condition and 5 in. [125 mm] in the quenched and tempered condition. Forgings under this specification are intended for service at operating temperatures not lower than -320°F [-196°C] for Type I or -275°F [-170°C] for Type II or higher than 250°F [121°C].

1.2 Material under this specification is available in two types having different chemical compositions as follows:

Type	Nominal Nickel Content, %
I	9
II	8

1.3 This specification is expressed in both inch-pound units and SI units. However, unless the order specifies the applicable “M” specification designation (SI units), the material shall be furnished to inch-pound units.

1.4 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification.

2. Referenced Documents

2.1 ASTM Standards:

A 370 Test Methods and Definitions for Mechanical Testing of Steel Products

A 788/A 788M Specification for Steel Forgings, General Requirements

A 961/A 961M Specification for Common Requirements for Steel Flanges, Forged Fittings, Valves, and Parts for Piping Applications

3. General Requirements and Ordering Information

3.1 Product furnished to this specification shall conform to the requirements of Specification A 961, including any supplementary requirements that are indicated in the purchase order. Failure to comply with the requirements of Specification A 961 constitutes nonconformance with this specification.

3.2 It is the purchaser’s responsibility to specify in the purchase order all ordering information necessary to furnish the needed material. Examples of such information include but are not limited to the ordering information in Specification A 961 and following:

3.2.1 Any supplementary requirements, and

3.2.2 Additional requirements, (See 4.5, 5.2, 6.1, 7.2, and 10.3).

4. Materials and Manufacture

4.1 The steel shall be produced in accordance with the melting process section of Specification A 788.

4.2 Material for forgings shall consist of ingots, or either forged or rolled blooms, billets, or bars.

4.3 The finished product shall be a forging as defined in the Terminology Section of Specification A 788.

4.4 Except for flanges of all types, hollow cylindrically shaped parts may be made from hot-rolled or forged bar,

provided that the axial length of the part is approximately parallel to the metal flow lines of the stock. Except for all types of flanges, elbows, return bends, tees, and header tees, other parts up to and including NPS 4 may be machined from hot-rolled or forged bar.

4.5 When specified in the order, the manufacturer shall submit for purchaser's approval a sketch showing the shape of the rough forging before machining.

5. Chemical Composition

5.1 The steel shall conform to the requirements of Table 1.

5.2 If required by the purchaser, product analysis may be performed in accordance with the requirements of A 961.

6. Heat Treatment

6.1 The forgings shall be heat treated by the manufacturer by either of the following methods as mutually agreed upon between the purchaser and the manufacturer.

6.1.1 Quenched and Tempered — Heat to a uniform temperature of $1475 \pm 25^\circ\text{F}$ [$800 \pm 15^\circ\text{C}$]; hold at this temperature for a minimum time of 1 h/in. [2.5 min/mm] of thickness but in no case less than 30 min; quench by immersion in circulating water. Reheat until the forging attains a uniform temperature within the range from 1050 to 1125°F [565 to 605°C]; hold at this temperature for a minimum time of 1 h/in. [2.5 min/mm] of thickness but in no case less than 30 min; cool in air or water quench, at a rate not less than 300°F [165°C]/h.

6.1.2 Double Normalized and Tempered — Heat to a uniform temperature of 1650°F [900°C]; hold at this temperature for a minimum time of 1 h/in. [2.5 min/mm] of thickness but in no case less than 30 min; cool in air. Reheat until the forging attains a uniform temperature of 1450°F [790°C]; hold at this temperature for a minimum time of 1 h/in. [2.5 min/mm] of thickness but in no case less than 30 min; cool in air. Reheat to a uniform temperature within the range from 1050 to 1125°F [565 to 605°C]; hold at this temperature for a minimum time of 1 h/in. [2.5 min/mm] of thickness but in no case less than 30 min; cool in air or water quench, at a rate not less than 300°F [165°C]/h.

6.2 When stress relieving is to be performed after fabrication, the recommended stress-relieving treatment is as follows: gradually and uniformly heat the steel to a temperature between 1025 and 1085°F [550 and 585°C]; hold for a minimum of 2 h for thicknesses up to 1 in. [25 mm]. For thicknesses over 1 in. [25 mm], a minimum additional holding time in the ratio of 1 h/in. [2.5 min/mm] of thickness in excess of 1 in. [25 mm] shall be added. Cool at a

minimum rate of 300°F [165°C]/h to a temperature not exceeding 600°F [315°C].

7. Mechanical Properties

7.1 Tension Test — Forgings to Types 1 and 2 shall conform to the tensile requirements of Table 2.

7.2 Impact Test — The Charpy impact test requirements in Table 3 shall be met unless Supplementary Requirement S2 of this specification has been specified.

7.2.1 The values for energy absorption and the fracture appearance in percentage of shear fracture for each specimen shall be recorded and reported for information.

8. Workmanship, Finish, and Appearance

8.1 The forgings shall have a workman-like finish and shall be free of injurious defects.

9. Number of Tests and Retests

9.1 At least one tension test and one set of Charpy V-notch impact tests shall be made from each heat in each heat-treatment charge.

9.2 If the results of the mechanical tests do not conform to the specified requirements, the manufacturer may retreat the forgings, but not more than three additional times. Retreatment involves re-austenitizing the forgings. Retests shall be made in accordance with this section.

9.3 If the lateral expansion result from one Charpy impact specimen falls below 0.015 in. [0.38 mm], but not less than 0.010 in. [0.25 mm], and the average test result equals or exceeds 0.015 mm [0.38 mm], then one retest of three additional specimens may be made. The lateral expansion obtained from each of the three retest specimens shall equal or exceed 0.015 in. [0.38 mm].

10. Test Specimens

10.1 The test specimens shall be located at any point midway between the center and surface of solid forgings, and at any point mid-thickness of the heaviest section of hollow or bored forgings. For solid forgings where test metal is provided on the periphery, test specimens shall be taken at mid-thickness of the test prolongation.

10.2 Tests shall be oriented so that the longitudinal axis of the specimen is parallel to the major direction of grain flow.

10.3 When fabrication requires stress relieving, the purchaser shall specify stress relieving of the test pieces prior to machining of the test specimens. Stress relieving shall be carried out as prescribed in 6.2.

11. Method of Impact Testing

11.1 The impact test shall be made in accordance with the simple beam, Charpy type of test described in the latest issue of Test Methods and Definitions A 370.

11.2 Precaution shall be taken so that when broken, the test specimens shall be within $\pm 3^\circ\text{F}$ [1.7°C] of the specified test temperature.

12. Inspection

12.1 The inspector representing the purchaser shall have free entry, at all times while work on the contract of the purchaser is being performed, to all parts of the manufacturer's works that concern the manufacture of the material ordered. The manufacturer shall afford the inspector all reasonable facilities to satisfy the inspector that the material is being furnished in accordance with this specification. All tests (except product analysis) and inspection shall be made at the place of manufacture prior to shipment, unless otherwise specified, and shall be conducted so as not to interfere unnecessarily with the operation of the works.

12.2 The manufacturer shall report to the purchaser or the purchaser's representative the heat treatments applied to the material and to the test blocks and the results of the chemical analysis and mechanical tests made in accordance with this specification and the heat number or his heat identification.

13. Rejection

13.1 Unless otherwise specified, any rejection based on tests made in accordance with Section 5 and 7 shall be reported to the manufacturer within 60 days from the receipt of samples or test reports by the purchaser.

13.2 Each forging in which injurious metal defects are exposed during subsequent machining shall be rejected and the manufacturer notified.

14. Certification

14.1 Test reports, when required, shall include certification that all requirements of this specification have been met. The manufacturer shall provide the following where applicable:

14.1.1 Whether Type 1 or Type 11 material has been supplied and the chemical analysis results in accordance with Section 5,

14.1.2 Type of heat treatment used,

14.1.3 Results of tension and Charpy impact tests (together with absorbed energy and % shear fracture)

including the impact test temperature, and test coupon stress relief details if applicable,

14.1.4 Results of any additional or supplementary requirements specified by the purchaser, and

14.1.5 The year date and revision letter, if any, of the specification. Note, this information is not required to be marked on the forgings.

15. Product Marking

15.1 Each forging shall be legibly stamped by the manufacturer with the heat number or his heat identification, the manufacturer's name (see Note 1) or trademark, and this specification number, A 522 or A 522M as applicable, 8NI, or 9NI, and QT or NNT as applicable.

NOTE 1 — For purposes of identification marking, the manufacturer is considered the organization that certifies the piping component was manufactured, sampled, and tested in accordance with this specification and the results have been determined to meet the requirements of this specification.

15.2 Forgings impact tested at a temperature other than that specified in Table 3, by the use of Supplementary Requirement S2, shall be marked with the letters LTV following the specification number, as well as the temperature scale used. For forgings to A 522, these letters shall be followed by the impact test temperature in degrees Fahrenheit. A prefix 0 to the test temperature indicates a temperature below 0°F , for example A 522 Type 1 LTV0300F indicates -300°F . For forgings to A 522M, the letters LTV shall be followed by the impact test temperature in degrees Celsius. A prefix 0 to the test temperature indicates a temperature below 0°C , for example A 522M Type 1 LTV0150C indicates -150°C .

15.3 The purchaser may specify additional identification marking and the location of all stamping. The type of stamps shall be round or "interrupted-dot" die stamps having a radius of $\frac{1}{32}$ in. [0.8 mm].

15.4 Bar Coding — In addition to the requirements in 15.1, 15.2, and 15.3, bar coding is acceptable as a supplemental identification method. The purchaser may specify in the order a specific bar coding system to be used. The bar coding system, if applied at the discretion of the supplier, should be consistent with one of the published industry standards for bar coding. If used on small parts, the bar code may be applied to the box or a substantially applied tag.

Type	Lateral Expansion in. [mm]	Temperature °F [°C] ⁴	Report Absorbed Energy and % Shear Fracture
1	0.015 [0.38]	–320 [–195]	Yes
2	0.015 [0.38]	–275 [–170]	Yes

⁴ Except when Supplementary Requirement S2 is specified.

SUPPLEMENTARY REQUIREMENTS

One or more of the supplementary requirements described below may be included in purchaser's order or contract. When so included, a supplementary requirement shall have the same force as if it were in the body of the specification. Supplementary requirement details not fully described shall be agreed upon between the purchaser and the supplier, but shall not negate any of the requirements in the body of the specification.

S1. Nondestructive Tests

S1.1 *Ultrasonic Tests* — Ultrasonic tests may be made by agreement between manufacturer and purchaser.

S1.2 *Liquid Penetrant Tests* — Liquid penetrant tests may be made by agreement between manufacturer and purchaser.

S2. Other Impact Test Temperatures

S2.1 The purchaser may specify an impact test temperature higher than that in Table 3 but no higher than the minimum intended operating temperature for the forging.

S2.2 Marking shall be in accordance with 15.2.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR SEAMLESS CARBON STEEL PIPE FOR ATMOSPHERIC AND LOWER TEMPERATURES

SA-524

(Identical with ASTM Specification A 524-93.)

1. Scope

1.1 This specification covers seamless carbon steel pipe intended primarily for service at atmospheric and lower temperatures, NPS $\frac{1}{8}$ to 26 inclusive, with nominal (average) wall thickness as given in ANSI B36.10. Pipe having other dimensions may be furnished, provided such pipe complies with all other requirements of this specification. Pipe ordered to this specification shall be suitable both for welding, and for bending, flanging, and similar forming operations.

1.2 The values stated in inch-pound units are to be regarded as the standard.

NOTE 1 — The dimensionless designator NPS (nominal pipe size) has been substituted in this standard for such traditional terms as “nominal diameter,” “size,” and “nominal size”.

1.3 The following hazard caveat applies to the test methods portion, Section 12, only. *This standard does not purport to address all of the safety problems, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

2. Referenced Documents

2.1 ASTM Standards:

A 530/A 530M Specification for General Requirements for Specialized Carbon and Alloy Steel Pipe
E 29 Practice for Using Significant Digits in Test Data to Determine Conformance with Specifications

2.2 American National Standards Institute Standard:
B36.10 Welded and Seamless Wrought Steel Pipe

3. General Requirements

3.1 Material furnished to this specification shall conform to the applicable requirements of the current edition

of Specification A 530/A 530M unless otherwise provided herein.

4. Ordering Information

4.1 Orders for material under this specification should include the following, as required, to describe the desired material adequately:

4.1.1 Quantity (feet or number of lengths),

4.1.2 Name of material (seamless carbon steel pipe),

4.1.3 Grade (Tables 1 and 2),

4.1.4 Manufacture (hot finished or cold drawn),

4.1.5 Size (either nominal wall thickness and weight class or schedule number, or both, or outside diameter and nominal wall thickness, ANSI B36.10),

4.1.6 Length (Section 16),

4.1.7 Optional requirements (Section 8, Section 11, and Section 17 of Specification A 530/A 530M),

4.1.8 Test report required (Certification Section of Specification A 530/A 530M),

4.1.9 Specification designation,

4.1.10 End use of material, and

4.1.11 Special requirements.

5. Materials and Manufacture

5.1 Process:

5.1.1 The steel shall be killed steel made by one or more of the following processes: open-hearth, electric-furnace, or basic-oxygen.

5.1.2 The steel shall be made to fine grain practice.

5.1.3 Steel may be cast in ingots or may be strand cast. When steel of different grades are sequentially strand

cast, identification of the resultant transition material is required. The producer shall remove the transition material by any established procedure that positively separates the grades.

5.1.4 Pipe NPS 1½ and under may be either hot finished or cold drawn.

5.1.5 Unless otherwise specified, pipe NPS 2 and over shall be furnished hot finished. When agreed upon between the manufacturer and purchaser, cold-drawn pipe may be furnished.

5.2 Heat Treatment:

5.2.1 All hot-finished and cold-drawn pipe shall be reheated to a temperature above 1550°F (845°C) and followed by cooling in air or in the cooling chamber of a controlled atmosphere furnace.

6. Chemical Composition

6.1 The steel shall conform to the chemical requirements prescribed in Table 1.

7. Heat Analysis

7.1 An analysis of each heat of steel shall be made by the steel manufacturer to determine the percentages of the elements specified in Section 6. The chemical composition thus determined, or that determined from a product analysis made by the manufacturer, if the latter has not manufactured the steel, shall be reported to the purchaser or the purchaser's representative, and shall conform to the requirements specified in Section 6.

8. Product Analysis

8.1 At the request of the purchaser, analyses of two pipes from each lot (Note 2) shall be made by the manufacturer from the finished pipe. The chemical composition thus determined shall conform to the requirements specified in Section 6.

NOTE 2 — A lot shall consist of 400 lengths, or fraction thereof, for each size NPS 2 up to but not including NPS 6, and of 200 lengths, or fraction thereof, for each size NPS 6 and over.

8.2 If the analysis of one of the tests specified in 8.1 does not conform to the requirements specified in Section 6, analyses shall be made on additional pipe of double the original number from the same lot, each of which shall conform to requirements specified.

9. Physical Properties

9.1 Tensile Properties — The material shall conform to the requirements as to tensile properties prescribed in Table 2.

9.2 Bending Properties:

9.2.1 For pipe NPS 2 and under, a sufficient length of pipe shall stand being bent cold through 90° around a cylindrical mandrel, the diameter of which is twelve times the nominal diameter of the pipe, without developing cracks. When ordered for close coiling, the pipe shall stand being bent cold through 180° around a cylindrical mandrel, the diameter of which is eight times the nominal diameter of the pipe, without failure.

9.2.2 For pipe whose diameter exceeds 25 in. (635 mm) and whose diameter to wall thickness ratio is 7.0 or less, bend test specimens shall be bent at room temperature through 180° without cracking on the outside of the bent portion. The inside diameter of the bend shall be 1 in. (25.4 mm). This test shall be in place of Section 10.

NOTE 3 — Diameter to wall thickness ratio = specified outside diameter/nominal wall thickness.

Example: For 28 in. diameter 5.000 in. thick pipe the diameter to wall thickness ratio = $28/5 = 5.6$.

10. Flattening Test Requirements

10.1 For pipe over NPS 2, a section of pipe not less than 2½ in. (63.5 mm) in length shall be flattened cold between parallel plates until the opposite walls of the pipe meet. Flattening tests shall be in accordance with Specification A 530, except that in the equation used to calculate the H value, the following e constants shall be used:

0.07 for Grade I

0.08 for Grade II

10.2 When low D -to- t ratio tubulars are tested, because the strain imposed due to geometry is unreasonably high on the inside surface at the 6 and 12 o'clock locations, cracks at these locations shall not be cause for rejection if the D -to- t ratio is less than 10.

11. Hydrostatic Test Requirements

11.1 Each length of pipe shall be subjected to the hydrostatic pressure, except as provided in 11.2.

11.2 When specified in the order, pipe may be furnished without hydrostatic testing and each length so furnished shall include with the mandatory marking the letters "NH."

11.3 When certification is required by the purchaser and the hydrostatic test has been omitted, the certification shall clearly state "Not Hydrostatically Tested," and the specification number and grade designation, as shown on the certification, shall be followed by the letters "NH."

12. Test Specimens and Methods of Testing

12.1 Specimens cut either longitudinally or transversely shall be acceptable for the tension test.

12.2 Test specimens for the bend test specified in 9.2 and for the flattening tests specified in Section 10 shall consist of sections cut from a pipe. Specimens for flattening tests shall be smooth on the ends and free from burrs, except when made on crop ends.

12.3 Test specimens for the bend test specified in 9.2.2 shall be cut from one end of the pipe and, unless otherwise specified, shall be taken in a transverse direction. One test specimen shall be taken as close to the outer surface as possible and another from as close to the inner surface as possible. The specimens shall be either $\frac{1}{2}$ by $\frac{1}{2}$ in. (12.7 mm) in section or 1 by $\frac{1}{2}$ in. (25.4 by 12.7 mm) in section with the corners rounded to a radius not over $\frac{1}{16}$ in. (1.6 mm) and need not exceed 6 in. (152 mm) in length. The side of the samples placed in tension during the bend shall be the side closest to the inner and outer surface of the pipe respectively.

13. Number of Tests and Retests

13.1 One of either of the tests specified in 9.1 shall be made on one length of pipe from each lot (Note 2).

13.2 For pipe NPS 2 and under, the bend test specified in 9.2 shall be made on one pipe from each lot (Note 2). The bend tests specified in 9.2.2 shall be made on one end of each pipe.

13.3 The flattening test specified in Section 10 shall be made on one length of pipe from each lot (Note 2).

13.4 Retests shall be in accordance with Specification A 530 and as provided in 13.5 and 13.6.

13.5 If a specimen breaks in an inside or outside surface flaw, a retest shall be allowed.

13.6 Should a crop end of a finished pipe fail in the flattening test, one retest may be made from the broken end.

14. Dimensions and Weights

14.1 The dimensions and weights of plain-end pipe are included in ANSI B36.10. Sizes and wall thicknesses most generally available are listed in Appendix, Table X1.2.

15. Dimensions, Weight, and Permissible Variations

15.1 Weight — The weight of any length of pipe shall not vary more than 6.5% over and 3.5% under that specified for pipe of Schedule 120 and lighter nor more than 10% over and 3.5% under that specified for pipe heavier than Schedule 120. Unless otherwise agreed upon between the manufacturer and purchaser, pipe in sizes NPS 4 and smaller may be weighed in convenient lots; pipe in sizes larger than NPS 4 shall be weighed separately.

15.2 Diameter — Variations in outside diameter shall not exceed those specified in Table 3.

15.3 Thickness — The minimum wall thickness at any point shall not be more than 12.5% under the nominal wall thickness specified.

NOTE 4 — The minimum wall thickness on inspection is shown in Appendix, Table X1.1.

16. Lengths

16.1 Pipe lengths shall be in accordance with the following regular practice:

16.1.1 The lengths required shall be specified in the order, and

16.1.2 No jointers are permitted unless otherwise specified.

16.2 If definite lengths are not required, pipe may be ordered in single random lengths of 16 to 22 ft (4.9 to 6.7 m), with 5% 12 to 16 ft (3.7 to 4.9 m), or in double random lengths with a minimum average of 35 ft (10.7 m) and a minimum length of 22 ft with 5% 16 to 22 ft.

17. Workmanship, Finish, and Appearance

17.1 The pipe manufacturer shall explore a sufficient number of visual surface imperfections to provide reasonable assurance that they have been properly evaluated with respect to depth. Exploration of all surface imperfections is not required but may be necessary to assure compliance with 17.2.

17.2 Surface imperfections that penetrate more than $12\frac{1}{2}\%$ of the nominal wall thickness or encroach on the minimum wall thickness shall be considered defects. Pipe with such defects shall be given one of the following dispositions:

17.2.1 The defect may be removed by grinding provided that the remaining wall thickness is within specified limits.

17.2.2 Repaired in accordance with the repair welding provisions of 17.6.

17.2.3 The section of pipe containing the defect may be cut off within the limits of requirements on length.

17.2.4 Rejected.

17.3 To provide a workmanlike finish and basis for evaluating conformance with 17.2, the pipe manufacturer shall remove by grinding the following noninjurious imperfections:

17.3.1 Mechanical marks, abrasions (Note 5) and pits, any of which imperfections are deeper than $\frac{1}{16}$ in. (1.58 mm).

NOTE 5 — Marks and abrasions are defined as cable marks, dinges, guide marks, roll marks, ball scratches, scores, die marks, and the like.

17.3.2 Visual imperfections, commonly referred to as scabs, seams, laps, tears or slivers, found by exploration in accordance with 17.1 to be deeper than 5% of the nominal wall thickness.

17.4 At the purchaser's discretion, pipe shall be subject to rejection if surface imperfections acceptable under 17.2 are not scattered, but appear over a large area in excess of what is considered a workmanlike finish. Disposition of such pipe shall be a matter of agreement between the manufacturer and the purchaser.

17.5 When imperfections or defects are removed by grinding, a smooth curved surface shall be maintained, and the wall thickness shall not be decreased below that permitted by this specification. The outside diameter at the point of grinding may be reduced by the amount so removed.

17.5.1 Wall thickness measurements shall be made with a mechanical caliper or with a properly calibrated nondestructive testing device of appropriate accuracy. In case of dispute, the measurement determined by use of the mechanical caliper shall govern.

17.6 Weld repair shall be permitted only subject to the approval of the purchaser and in accordance with Specification A 530/A 530M.

17.7 The finished pipe shall be reasonably straight.

18. Rejection

18.1 Each length of pipe that develops injurious defects during shop working or application operations will be rejected, and the manufacturer shall be notified. No rejections under this or any other specifications shall be marked as specified in Section 19 for sale under this specification except where such pipe fails to comply with the weight requirements alone, in which case it may be sold under the weight specifications with which it does comply.

19. Product Marking

19.1 In addition to the marking prescribed in Specification A 530/A 530M, the marking shall include the hydrostatic test pressure when tested or the letters "NH" when not tested, the length and schedule number, and on pipe sizes larger than NPS 4 the weight shall be given. Length shall be marked in feet and tenths of a foot, or metres to two decimal places, depending on the units to which the material was ordered, or other marking subject to agreement.

19.2 Bar Coding — In addition to the requirements in 19.1, bar coding is acceptable as a supplementary identification method. Bar coding should be consistent with the Automotive Industry Action Group (AIAG) standard prepared by the Primary Metals Subcommittee of the AIAG Bar Code Project Team.

TABLE 1
CHEMICAL REQUIREMENTS

Element	Grades I and II, Composition, %
Carbon, max	0.21
Manganese	0.90–1.35
Phosphorus, max	0.035
Sulfur, max	0.035
Silicon	0.10–0.40

TABLE 2
TENSILE REQUIREMENTS

	Wall Thicknesses			
	Grade I, 0.375 in. (95.2 mm) and under		Grade II, greater than 0.375 in. (95.2 mm)	
Tensile strength, psi (MPa)	60 000–85 000 (414–586)		55 000–80 000 (380–550)	
Yield strength, min, psi (MPa)	35 000 (240)		30 000 (205)	
	Longitudinal	Transverse	Longitudinal	Transverse
Elongation in 2 in. or 50 mm, min, %:				
Basic minimum elongation for walls $\frac{5}{16}$ in. (7.9 mm) and over in thickness, strip tests, and for all small sizes tested in full section	30	16.5	35	25
When standard round 2 in. or 50 mm gage length test specimen is used for strip tests, a deduction for each $\frac{1}{32}$ in. (0.8 mm) decrease in wall thickness below $\frac{5}{16}$ in. (7.9 mm) from the basic minimum elongation of the following percentage	22 1.504	12 1.004	28 ...	20 ...

A The following table gives the computed minimum values:

Wall Thickness		Elongation in 2 in. or 50 mm, min, %	
		Grade I	
in.	mm	Longitudinal	Transverse
$\frac{5}{16}$ (0.312)	7.94	30.0	16.5
$\frac{9}{32}$ (0.281)	7.14	28.5	15.5
$\frac{1}{4}$ (0.250)	6.35	27.0	14.5
$\frac{7}{32}$ (0.219)	5.56	25.5	...
$\frac{3}{16}$ (0.188)	4.76	24.0	...
$\frac{5}{32}$ (0.156)	3.97	22.5	...
$\frac{1}{8}$ (0.125)	3.18	21.0	...
$\frac{3}{32}$ (0.094)	2.38	19.5	...
$\frac{1}{16}$ (0.062)	1.59	18.0	...

NOTE — The above table gives the computer minimum elongation values for each $\frac{1}{32}$ in. (0.79 mm) decrease in wall thickness. Where the wall thickness lies between two values shown above, the minimum elongation value is determined by the following equation:

Grade	Direction of Test	Equation
I	transverse	$E = 32t + 6.50$
I	longitudinal	$E = 48t + 15.00$

where:

E = elongation in 2 in. or 50 mm in % and

t = actual thickness of specimen, in. (mm)

TABLE 3
VARIATIONS IN OUTSIDE DIAMETER

NPS Designator	Permissible Variations in Outside Diameter, in. (mm)	
	Over	Under
$\frac{1}{8}$ to $1\frac{1}{2}$, incl	$\frac{1}{64}$ (0.4)	$\frac{1}{32}$ (0.8)
Over $1\frac{1}{2}$ to 4, incl	$\frac{1}{32}$ (0.8)	$\frac{1}{32}$ (0.8)
Over 4 to 8, incl	$\frac{1}{16}$ (1.6)	$\frac{1}{32}$ (0.8)
Over 8 to 18, incl	$\frac{3}{32}$ (2.4)	$\frac{1}{32}$ (0.8)
Over 18	$\frac{1}{8}$ (3.2)	$\frac{1}{32}$ (0.8)

NOTES:

- (1) The following equation, upon which this table is based, may be applied to calculated minimum wall thickness from nominal (average) wall thickness:

$$t_n \times 0.875 = t_m$$

where:

t_n = nominal (average) wall thickness, in. [mm], and

t_m = minimum wall thickness, in. [mm]

The wall thickness is expressed to three decimal places, the fourth decimal place being carried forward or dropped, in accordance with Practice E 29.

- (2) This table is a master table covering wall thicknesses available in the purchase of different classifications of pipe, but it is not meant to imply that all of the walls listed therein are obtainable under this specification.

SPECIFICATION FOR GENERAL REQUIREMENTS FOR SPECIALIZED CARBON AND ALLOY STEEL PIPE

**SA-530/SA-530M**

(Identical with ASTM Specification A 530/A 530M-99.)

1. Scope

1.1 This specification covers a group of requirements which, with the exceptions of Sections 4.3, 12, 19, and 20, are mandatory requirements to the ASTM pipe product specifications noted below unless the product specification specifies different requirements, in which case the requirement of the product specification shall prevail.

1.2 Sections 4.3 or 19 are mandatory if the product specification has a requirement for product analysis or flattening tests.

1.3 Section 20 is mandatory if the product specification has a hydrostatic test requirement without defining the test parameters.

1.4 Section 12 is for information only.

1.5 In case of conflict between a requirement of the product specification and a requirement of this general requirement specification, only the requirement of the product specification need be satisfied.

Title of Specification	ASTM Designation ^A
Seamless Carbon Steel Pipe for High-Temperature Service	A 106
Seamless and Welded Austenitic Stainless Steel Pipe	A 312/A 312M
Seamless and Welded Steel Pipe for Low-Temperature Service	A 333/A 333M
Seamless Ferritic Alloy Steel Pipe for High-Temperature Service	A 335/A 335M
Electric-Fusion-Welded Austenitic Chromium-Nickel Alloy Steel Pipe for High-Temperature Service	A 358/A 358M
Carbon and Ferritic Alloy Steel Forged and Bored Pipe for High-Temperature Service	A 369/A 369M

Title of Specification	ASTM Designation ^A
Seamless Austenitic Steel Pipe for Use With High-Temperature Central-Station Service	A 376/A 376M
Metal-Arc-Welded Steel Pipe for Use With High-Pressure Transmission Systems	A 381
Seamless Ferritic Alloy Steel Pipe Specially Heat Treated for High-Temperature Service	A 405
Welded Large Diameter Austenitic Steel Pipe for Corrosive or High-Temperature Service	A 409/A 409M
Centrifugally Cast Ferritic Alloy Steel Pipe for High-Temperature Service	A 426
Austenitic Steel Forged and Bored Pipe for High-Temperature Service	A 430/A 430M
Centrifugally Cast Austenitic Steel Pipe for High-Temperature Service	A 451
Centrifugally Cast Austenitic Steel Cold-Wrought Pipe for High-Temperature Service	A 452
Seamless Carbon Steel Pipe for Atmospheric and Lower Temperatures	A 524
Centrifugally Cast Iron-Chromium-Nickel High-Alloy Tubing for Pressure Application at High Temperatures	A 608
Centrifugally Cast Carbon Steel Pipe for High-Temperature Service	A 660
Electric-Fusion-Welded Steel Pipe for Atmospheric and Lower Temperatures	A 671
Electric-Fusion-Welded Steel Pipe for High-Pressure Service at Moderate Temperatures	A 672
Carbon and Alloy Steel Pipe, Electric-Fusion-Welded for High-Pressure Service at High Temperatures	A 691
Seamless, Welded Ferritic, and Martensitic Stainless Steel Pipe	A 731/A 731M
Seamless and Welded Ferritic/Austenitic Stainless Steel Pipe	A 790/A 790M
Single- or Double-Welded Austenitic Stainless Steel Pipe	A 813/A 813M
Cold-Worked Welded Austenitic Stainless Steel Pipe	A 814/A 814M
Centrifugally Cast Ferritic/Austenitic Stainless Steel Pipe for Corrosive Environments	A 872

^A These designations refer to the latest issue of the respective specifications.

1.6 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification. The inch-pound units shall apply unless the “M” designation (SI) of the product specification is specified in the order.

NOTE 1 — The dimensionless designator NPS (nominal pipe size) has been substituted in this standard for such traditional terms as “nominal diameter,” “size,” and “nominal size.”

2.5 Steel Structures Painting Council:

SSPC-SP6 Surface Preparation Specification No. 6 Commercial Blast Cleaning

3. Process

3.1 The steel shall be made from any process.

3.2 If a specific type of melting is required by the purchaser, it shall be stated on the purchase order.

3.3 The primary melting may incorporate separate degassing or refining and may be followed by secondary

melting, using electroslag remelting or vacuum remelting. If secondary melting is employed, the heat shall be defined as all of the ingots remelted from a single primary heat.

3.4 Steel may be cast in ingots or may be strand cast. When steel of different grades is sequentially strand cast, identification of the resultant transition material is required. The producer shall remove the transition material by an established procedure that positively separates the grades.

4. Chemical Composition

4.1 Chemical Analysis — Samples for chemical analysis and method of analysis shall be in accordance with Test Methods, Practices, and Terminology A 751.

4.2 Heat Analysis — An analysis of each heat of steel shall be made by the steel manufacturer to determine the percentages of the elements specified. If secondary melting processes are employed, the heat analysis shall be obtained from one remelted ingot or the product of one remelted ingot of each primary melt. The chemical composition thus determined, or that determined from a product analysis made by the tubular product manufacturer shall conform to the requirements specified.

4.2.1 For stainless steels ordered under product specifications referencing this specification of general requirements, the steel shall not contain an unspecified element, other than nitrogen, for the ordered grade to the extent that the steel conforms to the requirements of another grade for which that element is a specified element having a required minimum content. For this requirement, a grade is defined as an alloy described individually and identified by its own UNS designation in a table of chemical requirements within any specification listed within the scope as being covered by this specification.

4.3 Product Analysis — Product analysis requirements and options, if any, are contained in the product specification.

5. Mechanical Requirements

5.1 Method of Mechanical Tests — The specimens and the mechanical tests required shall be in accordance with Test Methods and Definitions A 370, especially Annex A2 thereof.

5.2 Specimens shall be tested at room temperature.

5.3 Small or subsize specimens as described in Test Methods and Definitions A 370 may be used only when there is insufficient material to prepare one of the standard specimens. When using small or subsize specimens, the largest one possible shall be used.

6. Tensile Requirements

6.1 The material shall conform to the requirements as to tensile properties prescribed in the individual specifications.

6.2 The yield strength corresponding to a permanent offset of 0.2% of the gage length or to a total extension of 0.5% of the gage length under load shall be determined.

6.3 If the percentage of elongation of any test specimen is less than that specified and any part of the fracture is more than $\frac{3}{4}$ in. [19.0 mm] from the center of the gage length, as indicated by scribe marks on the specimen before testing, a retest shall be allowed.

7. Permissible Variation in Weight

7.1 The weight of any length of pipe NPS 12 and under shall not vary more than 10% over or 3.5% under that specified. For sizes over NPS 12, the weight of any length of pipe shall not vary more than 10% over or 5% under that specified. Unless otherwise specified, pipe of NPS 4 and smaller may be weighed in convenient lots; pipe in sizes larger than NPS 4 shall be weighed separately.

8. Permissible Variations in Wall Thickness

8.1 *Seamless and Welded (no filler metal added)* — The minimum wall thickness at any point shall be within the tolerances specified in Table 1, except that for welded pipe the weld area shall not be limited by the over tolerance. The minimum wall thickness on inspection for -12.5% is shown in Table X1.1.

8.2 *Forged and Bored* — The wall thickness shall not vary over that specified by more than $\frac{1}{8}$ in. [3.2 mm]. There shall be no variation under the specified wall thickness.

8.3 *Cast* — The wall thickness shall not vary over that specified by more than $\frac{1}{16}$ in. [1.6 mm]. There shall be no variation under the specified wall thickness.

9. Permissible Variations in Inside Diameter

9.1 *Forged and Bored, and Cast* — The inside diameter shall not vary under that specified by more than $\frac{1}{16}$ in. [1.6 mm]. There shall be no variation over the specified inside diameter.

10. Permissible Variations in Outside Diameter

10.1 Variations in outside diameter, unless otherwise specified, shall not exceed the limits prescribed in Table 2. The tolerances on outside diameter include ovality except as provided for in 10.2 and 10.2.1.

10.2 Thin-wall pipe usually develops significant ovality (out-of-roundness) during final annealing, straightening, or both. Thin-wall pipes are defined as having a wall thickness of 3% or less of the outside diameter.

10.2.1 The diameter tolerances of Table 2 are not sufficient to provide for additional ovality expected in thin-wall pipe and are applicable only to the mean of the extreme (maximum and minimum) outside diameter readings in any one cross-section. However, for thin-wall pipe the difference in extreme outside diameter readings (ovality) in any one cross-section shall not exceed 1.5% of the specified outside diameter.

11. Permissible Variations in Length

11.1 *Seamless and Welded (no filler metal added)* — If definite cut lengths are ordered, no length of pipe shall be under the length specified and not more than $\frac{1}{4}$ in. [6 mm] over that specified.

11.2 *Forged and Bored, Cast, and Cast Cold-Wrought* — If definite cut lengths are ordered, no length of pipe shall be under the length specified and not more than $\frac{1}{8}$ in. [3 mm] over that specified.

11.3 For pipe ordered to random lengths, the lengths and variations shall be agreed upon between the manufacturer and purchaser.

11.4 No jointers are permitted unless otherwise agreed upon.

12. Standard Weight

12.1 A system of standard pipe sizes has been approved by the American National Standards Institute as ANSI B36.10 and B36.19. These standard sizes do not prohibit the production and use of other sizes of pipe produced to the various specifications referenced to this Specification.

12.2 For nonstandard sizes of pipe, the calculated weight per foot, shall be determined from the following equation:

$$W = C(D - t)t \quad (1)$$

where:

$C = 10.69$ [0.0246615],

$W =$ weight, lb/ft [kg/m],

$D =$ specified or calculated (from specified inside diameter and wall thickness) outside diameter, in. [mm], and

$t =$ specified wall thickness, in. (to 3 decimal places) [mm to 2 decimal places].

NOTE 2 — The weights given in the American National Standards and the calculated weights given by eq. (1) are based on the weights for

carbon steel pipe. The weight of pipe made of ferritic stainless steels may be about 5% less, and that made of austenitic stainless steel about 2% greater than the values given.

13. Ends

13.1 Unless otherwise specified, the pipe shall be furnished with plain ends. All burrs at the ends of the pipe shall be removed.

14. Straightness

14.1 The finished pipe shall be reasonably straight.

14.2 For metal-arc welded pipe, the maximum deviation from a 10 ft [3.0 m] straightedge placed so that both ends are in contact with the pipe shall be $\frac{1}{8}$ in. [3.2 mm]. For metal-arc welded pipe with lengths shorter than 10 ft [3.0 m], this maximum deviation shall be pro-rated with respect to the ratio of the actual length to 10 ft [3.0 m].

15. Repair by Welding

15.1 Repair by welding of defects in seamless pipe (including centrifugally cast and forged and bored) and of plate defects in welded pipe and, when specifically stated by the product specification weld seam defects in welded pipe, shall be permitted subject to the approval of the purchaser and with the further understanding that the composition of the deposited filler metal shall be suitable for the composition being welded. Defects shall be thoroughly chipped or ground out before welding and each repaired length shall be reheat treated or stress relieved as required by the applicable specification. Each length of repaired pipe shall be tested hydrostatically as required by the product specification.

15.2 Repair welding shall be performed using procedures and welders or welding operators that have been qualified in accordance with the ASME Boiler and Pressure Vessel Code, Section IX.

16. Retests

16.1 If the results of the mechanical tests of any group or lot do not conform to the requirements specified in the individual specification, retests may be made on additional lengths of pipe of double the original number from the same group or lot, each of which shall conform to the requirements specified. Only one retest of any group or lot will be permitted. Nonconformance will be cause for the rejection of the group or lot.

16.2 Any individual length of pipe that meets the test requirements is acceptable. Individual lengths that do not conform to the test requirements may be resubmitted for

test provided the reason for nonconformance is established and the nonconforming portion removed.

17. Retreatment

17.1 If individual lengths of pipe selected to represent any group or lot fail to conform to the test requirements, the group or lot represented may be reheat treated and resubmitted for test. The manufacturer may reheat treat the pipe, but not more than twice, except with the approval of the purchaser on the basis of satisfactory metallurgical evidence that the cause of failure of the test is curable and the quality of the material is satisfactory.

18. Test Specimens

18.1 Test specimens shall be taken from the ends of finished pipe prior to any forming operations, or being cut to length. They shall be smooth on the ends and free from burrs and flaws, except for specimens for the flattening test when made from crop ends.

18.2 Specimens cut either longitudinally or transversely shall be acceptable for the tension test.

18.3 If any test specimen shows flaws or defective machining, the specimen may be discarded and another substituted.

19. Flattening Test Requirements

19.1 *Seamless and Centrifugally Cast Pipe* — A section of pipe not less than $2\frac{1}{2}$ in. [63 mm] in length shall be flattened cold between parallel plates in two steps. During the first step, which is a test for ductility, no cracks or breaks on the inside, outside, or end surfaces, except as provided for in 19.3.4, shall occur until the distance between the plates is less than the value of H calculated as follows:

$$H = (1 + e)t/(e + t/D) \quad (2)$$

where:

- H = distance between flattening plates, in. [mm],
- t = specified wall thickness, in. [mm],
- D = specified or calculated (from the specified inside diameter and wall thickness) outside diameter, in. [mm], and
- e = deformation per unit length (constant for a given grade of steel; 0.07 for medium carbon steel (maximum specified carbon 0.19% or greater), 0.08 for ferritic alloy steel, 0.09 for austenitic steel, and 0.09 for low-carbon steel (maximum specified carbon 0.18% or less)).

During the second step, which is a test for soundness, the flattening shall be continued until the specimen breaks or the opposite walls of the pipe meet.

19.2 Welded Pipe — A section of welded pipe not less than 4 in. [100 mm] in length shall be flattened cold between parallel plates in two steps. The weld shall be placed 90° from the direction of the applied force (at the point of maximum bending). During the first step, which is a test for ductility, no cracks or breaks on the inside or outside surfaces, except as provided for in 19.3.4, shall occur until the distance between the plates is less than the value of H calculated by the Eq. (2). During the second step, which is a test for soundness, the flattening shall be continued until the specimen breaks or the opposite walls of the pipe meet.

19.3 Seamless, Centrifugally Cast, and Welded Pipe:

19.3.1 Evidence of laminated or defective material or weld that is revealed during the entire flattening test shall be cause for rejection.

19.3.2 Surface imperfections not evident in the test specimen before flattening, but revealed during the first step of the flattening test, shall be judged in accordance with the finish requirements.

19.3.3 Superficial ruptures resulting from surface imperfections shall not be a cause for rejection.

19.3.4 When low D -to- t ratio tubular products are tested, because the strain imposed due to geometry is unreasonably high on the inside surface at the six and twelve o'clock locations, cracks at these locations shall not be cause for rejection if the D to t ratio is less than 10.

20. Hydrostatic Test Requirements

20.1 Except as provided in 20.2 and 20.3, each length of pipe shall be tested by the manufacturer to a hydrostatic pressure which will produce in the pipe wall a stress not less than 60% of the minimum specified yield strength for carbon and ferritic alloy steel pipe, or 50% of the specified minimum yield strength for austenitic alloy steel pipe. The test pressure or stress shall be determined by the following equation:

$$P = 2St/D \quad \text{or} \quad S = PD/2t \quad (3)$$

where:

P = hydrostatic test pressure in psi or MPa,

S = pipe wall stress in psi or MPa,

t = specified nominal wall thickness, nominal wall thickness corresponding to specified ANSI schedule number, or 1.143 times the specified minimum wall thickness, in. [mm], and

D = specified outside diameter, outside diameter corresponding to specified ANSI pipe size, or outside diameter calculated by adding $2t$ (as defined above) to the specified inside diameter, in. [mm].

20.1.1 The hydrostatic test pressure determined by the equation shall be rounded to the nearest 50 psi [0.5

MPa] for pressures below 1000 psi [7 MPa], and to the nearest 100 psi [1 MPa] for pressures 1000 psi [7 MPa] and above. The hydrostatic test may be performed prior to cutting to final length, or prior to upsetting, swaging, expanding, bending, or other forming operations.

20.2 Regardless of pipe-wall stress-level determined by Eq. (3), the minimum hydrostatic test pressure required to satisfy these requirements need not exceed 2500 psi [17.0 MPa] for outside diameters (see D in 20.1) of 3.5 in. [88.9 mm] or less, nor 2800 psi [19.0 MPa] for outside diameters over 3.5 in. [88.9 mm]. This does not prohibit testing at higher pressures at the manufacturer's option or as provided in 20.3.

20.3 With concurrence of the manufacturer, a minimum hydrostatic test pressure in excess of the requirements of 20.2 or 20.1, or both, may be stated on the order.

20.4 The test pressure shall be held for a minimum of 5 s without resultant leakage through the pipe wall. For welded pipe, the test pressure shall be held for a time sufficient to permit the inspector to examine the entire length of the welded seam.

20.5 The hydrostatic test may not be capable of inspecting the end portion of the pipe. The length of pipe that cannot be tested shall be determined by the manufacturer and, when specified in the purchase order, reported to the purchaser.

21. Certified Test Report

21.1 When specified in the purchase order or contract the producer or supplier shall furnish a Certified Test Report certifying that the material was manufactured, sampled, tested, and inspected in accordance with the Specification, including year date, the Supplementary Requirements, and any other requirements designated in the purchase order or contract, and that the results met the requirements of that Specification, the Supplementary Requirements, and the other requirements. A signature or notarization is not required on the Certified Test Report, but the document shall be dated and shall clearly identify the organization submitting the Report.

NOTE 3 — Notwithstanding the absence of a signature or notarization, the organization submitting the Report is responsible for the contents of the Report.

21.2 In addition, the Certified Test Report shall include the following information and test results, when applicable:

21.2.1 Heat Number,

21.2.2 Heat Analysis,

21.2.3 Product Analysis, if specified or required,

21.2.4 Tensile Properties,

21.2.5 Width of the gage length, when longitudinal strip tension test specimens are used,

21.2.6 Bend Test acceptable,

21.2.7 Flattening Test acceptable,

21.2.8 Hydrostatic Test pressure,

21.2.9 Non-destructive Electric Test method,

21.2.10 Impact Test results, and

21.2.11 Other test results or information required to be reported by the product specification.

21.3 Test results or information required to be reported by supplementary requirements, or other requirements designated in the purchase order or contract shall be reported, but may be reported in a separate document.

21.4 The Certified Test Report shall include a statement of explanation for the letter added to the specification number marked on the tubes (see 24.5) when all of the requirements of the specification have not been completed. The purchaser must certify that all requirements of the specification have been completed before removal of the letter (that is, X, Y, or Z).

21.5 When certification is required for material that has not been hydrostatically tested, the Certificate of Test shall state "Not hydrostatically tested," and the letters "NH" shall be appended to the product specification number, material grade, and class shown on the Certificate.

22. Inspection

22.1 The inspector representing the purchaser shall have entry at all times while work on the contract of the purchaser is being performed, to all parts of the manufacturer's works that concern the manufacture of the material ordered. The manufacturer shall afford the inspector all reasonable facilities to satisfy him that the material is being furnished in accordance with this specification. All required tests and inspection shall be made at the place of manufacture prior to shipment, unless otherwise specified, and shall be conducted so as not to interfere unnecessarily with operation of the works.

23. Rejection

23.1 Each length of pipe received from the manufacturer may be inspected by the purchaser and, if it does not meet the requirements of the specification based on the inspection and test method as outlined in the specification, the length may be rejected and the manufacturer shall be notified. Disposition of rejected pipe shall be a matter of agreement between the manufacturer and the purchaser.

23.2 Pipe that fails in any of the forming operations or in the process of installation and is found to be defective

shall be set aside and the manufacturer shall be notified for mutual evaluation of the suitability of the pipe. Disposition of such pipe shall be a matter for agreement.

24. Product Marking

24.1 Each length of pipe shall be legibly marked with the manufacturer's name or brand, the specification number (year of issue not required), and grade. Marking shall begin approximately 12 in. [300 mm] from the end of each length of pipe. For pipe less than NPS 2 and pipe under 3 ft [1 m] in length, the required information may be marked on a tag securely attached to the bundle or box in which the pipes are shipped.

24.2 When pipe marked as specified is rejected, the ASTM designation shall be cancelled.

24.3 For austenitic steel pipe, the marking paint or ink shall not contain any harmful metal, or metal salts, such as zinc, lead, or copper, which cause corrosive attack on heating.

24.4 Pipes which have been weld repaired in accordance with 15.1 shall be marked *WR*.

24.5 When it is specified that certain requirements of a specification adopted by the ASME Boiler and Pressure Vessel Committee are to be completed by the purchaser upon receipt of the material, the manufacturer shall indicate that all requirements of the specification have not been completed by a letter such as X, Y, or Z, immediately following the specification number. This letter may be removed after completion of all requirements in accordance with the specification. An explanation of specification requirements to be completed is provided in 23.1.

24.6 Bar Coding — In addition to the requirements in 24.1, 24.2, 24.3, 24.4, and 24.5, bar coding is acceptable as a supplemental identification method. The purchaser may specify in the order a specific bar coding system to be used.

25. Packaging, Marking, and Loading

25.1 When specified on the purchase order, packaging, marking, and loading for shipment shall be in accordance with the procedures of Practices A 700.

26. Government Procurement

26.1 When specified in the contract or order, the following requirements shall be considered in the inquiry contract or order for agencies of the U.S. Government where scale free pipe is required. These requirements shall take precedence if there is a conflict between these requirements and the product specification.

26.1.1 Pipe shall be ordered to nominal pipe size (NPS) and schedule. Nominal pipe shall be as specified in ANSI B36.10.

26.1.2 Responsibility for Inspection — Unless otherwise specified in the contract or purchase order, the manufacturer is responsible for the performance of all inspection and test requirements specified. The absence of any inspection requirements in the specification shall not relieve the contractor of the responsibility for ensuring that all products or supplies submitted to the Government for acceptance comply with all requirements of the contract. Sampling inspection, as part of the manufacturing operations, is an acceptable practice to ascertain conformance to requirements, however, this does not authorize submission of known defective material, either indicated or actual, nor does it commit the Government to accept the material. Except as otherwise specified in the contract or purchase order, the manufacturer may use his own or any other suitable facilities for the performance of the inspection and test requirements unless disapproved by the purchaser at the time the order is placed. The purchaser shall have the right to perform any of the inspections and tests set forth when such inspections and tests are deemed necessary to ensure that the material conforms to the prescribed requirements.

26.1.3 Sampling for Flattening and Flaring Test and for Visual and Dimensional Examination — Minimum sampling for flattening and flaring tests and visual and dimensional examination shall be as follows:

Lot Size (pieces per lot)	Sample Size
2 to 8	Entire lot
9 to 90	8
91 to 150	12
151 to 280	19
281 to 500	21
501 to 1200	27
1201 to 3200	35
3201 to 10 000	38
10 001 to 35 000	46

In all cases, the acceptance number is zero and the rejection number is one. Rejected lots may be screened and resubmitted for visual and dimensional examination. All defective items shall be replaced with acceptable items prior to lot acceptance.

26.1.4 Sampling for Chemical Analysis — One sample for chemical analysis shall be selected from each of two pipes chosen from each lot. A lot shall be all material poured from one heat.

26.1.5 Sampling for Tension and Bend Test — One sample shall be taken from each lot. A lot shall consist of

all pipe of the same outside diameter and wall thickness manufactured during an 8-h shift from the same heat of steel, and heat treated under the same conditions of temperature and time in a single charge in a batch type furnace, or heat treated under the same condition in a continuous furnace, and presented for inspection at the same time.

26.1.6 Hydrostatic and Ultrasonic Tests — Each pipe shall be tested by the ultrasonic (when specified) and hydrostatic tests.

26.1.7 Pipe shall be free from heavy oxide or scale. The internal surface of hot finished ferritic steel pipe shall be pickled or blast cleaned to a free of scale condition equivalent to the CSa2 visual standard listed in SSPC-SP6. Cleaning shall be performed in accordance with a written procedure that has been shown to be effective. This procedure shall be available for audit.

26.1.8 In addition to the marking in Specification A 450/A 450M, each length of pipe $\frac{1}{4}$ in. outside diameter and larger shall be marked with the following listed information. Marking shall be in accordance with FED-STD-183 and MIL-STD-792. (a) Nominal Pipe Size Schedule and Length (b) Heat or lot identification number.

26.1.9 Pipe shall be straight to within the tolerances specified in Table 3.

26.1.10 When specified, each pipe shall be ultrasonically examined in accordance with MIL-STD-271, except that the notch depth in the calibration standard shall be 5% of the wall thickness or 0.005 in., whichever is greater. Any pipe which produces an indication equal to or greater than 100% of the indication from the calibration standard shall be rejected.

26.1.11 The pipe shall be free from repair welds, welded joints, laps, laminations, seams, visible cracks, tears, grooves, slivers, pits, and other imperfections detrimental to the pipe as determined by visual and ultrasonic examination, or alternate tests, as specified.

26.1.12 Pipe shall be uniform in quality and condition and have a finish conforming to the best practice for standard quality pipe. Surface imperfections such as handling marks, straightening marks, light mandrel and die marks, shallow pits, and scale pattern will not be considered injurious if the imperfections are removable within the tolerances specified for wall thickness or 0.005 in., whichever is greater. The bottom of imperfections shall be visible and the profile shall be rounded and faired-in.

26.1.13 No weld repair by the manufacturer is permitted.

26.1.14 Preservation shall be level A or commercial, and packing shall be level A, B, or commercial, as specified. Level A preservation and level A or B packing shall

be in accordance with MIL-STD-163, and commercial preservation and packing shall be in accordance with Practices A 700 or Practice D 3951.

NOTES:

- (1) The following equation, upon which this table is based, may be applied to calculate minimum wall thickness from nominal (average) wall thickness:

$$t_n \times 0.875 = t_m$$

where:

t_n = nominal (average) wall thickness, in. [mm], and

t_m = minimum wall thickness, in. [mm].

The wall thickness is expressed to three decimal places, the fourth decimal place being carried forward or dropped, in accordance with the Practice E 29.

- (2) This table is a master table covering wall thicknesses available in the purchase of different classifications of pipe, but it is not meant to imply that all of the walls listed therein are obtainable under this specification.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR PRESSURE VESSEL PLATES, ALLOY STEEL, QUENCHED AND TEMPERED, MANGANESE-MOLYBDENUM AND MANGANESE- MOLYBDENUM-NICKEL

SA-533/SA-533M

(Identical with ASTM Specification A 533/A 533M-93.)

1. Scope

1.1 This specification covers manganese-molybdenum and manganese-molybdenum-nickel alloy steel plates for use in the quenched and tempered condition for the construction of welded pressure vessels.

1.2 This specification includes four types of chemical analysis and three classes of strength levels as follows:

Type	Nominal Molybdenum Content, %	Nominal Nickel Content, %
A	0.50	...
B	0.50	0.55
C	0.50	0.85
D	0.50	0.30

Class	Tensile Strength, ksi [MPa]
1	80-100 [550 to 690]
2	90-115 [620 to 795]
3	100-125 [690 to 860]

1.3 The maximum thickness of Class 1 and Class 2 plates is limited only by the capacity of the composition to meet the specified mechanical property requirements; however, current practice normally limits the maximum thickness to 12 in. [300 mm].

1.4 The maximum thickness of Class 3 plates is 2½ in. [65 mm].

1.5 The minimum nominal thickness of plates of all classes is 0.25 in. [6.5 mm].

1.6 These alloy steel plates in the as-rolled condition are sensitive to cracking during transit and handling, particularly in thicknesses over about 1 or 2 in. [25 or 50 mm]. They should be shipped in the as-rolled conditions only with the mutual agreement of manufacturer and fabricator.

1.7 Plates covered by this specification are often used in the beltline region of nuclear reactor vessels where the material properties may be affected by high levels of radiation. Appendix X1 provides some information pertinent to this usage.

1.8 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification.

2. Referenced Documents

2.1 ASTM Standards:

- A 20/A 20M Specification for General Requirements for Steel Plates for Pressure Vessels
- A 435/A 435M Specification for Straight-Beam Ultrasonic Examination of Steel Plates
- A 577/A 577M Specification for Ultrasonic Angle-Beam Examination of Steel Plates
- A 578/A 578M Specification for Straight-Beam Ultrasonic Examination of Plain and Clad Steel Plates for Special Applications

3. General Requirements and Ordering Information

3.1 Material supplied to this material specification shall conform to Specification A 20/A 20M. These requirements outline the testing and retesting methods and procedures, permissible variations in dimensions, and mass, quality and repair of defects, marking, loading, etc.

3.2 Specification A 20/A 20M also establishes the rules for the ordering information which should be complied with when purchasing material to this specification.

3.3 In addition to the basic requirements of this specification, certain supplementary requirements are available when additional control, testing, or examination is required to meet end use requirements. These include:

3.3.1 Vacuum treatment,

3.3.2 Additional or special tension testing,

3.3.3 Impact testing, and

3.3.4 Nondestructive examination.

3.4 The purchaser is referred to the listed supplementary requirements in this specification and to the detailed requirements in Specification A 20/A 20M.

3.5 If the requirements of this specification are in conflict with the requirements of Specification A 20/A 20M, the requirements of this specification shall prevail.

4. Manufacture

4.1 *Steelmaking Practice* — The steel shall be killed and shall conform to the fine austenitic grain requirement of Specification A 20/A 20M.

5. Heat Treatment

5.1 All plates shall be heat treated by heating to a suitable temperature within the range from 1550 to 1800°F [845 to 980°C], holding for a sufficient time to obtain uniform temperature throughout the plate thickness and then quenching, in water. Subsequently the plates shall be tempered at a suitable temperature to produce the specified properties, but not less than 1100°F [595°C] with a minimum holding time of $\frac{1}{2}$ h/in. [1.2 min/mm] of thickness, but not less than $\frac{1}{2}$ h.

5.2 When the plates are heat treated by the fabricator, it shall be his responsibility to apply the proper heat treatment and to conduct tests he deems necessary to assure that the specified properties are attained.

6. Chemical Requirements

6.1 The steel shall conform to the chemical requirements shown in Table 1 unless otherwise modified in accordance with Supplementary Requirement S17, Vacuum Carbon-Deoxidized Steel, in Specification A 20/A 20M.

7. Mechanical Requirements

7.1 Tension Test Requirements:

7.1.1 The material as represented by the tension-test specimens shall conform to the requirements shown in Table 2.

7.1.2 For nominal plate thicknesses of $\frac{3}{4}$ in. [20 mm] and under, the $1\frac{1}{2}$ in. [40 mm] wide rectangular specimen may be used, and the elongation may be determined in a 2 in. [50 mm] gage length that includes the fracture and that shows the greatest elongation.

TABLE 1
CHEMICAL REQUIREMENTS

	Composition, %			
	Type A	Type B	Type C	Type D
Carbon, max ^A	0.25	0.25	0.25	0.25
Manganese ^B :				
Heat analysis	1.15–1.50	1.15–1.50	1.15–1.50	1.15–1.50

APPENDIX

X1. NUCLEAR REACTOR BELTLINE CONSIDERATIONS — RESIDUAL ELEMENTS

X1.1 Reactor design requires review and control of residual elements that affect the material properties. Copper and phosphorus are limited to levels determined by the total fluence to be encountered during plant life. Vanadium and sulfur can affect the upper energy shelf level. In the case of sulfur, control of this element or its morphology

in the plate, or both, may offer alternative means of control. The limits required shall be specified in the ordering data. The following table itemizes currently available commercial limits for the referenced elements:

Element	Heat Analysis, %	Product Analysis, %
Copper	0.10	0.12
Phosphorus	0.012	0.015
Sulfur	0.015	0.018
Vanadium	0.05	0.06

SPECIFICATION FOR PRESSURE VESSEL PLATES, HEAT-TREATED, CARBON-MANGANESE-SILICON STEEL

SA-537/SA-537M

(Identical with ASTM Specification A 537/A 537M-06.)

1. Scope

1.1 This specification covers heat-treated carbon-manganese-silicon steel plates intended for fusion welded pressure vessels and structures.

1.2 Plates furnished under this specification are available in the following three classes:

Class	Heat Treatment	Thickness	Yield Strength, min, ksi [MPa]	Tensile Strength, min, ksi [MPa]
1	Normalized	2½ in. and under	50	70
		[65 mm and under]	[345]	[485]
		Over 2½ to 4 in.	45	65
		[Over 65 to 100 mm]	[310]	[450]
2	Quenched and tempered	2½ in. and under	60	80
		[65 mm and under]	[415]	[550]
		Over 2½ to 4 in.	55	75
		[Over 65 to 100 mm]	[380]	[515]
3	Quenched and tempered	Over 4 to 6 in.	46	70
		[Over 100 to 150 mm]	[315]	[485]
		2½ in. and under	55	80
		[65 mm and under]	[380]	[550]
		Over 2½ to 4 in.	50	75
		[Over 65 to 100 mm]	[345]	[515]
		Over 4 to 6 in.	40	70
		[Over 100 to 150 mm]	[275]	[485]

1.3 The maximum thickness of plates furnished under this specification is 4 in. [100 mm] for Class 1 and 6 in. [150 mm] for Class 2 and Class 3.

1.4 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system is to be used independently of the other without combining values in any way.

2. Referenced Documents

2.1 ASTM Standards:

- A 20/A 20M Specification for General Requirements for Steel Plates for Pressure Vessels
- A 435/A 435M Specification for Straight-Beam Ultrasonic Examination of Steel Plates
- A 577/A 577M Specification for Ultrasonic Angle-Beam Examination of Steel Plates
- A 578/A 578M Specification for Straight-Beam Ultrasonic Examination of Plain and Clad Steel Plates for Special Applications

3. General Requirements and Ordering Information

3.1 Plates furnished supplied to this material specification shall conform to Specification A 20/A 20M. These requirements outline the testing and retesting methods and procedures, permissible variations in dimensions, and mass, quality and repair of defects, marking, loading, etc.

3.2 Specification A 20/A 20M also establishes the rules for the ordering information which should be complied with when purchasing material to this specification.

3.3 In addition to the basic requirements of this specification, certain supplementary requirements are available when additional control, testing, or examination is required to meet end use requirements. These include:

- 3.3.1 Vacuum treatment,
- 3.3.2 Additional or special tension testing,
- 3.3.3 Impact testing, and
- 3.3.4 Nondestructive examination.

3.4 The purchaser is referred to the listed supplementary requirements in this specification and to the detailed requirements in Specification A 20/A 20M.

3.5 If the requirements of this specification are in conflict with the requirements of Specification A 20/A 20M, the requirements of this specification shall prevail.

4. Manufacture

4.1 *Steelmaking Practice* — The steel shall be killed and conform to the fine austenitic grain size requirement of Specification A 20/A 20M.

5. Heat Treatment

5.1 All plates shall be thermally treated as follows:

5.1.1 Class 1 plates shall be normalized.

5.1.2 Class 2 and Class 3 plates shall be quenched and tempered. The tempering temperature for Class 2 plates shall not be less than 1100°F [595°C] for not less than $\frac{1}{2}$ h and 1150°F [620°C] for Class 3 plates for not less than $\frac{1}{2}$ h.

6. Chemical Requirements

6.1 The steel shall conform to the chemical requirements shown in Table 1 unless otherwise modified in accordance with Supplementary Requirement S17, Vacuum Carbon-Deoxidized Steel, in Specification A 20/A 20M.

7. Mechanical Requirements

7.1 Tension Tests:

7.1.1 *Requirements* — The material as represented by the tension-test specimens shall conform to the requirements shown in Table 2.

7.1.2 For Class 2 and Class 3 plates with a nominal thickness of $\frac{3}{4}$ in. [20 mm] and under, the $1\frac{1}{2}$ in. [40 mm] wide rectangular specimen may be used for the tension test, and the elongation may be determined in a 2 in. [50 mm] gage length that includes the fracture and that shows the greatest elongation.

8. Keywords

8.1 carbon steel plate; pressure containing parts; pressure vessel steels; steel plates for pressure vessel application

TABLE 1
CHEMICAL REQUIREMENTS

Element	Composition, %
Carbon, max [Note (1)]	0.24
Manganese:	
1½ in. [40 mm] and under in thickness [Note (2)]	
Heat analysis	0.70–1.35
Product analysis	0.64–1.46
Over 1½ in. [40 mm] in thickness:	
Heat analysis	1.00–1.60
Product analysis	0.92–1.72
Phosphorus, max [Note (1)]	0.035
Sulfur, max [Note (1)]	0.035
Silicon:	
Heat analysis	0.15–0.50
Product analysis	0.13–0.55
Copper, max:	
Heat analysis	0.35
Product analysis	0.38
Nickel, max [Note (2)]:	
Heat analysis	0.25
Product analysis	0.28
Chromium, max:	
Heat analysis	0.25
Product analysis	0.29
Molybdenum, max:	
Heat analysis	0.08
Product analysis	0.09

NOTES:

- (1) Applies to both heat and product analyses.
- (2) Manganese may exceed 1.35% on heat analysis, up to a maximum of 1.60%, and nickel may exceed 0.25% on heat analysis, up to a maximum of 0.50%, provided the heat analysis carbon equivalent does not exceed 0.57% when based upon the following equation:

$$CE = C + \frac{Mn}{6} + \frac{Cr + Mo + V}{5} + \frac{Ni + Cu}{15}$$

When this option is exercised, the manganese and nickel contents on product analysis shall not exceed the heat analysis content by more than 0.12% and 0.03%, respectively.

SPECIFICATION FOR ALLOY-STEEL BOLTING MATERIALS FOR SPECIAL APPLICATIONS

SA-540/SA-540M

(Identical with ASTM Specification A 540/A 540M-06.)

(10)

1. Scope

1.1 This specification covers regular and special-quality alloy steel bolting materials which may be used for nuclear and other special applications. Bolting materials as used in this specification cover rolled or forged bars, rotary pierced or extruded seamless tubes, bored bars, or forged hollows from forged or rolled bar segments to be manufactured into bolts, studs, washers, and nuts.

1.2 Several grades of steel are covered. The grade and class shall be specified by the purchaser.

1.3 Supplementary requirements of an optional nature are provided for use when special quality is desired. These supplementary requirements call for additional tests to be made and when desired shall be so stated in the order, together with the acceptance limits required.

1.4 This specification is expressed in both inch-pound units and in SI units. However, unless the order specifies the applicable "M" specification designation (SI units), the material shall be furnished to inch-pound units.

1.5 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification.

2. Referenced Documents

2.1 ASTM Standards:

A 962/A 962M Specification for Common Requirements for Steel Fasteners or Fastener Materials, or Both, Intended for Use at Any Temperature from Cryogenic to the Creep Range
E 45 Test Methods for Determining the Inclusion Content of Steel

2.2 AIAG Standard:

AIAG B-5 02.00 Primary Metals Identification Tag Application Standard

2.3 ANSI Standards:

B 1.1 Unified Screw Threads
B 18.2.1 Square and Hex Bolts and Screws Including Hex Cap Screws and Lag Bolts
B 18.2.2 Square and Hex Nuts
B 18.3 Hexagon Socket and Spline Socket Screws

3. Ordering Information

3.1 The inquiry and orders for material under this specification shall include the following, as required, to describe the desired material adequately:

- 3.1.1** Condition (Section 5),
- 3.1.2** Heat treatment (Section 6),
- 3.1.3** Supplementary Requirements (S1 to S9),
- 3.1.4** Reports required (Section 17),
- 3.1.5** End use, and
- 3.1.6** Any special requirements.

3.2 The purchaser is referred to the listed supplementary requirements.

4. Common Requirements

4.1 Material and fasteners supplied to this specification shall conform to the requirements of Specification A 962/A 962M. These requirements include test methods, finish, thread dimensions, marking, certification, optional supplementary requirements, and others. Failure to comply with the requirements of Specification A 962/A 962M constitutes nonconformance with this specification. In case of conflict between this specification and Specification A 962/A 962M, this specification shall prevail.

5. Manufacture

5.1 The material shall be supplied hot-rolled or hot-forged or cold-finished at the option of the producer. However, if desired by the purchaser, cold finishing may be specified.

6. Heat Treatment

6.1 Material which is ordered in the annealed condition shall have a structure suitable for machining. Such annealed bolting material is not intended to be used without subsequent quenching and tempering as specified in 6.2.

6.2 Material which is ordered in the liquid-quenched and tempered condition shall be uniformly reheated from a temperature below the cooling transformation range to the proper austenitizing temperature. It shall be quenched in a liquid medium under substantially uniform conditions and then uniformly reheated for tempering. The minimum tempering temperature shall be 850°F [455°C].

6.3 Material that has been straightened after quenching and tempering shall be stress relieved by reheating to a temperature not lower than 100°F [55°C] under the tempering temperature.

7. Chemical Composition

7.1 The steel shall conform to the chemical requirements prescribed in Table 1.

8. Tensile Requirements

8.1 Material furnished in the annealed condition shall be capable of meeting the specified tensile properties for the class as specified in Table 2 when heat treated in accordance with 6.2 and 6.3 (see Supplementary Requirement S4).

8.2 Material in the quenched and tempered or quenched, tempered and stress-relieved condition shall conform to properties shown in Table 2 for the specified class.

9. Hardness Requirements

9.1 The hardness shall be determined on the surface of the material after removal of decarburization.

9.2 The hardness of material in the annealed condition shall not be greater than 235 HB.

9.3 The hardness of material in the quenched and tempered or quenched, tempered and stress-relieved condition shall be within the limits in Table 2 for the specified class.

10. Impact Requirements

10.1 Annealed material after proper heat treatment shall be capable of meeting the impact requirements in Table 2 or of Supplementary Requirement S8, if so specified (see Supplementary Requirement S4).

10.2 Material in the quenched and tempered or quenched, tempered, and stress-relieved condition shall conform to the impact requirements in Table 2, or of Supplementary Requirement S8 if so specified.

10.3 The percent of shear (ductility or fibrous) fracture shall be computed. The computed value shall be recorded for all impact specimens.

10.4 The amount of lateral expansion shall be measured. The measured value shall be recorded for all impact specimens.

10.5 The percent shear and the amount of lateral expansion shall be reported for information purposes (see 17.1).

11. Dimensions and Tolerances

11.1 Permissible Tolerances for Straightness:

11.1.1 Annealed material shall have an out-of-straightness tolerance of $\frac{1}{8}$ in. in any 5 ft or $\frac{1}{8} \times$ (number of feet of length/5) in. [2 mm/m].

11.1.2 Quenched, tempered and stress-relieved material shall have an out-of-straightness tolerance of $\frac{1}{4}$ in. in any 5 ft or $\frac{1}{4} \times$ (number of feet of length/5) in. [4 mm/m].

11.2 Unless otherwise specified, headed bolts shall be semi-finished, hexagon in shape, and in accordance with the dimensions of ANSI B 18.2.1. Unless otherwise specified, nuts shall be hexagonal in shape, and in accordance with the dimensions of ANSI B 18.2.2. Unless otherwise specified, the ANSI Standard heavy bolt and nut series shall be used. If socket head fasteners are required, the dimensions shall be in accordance with ANSI B 18.3, as specified by the purchaser.

11.3 All bolts, stud bolts and accompanying nuts, unless otherwise specified, shall be threaded in accordance with ANSI B 1.1, Class 2A or 2B fit.

12. Workmanship, Finish, and Appearance

12.1 The material shall be uniform in quality and free of defects that would be detrimental to the intended service. If magnetic particle inspection for such defects is desired, Supplementary Requirement S6 should be specified.

12.2 Surface Quality — Material shall be free of seams, laps, cracks, or other defects that are not removable within the machining cleanup allowance specified in Table 4.

13. Surface Condition

13.1 Material shall be cleaned and furnished in the scalefree condition.

14. Number of Tests

14.1 *Mechanical Tests on Quenched and Tempered Material:*

14.1.1 One test coupon shall be removed from each end of one bar, one seamless tube, or one bored bar or from each of two forged hollows from each size of each heat in each tempering charge, or each 10 000 lb [4540 kg], whichever is less. One tension test and one impact test consisting of three Charpy V-notch specimens shall be taken from each test coupon. For testing in accordance with 16.1.1, two tests shall be obtained from two representative production pieces from each size of each heat in each tempering charge or each 10 000 lb [4540 kg], whichever is less.

14.1.2 *Hardness Test:*

14.1.2.1 Bars 2 in. [50 mm] and over and all seamless tubes or bored bars shall be tested near each end of each mill-treated length. Each forged hollow with thickness 2 in. [50 mm] or over shall be tested on the surface.

14.1.2.2 Bars under 2 in. [50 mm] shall be tested near each end of not less than 10% of the bars. Forged hollows less than 2 in. [50 mm] thick shall be tested on the surface of not less than 10% of the forgings.

14.2 *Hardness Tests of Annealed Material:*

14.2.1 Hardness tests shall be made on the annealed bars to assure compliance with 10.2.

15. Retests

15.1 If the results of the mechanical tests of any test lot do not conform to the specified requirements, the manufacturer shall reject the lot or he may retreat such a lot not more than twice. After the lot is retreated, all of the tests specified in 14 shall be repeated, and all shall conform to the specified requirements.

16. Test Specimens and Methods of Testing

16.1 A discard equivalent to the diameter of the bar when heat treated as a solid or a discard equivalent to the wall thickness when heat treated as a seamless tube, bored bar, or hollow forging shall be taken prior to removal of test coupons.

16.1.1 When production pieces are not of sufficient length to permit removal of test coupons in accordance with 16.1, the mid-length of the specimens shall be at the

mid-length of the production pieces selected for destruction to provide test coupon material. The production pieces selected for test shall be identical with respect to the quenched contour and size except for length which shall equal or exceed the length of the represented production pieces.

16.2 Tension and impact specimens from bolting materials with cross sections of $1\frac{1}{2}$ in. [38 mm] or less shall be taken so that their longitudinal axis is on a line representing the center of the diameter or thickness.

16.3 Tension test specimens from bolting materials with cross sections exceeding $1\frac{1}{2}$ in. [38 mm] shall be taken so that their longitudinal axis is midway between mid-thickness and surface.

16.4 Impact specimens from bolting materials with cross sections exceeding $1\frac{1}{2}$ in. [38 mm] shall be taken so that their longitudinal axis is midway between mid-thickness and surface or 1 in. [25 mm] below the surface plus the machining allowance per side, whichever is the lesser.

17. Certification

17.1 When requested in the purchaser's order, a test report shall be furnished to the purchaser to indicate the specification, grade, and the test results required by this specification plus any other tests which may be specified in writing by the purchaser. The specification designation included on the test reports shall include year date, and revision letter, if any.

18. Product Marking

18.1 Bars under 2 in. [50 mm] in diameter shall be bundled and tagged with the specification, grade, and mill heat number. The specification number marked on the tag need not include specification year date and revision number.

18.2 Bars 2 in. [50 mm] and over in diameter and all seamless tubes and bored bars shall be die-stamped with the mill heat number and grade on one surface.

18.3 Each hollow forging shall be die-stamped with the heat number or heat symbol code and grade.

18.4 Grade and manufacturer's identification symbols shall be applied to one end of studs $\frac{3}{8}$ in. [10 mm] in diameter and larger and to the heads of bolts $\frac{1}{4}$ in. [6 mm] in diameter and larger. (If the available area is inadequate, the grade symbol may be marked on one end and the manufacturer's symbol marked on the other end.)

18.5 For purposes of identification marking, the manufacturer is considered the organization that certifies the

bolting material was manufactured, sampled, tested, and inspected in accordance with the specification and the results have been determined to meet the requirements of this specification.

18.6 Bar Coding — In addition to the requirements in 18.1-18.5, bar coding is acceptable as a supplementary identification method. Bar coding should be consistent with AIAG B-5 02.00. If used on small items, the bar code may be applied to the box or a substantially applied tag.

19. Keywords

19.1 bolts—steel; chromium-molybdenum alloy steel; chromium-molybdenum-vanadium alloy steel; chromium-nickel-molybdenum-vanadium alloy steel; fasteners—steel; nickel-chromium-molybdenum alloy steel; nuclear applications; nuts—steel; steel bars—alloy; steel bolting material; tubes—extruded seamless; washers—steel

NOTES:

- (1) The minimum average of 3 specimens shall not be less than 35 ft·lbf [47 J]. One specimen from a set of 3 may be less than 35 ft·lbf [47 J] but not less than 30 ft·lbf [41 J].
- (2) The minimum average of 3 specimens shall not be less than 30 ft·lbf [41 J]. One specimen from a set of 3 may be less than 30 ft·lbf [41 J] but not less than 25 ft·lbf [34 J].
- (3) The minimum average of 3 specimens shall not be less than 25 ft·lbf [34 J]. One specimen from a set of 3 may be less than 25 ft·lbf [34 J] but not less than 20 ft·lbf [27 J].
- (4) No minimum values established. Tests shall be run for information only.

⁴ Consult the manufacturer on forged bars, cold-finished bars, bored bars, seamless tubes, and forged hollows.

SUPPLEMENTARY REQUIREMENTS

These requirements shall not apply unless specified in the order, in which event the tests shall be made at the mill at the purchaser's expense unless otherwise agreed upon.

S1. Product Analysis

S1.1 Product analysis shall be made on each bar, seamless tube, bored bar, or the parent bar from which forged hollows are made. Individual pieces failing to conform to Table 1 shall be rejected.

recorded and the percent of fibrous fracture determined from Table S5.1 and Fig. S5.1. The other three sets shall be tested at successively lower or higher temperatures to bracket the temperature where the material will exhibit a 50% fibrous fracture. The results of all test data are to be reported to the purchaser.

S2. Macroetch Test

S2.1 The material shall be macroetch tested and shall meet the quality and cleanliness requirements as specified by the purchaser. The macroetch examination may be made on representative billets from which the material will be produced or it may be made on samples cut from the ends of the bars, seamless tubes, bored bars, or forged hollows. The samples shall be prepared in accordance with the procedure described in Method E 381.

NOTE S2.1 — The quality and cleanliness may be specified by the purchaser as equal to or better than that indicated by a designated letter and plate number of Military Standard—430 (latest revision).

S3. Ultrasonic Test

S3.1 Each length shall be ultrasonically inspected in a manner agreeable to the purchaser and supplier.

S4. Demonstration of Capability

S4.1 When annealed material is ordered to 6.1, a sample piece at least 3 *D* long of a representative bar shall be heat treated in accordance with 6.2 and 6.3. Mechanical test samples taken as required by Section 16 shall meet the requirements of 8.2 and 10.2.

S5. Fracture Transition Temperature

S5.1 The fracture transition temperature for a 50% fibrous (ductile shear) fracture shall be determined. The procedure for determination of the fracture transition temperature shall be to prepare four sets (three to a set) of Charpy V-notch specimens in accordance with Section 16. One set of three specimens shall be tested at approximately 70°F [20°C]. The absorbed energy in foot-pounds shall be

S6. Magnetic Particle Inspection

S6.1 Material may be supplied to cleanliness requirements by agreement between the purchaser and supplier. The cleanliness shall be determined by the magnetic particle method described in the latest issue of Practice E 45.

NOTE S6.1 — The material shall have the minimum stock removal specified in Table S6.1 prior to magnetic particle inspection.

S7. Elevated Temperature Test

S7.1 Three Charpy V-notch specimens shall be tested at 212°F [100°C] to determine the “upper shelf” fracture energy of the material. No specimen thus tested shall break at an energy less than 30 ft-lbf [41 J].

S8. Alternative Fracture Toughness Requirement

S8.1 The fracture toughness requirements (Charpy impact test) for material of the ASME Boiler and Pressure Vessel Code, Section III, Subarticle NB-2300, shall be used instead of the Charpy impact test requirement specified in Table 2.

S9. Marking

S9.1 Grade and manufacturer's identification symbols shall be applied to one end of the studs and to the heads of bolts of all sizes. (If the available area is inadequate, the grade symbol may be marked on one end and the manufacturer's identification symbol marked on the other end). For bolts and studs smaller than ¼ in. [6 mm] in diameter and for ¼ in. [6 mm] studs requiring more than a total of three symbols, the marking shall be a matter of agreement between the purchaser and manufacturer.

SPECIFICATION FOR QUENCHED AND TEMPERED CARBON AND ALLOY STEEL FORGINGS FOR PRESSURE VESSEL COMPONENTS

SA-541/SA-541M

(Identical with ASTM Specification A 541/A 541M-05.)

1. Scope

1.1 This specification covers requirements for quenched and tempered carbon and alloy steel forgings for pressure vessel components.

1.2 All grades are considered weldable under proper conditions. Welding technique is of fundamental importance, and it is presupposed that welding procedure and inspection will be in accordance with approved methods for the grade of material used.

NOTE 1 — Grades 1 and 1A have different chemistries but the same mechanical requirements.

NOTE 2 — Designations have been changed as follows:

Current	Formerly
Grade 1	Class 1
Grade 1A	Class 1A
Grade 1C	Class 4
Grade 2 Class 1	Class 2
Grade 2 Class 2	Class 2A
Grade 3 Class 1	Class 3
Grade 3 Class 2	Class 3A
Grade 4N Class 1	Class 7
Grade 4N Class 2	Class 7A
Grade 4N Class 3	Class 7B
Grade 5 Class 1	Class 8
Grade 5 Class 2	Class 8A
Grade 11 Class 4	Class 11C
Grade 22 Class 3	Class 22B
Grade 22 Class 4	Class 22C
Grade 22 Class 5	Class 22D
Grade 22V	Class 22V
Grade 3V	Class 3V

1.3 The values stated in either inch-pound units or SI (metric) units are to be regarded separately as the standard.

Within the text and tables, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification.

1.4 Unless the order specifies the applicable “M” specification designation, the material shall be furnished to the inch-pound units.

2. Referenced Documents

2.1 ASTM Standards:

- A 275/A 275M Test Method for Magnetic Particle Examination of Steel Forgings
- A 370 Test Methods and Definitions for Mechanical Testing of Steel Products
- A 388/A 388M Practice for Ultrasonic Examination of Heavy Steel Forgings
- A 788 Specification for Steel Forgings, General Requirements
- E 208 Test Method for Conducting Drop-Weight Test to Determine Nil-Ductility Transition Temperature of Ferritic Steels

3. Ordering Information and General Requirements

3.1 In addition to the ordering information required by Specification A 788, the purchaser shall include with the inquiry and order a detailed drawing that locates areas of significant loading in the forging (when required); the method of selecting test locations (see 6.2); purchase option (if any) in accordance with 9.1, and any supplementary requirements desired.

3.2 Material supplied to this specification shall conform to the requirements of Specification A 788, which outlines

additional ordering information, manufacturing requirements, testing and retesting methods and procedures, marking, certification, product analysis variations, and additional supplementary requirements.

3.3 If the requirements of this specification are in conflict with the requirements of Specification A 788, the requirements of this specification shall prevail.

4. Chemical Composition

4.1 Heat Analysis — The heat analysis obtained from sampling in accordance with Specification A 788 shall comply with Table 1 except that the additional features of Supplementary Requirements S8, S9, S10, S12, and S15 shall also apply as individually specified in the ordering information.

4.2 Product Analysis — The manufacturer shall use the product analysis provision of Specification A 788 to obtain a product analysis from a forging representing each heat or multiple heat. The permissible variations of Table 1 of Specification A 788 do not apply to carbon, phosphorus, silicon, and sulphur for all classes, vanadium for Grade 1C, and columbium and calcium for Grades 22V and 3VCb. Boron is not subject to product analysis. The purchaser may also make this determination in accordance with Specification A 788.

5. Heat Treatment for Mechanical Properties

5.1 After complete austenitization, the forgings shall be quenched in a suitable liquid medium by spraying or immersion. For Grade 22V forgings, the minimum austenitizing temperature shall be 1650°F [900°C]. Quenching shall be followed by tempering at a subcritical temperature and holding at this temperature for a minimum time of ½ h/in. [25 mm] of maximum section thickness. Minimum tempering temperatures shall be:

Grade	°F [°C]
1, 1A, 2 Class 2, 3 Class 2	1150 [620]
2, 3 Class 1, 22 Class 3	1200 [650]
1C, 11 Class 4, 22 Class 4, 4N Class 1, 4N Class 2, 5 Class 1, 5 Class 2	1100 [595]
22 Class 15	1050 [565]
4N Class 3	1125 [605]
3V, 3VCb	1250 [675]
22V	1250 [675]

5.2 For Classes 1, 1A, 2, 2A, 3, or 3A, a multiple stage austenitizing procedure may be used whereby the forging is first fully austenitized and liquid quenched, followed by reheating within the intercritical temperature range to partially reaustenitize, and again liquid quenched. On completion of the austenitizing/quenching cycles, the forgings

shall be tempered at a subcritical temperature as described in 5.1.

6. Mechanical Properties

6.1 General Requirements — The forgings shall conform to the requirements of Table 2. The forgings shall also conform to the requirements of Table 3 unless either Supplementary Requirement S6 or S13 is specified, in which case the requirements of those sections shall apply. The largest obtainable tension test specimen as specified in Fig. 4 of Test Methods and Definitions A 370 shall be used. Impact specimens shall be Charpy V-notch, as shown in Fig. 10 of Test Methods and Definitions A 370. The usage of subsize impact specimens due to material limitations must have prior purchaser approval.

6.2 Sampling — The longitudinal axis and mid-length of tension and impact test specimens shall be positioned in accordance with one of the following methods as specified by the purchaser:

6.2.1 Method 1 — This method shall always be used when the maximum quenched thickness does not exceed 2 in. [50 mm]. Specimens shall be located in the production forging or test forging (as described in Method 4) at mid-thickness and at least 2 in. from other quenched surfaces.

6.2.2 Method 2 — t by $2t$, where t is the distance from the area of significant loading (see 3.1) to the nearest quenched surface. However, the specimens shall not be nearer to one quenched surface than ¾ in. [20 mm] and to the second quenched surface than 1½ in. [40 mm]. When this method of testing is employed, forgings are usually manufactured in accordance with a purchaser-approved drawing showing pre-quenched dimensions and the location of mechanical test specimens.

6.2.3 Method 3 — ¼ T by T , where T is the maximum thickness of the forging as heat treated. Where this method of testing is employed, the following limitations for as-treated thickness shall apply, unless otherwise agreed upon:

Grade	in. [mm], max
1 and 1A	3 [75]
2 Class 2 and 3 Class 2	6 [150]
2 Class 1 and 3 Class 1	8 [200]
1C	4 [100]
11 Class 4	5 [125]
22 Class 4, 4N Class 2, 5 Class 2	6 [150]
22 Class 5	8 [200]
4N Class 1, 5 Class 1, 4N Class 3, 3V, 3VCb, 22V, and 22 Class 3	10 [250]

6.2.4 Method 4 — Test specimens shall be taken from a representative separate test forging or bar made from the same heat of steel, which shall receive substantially the same reduction and type of hot working as the production

forgings that it represents, except that a longitudinally forged bar may be used to represent a rolled ring of similar cross section. It shall be of the same nominal thickness as the as-quenched production forgings and shall be heat treated in the same furnace charge and under the same conditions as the production forgings. Test specimens shall be removed using the $\frac{1}{4} T$ by T procedure referenced in Method 3 with the same limitation on forging thickness as in 6.2.3. This method shall be limited to forgings with a rough machined weight of not more than 1 000 lb [450 kg].

6.3 Metal Buffers — The required distances from quenched surfaces may be obtained with metal buffers instead of integral extensions. Buffer material may be carbon or low-alloy steel, and shall be joined to the forging with a partial penetration weld that seals the buffered surface. Specimens shall be located at least $\frac{1}{2}$ in. [13 mm] from the buffered surface of the forging. Buffers shall be removed and the welded areas subjected to magnetic particle test to ensure freedom from cracks unless the welded areas are completely removed by subsequent machining.

6.4 Samples shall be removed from forgings after the quenching and tempering heat treatments. This sample material shall be subjected to a simulated post-weld heat treatment if Supplementary Requirement S1 is specified.

6.5 Orientation — For upset disk forgings, the longitudinal axis of all test specimens shall be oriented in the tangential direction. For all other forgings, the longitudinal axis of the specimens shall be oriented in the direction of maximum working of the forging unless Supplementary Requirements S11 or S14 are imposed.

6.6 Number of Tests:

6.6.1 Forgings under 500 lb [230 kg] As Treated — For duplicate forgings weighing less than 500 lb [230 kg] as treated, one tension test and one impact test (three specimens) shall be made to represent each heat in each heat-treatment charge. When heat treatment is performed in continuous-type furnaces with suitable temperature control and equipped with recording pyrometers so that complete heat-treatment records are available, a heat-treatment charge shall be considered as any continuous run not exceeding an 8 h duration.

6.6.2 Forgings weighing 500 to 10 000 lb [230 to 4500 kg] As-Heat Treated — One tension and one impact test (3 specimens) shall be made for each forging.

6.6.3 Each forging weighing over 10 000 lb [4500 kg] shall require two tension tests and two impact tests, located at opposite ends if the length is $1\frac{1}{2}$ times the diameter or more, or 180° apart otherwise.

7. Repair Welding

7.1 Repair welding of forgings may be permitted, but only at the option of the purchaser.

7.2 If repair welding is performed, welders and weld procedures shall be qualified in accordance with Section IX of the ASME Boiler and Pressure Vessel Code.

8. Workmanship and Quality Level Requirements

8.1 Dimensional and visual inspections shall be conducted by the manufacturer. Forgings shall be free of cracks, thermal ruptures, or other imperfections.

9. Certification and Reports

9.1 In addition to items required to be reported by Specification A 788, the following items shall also be reported:

9.1.1 Product chemical analysis.

9.1.2 The method used for locating test specimens.

9.1.3 Sketches included in the report of non-destructive examinations.

9.1.4 Details of the heat treatment cycle, as listed in Specification A 788.

10. Product Marking

10.1 The purchaser may specify additional identification marking and the location of the marking. If stamps are used, they shall be round-nosed or “interrupted-dot” die stamps having a minimum radius of $\frac{1}{32}$ in. [0.8 mm].

11. Keywords

11.1 chromium-molybdenum steel; nickel-chromium-molybdenum alloy steel; pressure vessel service; quenched and tempered steel; steel forgings—alloy; steel forgings—carbon

TABLE 3
CHARPY V-NOTCH IMPACT REQUIREMENTS AT 40°F (4°C) (EXCEPT FOR 2A)^{1, 2}

	Grades 1, 1A, and 11 Class 4	Grade 2 Class 2 and 3 Class 2	Grade 2 Class 1, 3 Class 1 and 1C	Grade 22 Class 5	Grades 22 CL 4 4N Classes 1, 2, 3, 5 Classes 1,2	Grades 3V and 3VCb, Grade 22, Class 3 and Grade 22V
Minimum average value of set of three specimens, ft·lbf (J) ³	15 [20]	35 [47] ⁴	30 [41]	25 [34]	35 [47]	40 [54] ⁵
Minimum value of one specimen, ft·lbf (J)	10 [14]	30 [41] ⁴	25 [34]	20 [27]	30 [41]	35 [47] ⁵

NOTES:

- (1) These Charpy values are for tests made on standard 10 mm square specimens. If sub-size impact specimens are used, the required minimum ft·lbf values shall be determined by multiplying the ft·lbf values in Table 3 by $\frac{5}{8}$ for 7.5 by 10 mm specimens, and by $\frac{2}{3}$ for 5 by 10 mm specimens.
- (2) These values apply for tests at lower temperatures if Supplementary Requirement S6 is specified in the order.
- (3) Not more than one specimen from a set may be below this value.
- (4) Tested at 70°F [21°C].
- (5) Tested at 0°F [−18°C].

SUPPLEMENTARY REQUIREMENTS

One or more of the following supplementary requirements shall apply only when specified by the purchaser in the inquiry or order. Details of these supplementary requirements shall be agreed upon by the manufacturer and the purchaser.

S1. Simulated Post-Weld Heat Treatment of Mechanical Test Samples

S1.1 All test coupons shall be subjected to single or multiple heat treatments at subcritical temperatures prior to testing. Such treatments are intended to simulate post-weld or other treatments to which the forgings will be subjected during subsequent fabrication. The purchaser shall furnish the manufacturer with details of the desired heat treatment for the test coupons, including temperatures, times, and cooling rates.

S2. Ultrasonic Inspection

S2.1 Forgings shall be ultrasonically examined in accordance with the procedures of Practice A 388/A 388M.

S2.1.1 Longitudinal Wave Test:

S2.1.1.1 Unless otherwise specified, the back reflection method of tuning shall be used in accordance with the Procedure Section (the paragraph regarding Back-Reflection Technique) of Practice A 388/A 388M.

S2.1.1.2 In addition to the reportable conditions of the Recording Section of Practice A 388/A 388M, indications exceeding the resultant back reflection shall be recorded.

S2.1.1.3 The following conditions are subject to rejection:

(a) Complete loss of back reflection accompanied by an indication of a discontinuity. For this purpose, a back reflection less than 5% of full screen height shall be considered complete loss of back reflection.

(b) An indication equal in amplitude to that of the back reflection established in an indication-free portion of the forging.

S2.1.2 Angle Beam Test:

S2.1.2.1 Calibration notches, calibration reference, and method of scanning shall be in accordance with the Procedure Section (the paragraph regarding AngleBeam Examination) of Practice A 388/A 388M.

S2.1.2.2 A forging that contains a discontinuity that results in an indication exceeding the amplitude of the reference line is subject to rejection.

S2.1.3 The report of the ultrasonic examination shall be in compliance with the Report Section of Practice A 388/A 388M.

S2.1.4 Additional nondestructive examination or trepanning may be employed to resolve questions of interpretation of ultrasonic indications. The manufacturer shall accept responsibility for injurious conditions that will not be removed in final machining.

S3. Magnetic Particle Examination

S3.1 Each forging shall be inspected by magnetic particle methods described in Test Method A 275/A 275M. Acceptance and rejection standards shall be mutually agreed upon by the purchaser and manufacturer.

S4. Charpy V-Notch Impact Transition Curve

S4.1 Sufficient impact tests shall be made from the forging test material to establish a temperature-absorbed energy curve. The test temperature range shall be wide enough to establish the upper and lower shelf foot pound energies, with sufficient testing at intermediate temperatures to permit plotting a reasonably smooth curve.

S5. Additional Charpy Data

S5.1 The percent shear fracture and mils or millimetres of lateral expansion, defined in Test Methods and Definitions A 370, shall be reported for each Charpy specimen tested.

S6. Charpy Impact Tests

S6.1 Charpy impact tests shall be made in accordance with the provisions of Section 6 of this specification except that the test temperature shall be lower than that specified in Table 3.

S7. Drop-Weight Test

S7.1 Drop-weight tests shall be conducted in accordance with the requirements of Test Method E 208. The fracture plane of the specimens shall coincide with the location required for other mechanical test specimens as

specified by the purchaser in accordance with 6.2. However, since the drop-weight specimen can be taken in any orientation, the fracture plane of the specimen when tested to Method 2 (6.2.2) shall be a minimum distance of $\frac{7}{16}$ in. [11 mm] from the nearest quenched surface, and $1\frac{1}{2}$ in. [40 mm] from any second surface. The purchaser may specify either duplicate no-break performance when tested 10° warmer than a specified temperature or request a determination of the nil-ductility temperature.

S8. Restrictive Chemistry for Grades 4N and 5

S8.1 Phosphorus and sulfur limits for Grades 4N and 5 may be specified 0.020%, max.

S9. Additional Vanadium

S9.1 For Grade 5 forgings, 0.05 to 0.15% vanadium may be specified.

S10. Special Steels

S10.1 Vacuum treated steel shall be specified.

S10.2 When Grades 2, 3, 4N, and 5 are vacuum carbon deoxidized, the silicon content shall be 0.10% maximum.

S10.3 The test report shall indicate that the steel was vacuum carbon deoxidized.

S11. Rings and Hollow Cylindrically Shaped Parts

S11.1 Tests shall be removed in the tangential (circumferential) direction regardless of direction of maximum working.

S12. Restrictive Chemistry

S12.1 The following restricted phosphorus and copper limits may be specified as follows:

P 0.012% max heat, 0.015% max product; Cu 0.10% max

P 0.015% max heat, 0.018% max product; Cu 0.15% max

S13. Alternative Fracture Toughness Requirements

S13.1 The fracture toughness requirements (drop-weight or Charpy impact tests, or both) for materials of the ASME Boiler and Pressure Vessel Code, Section III, Article NB-2300, NC-2300, ND-2300, NE-2300, NF-2300 or NG-2300, as specified, shall be used instead of the Charpy impact test requirements of this specification.

S14. Alternative Test Specimen Orientation

S14.1 The longitudinal axis of all test specimens shall be oriented in a direction transverse to the direction of maximum working of the forging.

S15. Restricted Sulfur Content

S15.1 The sulfur content shall be limited to 0.015% maximum heat and 0.018% maximum product.

SPECIFICATION FOR PRESSURE VESSEL PLATES, ALLOY STEEL, QUENCHED-AND-TEMPERED, CHROMIUM-MOLYBDENUM AND CHROMIUM- MOLYBDENUM-VANADIUM

SA-542/SA-542M

(Identical with ASTM Specification A 542/A 542M-99.)

1. Scope

1.1 This specification covers two types of 2¼Cr-1 Mo and three types of Cr-Mo-V alloy steel plates for use in the quenched-and-tempered condition, intended for the fabrication of welded pressure vessels and components.

1.2 Material under this specification is available in five types, designated “A,” “B,” “C,” “D,” and “E.” Type B is identical to Type A except for restrictive limits for carbon, phosphorus, sulfur, and nickel. The material is also available in five classes having the following strength levels. Type E is available only as Class 4 and 4a.

Class	Minimum Tensile Strength, ksi [MPa]
1	105 [725]
2	115 [795]
3	95 [655]
4 and 4a	85 [585]

1.3 The maximum thickness of plates is limited only by the capacity of the chemical composition to meet the specified mechanical property requirements.

1.4 The minimum thickness of plates is limited to ⅜ in. [5 mm].

1.5 The material is intended to be suitable for fusion welding. Welding technique is of fundamental importance and it is presupposed that welding procedures will be in accordance with approved methods.

1.6 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents, therefore, each system must be used independently of the other. Combining

values from the two systems may result in nonconformance with this specification.

2. Referenced Documents

2.1 ASTM Standards:

- A 20/A 20M Specification for General Requirements for Steel Plates for Pressure Vessels
- A 370 Test Methods and Definitions for Mechanical Testing of Steel Products
- A 435/A 435M Specification for Straight-Beam Ultrasonic Examination of Steel Plates
- A 577/A 577M Specification for Ultrasonic Angle-Beam Examination of Steel Plates
- A 578/A 578M Specification for Straight-Beam Ultrasonic Examination of Plain and Clad Steel Plates for Special Applications

3. General Requirements and Ordering Information

3.1 Material supplied to this material specification shall conform to Specification A 20/A 20M. These requirements outline the testing and retesting methods and procedures, permissible variations in dimensions, and mass, quality and repair of defects, marking, loading, etc.

3.2 Specification A 20/A 20M also establishes the rules for the ordering information which should be complied with when purchasing material to this specification.

3.3 In addition to the basic requirements of this specification, certain supplementary requirements are available when additional control, testing, or examination is required to meet end use requirements. These include:

3.3.1 Vacuum treatment.

3.3.2 Additional or special tension testing.

3.3.3 Impact testing.

3.3.4 Nondestructive examination.

3.4 The purchaser is referred to the supplementary requirements listed in this specification and to the detailed requirements in Specification A 20/A 20M.

3.5 If the requirements of this specification are in conflict with the requirements of Specification A 20/A 20M, the requirements of this specification shall prevail.

4. Manufacture

4.1 *Steelmaking Practice* — The steel shall be killed and shall conform to the fine austenitic grain size requirement of Specification A 20/A 20M.

5. Heat Treatment

5.1 All plates shall be heat treated by heating to a suitable austenitizing temperature, holding for a sufficient period of time to attain uniform temperature throughout the thickness, and quenching in a suitable liquid medium by spraying or immersion. For Type D material, the minimum austenitizing temperature shall be 1650°F [900°C]. For Type E material, the minimum austenitizing temperature shall be 1850°F [1010°C].

5.2 After quenching, the plates shall be tempered to produce the specified tensile requirements by heating to a suitable temperature and holding for a period of time of not less than 30 min/in. [1.2 min/mm] of thickness but not less than $\frac{1}{2}$ h. The minimum tempering temperature shall be as follows:

Type	Class	Temperature, °F [°C]
A, B, C	1, 2, 3	1050 [565]
A, B, C	4	1200 [650]
A, B, C, D	4a	1250 [675]

5.3 Plates over 4 in. [100 mm] in thickness shall receive a prior heat treatment of normalizing at, or water quenching

from, a temperature within the range from 1650 to 1850°F [900 to 1010°C] for Types A, B, C, and D and 1850 to 2050°F [1010 to 1120°C] for Type E before the heat treatment specified in 5.1.

5.4 When the purchaser elects to perform the heat treatment required above, the material manufacturer shall temper the plates prior to shipment at a temperature not lower than 1050°F [565°C] for Types A, B, C, and D and not lower than 1200°F [650°C] for Type E.

6. Chemical Composition

6.1 The steel shall conform to the chemical requirements shown in Table 1.

7. Mechanical Properties

7.1 Tension Test Requirements:

7.1.1 The material as represented by the tension-test specimens shall conform to the requirements shown in Table 2.

7.1.2 For nominal plate thicknesses of $\frac{3}{4}$ in. [20 mm] and under, the $1\frac{1}{2}$ in. [40 mm] wide rectangular specimen may be used for the tension test, and the elongation may be determined in a 2 in. [50 mm] gage length that includes the fracture and that shows the greatest elongation.

7.2 *Notch Toughness Requirements — Classes 4 and 4a:*

7.2.1 A transverse Charpy V-notch test from each plate-as-heat-treated shall have a minimum energy absorption value of 40 ft-lbf [54 J] average of three specimens and 35 ft-lbf [48 J] for one specimen only in the set.

7.2.2 For Class 4, the impact test temperature shall be as specified on the order.

7.2.3 For Class 4a, the impact test temperature shall be 0°F [−18°C].

SUPPLEMENTARY REQUIREMENTS

Supplementary requirements shall not apply unless specified in the order.

A list of standardized supplementary requirements for use at the option of the purchaser are included in Specification A 20/A 20M. Several of those considered suitable for use with this specification are listed in this section by title. Other tests may be performed by agreement between the supplier and the purchaser.

- | | |
|--|--|
| S1. Vacuum Treatment | S8. Ultrasonic Examination in Accordance With Specification A 435/A 435M |
| S2. Product Analysis | S9. Magnetic Particle Examination |
| S3. Simulated Post-Weld Heat Treatment of Mechanical Test Coupons | S11. Ultrasonic Examination in Accordance With Specification A 577/A 577M |
| S4.2 Additional Tension Test, | S12. Ultrasonic Examination in Accordance With Specification A 578/A 578M |
| S5. Charpy V-Notch Impact Test | S14. Bend Test |
| S6. Drop Weight Test | |
| S7. High-Temperature Tension Test | |

ADDITIONAL SUPPLEMENTARY REQUIREMENTS

In addition, the following supplementary requirements are suitable for this application.

S62. Temper Embrittlement Factor

S62.1 The composition of the steel, based on heat analysis, shall be restricted in accordance with the following equations:

$$J = (Si + Mn) \times (P + Sn) \times 10^4 \leq 150 \quad (Si, Mn, P \text{ and } Sn \text{ in wt } \%)$$

$$Cu \leq 0.20\%$$

$$Ni \leq 0.30\%$$

S62.1.1 Lower values of J , Cu and Ni can be specified by agreement between purchaser and the supplier.

S62.1.2 When so specified by the purchaser, the maximum value of J shall not exceed 100.

S62.1.3 The values of J shall be reported.

S62.1.4 If the plates are repaired by welding, the composition of the weld deposit shall be restricted in accordance with the following equations:

$$X = (10P + 5Sb + 4Sn + As)/100 \leq 15 \quad (P, Sb, Sn \text{ and } As \text{ in ppm})$$

$$Cu \leq 0.20\%$$

$$Ni \leq 0.30\%$$

S62.1.5 The values of X shall be reported.

S63. Impact Properties After Step Cooling

S63.1 The Charpy V-notch impact properties shall be determined as follows:

S63.1.1 A sufficient amount of Charpy V-notch test specimens shall be taken from the same location from a plate from each heat of steel to construct two transition temperature curves.

S63.1.2 The test specimens for one transition temperature curve shall be given the minimum post-weld heat treatment (PWHT) cycle specified by the purchaser.

S63.2 The test specimens for the other transition temperature curve shall be given the PWHT cycle specified in S63.1.2 plus the following step cooling heat treatment:

Hold at 1100°F (593°C) for 1 h, then cool at 10°F (5.6°C)/h to 1000°F (538°C).

Hold at 1000°F (538°C) for 15 h, then cool at 10°F (5.6°C)/h to 975°F (524°C).

Hold at 975°F (524°C) for 24 h, then cool at 10°F (5.6°C)/h to 925°F (496°C).

Hold at 925°F (496°C) for 60 h, then cool at 5°F (2.8°C)/h to 875°F (468°C).

Hold at 875°F (468°C) for 100 h, then cool at 50°F (27.8°C)/h to 600°F (315°C).

Cool in still air.

S63.3 Test the Charpy V-notch test specimens in accordance with Test Methods and Definitions A 370 to determine the 40 ft·lbf (55 J) transition temperature from each transition temperature curve using a set of three test specimens at each test temperature. The test temperatures shall include tests on the upper and lower shelves and a minimum of four intermediate temperatures.

S63.4 The following requirements shall be met.

$$\nu Tr40 + 2.5\Delta \nu Tr40 \leq 50^\circ F$$

$$\nu Tr55 + 2.5\Delta \nu Tr55 \leq 10^\circ C$$

where:

$\nu Tr40$ ($\nu Tr55$) = the 40 ft·lbf (55 J) transition temperature of the material subjected to the minimum PWHT specified by the purchaser

$\Delta \nu Tr40$ ($\Delta \nu Tr55$) = the shift of the 40 ft·lbf (55 J) transition temperature of the step cooled material. (The 40 ft·lbf (55 J) transition temperature of the step cooled material minus that of the material subjected to the minimum PWHT only)

S63.5 The 40 ft·lbf (55 J) transition temperatures for the two material conditions shall be reported.

FIG. S1.1 TRANSITION TEMPERATURE CURVES

SPECIFICATION FOR PRESSURE VESSEL PLATES, ALLOY STEEL, QUENCHED AND TEMPERED, NICKEL- CHROMIUM-MOLYBDENUM

SA-543/SA-543M

(Identical with ASTM Specification A 543/A 543M-93.)

1. Scope

1.1 This specification covers nickel-chromium-molybdenum alloy steel plates for use in the quenched and tempered condition, intended for the fabrication of welded pressure vessels and other pressure equipment. These alloy compositions are normally considered for construction involving plate thicknesses of 2 in. [50 mm] or greater.

1.2 Material under this specification is available in two types, B and C. The material is also available in three classes as follows:

Class	Minimum Tensile Strength, ksi [MPa]
1	105 [725]
2	115 [795]
3	90 [620]

1.3 The maximum thickness of plates is limited only by the capacity of the chemical composition to meet the specified mechanical property requirements.

1.4 The minimum plate thickness is $\frac{3}{16}$ in. [5 mm].

1.5 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification.

2. Referenced Documents

2.1 ASTM Standards:

A 20/A 20M Specification for General Requirements for Steel Plates for Pressure Vessels

A 435/A 435M Specification for Straight-Beam Ultrasonic Examination of Steel Plates

A 577/A 577M Specification for Ultrasonic Angle-Beam Examination of Steel Plates

A 578/A 578M Specification for Straight-Beam Ultrasonic Examination of Plain and Clad Steel Plates for Special Applications

3. General Requirements and Ordering Information

3.1 Material supplied to this material specification shall conform to Specification A 20/A 20M. These requirements outline the testing and retesting methods and procedures, permissible variations in dimensions, and mass, quality and repair of defects, marking, loading, etc.

3.2 Specification A 20/A 20M also establishes the rules for the ordering information which should be complied with when purchasing material to this specification.

3.3 In addition to the basic requirements of this specification, certain supplementary requirements are available when additional control, testing, or examination is required to meet end use requirements. These include:

3.3.1 Vacuum treatment,

3.3.2 Additional or special tension testing,

3.3.3 Impact testing, and

3.3.4 Nondestructive examination.

3.4 The purchaser is referred to the listed supplementary requirements in this specification and to the detailed requirements in Specification A 20/A 20M.

3.5 If the requirements of this specification are in conflict with the requirements of Specification A 20/A 20M, the requirements of this specification shall prevail.

4. Manufacture

4.1 Steelmaking Practice — The steel shall be killed and shall conform to the fine austenitic grain size requirement of Specification A 20/A 20M.

5. Heat Treatment

5.1 All plates shall be heat treated by heating to a suitable austenitizing temperature, holding for a sufficient time period to attain uniform temperature through the thickness and quenching in a suitable liquid medium by spraying or immersion. The plates shall then be tempered to produce the required properties by heating to a suitable temperature not lower than 1100°F [595°C] with a holding time of not less than $\frac{1}{2}$ h/in. [1.2 min/mm] of thickness but not less than $\frac{1}{2}$ h.

5.2 Plates over 4 in. [100 mm] in thickness shall receive a prior treatment of normalizing at, or water quenching from a temperature within the range from 1650 to 1850°F [900 to 1010°C] before the heat treatment specified in 5.1.

5.3 When the fabricator elects to perform the heat treatment in 5.1 and 5.2, the manufacturer shall temper the

plates prior to shipment at a temperature not lower than 1100°F [595°C].

6. Chemical Requirements

6.1 The steel shall conform to the chemical requirements shown in Table 1 unless otherwise modified in accordance with Supplementary Requirement S17, Vacuum Carbon-Deoxidized Steel, in Specification A 20/A 20M.

7. Mechanical Requirements

7.1 Tension Test Requirements:

7.1.1 The material as represented by the tension-test specimens shall conform to the requirements shown in Table 2.

7.1.2 For nominal plate thicknesses of $\frac{3}{4}$ in. [20 mm] and under, the $1\frac{1}{2}$ in. [40 mm] wide rectangular specimen may be used for the tension test and the elongation may be determined in a 2 in. [50 mm] gage length that includes the fracture and shows the greatest elongation.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR PRESSURE VESSEL PLATES, ALLOY STEEL, QUENCHED AND TEMPERED 8 AND 9% NICKEL

SA-553/SA-553M

(Identical with ASTM Specification A 553/A 553M-06.)

1. Scope

1.1 This specification covers 8 and 9% nickel alloy steel plates for use in the water quenched and tempered condition intended for the fabrication of welded pressure vessels.

1.2 Material under this specification is available in two types having different chemical composition as follows:

Type	Nominal Nickel Content, %
I	9
II	8

1.3 Plates produced under this specification are subject to impact testing at -320°F [-195°C] for Type I, and -275°F [-170°C] for Type II or at such other temperatures as are agreed upon.

1.4 The maximum thickness of plates is limited only by the capacity of the material to meet the specified mechanical property requirements; however, current mill practice normally limits this material to 2 in. [50 mm] max.

1.5 This material is susceptible to magnetization. Use of magnets in handling after heat treatment should be avoided if residual magnetism would be detrimental to subsequent fabrication or service.

1.6 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification.

2. Referenced Documents

2.1 ASTM Standards:

A 20/A 20M Specification for General Requirements for Steel Plates for Pressure Vessels

A 435/A 435M Specification for Straight-Beam Ultrasonic Examination of Steel Plates

A 577/A 577M Specification for Ultrasonic Angle-Beam Examination of Steel Plates

A 578/A 578M Specification for Straight-Beam Ultrasonic Examination of Plain and Clad Steel Plates for Special Applications

3. General Requirements and Ordering Information

3.1 Material supplied to this material specification shall conform to Specification A 20/A 20M. These requirements outline the testing and retesting methods and procedures, permissible variations in dimensions, and mass, quality and repair of defects, marking, loading, etc.

3.2 Specification A 20/A 20M also establishes the rules for the ordering information which should be complied with when purchasing material to this specification.

3.3 In addition to the basic requirements of this specification, certain supplementary requirements are available when additional control, testing, or examination is required to meet end use requirements. These include:

3.3.1 Vacuum treatment,

3.3.2 Additional or special tension testing,

3.3.3 Impact testing, and

3.3.4 Nondestructive examination.

3.4 The purchaser is referred to the listed supplementary requirements in this specification and to the detailed requirements in Specification A 20/A 20M.

3.5 If the requirements of this specification are in conflict with the requirements of Specification A 20/A 20M, the requirements of this specification shall prevail.

4. Manufacture

4.1 Steelmaking Practice — The steel shall be killed and shall conform to the fine austenitic grain size requirement of Specification A 20/A 20M.

5. Heat Treatment

5.1 All plates shall be heat treated in accordance with 5.2. Shell plates and other parts, including heads and reinforcing pads, which are heated for forming, shall be heat treated after forming in accordance with 5.2.

5.2 Heat Treatment Procedure — Heat treat all plates by heating to a suitable temperature within the range from 1475 to 1700°F [800 to 925°C], holding for a sufficient time to obtain uniform temperature throughout the plate thickness and then quenching in water. Subsequently, temper the plates within the range from 1050 to 1175°F [565 to 635°C], holding at this temperature for a minimum of 30 min/in. [1.2 min/mm] of thickness but not less than 15 min, and cool in air or water quench at a rate not less than 300°F/h [165°C/h].

5.2.1 Hardening — The plates shall be heated to a temperature within the range from 1475 to 1700°F [800 to 925°C], held at that temperature for a sufficient time to obtain uniform temperature throughout the plate thickness, and then quenched in a liquid media.

5.2.2 Tempering — The plates shall be tempered at a temperature within the range from 1050 to 1175°F [565 to 635°C], being held at that temperature for a minimum of 30 min/in. [1.2 min/mm] of thickness, but in no case less than 15 min., and then cooled in air or liquid-quenched at a rate not less than 300°F/h [165°C/h].

5.2.2.1 Prior to the tempering treatment, the plates may be subjected to an intermediate heat treatment consisting of heating to a temperature in the range from 1165 to 1290°F [630 to 700°C] for Type I, or 1185 to 1310°F [640 to 710°C] for Type II, holding at that temperature for a minimum of 1 h/in. [2.4 min/mm] of thickness, but in no case less than 15 min, and then water-quenching to below 300°F [150°C] in the case of plate thicknesses of more than $\frac{5}{8}$ in. [16 mm] or cooling in air or water-quenching to below 300°F [150°C] in the case of plate thicknesses of $\frac{5}{8}$ in. [16 mm] and under.

NOTE 1 — The intermediate heat treatment is for the purpose of enhancing elongation and notch-toughness and for reducing susceptibility to strain-aging embrittlement and temper embrittlement. It may be performed at the option of the material manufacturer or may be specified by the purchaser.

6. Chemical Requirements

6.1 The steel shall conform to the chemical requirements shown in Table 1 unless otherwise modified in accordance with Supplementary Requirement S17, Vacuum Carbon-Deoxidized Steel, in Specification A 20/A 20M.

7. Mechanical Requirements

7.1 Tension Test Requirements — The material as represented by tension-test specimens shall conform to the requirements specified in Table 2.

7.1.1 Upon agreement between the purchaser and the manufacturer, yield strength may be determined by the extension under load method, using 0.005 in./in. [mm/mm] total extension.

7.1.2 For nominal plate thicknesses of $\frac{3}{4}$ in. [20 mm] and under, the $1\frac{1}{2}$ in. [40 mm] wide rectangular specimen may be used for the tension test and the elongation may be determined in a 2 in. [50 mm] gage length that includes the fracture and shows the greatest elongation.

7.2 Impact Test Requirements:

7.2.1 Charpy V-notch impact tests shall be made in accordance with Specification A 20/A 20M.

7.2.2 The longitudinal axis of the test specimens shall be transverse to the final rolling direction of the plate.

7.2.3 Unless otherwise agreed, tests shall be conducted at −320°F [−195°C] for Type I and at −275°F [−170°C] for Type II.

7.2.4 Each test specimen shall have a lateral expansion opposite the notch of not less than 0.015 in. [0.381 mm].

8. Finish

8.1 Because retained scale may mask surface imperfections, as well as mar the plate surface, plates shall be descaled by the producer after heat treatment. In the case of material to be heat-treated by the purchaser, the plates shall be descaled by the producer prior to shipment.

9. Marking

9.1 In addition to the marking required in Specification A 20/A 20M, each plate shall be legibly stamped or stenciled, depending upon the ordered thickness, with the letters *QT*, except as otherwise specified in 9.1.1.

9.1.1 When the optional heat treatment in 5.2.2.1 is performed, the plates shall be marked with the letters *QTT* instead of *QT*.

10. Keywords

ADDITIONAL SUPPLEMENTARY REQUIREMENTS

Also listed below are additional optional Supplementary Requirements S55 and S56, which are suitable for this specification.

S55. Longitudinal Charpy Impact Energy Absorption Requirement

S55.1 The longitudinal Charpy V-notch impact properties shall not be less than 25 ft·lbf [34 J] at the specified temperature.

S55.2 Each impact test value shall constitute the average value of three specimens, with not more than one value below the specified minimum value of 25 ft·lbf [34 J] but in no case below 20 ft·lbf [27 J] for full size specimens.

S56. Transverse Charpy Impact Energy Absorption Requirement

S56.1 The transverse Charpy V-notch impact properties shall not be less than 20 ft·lbf [27 J] at the specified temperature.

S56.2 Each impact test value shall constitute the average value of three specimens, with not more than one value below the specified minimum value of 20 ft·lbf [27 J] but in no case below 15 ft·lbf [20 J] for full size specimens.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR SEAMLESS COLD-DRAWN CARBON STEEL FEEDWATER HEATER TUBES

SA-556/SA-556M

[Identical with ASTM Specification A 556/A 556M-90a (Reapproved 1995)^{e1}.]

1. Scope

1.1 This specification covers minimum-wall-thickness, seamless cold-drawn carbon steel tubes including bending into the form of U-tubes, if specified, for use in tubular feedwater heaters.

1.2 The tubing sizes covered shall be $\frac{5}{8}$ to $1\frac{1}{4}$ in. [15.9 to 31.8 mm] outside diameter, inclusive, with minimum wall thicknesses equal to or greater than 0.045 in. [1.1 mm].

1.3 Optional supplementary requirements are provided, and when desired, shall be stated in the order.

1.4 The values stated in either inch-pound units or SI units are to be regarded separately as the standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification. The inch-pound units shall apply unless the “M” designation of this specification is specified in the order.

2. Referenced Documents

2.1 ASTM Standards:

A 450/A 450M Specification for General Requirements for Carbon, Ferritic Alloy, and Austenitic Alloy Steel Tubes
E 30 Test Methods for Chemical Analysis of Steel, Cast Iron, Open-Hearth Iron, and Wrought Iron

3. General Requirements

3.1 Material furnished to this specification shall conform to the applicable requirements of the current edition of the Specification A 450/A 450M, unless otherwise provided herein.

4. Ordering Information

4.1 Orders for material under this specification should include the following as required to describe the desired material adequately:

4.1.1 Quantity (feet, metres, or number of pieces).

4.1.2 Name of material (seamless steel tubing).

4.1.3 Dimensions (outside diameter and minimum wall thickness).

4.1.4 Length (specific or random).

4.1.5 Manufacture (cold drawn).

4.1.6 Grade (chemical composition).

4.1.7 Optional requirements.

4.1.8 Bending Requirements — If order specifies tubes to be bent, the design of the U-tubes shall accompany the order. Purchaser must specify if stress-relief anneal of the U-bends is required.

4.1.9 Test report required (see Certification Section of Specification A 450/A 450M).

4.1.10 Specification number.

4.1.11 Special requirements and any supplementary requirements selected.

5. Manufacture

5.1 Manufacture — Tubes shall be made by the seamless process and shall be cold drawn.

5.2 Heat Treatment:

5.2.1 Cold-drawn tubes shall be heat treated after the final cold-draw pass at a temperature of 1200°F [640°C] or higher to ensure ductility satisfactory for rolling into tube sheets and to meet mechanical properties as specified.

5.2.2 If stress-relief anneal of the U-bends is specified, the anneal shall consist of heating the bent portion within a range of 1100 to 1200°F [585 to 640°C].

6. Chemical Composition

6.1 The steel shall conform to one of the requirements as to chemical composition as prescribed in Table 1.

6.2 When a grade is ordered under this specification, supplying an alloy grade that specifically requires the addition of any element other than those listed for the ordered grade in Table 1 is not permitted.

7. Product Analysis

7.1 When requested in the purchase order, a product analysis shall be made by the manufacturer or supplier from one tube or billet per heat.

7.2 If the original test for product analysis fails, retests of two additional tubes or billets shall be made. Both retests for the elements in question shall meet the requirements of this specification; otherwise, all remaining material in the heat or lot (Note) shall be rejected or, at the option of the producer, each tube may be individually tested for acceptance. Tubes that do not meet the requirements of this specification shall be rejected.

NOTE — For tension and hardness test requirements, the term *lot* applies to all tubes prior to cutting, of the same nominal diameter and wall thickness which are produced from the same heat of steel. When final heat treatment is in a batch-type furnace, a lot shall include only those tubes of the same size and the same heat which are heat treated in the same furnace charge. When the final heat treatment is in a continuous furnace, a lot shall include all tubes of the same size and heat, heat treated in the same furnace at the same temperature, time at heat and furnace speed.

7.3 For referee purposes, Test Methods E 30 shall be used.

8. Mechanical Properties

8.1 Tensile Properties — The material shall conform to the requirements as to tensile properties prescribed in Table 2, when pulled in full section.

8.2 Hardness Requirements — The tubes shall not exceed the Rockwell Hardness shown in Table 3.

9. Permissible Variations in Dimensions (Fig. 1)

9.1 Permissible variations from the specified outside diameter shall not exceed ± 0.004 in. [0.10 mm] for tubing under 1.0 in. [25.4 mm] outside diameter nor ± 0.006 in. [0.15 mm] for tubing 1.0 in. [25.4 mm] to 1.25 in. [31.7 mm] inclusive. These tolerances do not apply to the bent portion of the U-tubes. At the bent portion of a U-tube for $R = 2 \times D$ or greater neither the major nor minor diameter of tube shall deviate from nominal by more than 10%. If $1\frac{1}{2} D$ is specified, tolerances could be greater.

9.2 Permissible variations from the specified minimum wall thickness shall not exceed +20% or -0. The wall thickness of the tube in U-bent section shall be not less than value determined by:

$$t_f = T(2R)/(2R + D)$$

where:

t_f = wall thickness after bending, in. [mm],

T = specified minimum tube wall thickness, in. [mm],

R = centerline bend radius, in. [mm], and

D = nominal outside tube diameter, in. [mm].

9.3 In the case of U-tubes, the length of the tube legs as measured from the point of tangency of the bend and the tube leg to the end of the tube leg shall not be less than specified, but may exceed the specified values by the amount given in Table 4. The difference in lengths of the tube legs shall not be greater than $\frac{1}{8}$ in. [3 mm] unless otherwise specified.

9.4 The end of any tube may depart from square by not more than the amount given in Table 5.

9.5 The leg spacing measured between the points of tangency of the bend to the legs shall not vary from the value ($2R$ — specified tube OD) by more than $\frac{1}{16}$ in. [1.5 mm] where R is the centerline bend radius.

9.6 The bent portion of the U-tube shall be substantially uniform in curvature and not exceed $\pm \frac{1}{16}$ in. [± 1.5 mm] of the normal centerline radius.

10. Workmanship, Finish, and Appearance

10.1 Finished tubes shall be free from scale but may have a superficial oxide film on the surfaces. A light oxide scale on the outside and inside surfaces of U-bend shall be allowed for tubes which have been heat treated.

10.2 Finished tubes shall be reasonably straight and have smooth ends free from burrs. Tubes shall have a workmanlike finish and shall be free of surface imperfections that cannot be removed within the allowable wall tolerances. Removal of surface imperfections such as handling marks, straightening marks, light mandrel and die marks, shallow pits, and scale pattern will not be required provided they are within the allowable wall tolerances.

10.3 Finished tubes shall be coated both on the outside and the inside diameter to prevent corrosion in transit. The type of coating applied should be mutually agreed upon and specified in the order.

11. Mechanical Tests Required

11.1 Tension Test — One tension test shall be made on a specimen for lots of not more than 50 tubes. Tension

tests shall be made on specimens from two tubes for lots of more than 50 tubes (Note).

11.2 Flattening Test — One flattening test shall be made on specimens taken from each end of one finished tube, not the one used for the flaring test, from each lot of not more than 125 tubes or fraction thereof.

11.3 Flaring Test — One flaring test shall be made on specimens taken from each end of one finished tube, not the one used for flattening test, from each lot of not more than 125 tubes or fraction thereof.

11.4 Hardness Test — Brinell or Rockwell hardness tests shall be made on specimens from two tubes from each lot (Note).

11.5 Hydrostatic Test — Each U-tube shall be subjected to a hydrostatic test, using a noncorrosive fluid, or when agreed upon between the purchaser and manufacturer, they may be tested at $1\frac{1}{2}$ times the specified design working pressure.

12. Nondestructive Test (Electric Test)

12.1 Each tube shall be tested after the finish heat treatment following the final cold-drawn pass by passing

through a nondestructive tester capable of detecting defects on the entire cross section of the tube, in accordance with Specification A 450/A 450M.

13. Packaging and Package Marking

13.1 The tubing shall be packaged or bundled in such a manner as to prevent damage in ordinary handling and transportation and identified by a tag with the name of the manufacturer, purchase order number, specification number and grade, and size.

13.2 In the case of U-tubes, each box shall be palletized and legibly marked showing the manufacturer's name, purchase order number, specification number and grade, size, and identification of items contained.

SUPPLEMENTARY REQUIREMENTS

The following supplementary requirement or requirements may become a part of the specification when specified in the inquiry or invitation to bid, and purchase order or contract. These requirements shall not be considered, unless specified in the order, in which event the necessary tests shall be made by the manufacturer prior to the bending or shipment of the tubing.

S1. Nondestructive Ultrasonic Test — Round Tubing (Commercial Grade)

S1.1 The manufacturer shall test the tubing by an ultrasonic nondestructive test for detection of harmful faults and soundness.

S1.1.1 Ultrasonic testing shall be performed using pulse-echo shear wave techniques to locate longitudinal or circumferential defects, or both.

S1.1.2 Tubes being tested shall be reasonably straight for proper rotation. The outside and inside diameter surfaces of the tubes shall be free of dirt, grit, grease, oil, loose scale, or other materials which tend to attenuate, scatter, or reflect ultrasonic signals.

S1.1.3 Tubing shall be inspected by feeding spirally past a suitable transducer with rotation of material to be toward the transducer.

S1.1.4 Suitable ultrasonic instrumentation shall be used to clearly distinguish the artificial defects (hereafter called reference notches) described later. Automatic electronic monitoring of the reflected ultrasonic signals shall be provided in such manner that any naturally occurring defects which present an ultrasonic reflection equal to or greater than the reference standard(s) shall trigger audible and visible alarms.

S1.1.5 Instrument calibration as described herein shall be accomplished with the reference standard being rotated and fed past the transducer at the same approximate rate at which the tubing under test will be tested.

S1.1.6 The following factors will be adjusted so as to achieve optimum instrument distinction between the reference notch(es) and plain portion of tubing when calibrating equipment to the reference standard.

S1.1.6.1 Search unit position shall be such that shear waves are propagated within the tube being tested. If both outside and inside diameter reference notches are used, the optimum angle shall be used which will indicate both notches as close to equal size as possible.

S1.1.6.2 The test frequency to be used shall be chosen to yield the best distinction between reference notches and plain areas of tubing. In general, 2.25 or 5.0 MHz will be used.

S1.1.6.3 Instrument sensitivity shall be adjusted to allow reference notch or notches to present a pip or pips on the scope screen at 50% to 70% of instrument saturation level. The Automatic Defect Monitoring System shall be adjusted to monitor by means of electronic gates, the portion of the screen where the reference notch is presented. The sensitivity of the alarm system shall be adjusted to indicate audibly and visibly when the reference notch is fed past the search unit.

S1.1.6.4 The recording equipment, if agreed upon, shall be adjusted to clearly indicate the reference notch or notches and also whether or not any reflected signals actuate the alarm system.

S1.1.7 A reference standard of an appropriate length (sufficient to allow in-line feeding) shall be prepared from a randomly selected tube of the same size, grade, and physical condition as the material to be tested.

S1.1.8 The reference standard shall contain machined notches as follows:

Notch to be 10% of wall thickness in depth but not less than 0.004 in. [0.10 mm]. Tolerance on depth +0.0000 in. or -0.001 in. [0.03 mm].

S1.1.8.1 Notch Locations and Orientation — Notches shall be located on outside or inside diameter, or both, and shall be oriented to lie in a longitudinal direction for radial inspection or circumferentially, or both, for transverse inspection. The notch or notches shall be located in the reference tube in such a manner that no physical or acoustical interference exists between notches or end of reference tube. These various locations and orientations will be classified as follows:

Type A — Longitudinal outside diameter for radial inspection,

Type B — Longitudinal inside diameter for radial inspection,

Type C — Circumferential outside diameter for transverse inspection, and

Type D — Circumferential inside diameter for transverse inspection.

S1.1.8.2 Standard Nomenclature — The size, location and orientation of the reference notches which become

a part of a particular order covered under this specification shall be specified.

S1.1.9 The basic procedure will be to rotary feed all the tubes in the order past the search unit (transducer) with the feed helix less than the scanning width of the search unit. As the tubes are fed past the transducer, the alarm system shall be observed for indications of defects equal to or greater than the reference standard. Tubes which show such indications shall be rejected.

S1.1.10 Standard procedure will be to test the material in one direction of helical feed only. Testing in both directions may be done if so specified by customer.

S1.1.11 Any tubes that do not show indications above the level determined by the reference standard shall be held in a lot until the reference standard is run and instrument calibration is proved by triggering alarm system on the reference notch or notches. After calibration is proved to have been correct, this lot of tubes shall be considered tested and accepted as to maximum defect size corresponding to the reference standard used.

S1.1.12 Rejected tubing may be salvaged by polishing or other suitable means when practical and retested after the elimination of the cause of rejection. Such material that meets the dimensional requirements and does not cause triggering of ultrasonic alarm system upon retesting shall be considered as having met the requirements of this supplement.

S2. Nondestructive Ultrasonic Test — Round Tubing (Select Commercial Grade)

S2.1 The manufacturer shall test the tubing using the procedure outlined in Supplementary Requirement S1, except for the notch depth, which shall be 5% of wall thickness in depth but not less than 0.004 in. [0.10 mm]. Tolerance on depth shall be +0.000 in. or -0.0005 in. [0.01 mm].

S3. Nondestructive Eddy-Current Test

S3.1 Each tube shall be tested after the finish heat treatment following the final cold-draw pass by passing through an electric nondestructive tester capable of detecting defects on the entire cross section of the tube. Suitable instrumentation shall be used to clearly distinguish artificial defects or reference notches. Tubes to be tested shall be reasonably straight and the outside and inside diameter surfaces shall be free of loose scale, metallic particles, or other material which would tend to restrict signals or create electrical noise. The tubing shall be

inspected by feeding longitudinally through an inspection coil or coils of a diameter suitable for the diameter of tubing to be inspected. The instrument calibration shall be accomplished with a reference standard prepared from an appropriate length of selected tubing of the same size, grade, and physical condition as the material to be inspected. The standard shall be fed through the coil at the same speed at which the inspection of the tubing is performed. The following factors shall be selected or adjusted, or both, in accordance with the instrument manufacturer's instructions for the particular instrument involved as required to achieve optimum instrument distinction between the reference defects and plain portion of the tube. These as well as other factors involved shall not be used in such a manner that they detract from the instrument's overall ability to detect injurious defects:

S3.1.1 Test frequency.

S3.1.2 Direct-current saturation level.

S3.1.3 Filter networks.

S3.1.4 Phase analysis circuits.

S3.1.5 Coil diameter.

S3.1.6 Instrument gain.

S3.2 The reference standard shall contain longitudinal and circumferential notches in the outside diameter and shall be used to establish the rejection level for the tubing to be tested. Inside diameter notches, both longitudinal and circumferential, shall also be a part of the reference standard. These notches may be larger than outside diameter notches and are intended for use only to assure instrument phase settings capable of yielding optimum inside diameter surface sensitivity. The outside diameter reference notches shall have a depth equal to 10% of the wall thickness. The tolerance of the notch shall be $\pm 8\%$ or 0.0005 in. [0.01 mm], whichever is the greater. Width of notch shall not exceed twice the depth. The length of the reference notches shall not exceed 0.375 in. [9.5 mm]. All tubing including that which may be reconditioned, provided the dimensional or other properties of the tubing are not adversely affected and provided the tubing does not show indications above the level determined by the outside diameter references, shall meet this specification provided the instrument calibration is verified by indicating the standard outside diameter reference notches of a given lot. Tubes generating a signal above the calibration standard sensitivity level shall be rejected. Tubes may be reconditioned if not adversely affecting the dimensional or other properties of the tube and so tested as to assure a satisfactory tube within the limits of this specification. All tubing shall be demagnetized after inspection has been completed.

SPECIFICATION FOR ELECTRIC-RESISTANCE- WELDED CARBON STEEL FEEDWATER HEATER TUBES

SA-557/SA-557M

(Identical with ASTM Specification A 557/A 557M-90a.)

1. Scope

1.1 This specification covers minimum-wall-thickness, electric-resistance-welded, carbon steel tubes including those bent, if specified, into the form of U-tubes for application in tubular feedwater heaters.

1.2 The tubing sizes covered shall be $\frac{1}{8}$ to $1\frac{1}{4}$ in. [15.9 to 31.8 mm] outside diameter, inclusive, and wall thicknesses equal to or greater than 0.045 in. [1.1 mm].

1.3 Optional supplementary requirements are provided and, when desired, shall be stated in the order.

1.4 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification. The inch-pound units shall apply unless the "M" designation of this specification is specified in the order.

2. Referenced Documents

2.1 ASTM Standards:
A 450/A 450M Specification for General Requirements for Carbon, Ferritic Alloy, and Austenitic Alloy Steel Tubes
E 30 Methods for Chemical Analysis of Steel, Cast Iron, Open-Hearth Iron, and Wrought Iron

3. General Requirements

3.1 Material furnished to this specification shall conform to the applicable requirements of the current edition of Specification A 450/A 450M, unless otherwise provided herein.

4. Ordering Information

4.1 Orders for material to this specification should include the following as required to describe the desired material adequately:

4.1.1 Quantity (feet, metres, or number of pieces).

4.1.2 Name of material (electric-resistance-welded steel tubing).

4.1.3 Dimensions (outside diameter and minimum wall thickness).

4.1.4 Length (specific or random).

4.1.5 Manufacture (hot rolled or cold drawn; cold-rolled strip may be used as an alternate to hot-rolled strip).

4.1.6 Grade (Section 7) Table 1.

4.1.7 Optional requirements — If order specifies bending, a drawing of the U-tubes shall accompany the order. Purchaser must specify if stress-relief anneal of the U-bends is required (Product analysis, Section 8).

4.1.8 Test Report required (see Certification Section of Specification A 450/A 450M).

4.1.9 Specification designation.

4.1.10 Special requirements and any supplementary requirements selected.

5. Manufacture

5.1 Manufacture — Tubes shall be made by electric-resistance welding.

5.2 Heat Treatment:

5.2.1 Following welding, tubes shall be normalized at a temperature of at least 1600°F [860°C] followed by cooling in air or cooling in the cooling zone of continuous atmosphere controlled furnace.

5.2.2 If cold drawn, tubes shall be heated after the final cold-working operation to a temperature of at least 1200°F [640°C] to ensure ductility satisfactory for rolling into tube sheets and to meet the specified mechanical properties.

5.2.3 If heat treatment of the U-bends is specified, such heat treatment shall consist of heating the stressed portion within a range from 1100 to 1200°F [590 to 640°C].

6. Surface Condition

6.1 Finished tubes shall be free of scale but may have a superficial oxide film on the surfaces. A light-oxide scale on the outside and inside surfaces of U-bend shall be allowed for tubes which have been heat treated for relief of stress.

6.2 Finished tubes shall be coated on both outside and inside diameter with a thin paraffin oil to prevent corrosion in transit. Other types of coatings may be applied as mutually agreed upon and specified in the order.

7. Chemical Composition

7.1 The steel shall conform to one of the requirements as to chemical composition as prescribed in Table 1.

7.2 For all tubes, the steel shall be fully killed.

7.3 When a grade is ordered under this specification, supplying an alloy grade that specifically requires the addition of any element other than those listed for the ordered grade in Table 1 is not permitted.

8. Product Analysis

8.1 When requested in the purchase order, a product analysis shall be made by the supplier from one tube or coil of steel per heat.

8.2 If the original test for product analysis fails, retests of two additional lengths of flat-rolled stock or tubes, shall be made. Both retests, for the elements in question shall meet the requirements of this specification; otherwise all remaining material in the heat shall be rejected or, at the option of the producer, each length of flat-rolled stock or tube may be individually tested for acceptance. Lengths of flat-rolled stock or tubes which do not meet the requirements of this specification shall be rejected.

8.3 For referee purposes, Methods E 30 shall be used.

9. Mechanical Requirements

9.1 Tensile Properties — The material shall conform to the requirements as to tensile properties prescribed in Table 2.

9.2 Hardness Requirements — The tubes shall not exceed the Rockwell Hardness shown in Table 3.

10. Permissible Variations in Dimensions

10.1 Permissible variations from the specified outside diameter shall be in accordance with the applicable portions of Specification A 450/A 450M. The height of flash on the inside of hot-rolled tubes shall be as specified in Specification A 450/A 450M. Cold-drawn tubes shall have no dimensional indication of welding flash. Tolerances for diameter and wall thickness do not apply to the bent portion of U-tubes. At the bent portion of a U-tube, for $R = 2 \times D$, neither the major nor minor diameter of the tube shall deviate from nominal by more than 10%.

10.2 Permissible variations from the specified minimum wall thickness shall not exceed $+18\% - 0$ for the straight tubing. The wall thickness of the U-tube in the bent section shall be not less than the value determined by:

$$t_f = T(2R)/(2R + D)$$

where:

t_f = wall thickness after bending, in. [mm],

T = specified minimum tube wall thickness, in. [mm],

R = centerline bend radius, in. [mm], and

D = nominal outside tube diameter, in. [mm].

10.3 Permissible variations from the specified straight length shall be in accordance with Specification A 450/A 450M.

10.4 In the case of U-tubes, the length of the tube legs, as measured from the point of tangency of the bend and the tube leg to the end of the tube leg, shall not be less than specified, but may exceed the specified values by the amount given in Table 4. The difference in lengths of the tube legs shall not be greater than $\frac{1}{8}$ in. [3 mm] unless otherwise specified.

10.5 The end of any tube may depart from the square by not more than the amount given in Table 5.

10.6 The leg spacing measured between the points of tangency of the bend to the legs shall not vary from the value $(2R - \text{specified tube OD})$ by more than $\frac{1}{16}$ in. [1.5 mm] where R is the centerline bend radius.

10.7 The bent portion of the U-tube shall be substantially uniform in curvature and not exceed $\pm \frac{1}{16}$ in. [± 1.5 mm] of the normal centerline radius.

11. Mechanical Tests Required

11.1 Tension Test — One tension test shall be made on a specimen for lots of not more than 50 tubes. Tension

tests shall be made on specimens from two tubes for lots of more than 50 tubes (Note 2).

NOTE 1 — For flattening and flange requirements, a lot consists of the 125 tubes.

NOTE 2 — For tension and hardness test requirements, the term *lot* applies to all tubes prior to cutting, of the same nominal diameter and wall thickness which are produced from the same heat of steel. When final heat treatment is in a batch-type furnace, a lot shall include only those tubes of the same size and the same heat which are heat treated in the same furnace charge. When the final heat treatment is in a continuous furnace, a lot shall include all tubes of the same size and heat, heat treated in the same furnace at the same temperature, time at heat and furnace speed.

11.2 Flattening Test — One flattening test as specified in Specification A 450/A 450M shall be made on a specimen taken from one tube from each lot (Note 1) or fraction thereof.

11.3 Flange Test — One flange test as specified in Specification A 450/A 450M shall be made on a specimen from one tube from each lot (Note 2) or fraction thereof. For Grades B and C, the width of the flange shall not be less than 75% of that specified in Specification A 450/A 450M.

11.4 Reverse Flattening Test — One reverse flattening test shall be made on a specimen from each 1500 ft [460 m] of finished tubing.

11.5 Hardness Test — Brinell or Rockwell hardness tests shall be made on specimens from two tubes from each lot (Note 2). Method of testing and restrictions on wall thickness shall be in accordance with Specification A 450/A 450M.

11.6 Hydrostatic Test — Each U-tube shall be subjected to a hydrostatic test, using a noncorrosive fluid, or when agreed upon by the purchaser and manufacturer, they may be tested to $1\frac{1}{2}$ times the specified design pressure.

11.7 Methods of mechanical testing, test specimens, retests and retreatment shall be in accordance with Specification A 450/A 450M.

12. Nondestructive Test (Electric Test)

12.1 Each tube shall be tested after the final heat treatment in accordance with the requirements of the nondestructive electric test in Specification A 450/A 450M.

13. Product Marking

13.1 Marking shall be in accordance with Specification A 450/A 450M. Symbols stamped or rolled into the tube surface are not permissible.

14. Packaging

14.1 The manufacturer at his option will box, crate, carton, or package in secured lifts, or bundle to ensure safe delivery. Special packaging requiring extra operations other than those normally used by the manufacturer must be specified on the order.

14.2 In case of U-tubes, each box shall be palletized and legibly marked with purchase order number, specification number, size, name of manufacturer, and identification of items contained.

SUPPLEMENTARY REQUIREMENTS

The following supplementary requirement or requirements may become a part of the specification when specified in the inquiry or invitation to bid, and purchase order or contract. These requirements shall not be considered unless specified in the order, in which event the necessary tests shall be made by the manufacturer prior to the bending or shipment of the tubing.

S1. Nondestructive Ultrasonic Test-Round Tubing (Commercial Grade)

S1.1 The manufacturer shall test the tubing by an ultrasonic nondestructive test for detection of harmful faults.

S1.1.1 Ultrasonic testing shall be performed using pulse-echo shear-wave techniques to locate longitudinal or circumferential defects, or both.

S1.1.2 Tubes being tested shall be reasonably straight for proper rotation. The outside and inside diameter surfaces of the tubes shall be free of dirt, grit, grease, oil, loose scale, or other materials which tend to attenuate, scatter, or reflect ultrasonic signals.

S1.1.3 Tubing shall be inspected by feeding spirally past a suitable transducer with rotation of material to be toward transducer.

S1.1.4 Suitable ultrasonic instrumentation shall be used to clearly distinguish the artificial defects (hereafter called "reference notches") described later. Automatic electronic monitoring of the reflected ultrasonic signals shall be provided in such manner that any naturally occurring defects which present an ultrasonic reflection equal to or greater than the reference standard(s) shall trigger audible and visible alarms.

S1.1.5 Instrument calibration as described herein shall be accomplished with the reference standard being rotated and fed past the transducer at the same approximate rate as the tubing to be tested.

S1.1.6 The following factors shall be adjusted so as to achieve optimum instrument distinction between the reference notch(es) and plain portion of tubing when calibrating equipment to the reference standard.

S1.1.6.1 Search unit position shall be such that shear waves are propagated within the tube being tested. If both outside and inside diameter reference notches are used, the optimum angle shall be used which will indicate both notches as close to equal size as possible.

S1.1.6.2 The test frequency to be used shall be chosen to yield the best distinction between reference notches and plain areas of tubing. In general, 2.25 or 5.0 MH will be used.

S1.1.6.3 Instrument sensitivity shall be adjusted to allow reference notch or notches to present a pip or pips on the scope screen at 50 to 70% of instrument saturation level. The automatic defect monitoring system shall be adjusted to monitor, by means of electronic gates, the portion of the screen where the reference notch is presented. The sensitivity of the alarm system shall be adjusted to indicate audibly and visibly when the reference notch is fed past the search unit.

S1.1.6.4 The recording equipment, if agreed upon, shall be adjusted to clearly indicate the reference notch or notches and also whether or not any reflected signals actuate the alarm system.

S1.1.7 A reference standard of an appropriate length (sufficient to allow in-line feeding) shall be prepared from a randomly selected tube of the same size, grade, and physical condition as the material to be tested.

S1.1.8 The reference standard shall contain machined notches as follows: Notch to be 10% of wall thickness in depth but not less than 0.004 in. [0.10 mm]. Tolerance on depth shall be +0.0000 or -0.001 in. [0.03 mm].

S1.1.8.1 Notch Locations and Orientation — Notches shall be located on outside or inside diameter, or both, and shall be oriented to lie in a longitudinal direction for "radial" inspection or circumferentially for "transverse" inspection, or both. The notch or notches shall be located in the reference tube in such a manner that no physical or acoustical interference exists between notches or end of reference tube. These various locations and orientations will be classified as follows:

Type A — Longitudinal outside diameter for radial inspection,

Type B — Longitudinal inside diameter for radial inspection,

Type C — Circumferential outside diameter for transverse inspection, and

Type D — Circumferential inside diameter for transverse inspection.

S1.1.8.2 Standard Nomenclature — The size, location, and orientation of the reference notches which become

a part of a particular order covered under this specification shall be specified.

S1.1.9 The basic procedure will be to rotary feed all the tubes on the order past the search unit (transducer) with the feed helix less than the scanning width of the search unit. As the tubes are fed past the transducer, the alarm system shall be observed for indications of defects equal to or greater than the reference standard. Tubes that show such indication shall be rejected.

S1.1.10 Standard procedure will be to test the material in one direction of helical feed only. Testing in both directions may be done if so specified by customer.

S1.1.11 Any tubes that do not show indications above the level determined by the reference standard shall be held in a lot until the reference standard is run and instrument calibration is proved by triggering the alarm system on the reference notch or notches. After calibration is proved to have been correct, this lot of tubes shall be considered tested and accepted as to maximum defect size corresponding to the reference standard used.

S1.1.12 Rejected tubing may be salvaged by polishing or other suitable means when practical and retested after the elimination of the cause of rejection. Such material that meets the dimensional requirements and does not cause triggering of the ultrasonic alarm system upon retesting shall be considered as having met the requirements of this supplement.

S2. Nondestructive Ultrasonic Test-Round Tubing (Select Commercial Grade)

S2.1 The manufacturer shall test the tubing using the procedure outlined in Supplementary Requirement S1, except for the notch depth. The notch shall be 5% of wall thickness in depth but not less than 0.004 in. [0.10 mm]. Tolerance on depth shall be +0.000, -0.005 in. [0.01 mm].

S3. Nondestructive Test (Eddy-Current Test)

S3.1 Each tube shall be tested after the finish heat treatment by passing through an electric nondestructive tester capable of detecting defects on the entire cross section of the tube. Suitable instrumentation shall be used to clearly distinguish artificial defects or reference notches. Tubes to be tested shall be reasonably straight and the outside and inside diameter surfaces shall be free of loose scale, metallic particles, or other material which would tend to restrict signals or create electrical noise. The tubing shall be inspected by feeding longitudinally through an inspection coil of a diameter suitable for the diameter of

tubing to be inspected. The instrument calibration shall be accomplished with a reference standard prepared from an appropriate length of selected tubing of the same size, grade, and physical condition as the material to be inspected. The standard shall be fed through the coil at the same speed at which the inspection of the tubing is performed.

S3.1.1 The following factors will be selected or adjusted, or both, in accordance with the instrument manufacturer's instructions for the particular instrument involved as required to achieve optimum instrument distinction between the reference defects and plain portion of the tube. These as well as other factors involved shall not be used in such a manner that they detract from the instrument's overall ability to detect injurious defects:

S3.1.1.1 Test frequency.

S3.1.1.2 Direct-current saturation level.

S3.1.1.3 Filter networks.

S3.1.1.4 Phase analysis circuits.

S3.1.1.5 Coil diameter.

S3.1.1.6 Instrument gain.

S3.1.2 The reference standard shall contain longitudinal and circumferential notches in the outside diameter and shall be used to establish rejection level for the tubing to be tested. Inside diameter notches, both longitudinal and circumferential, shall also be a part of the reference standard. These notches may be larger than outside diameter notches and are intended for use only to assure instrument phase settings capable of yielding optimum inside diameter surface sensitivity. The outside diameter reference notches shall have a depth equal to 10% of the wall thickness. The tolerance of the notch shall be $\pm 8\%$ or 0.0005 in. [0.01 mm], whichever is the greater. Width of notch shall not exceed twice the depth. The length of the reference notches shall not exceed 0.375 in. [9.5 mm]. All tubing including that which may be reconditioned, provided the dimensional or other properties of the tubing are not adversely affected, and provided the tubing does not show indications above the level determined by the outside diameter references, shall meet this specification. This is contingent upon the instrument calibration being verified by indicating the standard outside diameter reference notches of a given lot. Tubes generating a signal above the calibration standard sensitivity level shall be rejected. Tubes may be reconditioned if not adversely affecting the dimensional or other properties of the tube and so tested as to assure a satisfactory tube within the limits of this specification. All tubing shall be demagnetized after inspection has been completed.

SPECIFICATION FOR PRESSURE VESSEL PLATES, CARBON STEEL, MANGANESE-TITANIUM FOR GLASS OR DIFFUSED METALLIC COATINGS

SA-562/SA-562M

(Identical with ASTM Specification A 562/A 562M-06.)

1. Scope

1.1 This specification covers titanium-bearing carbon steel plates intended for welded glass lined pressure vessels or other applications where the presence of free-iron carbide would be deleterious to the coating. A minimum specific ratio of titanium to carbon is specified.

1.2 The maximum thickness of plates is limited to 2 in. [50 mm].

1.3 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification.

2. Referenced Documents

2.1 *ASTM Standards:*
A 20/A 20M Specification for General Requirements for Steel Plates for Pressure Vessels

3. General Requirements and Ordering Information

3.1 Material supplied to this material specification shall conform to Specification A 20/A 20M. These requirements outline the testing and retesting methods and procedures, permissible variations in dimensions, and mass, quality and repair of defects, marking, loading, etc.

3.2 Specification A 20/A 20M also establishes the rules for the ordering information which should be complied with when purchasing material to this specification.

3.3 In addition to the basic requirements of this specification, certain supplementary requirements are available

when additional control, testing, or examination is required to meet end use requirements. These include:

- 3.3.1** Vacuum treatment,
- 3.3.2** Additional or special tension testing,
- 3.3.3** Impact testing, and
- 3.3.4** Nondestructive examination.

3.4 The purchaser is referred to the listed supplementary requirements in this specification and to the detailed requirements in Specification A 20/A 20M.

3.5 If the requirements of this specification are in conflict with the requirements of Specification A 20/A 20M, the requirements of this specification shall prevail.

4. Manufacture

4.1 *Steelmaking Practice* — The steel shall be killed.

5. Heat Treatment

5.1 Plates shall be thermally treated to produce grain refinement, either by normalizing or heating uniformly for hot forming at a minimum temperature of 1600°F [870°C] or some higher agreed temperature, and held at this temperature for a minimum of 1 h/in. [2.4 min/mm] of thickness.

6. Chemical Requirements

6.1 The steel shall conform to the chemical requirements shown in Table 1 unless otherwise modified in accordance with Supplementary Requirement S17, Vacuum Carbon-Deoxidized Steel, in Specification A 20/A 20M.

7. Mechanical Requirements

7.1 *Tension Test Requirements* — The material as represented by the tension-test specimens shall conform to the requirements shown in Table 2.

TABLE 1
CHEMICAL REQUIREMENTS

Element	Composition, %
Carbon, max ^A	0.12
Manganese, max	1.20
Heat analysis	
Product analysis	1.30
Phosphorus, max ^A	0.035
Sulfur, max ^A	0.035
Silicon ^A	0.15–0.50
Copper, max ^A	0.15
Titanium, min	4 × C

^A Applies to both heat and product analyses.

TABLE 2
TENSILE REQUIREMENTS

	ksi [MPa]
Tensile strength	55–75 [380–515]
Yield strength, min	30 [205]
Elongation in 8 in. [200 mm] min, % ^A	22
Elongation in 2 in. [50 mm] min, % ^A	26

^A See Specification A 20/A 20M for elongation adjustments.

SUPPLEMENTARY REQUIREMENTS

Supplementary requirements shall not apply unless specified in the order.

A list of standardized supplementary requirements for use at the option of the purchaser are included in Specification A 20/A 20M. Those which are considered suitable for use with this specification are listed below by title.

- | | |
|---|---|
| S1. Vacuum Treatment, | S8. Ultrasonic Examination in Accordance With Specification A 435/A 435M, |
| S2. Product Analysis, | |
| S3. Simulated Post-Weld Heat Treatment of Mechanical Test Coupons, | S9. Magnetic Particle Examination, |
| S4. Additional Tension Test, | S11. Ultrasonic Examination in Accordance With Specification A 577/A 577M, |
| S5. Charpy V-Notch Impact Test, | S12. Ultrasonic Examination in Accordance With Specification A 578/A 578M, and |
| S6. Drop Weight Test (for Material 0.625 in. [16 mm] and over in Thickness), | S17. Vacuum Carbon-Deoxidized Steel. |
| S7. High-temperature Tension Test, | |

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR CARBON AND ALLOY STEEL NUTS

SA-563

(Identical with ASTM Specification A 563-07a except for deletion of the term “private label distributor” in para. 14.7 and 14.9 and editorially correct title.)

1. Scope

1.1 This specification covers chemical and mechanical requirements for eight grades of carbon and alloy steel nuts for general structural and mechanical uses on bolts, studs, and other externally threaded parts.

NOTE 1 — See Appendix X1 for guidance on suitable application of nut grades.

1.2 The requirements for any grade of nut may, at the supplier's option, and with notice to the purchaser, be fulfilled by furnishing nuts of one of the stronger grades specified herein unless such substitution is barred in the inquiry and purchase order.

1.3 Grades C3 and DH3 nuts have atmospheric corrosion resistance and weathering characteristics comparable to that of the steels covered in Specifications A 242/A 242M, A 588/A 588M, and A 709/A 709M. The atmospheric corrosion resistance of these steels is substantially better than that of carbon steel with or without copper addition (see 5.2). When properly exposed to the atmosphere, these steels can be used bare (uncoated) for many applications.

NOTE 2 — A complete metric companion to Specification A 563 has been developed—A 563M; therefore, no metric equivalents are presented in this specification.

1.4 Terms used in this specification are defined in Terminology F 1789 unless otherwise defined herein.

2. Referenced Documents

2.1 ASTM Standards:

- A 194/A 194M Specification for Carbon and Alloy Steel Nuts for Bolts for High Pressure or High Temperature Service, or Both
- A 242/A 242M Specification for High-Strength Low-Alloy Structural Steel

- A 307 Specification for Carbon Steel Bolts and Studs, 60 000 psi Tensile Strength
- A 325 Specification for Structural Bolts, Steel, Heat Treated, 120/105 ksi Minimum Tensile Strength
- A 354 Specification for Quenched and Tempered Alloy Steel Bolts, Studs, and Other Externally Threaded Fasteners
- A 394 Specification for Steel Transmission Tower Bolts, Zinc-Coated and Bare
- A 449 Specification for Hex Cap Screws, Bolts and Studs, Steel, Heat Treated, 120/105/90 ksi Minimum Tensile Strength, General Use
- A 490 Specification for Structural Bolts, Alloy Steel, Heat Treated, 150 ksi Minimum Tensile Strength
- A 588/A 588M Specification for High-Strength Low-Alloy Structural Steel, up to 50 ksi [345 MPa] Minimum Yield Point, with Atmospheric Corrosion Resistance
- A 687 Specification for High-Strength Nonheaded Steel Bolts and Studs
- A 709/A 709M Specification for Structural Steel for Bridges
- A 751 Test Methods, Practices, and Terminology for Chemical Analysis of Steel Products
- B 695 Specification for Coatings of Zinc Mechanically Deposited on Iron and Steel

- F 606 Test Methods for Determining the Mechanical Properties of Externally and Internally Threaded Fasteners, Washers, Direct Tension Indicators, and Rivets
- F 812/F 812M Specification for Surface Discontinuities of Nuts, Inch and Metric Series
- F 1789 Terminology for F16 Mechanical Fasteners
- F 2329 Specification for Zinc Coating, Hot-Dip, Requirements for Application to Carbon and Alloy Steel Bolts, Screws, Washers, Nuts, and Special Threaded Fasteners
- G 101 Guide for Estimating the Atmospheric Corrosion Resistance of Low-Alloy Steels

2.2 ANSI Standards:

ANSI B1.1 Unified Screw Threads

ANSI B18.2.2 Square and Hex Nuts

3. Ordering Information**3.1** Orders for nuts under this specification shall include the following:**3.1.1** Quantity (number of nuts),**3.1.2** Nominal size and thread series of nuts,**3.1.3** Style of nut (for example, heavy hex),**3.1.4** Grade of nut,**3.1.5 Zinc Coating** — Specify the zinc-coating process required, for example, hot-dip, mechanically deposited, or no preference (see 4.7),**3.1.6 Other Finishes** — Specify other protective finish if required,**3.1.7** ASTM designation and year of issue, and**3.1.8** Supplementary or special requirements.NOTE 3 — An example of an ordering description follows: 1000 $\frac{7}{8}$ -9 heavy hex nuts, Grade DH, hot-dip zinc-coated, and lubricated, ASTM A 563-XX.**4. Materials and Manufacture****4.1** Steel for nuts shall be made by the open-hearth, basic-oxygen, or electric-furnace process except that steel for Grades O, A, and B nuts may be made by the acid-bessemer process.**4.2** Nuts may be made cold or hot by forming, pressing, or punching or may be machined from bar stock.**4.3** Grades DH and DH3 nuts shall be heat treated by quenching in a liquid medium from a temperature above the transformation temperature and tempering at a temperature of at least 800°F.**4.4** Grades C and D nuts made of steel having carbon content not exceeding 0.20%, phosphorus not exceeding 0.04%, and sulfur not exceeding 0.05% by heat analysis may be heat treated by quenching in a liquid medium from a temperature above the transformation temperature and need not be tempered. When this heat treatment is used, there shall be particular attention to the requirements in 6.1.1.**4.5** Grades C, C3, and D nuts made of any steel permitted for these grades may be heat treated by quenching in a liquid medium from a temperature above the transformation temperature and tempering at a temperature of at least 800°F.**4.6** Threads shall be formed by tapping or machining.**4.7 Zinc Coatings, Hot-Dip and Mechanically Deposited:****4.7.1** When zinc-coated fasteners are required, the purchaser shall specify the zinc coating process, for example, hot-dip, mechanically deposited, or no preference.**4.7.2** When hot-dip is specified, the fasteners shall be zinc-coated by the hot-dip process in accordance with the requirements of Specification F 2329.**4.7.3** When mechanically deposited is specified, the fasteners shall be zinc coated by the mechanical deposition process in accordance with the requirements of Class 55 of Specification B 695.**4.7.4** When no preference is specified, the supplier may furnish either a hot-dip zinc coating in accordance with Specification F 2329, or a mechanically deposited zinc coating in accordance with Specification B 695, Class 55. Threaded components (bolts and nuts) shall be coated by the same zinc-coating process and the supplier's option is limited to one process per item with no mixed processes in a lot.**4.7.5** Hot-dip zinc-coated nuts shall be tapped after zinc coating.**4.7.6** Mechanically deposited zinc-coated nuts for assembly with mechanically deposited zinc-coated bolts shall be tapped oversize prior to zinc coating and need not be retapped afterwards.**4.8 Lubricant:****4.8.1** Hot-dip and mechanically deposited zinc-coated Grade DH nuts shall be provided with an additional lubricant which shall be clean and dry to the touch (see Supplementary Requirement S1 to specify lubrication requirements for plain finish nuts).**4.8.2** See Supplementary Requirement S2 for option to specify a dye in the lubricant.**5. Chemical Composition****5.1** Grades O, A, B, C, D, and DH shall conform to the chemical composition specified in Table 1.**5.2** Grades C3 and DH3 shall conform to the chemical composition specified in Table 2. See Guide G 101 for methods of estimating the atmospheric corrosion resistance of low alloy steels.**5.3** Resulfurized or rephosphorized steel, or both, are not subject to rejection based on product analysis for sulfur or phosphorus.**5.4** Application of heats of steel to which bismuth, selenium, tellurium, or lead has been intentionally added shall not be permitted for Grades D, DH, and DH3.

5.5 Chemical analyses shall be performed in accordance with Test Methods, Practices, and Terminology A 751.

6. Mechanical Properties

6.1 Hardness:

6.1.1 The hardness of nuts of each grade shall not exceed the maximum hardness specified for the grade in Table 3.

6.1.2 Jam nuts, slotted nuts, nuts smaller in width across flats or thickness than standard hex nuts (7.1), and nuts that would require a proof load in excess of 160 000 lbf may be furnished on the basis of minimum hardness requirements specified for the grade in Table 3, unless proof load testing is specified in the inquiry and purchase order.

6.2 Proof Load:

6.2.1 Nuts of each grade, except those listed in 6.1.2, shall withstand the proof load stress specified for the grade, size, style, thread series, and surface finish of the nut in Table 3 and Table 4.

6.2.2 Nuts hot dip or mechanically zinc coated in accordance with 4.7.2 or 4.7.3 shall be proof load tested after zinc coating and overtapping.

7. Dimensions

7.1 Unless otherwise specified, nuts shall be plain (uncoated) and shall conform to the dimensions prescribed in ANSI B18.2.2.

7.2 Hex and hex-slotted nuts over 1½ to 2 in. inclusive shall have dimensions conforming to ANSI B18.2.2 calculated using the formulas for the 1¼ through 1½ in. size range in Appendix III (Formulas for Nut Dimensions) of ANSI B18.2.2.

7.3 Threads: Plain (Uncoated) Nuts

7.3.1 Unless otherwise specified, the threads shall conform to the dimensions for coarse threads with Class 2B tolerances prescribed in ANSI B1.1.

7.4 Threads: Nuts Hot Dip Zinc Coated Specification F 2329 (4.7.2)

7.4.1 Nuts to be used on bolts with Class 2A threads before hot-dip zinc coating, and then hot-dip zinc coated in accordance with Specification F 2329, shall be tapped oversize after coating, to the minimum and maximum thread dimensions in Table 5. The major and minor diameters shall also be increased by the allowance to provide the corresponding minimum and maximum major and minor diameters.

7.5 Threads: Nuts With Other Coatings

7.5.1 Nuts to be used on bolts mechanically zinc coated or on bolts hot-dip zinc-coated to a specification other than Specification F 2329, or otherwise hot-dip coated, shall be tapped oversize by a diametral amount sufficient to permit assembly on the coated bolt thread, unless other requirements are specified in the inquiry or purchase order.

7.5.2 When specifically permitted by the purchaser, nuts for bolts with electrodeposited coating, such as cadmium, zinc, and so forth, or with chemically applied coating may be tapped oversize by a diametral amount sufficient to permit assembly on the coated bolt thread.

7.5.3 The allowable oversize tapping shall not exceed that specified in Table 5.

8. Workmanship

8.1 Surface discontinuity limits shall be in accordance with Specification F 812/F 812M.

9. Number of Tests

9.1 The requirements of this specification shall be met in continuous mass production for stock, and the manufacturer shall make sample inspections to ensure that the product conforms to the specified requirements. Additional tests of individual shipments of material are not ordinarily contemplated. Individual heats of steel are not identified in the finished product.

9.2 When additional tests are specified in the inquiry and purchase order, a lot, for purposes of selecting test samples, shall consist of all material offered for inspection at one time that has the following common characteristics:

9.2.1 Grade,

9.2.2 Nominal size,

9.2.3 Style of nut,

9.2.4 Thread series and class, and

9.2.5 Surface finish.

9.3 Unless otherwise specified in the inquiry and purchase order, the number of tests for each lot of required property shall be as follows:

Number of Nuts in Lot	Number of Specimens
800 and under	1
801 to 8 000	2
8 001 to 22 000	3
Over 22 000	5

9.4 If any test specimen shows flaws, it may be discarded and another specimen substituted.

9.5 Should any specimen fail to meet the requirements of any specified test, double the number of specimens from the same lot shall be tested for this property, in which case all of the additional specimens shall meet the specifications.

10. Test Methods

10.1 Tests shall be conducted in accordance with Test Methods F 606.

11. Report

11.1 When specified in the order, the manufacturer shall furnish a test report certified to be the last completed set of mechanical tests for each stock size in each shipment.

12. Inspection

12.1 If the inspection described in 12.2 is required by the purchaser, it shall be specified in the inquiry and contract or order.

12.2 The inspector representing the purchaser shall have free entry to all parts of the manufacturer's works that concern the manufacture of the material ordered. The manufacturer shall afford the inspector all reasonable facilities to satisfy him that the material is being furnished in accordance with this specification. All tests and inspections required by the specification that are requested by the purchaser's representative shall be made before shipment, and shall be conducted as not to interfere unnecessarily with the operation of the works.

13. Rejection and Rehearing

13.1 Material that fails to conform to the requirements of this specification may be rejected. Rejection should be reported to the producer or supplier promptly and in writing. In case of dissatisfaction with the results of the test, the producer or supplier may make claim for a rehearing.

14. Product Marking

14.1 Nuts made to the requirements of Grades O, A, and B are not required to be marked unless individual marking is specified in the inquiry and order. When individual marking is required, the mark shall be the grade letter symbol on one face of the nut.

14.2 Heavy hex nuts made to the requirements of Grade C (Note 4) shall be marked on one face with three circumferential marks 120° apart.

14.3 Heavy hex nuts made to the requirements of Grade C3 shall be marked on one face with three circumferential marks 120° apart and the numeral 3. In addition, the manufacturer may add other distinguishing marks indicating that the nut is atmospheric corrosion resistant and of a weathering type.

14.4 Nuts made to the requirements of Grade D shall be marked with the grade symbol, D (Note 4) on one face.

14.5 Nuts made to the requirements of Grade DH shall be marked with the grade symbol, DH (Note 4) on one face.

14.6 Heavy hex nuts made to the requirements of Grade DH3 shall be marked with the grade symbol DH3 on one face. Hex nuts made to the requirements of DH3 shall be marked with the symbol HX3 on one face. In addition, the manufacturer may add other distinguishing marks indicating that the nut is atmospheric corrosion resistant and of a weathering type.

14.7 In addition, nuts of Grades C, C3, D, DH, and DH3 and hex nuts made to the requirements of DH3, shall be marked with a symbol to identify the manufacturer.

14.8 Marks may be raised or depressed at the option of the manufacturer. However, if markings are located on the bearing surface, they shall be depressed.

14.9 Grade and manufacturer's identification shall be separate and distinct. The two identifications shall preferably be in different locations and, when on the same level, shall be separated by at least two spaces.

NOTE 4 — See Table 3 for marking of equivalent nuts made in accordance with requirements of Specification A 194/A 194M.

15. Packaging and Package Marking

15.1 Packaging:

15.1.1 Unless otherwise specified, packaging shall be in accordance with Practice D 3951.

15.1.2 When special packaging requirements are required, they shall be defined at the time of the inquiry and order.

15.2 Package Marking:

15.2.1 Each shipping unit shall include or be plainly marked with the following information:

15.2.1.1 ASTM designation and grade,

15.2.1.2 Size,

15.2.1.3 Name and brand or trademark of the manufacturer,

15.2.1.4 Number of pieces,

15.2.1.5 Purchase order number, and

15.2.1.6 Country of origin.

16. Responsibility

16.1 The party responsible for the fastener shall be the organization that supplies the fastener to the purchaser.

17. Keywords

17.1 alloy steel; carbon steel; nuts; steel; weathering steel

TABLE 1
CHEMICAL REQUIREMENTS FOR GRADES O, A, B, C,
D, AND DH NUTS

Grade of Nut	Analysis	Composition, %			
		Carbon	Manganese, min	Phosphorus, max	Sulfur, max
O, A, B, C	heat	0.55 max	. . .	0.12	0.15(A)
	product	0.58 max	. . .	0.13 (B)	. . .
D (C)	heat	0.55 max	0.30	0.04	0.05
	product	0.58 max	0.27	0.048	0.058
DH (C)	heat	0.20–0.55	0.60	0.04	0.05
	product	0.18–0.58	0.57	0.048	0.058

NOTES:

(A) For Grades O, A, and B a sulfur content of 0.23% max is acceptable with the purchasers approval.

(B) Acid bessemer steel only.

(C) For Grades D and DH a sulfur content of 0.05 – 0.15% is acceptable provided the manganese is 1.35% min.

NOTES:

- (A) To determine nut proof load in pounds, multiply the appropriate nut proof load stress by the tensile stress area of the thread. Stress areas for UNC, UNF, and 8 UN thread series are given in Table 4.
- (B) Non-zinc-coated nuts are nuts intended for use with externally threaded fasteners which have a plain (nonplated or noncoated) finish or have a plating or coating of insufficient thickness to necessitate overtapping the nut thread to provide assemblability. Zinc-coated nuts are nuts intended for use with externally threaded fasteners which are hot-dip zinc-coated, mechanically zinc-coated, or have a plating or coating of sufficient thickness to necessitate overtapping the nut thread to provide assemblability.
- (C) Nuts made in accordance to the requirements of Specification A 194/A 194M, Grade 2 or Grade 2H, and marked with their grade symbol are acceptable equivalents for Grades C and D nuts. When A 194 zinc-coated inch series nuts are supplied, the zinc coating, overtapping, lubrication and rotational capacity testing shall be in accordance with Specification A 563.
- (D) Nuts made in accordance with the requirements of Specification A 194/A 194M, Grade 2H, and marked with its grade symbol are an acceptable equivalent for Grade DH nuts. When A 194 zinc-coated inch series nuts are supplied, the zinc coating, overtapping, lubrication and rotational capacity testing shall be in accordance with Specification A 563.

4-4	11.08	...	...	4-8	11.81

GENERAL NOTE: A_s The stress area is calculated as follows:

$$A_s = 0.7854 \left[D - \frac{0.9743}{n} \right]^2$$

where:

A_s = stress area, in.²,
 D = nominal size, in., and
 n = threads per inch.

(A) These allowances also apply to the minimum and maximum major and minor diameters.

SUPPLEMENTARY REQUIREMENTS

The following supplementary requirement shall be applied only when specified by the purchaser on the contract or order. Details of these supplementary requirements shall be agreed upon in writing between the manufacturer and purchaser. This supplementary requirement shall in no way negate any requirement of the specification itself.

S1. Supplementary Lubricant Requirements for Nuts

S1.1 Nuts, regardless of specified finish, shall be provided with an additional lubricant that shall be clean and dry to the touch.

S2. Lubricant Dye

S2.1 In addition to the requirements of Supplementary Requirement S1, the lubricant shall have a contrasting color so that its presence is visually obvious.

S3. Lubricant Placement

The lubricant shall be applied to specified surfaces on the nuts, such as (1) principally only those portions which are threaded, or (2) on threaded portions and either only one bearing face or both bearing faces, as required, or (3) such other specific lubricant placement criteria as are agreed to between the purchaser and the user.

APPENDIX

(Nonmandatory Information)

X1. INTENDED APPLICATION

X1.1 Table X1.1 gives additional information for the intended application of nuts.

NOTES:

- (A) The availability of DH nuts in nominal sizes $\frac{3}{4}$ in. and larger is very limited and generally available only on special orders for 50 000 pieces or more. For smaller quantities A 194 Gr. 2H nuts should be considered.
- (B) "Recommended" denotes a commercially available nut having the most suitable mechanical properties and dimensional configuration (style) that will make it possible to torque the bolt to the required load when used in combination with the nut.
- (C) "Suitable" denotes nuts having mechanical properties that will make it possible to torque the bolt to the required load when used in combination with the nut; but, which require consideration of dimensional configuration (style) suitability and availability. Others are not suitable.
- (D) The term "bolt" includes all externally threaded types of fasteners.
- (E) Non-zinc-coated nuts are nuts intended for use with externally threaded fasteners which have a plain (nonplated or noncoated) finish or have a plating or coating of insufficient thickness to necessitate overlapping the nut thread to provide assemblability. Zinc-coated nuts are nuts intended for use with externally threaded fasteners which are hot-dip zinc-coated, mechanically zinc-coated, or have a plating or coating of sufficient thickness to necessitate overlapping the nut thread to provide assemblability.
- (F) Hex nuts in nominal sizes over $1\frac{1}{2}$ to 2 in. inclusive are not covered in the tables of tabulated sizes in ANSI B18.2.2 but are commercially available. Such nuts are suitable. See 7.2 for dimensions.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR HOT-ROLLED AND COLD-FINISHED AGE-HARDENING STAINLESS STEEL BARS AND SHAPES

SA-564/SA-564M

[Identical with ASTM Specification A 564/A 564M-04(R07).]

1. Scope

1.1 This specification covers bars and shapes of age-hardening stainless steels. Hot-finished or cold-finished rounds, squares, hexagons, bar shapes, angles, tees, and channels are included; these shapes may be produced by hot rolling, extruding, or forging. Billets or bars for re-forging may be purchased to this specification.

1.2 These steels are generally used for parts requiring corrosion resistance and high strength at room temperature, or at temperatures up to 600°F [315°C]; 700°F [370°C] for Type 632; 840°F [450°C] for Type UNS S46910. They are suitable for machining in the solution-annealed condition after which they may be age-hardened to the mechanical properties specified in Section 7 without danger of cracking or distortion. Type XM-25 is machinable in the as-received fully heat treated condition. Type UNS S46910 is suitable for machining in the solution-annealed, cold-worked, and aged-hardened condition.

1.3 Types 631 and 632 contain a large amount of ferrite in the microstructure and can have low ductility in forgings and larger diameter bars. Applications should be limited to small diameter bar.

1.4 The values stated in either inch-pound units or SI (metric) units are to be regarded separately as standards; within the text and tables, the SI units are shown in [brackets]. The values stated in each system are not exact equivalents; therefore, each system must be used independent of the other. Combining values from the two systems may result in nonconformance with the specification.

1.5 Unless the order specifies an “M” designation, the material shall be furnished to inch-pound units.

NOTE 1 — For forgings, see Specification A 705/A 705M.

NOTE 2 — For billets and bars for forging see Specification A 314.

2. Referenced Documents

2.1 ASTM Standards:

- A 314 Specification for Stainless Steel Billets and Bars for Forging
- A 370 Test Methods and Definitions for Mechanical Testing of Steel Products
- A 484/A 484M Specification for General Requirements for Stainless Steel Bars, Billets, and Forgings
- A 705/A 705M Specification for Age-Hardening, Stainless Steel Forgings
- A 751 Test Methods, Practices, and Terminology for Chemical Analysis of Steel Products
- E 527 Practice for Numbering Metals and Alloys (UNS)

2.2 Other Documents:

- SAE J1086 Recommended Practice for Numbering Metals and Alloys (UNS)

3. Ordering Information

3.1 It is the responsibility of the purchaser to specify all requirements that are necessary for material ordered under this specification. Such requirements may include but are not limited to the following:

3.1.1 Quantity (weight or number of pieces),

3.1.2 Type or UNS designation (Table 1),

3.1.3 Specific melt type when required,

3.1.4 Heat treated condition (5.1),

3.1.5 Transverse properties when required (7.6),

3.1.6 Finish (Specification A 484/A 484M),

3.1.7 Surface preparation of shapes (5.2.1),

3.1.8 Size, or applicable dimension including diameter, thickness, width, length, etc.,

3.1.9 Preparation for delivery (Specification A 484/A 484M),

3.1.10 Special requirements (refer to 7.4 and 8.3),

3.1.11 Marking requirements (Specification A 484/A 484M), and

3.1.12 ASTM designation and date of issue if other than that currently published.

3.2 If possible, the intended use of the item should be given on the purchase order especially when the item is ordered for a specific end use or uses.

NOTE 3 — A typical ordering description is as follows: 5000 lb [2270 kg] Type 630, Solution-Annealed Cold Finished Centerless Ground, 1½ in. [38.0 mm] round bar, 10 to 12 ft [3.0 to 3.6 m] in length, ASTM A 564 dated _____. End use: valve shafts.

4. General Requirements

4.1 In addition to the requirements of this specification, all requirements of the current edition of Specifications A 484/A 484M shall apply. Failure to comply with the general requirements of Specification A 484/A 484M constitutes nonconformance with this specification.

5. Materials and Manufacture

5.1 Heat Treatment and Condition:

5.1.1 Material of types other than XM-16, XM-25, and Type 630 shall be furnished in the solution-annealed condition, or in the equalized and oven-tempered condition, as noted in Table 2, unless otherwise specified by the purchaser.

5.1.1.1 Types 630, XM-16, and XM-25 may be furnished in the solution-annealed or age-hardened condition.

5.1.2 Type UNS S46910 shall be furnished in solution-annealed condition per Table 2, or solution-annealed and cold-worked condition per Table 3, or aged-hardened condition per Table 4.

5.1.3 Reforging stock shall be supplied in a condition of heat treatment to be selected by the forging manufacturer.

5.2 Shapes may be subjected to either Class A or Class C preparation as specified on the purchase order.

5.2.1 Class A consists of preparation by grinding for the removal of imperfections of a hazardous nature such as fins, tears, and jagged edges provided the underweight tolerance is not exceeded and the maximum depth of grinding at any one point does not exceed 10% of the thickness of the section.

5.2.2 Class C consists of preparation by grinding for the removal of all visible surface imperfections provided

the underweight tolerance is not exceeded and the maximum depth of grinding at any one point does not exceed 10% of the thickness of the section.

6. Chemical Composition

6.1 Each alloy covered by this specification shall conform to the chemical requirements specified in Table 1.

6.2 Methods and practices relating to chemical analysis required by this specification shall be in accordance with Test Methods, Practices, and Terminology A 751.

7. Mechanical Properties Requirements

7.1 The material, as represented by mechanical test specimens, shall conform to the mechanical property requirements specified in Table 2 or Table 3 and shall be capable of developing the properties in Table 4 when heat treated as specified in 5.1.

7.2 Samples cut from bars for forging stock shall conform to the mechanical properties of Table 2 and Table 4 when heat treated as specified in Table 2 and Table 4.

7.3 The yield strength shall be determined by the offset method as described in the current edition of Test Methods and Definitions A 370. The limiting permanent offset shall be 0.2% of the gage length of the specimen.

7.4 The impact requirement shall apply only when specified in the purchase order. When specified, the material, as represented by impact test specimens, shall be capable of developing the impact property requirements specified in Table 4 when heat treated in accordance with 5.1.

7.5 Longitudinal impact requirements are not applicable to bars less than ⅝ in. (16.9 mm) diameter or size or flats less than ⅝ in. (16.9 mm) thick.

7.6 Tensile and impact requirements in the transverse (through thickness) direction are not applicable to bars less than 3 in. [75 mm] diameter in size or flats less than 3 in. [75 mm] thick.

7.7 Material tensile tested and, when specified, impact tested in the transverse (through thickness) direction and meeting the requirements shown in Table 4 need not be tested in the longitudinal direction.

8. Number of Tests

8.1 At least one room temperature tension test and one or more hardness tests shall be made on each lot.

8.2 One or more hardness tests and at least one tension test shall be made from each lot on test samples heat

treated as required in 5.1. Unless otherwise specified in the purchase order, the condition of hardening heat treatment shall be at the option of the producer. The tests shall meet the requirements of Table 4.

8.3 When specified in the purchase order, the impact test shall consist of testing three Charpy V-notch Type A specimens in accordance with Methods and Definitions A 370. The specimens shall be heat treated in accordance with 5.1. Unless otherwise specified in the purchase order, the condition of hardening heat treatment shall be at the

option of the producer and testing shall be done at 70 to 80°F [20 to 25°C]. The tests shall meet the requirements of Table 4. When tested at temperatures other than 70 to 80°F, [20 to 25°C] the impact test requirements will be as agreed upon by purchaser and producer.

^A See 7.1.

^B See 7.3.

^C Either Rockwell C hardness or Brinell is permissible. On sizes ½ in. (12.70 mm) and smaller, Rockwell C is preferred.

^D 321 BH for rounds cold drawn after solution treating.

^E Equalization and over-tempering treatment 1425 ± 50°F (775 ± 30°C) for not less than 3 h, cool to room temperature, heat to 1075 ± 25°F [580 ± 15°C] for not less than 3 h.

^F Maximum 165 ksi [1140 MPa] tensile strength only for sizes up to ½ in. (13 mm).

TABLE 3
 SOLUTION-ANNEALED AND COLD-WORKED CONDITION

^A See 7.1.^B Time refers to minimum time material is at temperature and may be extended to obtain required ductility properties.^C Unless otherwise noted, temperatures shown are suggested temperatures and may be varied to obtain required tensile properties.^D Intermediate temperatures must meet the ductility requirements of the next highest suggested hardening or aging temperature, or both.

Example: Type 630 at 1050°F [565°C] must have 13% elongation and 45% reduction, same as for age hardening at 1075°F [580°C].

^E (L) — Longitudinal axis of specimen parallel to direction of grain flow during rolling or forging. (T) — Transverse axis of specimen perpendicular to direction of grain flow during rolling or forging.^F See 7.3.^G Either Rockwell C hardness or Brinell is permissible. On sizes 1/2 in. (12.70 mm) and smaller, Rockwell C is preferred.^H When air cooling is specified, gases other than air may be used.^I Refer to Table 2 for details on equalize and over temper heat treatment.

SPECIFICATION FOR STEEL, SHEET, CARBON, STRUCTURAL, AND HIGH-STRENGTH, LOW-ALLOY, HOT-ROLLED AND COLD-ROLLED, GENERAL REQUIREMENTS FOR

(10)

SA-568/SA-568M

(Identical with ASTM Specification A 568/A 568M-07a.)

1. Scope

1.1 This specification covers the general requirements for steel sheet in coils and cut lengths. It applies to the following specifications that describe carbon steel, structural steel, and high-strength, low-alloy steel (HSLA) furnished as hot-rolled sheet and cold-rolled sheet: Specifications A 414/A 414M, A 424, A 606, A 659/A 659M, A 794, A 1008/A 1008M, A 1011/A 1011M, and A 1039/A 1039M.

1.2 This specification is not applicable to hot-rolled heavythickness carbon sheet coils (Specification A 635/A 635M).

1.3 In case of any conflict in requirements, the requirements of the individual material specification shall prevail over those of this general specification.

1.4 For the purposes of determining conformance with this and the appropriate product specification referenced in 1.1, values shall be rounded to the nearest unit in the right hand place of figures used in expressing the limiting values in accordance with the rounding method of Practice E 29.

1.5 Annex A1 lists permissible variations in dimensions and mass (see Note 1) in SI [metric] units. The values listed are not exact conversions of the values listed in the inch-pound tables, but instead are rounded or rationalized values. Conformance to Annex A1 is mandatory when the "M" specification is used.

NOTE 1 — The term *weight* is used when inch-pound units are the standard. However, under SI the preferred term is *mass*.

1.6 The values stated in either inch-pound units or SI units are to be regarded as standard. Within the text, the

SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification.

1.7 This specification and the applicable material specifications are expressed in both inch-pound units and SI units. However, unless the order specifies the applicable "M" specification designation (SI units), the material shall be furnished to inch-pound units.

MIL-STD-129 Marking for Shipment and Storage

2.3 Federal Standards:

Fed. Std. No. 123 Marking for Shipments (Civil Agencies)
Fed. Std. No. 183 Continuous Identification Marking of Iron and Steel Products

3. Terminology

3.1 Definitions of Terms Specific to This Standard:

3.1.1 Steel Types:

3.1.2 carbon steel — designation for steel when no minimum content is specified or required for aluminum, chromium, cobalt, columbium, molybdenum, nickel, titanium, tungsten, vanadium, zirconium, or any element added to obtain a desired alloying effect; when the specified minimum for copper does not exceed 0.40%; or when the maximum content specified for any of the following elements does not exceed the percentages noted: manganese 1.65, silicon 0.60, or copper 0.60.

3.1.2.1 Discussion — In all carbon steels small quantities of certain residual elements unavoidably retained from raw materials are sometimes found which are not specified or required, such as copper, nickel, molybdenum,

chromium, etc. These elements are considered as incidental and are not normally determined or reported.

3.1.3 high-strength, low-alloy steel — specific group of steels in which higher strength, and in some cases additional resistance to atmospheric corrosion or improved formability, are obtained by moderate amounts of one or more alloying elements.

3.1.4 Product Types:

3.1.5 hot-rolled sheet — manufactured by hot rolling slabs in a continuous mill to the required thickness and can be supplied in coils or cut lengths as specified.

(1) Hot-rolled carbon and high-strength low-alloy (HSLA) steel sheet is commonly classified by size as follows:

Coils and Cut Lengths

Width, in.	Thickness, in.
Over 12	0.031 to 0.230, excl

Coils and Cut Lengths

Width, mm	Thickness, mm
Over 300	0.7 to 6.0, excl

NOTE 2 — The changes in width limits with the publication of A 568/A 568M-06a result in a change in tensile testing direction for material from 0.180 in. [4.5 mm] to 0.230 in. exclusive [6.0 mm exclusive] over 48 in. [1200 mm] wide. Material formerly tested in the transverse direction will be tested in the longitudinal direction. This is expected to result in some changes in reported properties. The purchaser is advised to discuss this change with the supplier.

3.1.6 cold-rolled sheet — manufactured from hot-rolled descaled coils by cold reducing to the desired thickness, generally followed by annealing to recrystallize the grain structure. If the sheet is not annealed after cold reduction it is known as full hard with a hardness of 84 HRB minimum and can be used for certain applications where ductility and flatness are not required.

(1) Cold-rolled carbon sheet is commonly classified by size as follows:

Width, in.	Thickness, in.
All Width ^{A,B}	Through 0.142
Width, mm	Thickness, mm
All Width ^{A,B}	Through 4.0

^A Cold-rolled sheet coils and cut lengths, slit from wider coils with cut edge (only) and in thicknesses through 0.142 in. [4.0 mm] carbon 0.25% maximum by cast analysis.

^B When no special edge or finish (other than matte, commercial bright, or luster finish) or single strand rolling of widths, or both under 24 in. [600 mm] is not specified or required.

(2) Cold-rolled high-strength low-alloy sheet is commonly classified by size as follows:

Width, in.	Thickness, in.
Through 12 ^A	0.019 through 0.082
Over 12 ^B	0.020 and over
Width, mm	Thickness, mm
To 300, incl ^A	0.5 to 2.0, incl
Over 300 ^B	0.5 and over

^A Cold-rolled sheet coils and cut lengths, slit from wider coils with cut edge (only) and in thicknesses 0.019 in. [0.5 mm] through 0.82 in. [2.0 mm] carbon 0.25% maximum by cast analysis.

^B When no special edge or finish (other than matte, commercial bright, or luster finish) or single strand rolling of widths, or both under 24 in. [600 mm] is not specified or required.

3.1.6.1 Discussion — Steel products are available in various thickness, width, and length combinations depending upon equipment and processing capabilities of various manufacturers and processors. Historic limitations of a product based upon dimensions (thickness, width, and length) do not take into account current production and processing capabilities. To qualify any product for a particular product specification requires all appropriate and necessary tests be performed and that the results meet the limits prescribed in that product specification. If the necessary tests required by a product specification cannot be conducted, the product cannot be qualified to that specification. This general requirements specification contains permitted variations for the commonly available sizes. Permitted variations for other sizes are subject to agreement between the customer and the manufacturer or processor, whichever is applicable.

3.1.7 retests, *n* — additional test, or tests, made from the original material when the original test did not meet the appropriate acceptance criteria required by a product specification and the failure was mechanical in nature as described in Section 11.

3.1.8 resample, *n* — additional test or tests made when the test on the original sample did not meet the appropriate acceptance criteria required by the product specification, but possibly requiring that the material in question have an appropriate amount discarded prior to securing the new sample or samples.

3.1.9 steel manufacturer, *n* — the organization that directly controls or is responsible for the melting and refining of steel and the conversion of that steel into semifinished steel products known as slabs either through continuous casting, conventional or compact methods, or ingot casting and subsequent conversion of the ingots to slabs, and for one or more additional operations such as testing, marking, loading for shipment, and certification.

3.1.10 coil processor — the organization that directly controls or is responsible for operations involved in processing the coil such as leveling, cutting to length, testing,

inspection, blanking, slitting, pickling, cold rolling (cold reduction), heat treating, temper rolling, coating, packaging, marking, loading for shipment, and certification.

3.1.10.1 Discussion — The processing operations need not be controlled by the organization that hot rolls the slab into a coil. If only one organization controls or is responsible for (or both) the hot rolling and processing operations, that organization is termed the manufacturer. If more than one organization controls or is responsible for (or both) hot rolling and processing operations, the organization that controls and is responsible for the hot rolling is termed the hot roll manufacturer and the organization or organizations controlling and responsible for the processing operations is/are termed the processor or processors. Likewise, one organization may be the manufacturer of the hot roll coil and another the manufacturer of the cold roll coil. In such case, the organization responsible for the conversion of the hot roll coil to a cold roll coil and other processing operations will also be termed the cold roll manufacturer and organizations performing additional processing operations to the cold roll coil will be termed the coil processor or coil processors.

3.1.11 hot roll manufacturer, *n* — the organization that directly controls or is responsible for the conversion of steel slabs, by hot rolling into coils, and for one or more additional operations such as leveling, cutting to length, testing, inspection, blanking, slitting, pickling, cold rolling, heat treating, coating, packaging, marking, loading for shipment, and certification.

3.1.12 cold roll manufacturer, *n* — the organization that directly controls or is responsible for the conversion of hot roll coils into cold roll coils, and for one or more additional operations such as pickling, annealing, temper rolling, slitting, cutting to length, testing, inspection, blanking, coating, packaging, marking, loading for shipment, and certification.

3.2 Refer to Terminology A 941 for additional definitions of terms used in this standard.

4. Materials and Manufacture

4.1 Unless otherwise specified, hot-rolled material shall be furnished hot-rolled, not annealed, not pickled.

4.2 Coil breaks, stretcher strains, and fluting can occur during the user's processing of hot-rolled or hot-rolled pickled sheet. When any of these features are detrimental to the application, the manufacturer shall be notified at time of ordering in order to properly process the sheet.

4.3 Cold-rolled carbon steel sheet is available as discussed in 10.2, 10.3, and in Table 1.

4.4 Unless specified as a full-hard product, cold-rolled sheet is annealed after being cold reduced to thickness.

The annealed, cold-rolled sheet can be used as annealed last (dead soft) for unexposed end-use applications. When cold-rolled sheet is used for unexposed applications and coil breaks are a hazard in uncoiling, it may be necessary to further process the material. In this case the manufacturer should be consulted. After annealing, cold-rolled sheet is generally given a light skin pass to impart shape or may be given a heavier skin pass or temper pass to prevent the phenomenon known as stretcher straining or fluting, when formed. Temper passing also provides a required surface texture.

4.5 Temper Rolling:

4.5.1 Unless otherwise specified, cold-rolled sheet for exposed applications shall be temper rolled and is usually specified and furnished in the strain free condition as shipped. See Appendix X1, Effect of Aging of Cold-Rolled Carbon Steel Sheet on Drawing and Forming.

4.5.2 Cold-rolled sheet for unexposed applications may be specified and furnished “annealed last” or “temper rolled.” “Annealed last” is normally produced without temper rolling but may be lightly temper rolled during oiling or rewinding. Unexposed temper-rolled material may be specified strain-free or nonfluting. Where specific hardness range or limit or a specified surface texture is required, the application is considered as exposed.

NOTE 3 — Skin-passed sheet is subject to an aging phenomenon (see Appendix X1). Unless special killed (nonaging) steel is specified, it is to the user's interest to fabricate the sheet as soon as possible, for optimum performance.

5. Chemical Composition

5.1 Limits:

5.1.1 The chemical composition shall be in accordance with the applicable product specification. However, if other compositions are required for carbon steel, they shall be prepared in accordance with Appendix X2.

5.1.2 Where the material is used for fabrication by welding, care must be exercised in selection of chemical composition or mechanical properties to assure compatibility with the welding process and its effect on altering the properties.

5.2 Cast or Heat Analysis:

5.2.1 An analysis of each cast or heat of steel shall be made by the steel manufacturer to determine the percentage of elements specified or restricted by the applicable specification.

5.2.2 When requested, cast or heat analysis for elements listed or required shall be reported to the purchaser or to his representative. The steel manufacturer, or the hot roll manufacturer, cold roll manufacturer, or processor, if different from the steel manufacturer, is responsible for

providing this information to the purchaser or his representative as requested.

5.3 Product, Check, or Verification Analysis:

5.3.1 Non-killed steels such as capped or rimmed steels are not technologically suited to product analysis due to the nonuniform character of their chemical composition and therefore, the tolerances in Table 2 do not apply. Product analysis is appropriate on these types of steel only when misapplication is apparent or for copper when copper steel is specified.

5.3.2 For steels other than non-killed (capped or rimmed), product analysis may be made by the purchaser. The chemical analysis shall not vary from the limits specified by more than the amounts in Table 2. The several determinations of any element in a cast shall not vary both above and below the specified range.

5.4 Sampling for Product Analysis:

5.4.1 To indicate adequately the representative composition of a cast by product analysis, it is general practice to select samples to represent the steel, as fairly as possible, from a minimum number of pieces as follows: 3 pieces for lots up to 15 tons incl, and 6 pieces for lots over 15 tons (see Practice E 59).

5.4.2 When the steel is subject to tension test requirements, samples for product analysis may be taken either by drilling entirely through the used tension test specimens themselves, or as covered in 5.4.3.

5.4.3 When the steel is not subject to tension test requirements, the samples for analysis must be taken by milling or drilling entirely through the sheet in a sufficient number of places so that the samples are representative of the entire sheet or strip. The sampling may be facilitated by folding the sheet both ways, so that several samples may be taken at one drilling. Steel subjected to certain heating operations by the purchaser may not give chemical analysis results that properly represent its original composition. Therefore, users must analyze chips taken from the steel in the condition in which it is received from the steel manufacturer.

5.5 Specimen Preparation — Drillings or chips must be taken without the application of water, oil, or other lubricant, and must be free of scale, grease, dirt, or other foreign substances. They must not be overheated during cutting to the extent of causing decarburization. Chips must be well mixed and those too coarse to pass a No. 10 sieve or too fine to remain on a No. 30 sieve are not suitable for proper analysis. Sieve size numbers are in accordance with Specification E 11.

5.6 Test Methods — In case a referee analysis is required and agreed upon to resolve a dispute concerning the results of a chemical analysis, the procedure of performing the

referee analysis must be in accordance with the latest issue of Test Methods, Practices, and Terminology A 751, unless otherwise agreed upon between the manufacturer and the purchaser.

6. Mechanical Properties

6.1 The mechanical property requirements, number of specimens, and test locations and specimen orientation shall be in accordance with the applicable product specification.

6.2 Unless otherwise specified in the applicable product specification, test specimens must be prepared in accordance with Test Methods and Definitions A 370.

6.3 Mechanical tests shall be conducted in accordance with Test Methods and Definitions A 370.

6.4 Bend tests where required shall be conducted in compliance with Test Method E 290.

6.5 To determine conformance with the product specification, a calculated value should be rounded to the nearest 1 ksi tensile strength and yield point or yield strength, and to the nearest unit in the right hand place of figures used in expressing the limiting value for other values in accordance with the rounding off method given in Practice E 29.

6.6 Structural sheet steels are commonly fabricated by cold bending. There are many interrelated factors that affect the ability of a given steel to cold form over a given radius under shop conditions. These factors include thickness, strength level, degree of restraint, relationship to rolling direction, chemistry and microstructure. Each of the appropriate product specifications lists in the appendix the suggested minimum inside radius for cold bending. These radii should be used as minima for 90° bends. They presuppose “hard way” bending (bend axis parallel to rolling direction) and reasonably good shop forming practices. Where possible, the use of larger radii or “easy way” bends are recommended for improved performance.

6.7 Fabricators should be aware that cracks may initiate upon bending a sheared or burned edge. This is not considered to be a fault of the steel but is rather a function of the induced cold-work or heat-affected zone.

7. General Requirements for Delivery

7.1 The products covered by this specification are produced to inch-pound or metric decimal thickness only and the appropriate thickness tolerances apply.

7.2 Steel may be produced as ingot-cast or strand-cast. When different grades of strand-cast steel are sequentially cast, identification and separation of the transition material is required.

8. Dimensions, Tolerances, and Allowances

8.1 Dimensions, tolerances, and allowances applicable to products covered by this specification are contained in Tables 3-23 [Annex A1, Tables A1.1–A1.20]. The appropriate tolerance tables shall be identified in each individual specification.

8.2 Flatness Tolerances:

8.2.1 Standard flatness tolerances are contained in Table 15 and Table 16 for hot-rolled sheet and Table 23 for cold-rolled sheet.

8.2.2 Measurement techniques for flatness characteristics are described in Practice A 1030/A 1030M.

8.2.3 Two alternative methods for flatness determination are the use of I-units and percent steepness. A description of these two alternative methods is contained in Practice A 1030/A 1030M, as well as Appendix X5.

8.2.3.1 The use of I-units or percent steepness as a flatness standard is subject to negotiation between the purchaser and the producer.

8.2.3.2 Measurement techniques for I-units and percent steepness and rejection limits are subject to negotiation between the purchaser and the producer.

9. Finish and Condition

9.1 Hot-rolled sheet has a surface with an oxide or scale resulting from the hot-rolling operation. The oxide or scale can be removed by pickling or blast cleaning when required for press-work operations or welding. Hot-rolled and hot-rolled descaled sheet is not generally used for exposed parts where surface is of prime importance.

9.1.1 Hot-rolled sheet can be supplied with mill edges or cut edges as specified. Mill edges are the natural edges resulting from the hot-rolling operation. They do not conform to any particular contour. They may also contain some edge imperfections, the more common types of which are cracked edges, thin edges (feather), and damaged edges due to handling or processing and which should not extend in beyond the ordered width. These edge conditions are detrimental where joining of the mill edges by welding is practiced. When the purchaser intends to shear or to blank, a sufficient width allowance should be made when purchasing to ensure obtaining the desired contour and size of the pattern sheet. The manufacturer may be consulted for guidance. Cut edges are the normal edges which result from the shearing, slitting, or trimming of mill-edge sheet.

9.1.1.1 The ends of plain hot-rolled mill-edge coils are irregular in shape and are referred to as uncropped ends. Where such ends are not acceptable, the purchaser's order should so specify. Processed coils such as pickled or blast cleaned are supplied with square-cut ends.

9.2 Cold-rolled carbon sheet (exposed) is intended for those applications where surface appearance is of primary importance. This class will meet requirements for controlled surface texture, surface quality, and flatness. It is normally processed by the manufacturer to be free of stretcher strain and fluting. Subsequent user roller leveling immediately before fabrication will minimize strain resulting from aging.

9.2.1 Cold-rolled carbon sheet, when ordered for exposed applications, can be supplied in the following finishes:

9.2.1.1 Matte finish is a dull finish, without luster, produced by rolling on rolls that have been roughened by mechanical or chemical means to various degrees of surface texture depending upon application. With some surface preparation matte finish is suitable for decorative painting. It is not generally recommended for bright plating.

9.2.1.2 Commercial bright finish is a relatively bright finish having a surface texture intermediate between that of matte and luster finish. With some surface preparation commercial bright finish is suitable for decorative painting or certain plating applications. If sheet is deformed in fabrication the surface may roughen to some degree and areas so affected will require surface preparation to restore surface texture to that of the undeformed areas.

9.2.1.3 Luster finish is a smooth bright finish produced by rolling on ground rolls and is suitable for decorative painting or plating with additional special surface preparation by the user. The luster may not be retained after fabrication; therefore, the formed parts will require surface preparation to make them suitable for bright plating.

9.3 Cold-rolled carbon sheet, when intended for unexposed applications, is not subject to limitations on degree and frequency of surface imperfections, and restrictions on texture and mechanical properties are not applicable. When ordered as "annealed last," the product will have coil breaks and a tendency toward fluting and stretcher straining. Unexposed cold-rolled sheet may contain more surface imperfections than exposed cold-rolled sheet because steel applications, processing procedures, and inspection standards are less stringent.

9.4 Cold-rolled high-strength low-alloy sheet is supplied with a matte finish, unless otherwise specified.

9.5 The cold-rolled products covered by this specification are furnished with cut edges and square cut ends, unless otherwise specified.

9.6 Oiling:

9.6.1 Plain hot-rolled sheet is customarily furnished not oiled. Oiling must be specified, when required.

9.6.2 Hot-rolled pickled or descaled sheet is customarily furnished oiled. If the product is not to be oiled, it must be so specified since the cleaned surface is prone to rusting.

9.6.3 Cold-rolled products covered by this specification can be furnished oiled or not oiled as specified.

9.7 Sheet steel in coils or cut lengths may contain surface imperfections that can be removed with a reasonable amount of metal finishing by the purchaser.

10. Workmanship

10.1 Cut lengths shall have a workmanlike appearance and shall not have imperfections of a nature or degree for the product, the grade, class, and the quality ordered that will be detrimental to the fabrication of the finished part.

10.2 Coils may contain some abnormal imperfections that render a portion of the coil unusable since the inspection of coils does not afford the producer the same opportunity to remove portions containing imperfections as in the case with cut lengths.

10.3 Surface Conditions:

10.3.1 Exposed cold-rolled sheet is intended for applications where surface appearance is of primary importance, that is, exposed applications. Unexposed or annealed cold-rolled sheet is intended for applications where surface appearance is not of primary importance, that is, unexposed applications.

10.3.2 Cut lengths for exposed applications shall not include individual sheets having major surface imperfections (holes, loose slivers, and pipe) and repetitive minor surface imperfections. Cut lengths may contain random minor surface imperfections that can be removed with a reasonable amount of metal finishing by the purchaser. These imperfections shall be acceptable to the purchaser within the manufacturer's published standards.

10.3.3 For coils for exposed applications, it is not possible to remove the surface imperfections listed in 10.3.2. Coils will contain such imperfections which shall be acceptable to the purchaser within the manufacturer's published standards. Coils contain more surface imperfections than cut lengths because the producer does not have the same opportunity to sort portions containing such imperfections as is possible with cut lengths.

10.3.4 Cut lengths for unexposed applications shall not include individual sheets having major surface imperfections such as holes, loose slivers, and pipe. In addition, unexposed cut lengths can be expected to contain more minor imperfections such as pits, scratches, sticker breaks, edge breaks, pinchers, cross breaks, roll marks, and other surface imperfections than exposed. These imperfections shall be acceptable to the purchaser without limitation.

10.3.5 For coils for unexposed applications, it is not possible to remove the surface imperfections listed in 10.3.4. Coils will contain surface imperfections that are normally not repairable. Minor imperfections shall be acceptable to the purchaser within the manufacturer's published standards. Unexposed coils contain more surface imperfections than exposed coils.

11. Retests and Disposition of Non-Conforming Material

11.1 Retests:

11.1.1 Unless otherwise prohibited by the product specification, retests are permitted under the following circumstances:

11.1.1.1 If any tension test specimen shows defective machining or develops flaws, it must be discarded and another specimen substituted.

11.1.1.2 If the percent elongation of any tension test specimen is less than that specified and any part of the fracture is more than $\frac{3}{4}$ in. [20 mm] from the center of the gauge length of a 2 in. [50 mm] specimen or is outside the middle half of the gauge length of an 8 in. [200 mm] specimen, as indicated by scribe scratches marked on the specimen before testing, a retest is allowed.

11.1.1.3 If the test result of any tension test specimen fails to meet the specification requirements and the failure is the result of improper adherence to tension test procedures, a retest is permitted.

11.1.1.4 If the test result of an original tension test specimen fails to meet the specification requirements and the failure is not related to the conditions described in 11.1.1.1, 11.1.1.2, and 11.1.1.3, but the results are within 2 ksi [14 MPa] of the required yield strength, within 2 ksi [14 MPa] of the required tensile strength, or within 2 percentage points of the required elongation, one retest shall be permitted to replace the failing test.

11.1.2 The retest specimen shall be taken either adjacent to the first failed specimen, or selected at random from the material to be certified to the specification.

11.1.3 If the results of a retest satisfy the specified tension test requirements and all other requirements of the applicable specification are satisfied, the material shall be accepted.

11.2 Disposition of Non-Conforming Material:

11.2.1 In those cases where the lot is found to be non-conforming, and resampling of non-conforming material is not prohibited by the specification, resampling is permitted under the following circumstances and using the following practices:

11.2.1.1 If the results of an original tension test or retest specimen fail to satisfy the specification requirements

and the failed test results are not related to the conditions described in 11.1, the lot shall be quarantined and resampled for certification of the non-conforming material to the specification requirements.

11.2.1.2 Resampling for certification of the non-conforming material shall include the discarding of out-of-specification material and the resampling of the lot. The resampling shall be appropriate to the specific out-of-specification condition and the processing history of the lot.

11.2.1.3 A maximum of two resampling efforts shall be permitted. If after conducting two resampling efforts, the material does not satisfy the specification requirements, the lot shall be rejected.

12. Inspection

12.1 When purchaser's order stipulates that inspection and tests (except product analyses) for acceptance on the steel be made prior to shipment from the mill, the manufacturer shall afford the purchaser's inspector all reasonable facilities to satisfy him that the steel is being produced and furnished in accordance with the specification. Mill inspection by the purchaser shall not interfere unnecessarily with the manufacturer's operation.

13. Rejection and Rehearing

13.1 Unless otherwise specified, any rejection shall be reported to the manufacturer within a reasonable time after receipt of material by the purchaser.

13.2 Material that is reported to be defective subsequent to the acceptance at the purchaser's works shall be set aside, adequately protected, and correctly identified. The manufacturer shall be notified as soon as possible so that an investigation may be initiated.

13.3 Samples that are representative of the rejected material shall be made available to the manufacturer. In the event that the manufacturer is dissatisfied with the rejection, he may request a rehearing.

14. Test Reports and Certification

14.1 When test reports are required by the purchase order or the material specification, the supplier shall report the results of all test required by the material specification and the order.

14.2 When certification is required by the purchase order, the supplier shall furnish a certification that the material has been manufactured and tested in accordance with the requirements of the material specification.

14.3 A signature is not required on test reports or certifications. However, the document shall clearly identify

the organization submitting the document. Notwithstanding the absence of a signature, the organization submitting the document is responsible for the content of the document.

14.4 When test reports are required, copies of the original material manufacturer's test report shall be included with any subsequent test report.

14.5 A Material Test Report, Certificate of Inspection, or similar document printed from or used in electronic form from an electronic data interchange (EDI) transmission shall be regarded as having the same validity as a counterpart printed in the certifier's facility. The content of the EDI transmitted document must meet the requirements of the invoked ASTM standard(s) and conform to any existing EDI agreement between the purchaser and the supplier. Notwithstanding the absence of a signature, the organization submitting the EDI transmission is responsible for the content of the report.

NOTE 4 — The industry definition as invoked here is: EDI is the computer to computer exchange of business information in an agreed upon standard format such as ANSI ASC X12.

15. Product Marking

15.1 As a minimum requirement, the material shall be identified by having the manufacturer's name, ASTM designation, weight, purchaser's order number, and material identification legibly stenciled on top of each lift or shown on a tag attached to each coil or shipping unit.

15.2 When specified in the contract or order, and for direct procurement by or direct shipment to the government, marking for shipment in addition to requirements specified in the contract or order, shall be in accordance with MIL-STD-129 for military agencies and in accordance with Fed. Std. No. 123 for civil agencies.

15.3 Bar coding is acceptable as a supplementary identification method. Bar coding should be consistent with the Automotive Industry Action Group (AIAG) standard prepared by the primary metals subcommittee of the AIAG bar code project team.

16. Packing and Package Marking

16.1 Unless otherwise specified, the sheet shall be packaged and loaded in accordance with Practices A 700.

16.2 When coils are ordered, it is customary to specify a minimum or range of inside diameter, maximum outside diameter, and a maximum coil weight, if required. The ability of manufacturers to meet the maximum coil weights depends upon individual mill equipment. When required, minimum coil weights are subject to negotiation.

17. Keywords

17.1 carbon steel sheet; cold rolled steel sheet; general delivery requirements; high strength low alloy steel; hot rolled steel sheet; steel sheet; structural steel sheet

TABLE 1
COLD-ROLLED SHEET STEEL CLASS COMPARISON

	Exposed	Unexposed
Major imperfections:		
Cut lengths	Mill rejects	Mill rejects
Coils	Purchaser accepts within the manufacturer's published standards (policy)	Purchaser accepts within the manufacturer's published standards (policy)
Minor imperfections:		
Cut lengths	Mill rejections repetitive imperfections. May contain random imperfections which the purchaser accepts within the manufacturer's published standards (policy)	Purchaser accepts all minor imperfections
Coils	Purchaser accepts within the manufacturer's published standards (policy)	Purchaser accepts all minor imperfections
Finish	Matte unless otherwise specified	Purchaser accepts all finishes
Special oils	May be specified	May not be specified
Thickness, width and length tolerance:		
Standard	Will be met	Will be met
Restricted	May be specified	May not be specified
Flatness tolerance:		
Standard	Will be met	Will be met (temper rolled) Not guaranteed — normally within twice standard (annealed last)
Restricted Squareness	May be specified	May not be specified
Coil wraps	Purchaser accepts within the manufacturer's published standards (policy)	Purchaser accepts all
Coil welds	Purchaser accepts within the manufacturer's published standards (policy)	Purchaser accepts within the manufacturer's published standards (policy)
Outside inspection	May be specified	May not be specified
Special testing	May be specified	May not be specified

TABLE 2
TOLERANCES FOR PRODUCT ANALYSIS

Element	Limit, or Maximum of Specified Element, %	Tolerance	
		Under Minimum Limit	Over Maximum Limit
Carbon	to 0.15, incl	0.02	0.03
	over 0.15 to 0.40, incl	0.03	0.04
	over 0.40 to 0.80, incl	0.03	0.05
	over 0.80	0.03	0.06
Manganese	to 0.60, incl	0.03	0.03
	over 0.60 to 1.15, incl	0.04	0.04
	over 1.15 to 1.65, incl	0.05	0.05
Phosphorus	...	... ^A	0.01
Sulfur	...	... ^A	0.01
Silicon	to 0.30, incl	0.02	0.03
	over 0.30 to 0.60, incl	0.05	0.05
Copper	...	0.02	... ^A
Nickel	to 1.00, incl	... ^A	0.03
Chromium	to 0.90, incl	... ^A	0.04
Molybdenum	to 0.20, incl	... ^A	0.01
Vanadium	to 0.10, incl	0.01 ^B	0.01 ^B
Columbium (Niobium)	to 0.10, incl	0.01 ^B	0.01 ^B
Titanium	to 0.15, incl	0.01 ^A	0.01 ^B
Aluminum	to 0.10, incl	0.03 ^C	... ^A
Nitrogen	to 0.030, incl	0.005	0.005

^A Where an ellipsis (. . .) appears in the table, the requirements have not been defined.

^B If the minimum of the range is 0.01%, the under tolerance is 0.005%.

^C If the minimum of the range is 0.01%, the under tolerance is 0.005%, and if the minimum of the range is 0.02%, the under tolerance is 0.01%.

TABLE 3
LIST OF TABLES FOR DIMENSIONS, TOLERANCES, AND ALLOWANCES

Carbon ^A and High-Strength Low-Alloy Steel				
Dimensions	Table No.			
	Hot-Rolled Sheet		Cold-Rolled Sheet	
	Inch-Pound Units	SI Units	Inch-Pound Units	SI Units
Camber tolerances	12	A1.9	12, 22	A1.9, A1.19
Diameter tolerances of sheared circles	11	A1.8	11	A1.8

Over 72	... ^C	... ^C	... ^C	0.016	0.016	0.024

NOTE 1 — Thickness is measured at any point across the width not less than $\frac{3}{8}$ in. from a cut edge and not less than $\frac{3}{4}$ in. from a mill edge. This table does not apply to the uncropped ends of mill edge coils.

NOTE 2 — Micrometers used for measurement of thickness shall be constructed with anvils and spindles having minimum diameters of 0.188 in. [4.80 mm]. The tip of the spindle shall be flat, and the tip of the anvil shall be flat or rounded with a minimum radius of curvature of 0.10 in. [2.55 mm]. Micrometers with pointed tips are not suitable for thickness measurements.

^A The specified thickness range captions apply independent of whether the ordered thickness is stated as a nominal or minimum.

^B The tolerances provided in the table are based on minimum thickness (tolerance over, no tolerance under). For nominal thickness, the tolerance is divided equally over and under.

^C Where an ellipsis (. . .) appears in the table, the requirements have not been defined.

TABLE 5
RESTRICTED THICKNESS TOLERANCES FOR HOT-ROLLED SHEET (CARBON AND STRUCTURAL STEEL ONLY) —
 $\frac{5}{8}$ in. (CUT EDGE) AND 1 in. (MILL EDGE) MINIMUM EDGE DISTANCE (Coils and Cut Lengths, Including Pickled)

Specified Width, in.	Specified Ordered Thickness, in. ^A					
	Thickness Tolerances Over, in., No Tolerance Under ^B					
	0.027 to 0.051, incl	Over 0.051 to 0.057, incl	Over 0.057 to 0.071, incl	Over 0.071 to 0.098, incl	Over 0.098 to 0.180, excl	0.180 to 0.230, excl
Over 12 to 20, incl	0.008	0.008	0.009	0.009	0.010	0.010

Over 26 to 28, incl	$\frac{15}{16}$
Over 28 to 35, incl	$1\frac{1}{8}$
Over 35 to 50, incl	$1\frac{1}{4}$
Over 50 to 60, incl	$1\frac{1}{2}$
Over 60 to 65, incl	$1\frac{5}{8}$
Over 65 to 70, incl	$1\frac{3}{4}$
Over 70 to 80, incl	$1\frac{7}{8}$
Over 80	2

⁴ The above tolerances do not apply to the uncropped ends of mill edge coils (10.1.1.1).

TABLE 9
WIDTH TOLERANCES OF HOT-ROLLED CUT EDGE
SHEET AND COLD-ROLLED SHEET
(OVER 12 in. WIDTH) (ALL DESIGNATIONS)
(Not Resquared, Coils and Cut Lengths, Including Pickled)

Specified Width, in.	Tolerances Over Specified Width, in., No Tolerance Under
Over 12 to 30, incl	$\frac{1}{8}$
Over 30 to 48, incl	$\frac{3}{16}$
Over 48 to 60, incl	$\frac{1}{4}$
Over 60 to 80, incl	$\frac{5}{16}$
Over 80	$\frac{3}{8}$

TABLE 10
LENGTH TOLERANCES OF HOT-ROLLED SHEET
(ALL DESIGNATIONS)
(Cut Lengths not Resquared, Including Pickled)

Specified Length, in.	Tolerances Over Specified Length, in., No Tolerance Under
To 15, incl	$\frac{1}{8}$
Over 15 to 30, incl	$\frac{1}{4}$
Over 30 to 60, incl	$\frac{1}{2}$
Over 60 to 120, incl	$\frac{3}{4}$
Over 120 to 156, incl	1
Over 156 to 192, incl	$1\frac{1}{4}$
Over 192 to 240, incl	$1\frac{1}{2}$
Over 240	$1\frac{3}{4}$

TABLE 11
DIAMETER TOLERANCES OF CIRCLES SHEARED
FROM HOT-ROLLED (INCLUDING PICKLED) AND
COLD-ROLLED SHEET (OVER 12 in. WIDTH)
(ALL DESIGNATIONS)

Specified Thickness, ⁴ in.	Tolerances Over Specified Diameter, in. (No Tolerances Under)		
	Under 30	Over 30 to 48, incl	Over 48
0.044 to 0.057, incl	$\frac{1}{16}$	$\frac{1}{8}$	$\frac{3}{16}$
Over 0.057 to 0.098, incl	$\frac{3}{32}$	$\frac{5}{32}$	$\frac{7}{32}$
Over 0.098	$\frac{1}{8}$	$\frac{3}{16}$	$\frac{1}{4}$

⁴ 0.071 in. minimum thickness for hot-rolled high-strength low-alloy steel sheet.

TABLE 12
CAMBER TOLERANCES^A FOR HOT-ROLLED
(INCLUDING PICKLED) AND COLD-ROLLED SHEET
(OVER 12 in. WIDTH) (ALL DESIGNATIONS)
(Cut Lengths, not Resquared)

Cut Length, ft	Camber Tolerances, in.
To 4, incl	$\frac{1}{8}$
Over 4 to 6, incl	$\frac{3}{16}$
Over 6 to 8, incl	$\frac{1}{4}$
Over 8 to 10, incl	$\frac{5}{16}$
Over 10 to 12, incl	$\frac{3}{8}$
Over 12 to 14, incl	$\frac{1}{2}$
Over 14 to 16, incl	$\frac{5}{8}$
Over 16 to 18, incl	$\frac{3}{4}$
Over 18 to 20, incl	$\frac{7}{8}$
Over 20 to 30, incl	$1\frac{1}{4}$
Over 30 to 40, incl	$1\frac{1}{2}$

NOTE 1 — Camber is the greatest deviation of a side edge from a straight line, the measurement being taken on the concave side with a straightedge.

^A The camber tolerance for coils is 1 in. in any 20 ft.

TABLE 13
OUT-OF-SQUARE TOLERANCES OF HOT-ROLLED CUT-
EDGE (INCLUDING PICKLED) AND COLD-ROLLED
SHEET (OVER 12 in. WIDTH)
(ALL DESIGNATIONS)
(Cut Lengths not Resquared)

Out-of-square is the greatest deviation of an end edge from a straight line at right angle to a side and touching one corner. It is also obtained by measuring the difference between the diagonals of the cut length. The out-of-square deviation is one half of that difference. The tolerance for all thicknesses and all sizes is $\frac{1}{16}$ in./6 in. of width or fraction thereof.

TABLE 14
RESTRICTED SQUARENESS TOLERANCES OF HOT-
ROLLED (INCLUDING PICKLED) AND COLD-ROLLED
SHEET (OVER 12 in. WIDTH) (ALL DESIGNATIONS)
(Cut Lengths)

When cut lengths are specified resquared, the width and the length are not less than the dimensions specified. The individual tolerance for over-width, overlength, camber, or out-of-square should not exceed $\frac{1}{16}$ in. up to and including 48 in. in width and up to and including 120 in. in length. For cut lengths wider or longer, the applicable tolerance is $\frac{1}{8}$ in.

TABLE 15
FLATNESS TOLERANCES^A OF TEMPER ROLLED OR
PICKLED HOT-ROLLED SHEET CUT LENGTHS^B
(ALL DESIGNATIONS)

Specified Minimum Thickness, in.	Specified Width, in.	Flatness Tolerances, ^C in.	
		Specified Yield Strength, min, ksi	
		Under 45	45 to 50 ^{D, E}
0.027 to 0.057, incl	over 12 to 36, incl	$\frac{1}{2}$	$\frac{3}{4}$
	over 36 to 60, incl	$\frac{3}{4}$	$1\frac{1}{8}$
	over 60	1	...
0.057 to 0.180, excl	over 12 to 60, incl	$\frac{1}{2}$	$\frac{3}{4}$
	over 60 to 72, incl	$\frac{3}{4}$	$1\frac{1}{8}$
	over 72	1	$1\frac{1}{2}$
0.180 to 0.230, excl	over 12 to 60, incl	$\frac{1}{2}$	$\frac{3}{4}$
	over 60 to 72, incl	$\frac{3}{4}$	$1\frac{1}{8}$
	over 72	1	$1\frac{1}{2}$

^A The above table also applies to lengths cut from coils by the consumer when adequate flattening operations are performed.

^B Application of this table to product in coil form is not appropriate unless the coil has been rolled out and adequately flattened with all coil set removed.

^C Maximum deviation from a horizontal flat surface.

^D Tolerances for steels with specified minimum yield strength in excess of 50 ksi are subject to negotiation.

^E 0.071 minimum thickness of HSLA.

TABLE 16
FLATNESS TOLERANCES^A OF NON-PROCESSED HOT
ROLLED SHEET CUT LENGTHS^B
(ALL DESIGNATIONS)

Specified Minimum Thickness, in.	Specified Width, in.	Flatness Tolerances, ^C in.	
		Specified Yield Strength, min, ksi	
		Under 45	45 to 50 ^{D, E}
0.027 to 0.057, incl	over 12 to 36, incl	$1\frac{1}{2}$	$2\frac{1}{4}$
	over 36 to 60, incl	$2\frac{1}{4}$	$3\frac{3}{8}$
	over 60	3	...
over 0.057 to 0.180, excl	over 12 to 60, incl	$1\frac{1}{2}$	$2\frac{1}{4}$
	over 60 to 72, incl	$2\frac{1}{4}$	$3\frac{3}{8}$
	over 72	3	$4\frac{1}{2}$
0.180 to 0.230, excl	over 12 to 60, incl	$1\frac{1}{2}$	$2\frac{1}{4}$
	over 60 to 72, incl	$2\frac{1}{4}$	$3\frac{3}{8}$
	over 72	3	$4\frac{1}{2}$

^A The above table also applies to lengths cut from coils by the consumer when adequate flattening operations are performed.

^B Application of this table to product in coil form is not appropriate unless the coil has been rolled out and adequately flattened with all coil set removed.

^C Maximum deviation from a horizontal flat surface.

^D Tolerances for steels with specified minimum yield strength in excess of 50 ksi are subject to negotiation.

^E 0.071 minimum thickness of HSLA.

TABLE 17
STANDARD THICKNESS TOLERANCES FOR COLD-ROLLED SHEET (ALL DESIGNATIONS)^A — $\frac{3}{8}$ in. MINIMUM
EDGE DISTANCE (Coils and Cut Lengths)

Specified Width, in.	Specified Ordered Thickness, in. ^B						
	Thickness Tolerances, Over, in., No Tolerance Under ^C						
	To 0.014, excl	0.014 to 0.019, incl	Over 0.019 ^A to 0.039, incl	Over 0.039 to 0.057, incl	Over 0.057 to 0.071, incl	Over 0.071 to 0.098, incl	Over 0.098 to 0.142, incl

TABLE 21
WIDTH TOLERANCES FOR COLD-ROLLED SHEET
(ALL DESIGNATIONS)^A
(Coils and Cut Lengths to 12 in. Width, Not Resquared)

Specified Width, in.	Width Tolerance Plus and Minus, in.
To 6, incl	0.012
Over 6 to 9, incl	0.016
Over 9 to 12, incl	0.032

^A 0.020 in. minimum thickness for high-strength, low-alloy.

TABLE 22
CAMBER TOLERANCES OF COLD-ROLLED SHEET IN
COILS (ALL DESIGNATIONS)^A (Coils to 12 in. Width)

Width, in.	Camber Tolerance
To 12, incl	$\frac{1}{4}$ in. any 8 ft

NOTE 1 — Camber is the greatest deviation of a side edge from a straight line, the measurement being taken on the concave side with a straightedge.

NOTE 2 — This table applies to widths produced by slitting from wider sheet.

^A 0.020 in. minimum thickness for high-strength, low-alloy.

TABLE 23
FLATNESS TOLERANCES OF COLD-ROLLED SHEET
(ALL DESIGNATIONS)

Specified Thickness, in.	Specified Width, in.	Flatness Tolerance, ^A in.	
		Specified Yield Point, min, ksi	
To 0.044, incl	to 36, incl	Under 45	45 to 50 ^B
	over 36 to 60, incl		
Over 0.044	over 60		
	to 36, incl		
	over 36 to 60, incl		
	over 60 to 72, incl		
	over 72		

NOTE 1 — This table does not apply when product is ordered full hard, to a hardness range, or "annealed last" (dead soft).

NOTE 2 — This table also applies to lengths cut from coils by the consumer when adequate flattening measures are performed.

^A Maximum deviation from a horizontal flat surface.

^B Tolerances for high-strength, low-alloy steel with specified minimum yield point in excess of 50 ksi are subject to negotiation.

ANNEX

(Mandatory Information)

A1. PERMISSIBLE VARIATIONS IN DIMENSIONS AND MASS IN SI UNITS

A1.1 Listed in Tables A1.1–A1.20 are permissible variations in dimensions and mass expressed in the International System of Units (SI) terminology.

TABLE A1.1
STANDARD THICKNESS TOLERANCES [METRIC] FOR HOT-ROLLED SHEET (CARBON AND STRUCTURAL STEEL ONLY) — 10 mm (CUT EDGE) AND 20 mm (MILL EDGE) MINIMUM EDGE DISTANCE
(Coils and Cut Lengths, Including Pickled)

Specified Width, mm	Specified Ordered Thickness, mm ^A			
	Thickness Tolerances, Over, mm, No Tolerance Under ^B			
	Through 2.0	Over 2.0 to 2.5, incl	Over 2.5 to 4.5, excl	4.5 to 6.0, excl
Over 300 to 600, incl	0.30	0.30	0.35	0.40
Over 600 to 1200, incl	0.30	0.35	0.40	0.45
Over 1200 to 1500, incl	0.35	0.35	0.40	0.50
Over 1500 to 1800, incl	0.35	0.40	0.40	0.56
Over 1800	0.35	0.40	0.40	0.60

NOTE 1 — Thickness is measured at any point across the width not less than 10 mm from a cut edge and not less than 20 mm from a mill edge. This table does not apply to the uncropped ends of mill edge coils.

NOTE 2 — Micrometers used for measurement of thickness shall be constructed with anvils and spindles having minimum diameters of 0.188 in. [4.80 mm]. The tip of the spindle shall be flat, and the tip of the anvil shall be flat or rounded with a minimum radius of curvature of 0.10 in. [2.55 mm]. Micrometers with pointed tips are not suitable for thickness measurements.

^A The specified thickness range captions apply independent of whether the ordered thickness is stated as a nominal or minimum.

^B The tolerance provided in the table are based on minimum thickness (tolerance over, not tolerance under). For nominal thickness, the tolerance is divided equally over and under.

TABLE A1.2
RESTRICTED THICKNESS TOLERANCES [METRIC] FOR HOT-ROLLED SHEET
(CARBON AND STRUCTURAL STEEL ONLY) — 15 mm (CUT EDGE) AND 25 mm
(MILL EDGE) MINIMUM EDGE DISTANCE (Coils and Cut Lengths, Including Pickled)

Specified Width, mm	Specified Ordered Thickness, mm ^A			
	Thickness Tolerances Over, mm, No Tolerance Under ^B			
	Through 2.0	Over 2.0 to 2.5, incl	Over 2.5 to 4.5, excl	4.5 to 6.0, excl
Over 300 to 600	0.22	0.22	0.26	0.30
Over 600 to 1200, incl	0.22	0.26	0.30	0.34
Over 1200 to 1500, incl	0.26	0.26	0.30	0.38
Over 1500 to 1800, incl	0.26	0.30	0.30	0.42
Over 1800	0.26	0.30	0.30	0.45

NOTE 1 — Thickness is measured at any point across the width not less than 15 mm from a cut edge and not less than 25 mm from a mill edge. This table does not apply to the uncropped ends of mill edge coils.

NOTE 2 — Micrometers used for measurement of thickness shall be constructed with anvils and spindles having minimum diameters of 0.188 in. [4.80 mm]. The tip of the spindle shall be flat, and the tip of the anvil shall be flat or rounded with a minimum radius of curvature of 0.10 in. [2.55 mm]. Micrometers with pointed tips are not suitable for thickness measurements.

NOTE 3 — This table was constructed by multiplying the values in the standard table by 0.75 and rounding to 2 decimal places using standard ASTM practice.

^A The specified thickness range captions apply independent of whether the ordered thickness is stated as a nominal or minimum.

^B The tolerances provided in the table are based on minimum thickness (tolerance over, not tolerance under). For nominal thickness, the tolerance is divided equally over and under.

TABLE A1.3
STANDARD THICKNESS TOLERANCES [METRIC] FOR HOT-ROLLED SHEET (HIGH-STRENGTH, LOW-ALLOY STEEL) — 10 mm (CUT EDGE) AND 20 mm (MILL EDGE)
MINIMUM EDGE DISTANCE
(Coils and Cut Lengths, Including Pickled)

Specified Width, mm	Specified Ordered Thickness, mm ^A			
	Thickness Tolerances Over, mm, No Tolerance Under ^B			
	Through 2.0	Over 2.0 to 2.5, incl	Over 2.5 to 4.5, excl	4.5 to 6.0, excl
Over 300 to 600, incl	0.30	0.35	0.40	0.40
Over 600 to 1200, incl	0.35	0.40	0.45	0.50
Over 1200 to 1500, incl	0.35	0.40	0.50	0.50
Over 1500 to 1800, incl	0.40	0.45	0.55	0.56
Over 1800 to 2000, incl	0.40	0.45	0.60	0.60
Over 2000	... ^C	0.50	0.60	0.60 ^C

NOTE 1 — Thickness is measured at any point across the width not less than 10 mm from a cut edge and not less than 20 mm from a mill edge. This table does not apply to the uncropped ends of mill edge coils.

NOTE 2 — Micrometers used for measurement of thickness shall be constructed with anvils and spindles having minimum diameters of 0.188 in. [4.80 mm]. The tip of the spindle shall be flat, and the tip of the anvil shall be flat or rounded with a minimum radius of curvature of 0.10 in. [2.55 mm]. Micrometers with pointed tips are not suitable for thickness measurements.

^A The specified thickness range captions apply independent of whether the ordered thickness is stated as a nominal or minimum.

^B The tolerance provided in the table are based on minimum thickness (tolerance over, not tolerance under). For nominal thickness, the tolerance is divided equally over and under.

^C Where an ellipsis (. . .) appears in the table, the requirements have not been defined.

TABLE A1.4
RESTRICTED THICKNESS TOLERANCES OF HOT-ROLLED SHEET (HIGH-STRENGTH, LOW-ALLOY STEEL) — 15 mm (CUT EDGE) AND 25 mm (MILL EDGE) MINIMUM EDGE DISTANCE (Coils and Cut Lengths, Including Pickled)

Specified Width, mm	Specified Ordered Thickness, mm ^A			
	Thickness Tolerances Over, mm, No Tolerance Under ^B			
	Through 2.0	Over 2.0 to 2.5, incl	Over 2.5 to 4.5, excl	4.5 to 6.0, excl
Over 300 to 600, incl	0.22	0.26	0.30	0.30
Over 600 to 1200, incl	0.26	0.30	0.34	0.38
Over 1200 to 1500, incl	0.26	0.30	0.38	0.38
Over 1500 to 1800, incl	0.30	0.34	0.41	0.42
Over 1800 to 2000, incl	0.30	0.34	0.45	0.45
Over 2000	... ^C	0.38	0.45	0.45 ^C

NOTE 1 — Thickness is measured at any point across the width not less than 15 mm from a cut edge and not less than 25 mm from a mill edge. This table does not apply to the uncropped ends of mill edge coils.

NOTE 2 — Micrometers used for measurement of thickness shall be constructed with anvils and spindles having minimum diameters of 0.188 in. [4.80 mm]. The tip of the spindle shall be flat, and the tip of the anvil shall be flat or rounded with a minimum radius of curvature of 0.10 in. [2.55 mm]. Micrometers with pointed tips are not suitable for thickness measurements.

NOTE 3 — This table was constructed by multiplying the values in the standard table by 0.75 and rounding to 2 decimal places using standard ASTM practice.

^A The specified thickness captions apply independent of whether the ordered thickness is stated as a nominal or minimum.

^B The tolerances provided in the table are based on minimum thickness (tolerance over, not tolerance under). For nominal thickness, the tolerance is divided equally over and under.

^C Where an ellipsis (. . .) appears in the table, the requirements have not been defined.

TABLE A1.5
WIDTH TOLERANCES^A OF HOT-ROLLED MILL EDGE SHEET (ALL DESIGNATIONS)
(Coils and Cut Lengths, Including Pickled)

Specified Width, mm		Width Tolerance, Over Only, mm	
Over	Through	Carbon	HSLA
300	600	16	16
600	1200	26	28
1200	1500	32	38
1500	1800	35	45
1800	...	48	50

^A The above tolerances do not apply to the uncropped ends of mill edge coils (9.1.1.1).

TABLE A1.6
WIDTH TOLERANCES OF HOT-ROLLED CUT EDGE
SHEET AND COLD-ROLLED SHEET
(ALL DESIGNATIONS)
(Not Resquared Coils and Cut Lengths, Including Pickled)

Specified Width, mm		Width Tolerance, Over Only, mm
Over	Through	
300	600	3
600	1200	5
1200	1500	6
1500	1800	8
1800	...	10

TABLE A1.7
LENGTH TOLERANCES OF HOT-ROLLED SHEET
(ALL DESIGNATIONS)
(Cut Lengths not Resquared, Including Pickled)

Specified Length, mm		Length Tolerance, Over Only, mm
Over	Through	
300	600	6
600	900	8
900	1500	12
1500	3000	20

4000	5000	35
5000	6000	40
6000	...	45

TABLE A1.8
DIAMETER TOLERANCES OF CIRCLES FROM HOT-
ROLLED (INCLUDING PICKLED) AND COLD-ROLLED
SHEET (OVER 300 mm WIDTH)
(ALL DESIGNATIONS)

Specified Thickness ^A , mm		Tolerances Over Specified Diameter, mm, (No Tolerances Under)		
		Diameters, mm		
		Over 600 to		
Over	Through	Through 600	1200, incl	Over 1200
...	1.5	1.5	3.0	5.0
1.5	2.5	2.5	4.0	5.5
2.5	...	3.0	5.0	6.5

^A 1.8 mm minimum thickness for hot-rolled high-strength low-alloy steel sheet.

TABLE A1.9
CAMBER TOLERANCES^A FOR HOT-ROLLED
(INCLUDING PICKLED) AND COLD-ROLLED SHEET
(OVER 300 mm WIDTH) (ALL DESIGNATIONS)
(Cut Lengths, not Resquared)

Cut Length, mm		Camber Tolerances ^A , mm
Over	Through	
...	1200	4
1200	1800	5
1800	2400	6
2400	3000	8
3000	3700	10
3700	4300	13
4300	4900	16
4900	5500	19
5500	6000	22
6000	9000	32
9000	12 200	38

NOTE 1 — Camber is the greatest deviation of a side edge from a straight line, the measurement being taken on the concave side with a straightedge.

^A The camber tolerance for coils is 25.0 mm in any 6000 mm.

TABLE A1.10
OUT-OF-SQUARE TOLERANCES OF HOT-ROLLED CUT-
EDGE (INCLUDING PICKLED) AND COLD-ROLLED
SHEET (OVER 300 mm WIDTH) (ALL DESIGNATIONS)
(Cut Lengths not Resquared)

Out-of-square is the greatest deviation of an end edge from a straight line at right angle to a side and touching one corner. It is also obtained by measuring the difference between the diagonals of the cut length. The out-of-square deviation is one half of that difference. The tolerance for all thicknesses and all sizes is 1.0 mm/100 mm of width or fraction thereof.

TABLE A1.11
RESTRICTED SQUARENESS TOLERANCES OF HOT-
ROLLED (INCLUDING PICKLED) AND COLD-ROLLED
SHEET (OVER 300 mm WIDTH) (ALL DESIGNATIONS)
(Cut Lengths)

When cut lengths are specified resquared, the width and the length are not less than the dimensions specified. The individual tolerance for over-width, overlength, camber, or out-of-square should not exceed 1.6 mm up to and including 1200 mm in width and up to and including 3000 mm in length. For cut lengths wider or longer, the applicable tolerance is 3.2 mm.

TABLE A1.12
FLATNESS TOLERANCES^A OF TEMPER ROLLED OR PICKLED HOT-ROLLED SHEET
CUT LENGTHS^B (ALL DESIGNATIONS)

Specified Thickness, mm			Flatness Tolerance ^C , mm Specified Yield Strength, min, MPa ^D	
Over	Through	Specified Width, mm	Under 310	310 to 340 MPa Yield Point, min, MPa
1.2	1.5	to 900, incl	15	20
		over 900 to 1500, incl	20	30
		over 1500	25	...
1.5	4.5	to 1500, incl	15	20
		over 1500 to 1800, incl	20	30
		over 1800	25	40
4.5	6.0 excl	to 1500, incl	15	20
		over 1500 to 1800, incl	20	30
		over 1800	25	40

^A The above table also applies to lengths cut from coils by the consumer when adequate flattening operations are performed.

^B Application of this table to product in coil form is not appropriate unless the coil has been rolled out and adequately flattened with all coil set removed.

^C Maximum deviation from a horizontal surface.

^D Tolerances for high-strength, low-alloy steels with specified minimum yield strength in excess of 340 MPa are subject to negotiation.

TABLE A1.13
FLATNESS TOLERANCES^A OF NON-PROCESSED HOT-ROLLED SHEET CUT
LENGTHS^B (ALL DESIGNATIONS)

Specified Thickness, mm			Flatness Tolerance ^C , mm Specified Yield Strength, min, MPa ^D	
Over	Through	Specified Width, mm	Under 310	310 to 340 MPa Yield Point, min, MPa
1.2	1.5	to 900, incl	45	60
		over 900 to 1500, incl	60	90
		over 1500	75	...
1.5	4.5	to 1500, incl	45	60
		over 1500 to 1800, incl	60	90
		over 1800	75	120
4.5	6.0 excl	to 1500, incl	45	60
		over 1500 to 1800, incl	60	90
		over 1800	75	120

^A The above table also applies to lengths cut from coils by the consumer when adequate flattening operations are performed.

^B Application of this table to product in coil form is not appropriate unless the coil has been rolled out and adequately flattened with all coil set removed.

^C Maximum deviation from a horizontal surface.

^D Tolerances for high-strength, low-alloy steels with specified minimum yield strength in excess of 340 MPa are subject to negotiation.

TABLE A1.14
STANDARD THICKNESS TOLERANCES [METRIC] FOR COLD-ROLLED SHEET (ALL DESIGNATIONS)^A — 10 mm
MINIMUM EDGE DISTANCE

Specified Width, mm		Specified Ordered Thickness, mm ^B				
		Thickness Tolerances Over, mm, No Tolerance Under ^C				
Over	Through	Through 0.4	Over 0.4 to 1.0, incl	Over 1.0 to 1.2, incl	Over 1.2 to 2.5, incl	Over 2.5 to 4.0, incl
...	1800	0.10	0.15	0.20	0.25	0.30
1800	2000	... ^D	0.15	0.20	0.30	0.35
2000	... ^D	... ^D	0.30	0.30	0.35	0.40

NOTE 1 — Thickness is measured at any point across the width not less than 10 mm from a side edge.

NOTE 2 — Widths up to and including 300 mm in this table apply to widths produced by slitting from wider sheet.

NOTE 3 — Micrometers used for measurement of thickness shall be constructed with anvils and spindles having minimum diameters of 0.188 in. [4.80 mm]. The tip of the spindle shall be flat, and the tip of the anvil shall be flat or rounded with a minimum radius of curvature of 0.10 in. [2.55 mm]. Micrometers with pointed tips are not suitable for thickness measurements.

NOTE 4 — The thickness of material <25 mm wide shall be measured at mid-width.

^A 0.55 mm minimum thickness for high-strength, low-alloy.

^B The specified thickness range captions apply independent of whether the ordered thickness is stated as a nominal or minimum.

^C The tolerances provided in the table are based on minimum thickness (tolerance over, no tolerance under). For nominal thickness, the tolerance is divided equally over and under.

^D Where an ellipsis (...) appears in the table, the requirements have not been defined.

TABLE A1.15
RESTRICTED THICKNESS TOLERANCES OF COLD-ROLLED SHEET (ALL DESIGNATIONS)^A — 25 mm MINIMUM
EDGE DISTANCE

Specified Width, mm		Specified Ordered Thickness, mm ^B				
		Thickness Tolerances Over, mm, No Tolerance Under ^C				
Over	Through	Through 0.4	Over 0.4 to 1.0, incl	Over 1.0 to 1.2, incl	Over 1.2 to 2.5, incl	Over 2.5 to 4.0, incl
...	1800	0.05	0.08	0.10	0.12	0.15
1800	2000	... ^D	0.08	0.10	0.15	0.18
2000	... ^D	... ^D	0.15	0.15	0.15	0.20

NOTE 1 — Thickness is measured at any point across the width not less than 25 mm from a side edge.

NOTE 2 — Widths up to and including 300 mm in this table apply to widths produced by slitting from wider sheet.

NOTE 3 — Micrometers used for measurement of thickness shall be constructed with anvils and spindles having minimum diameters of 0.188 in. [4.80 mm]. The tip of the spindle shall be flat, and the tip of the anvil shall be flat or rounded with a minimum radius of curvature of 0.10 in. [2.55 mm]. Micrometers with pointed tips are not suitable for thickness measurements.

NOTE 4 — This table was constructed by multiplying the values in the standard table by 0.50 and rounding to 2 decimal places using standard ASTM practice.

NOTE 5 — The thickness of material <50 mm wide shall be measured at mid-width.

^A 0.55 mm minimum thickness for high-strength, low-alloy.

^B The specified thickness range captions apply independent of whether the ordered thickness is stated as a nominal or minimum.

^C The tolerance provided in the table are based on minimum thickness (tolerance over, no tolerance under). For nominal thickness, the tolerance is divided equally over and under.

^D Where an ellipsis (...) appears in the table, the requirements have not been defined.

TABLE A1.16

NOTE 1 — This table does not apply when product is ordered full hard, to a hardness range or "annealed last" (dead soft).

NOTE 2 — This table also applies to lengths cut from coils by the consumer when adequate flattening measures are performed.

NOTE 3 — Application of this table to product in coil form is not appropriate unless the coil has been rolled out and adequately flattened with all coil set removed.

^A Maximum deviation from a horizontal flat surface.

^B Tolerances for high-strength, low-alloy steel with specified minimum yield point in excess of 340 MPa are subject to negotiation.

APPENDICES

(Nonmandatory Information)

X1. AGING EFFECTS ON FORMABILITY OF COLD-ROLLED CARBON-STEEL SHEET PRODUCTS

X1.1 Cold-rolled carbon-steel sheet products exhibit maximum formability in the annealed last, or dead-soft, condition. However, many sheet products are not suitable for exposed applications in the dead-soft condition because Luder's lines (sometimes referred to as "stretcher strains" or "fluting") may develop during subsequent forming. This problem is avoided in most cases by temper rolling the sheet after annealing. After temper rolling, however, some sheet products are susceptible to aging. Aging refers to a gradual increase in yield strength and corresponding decrease in ductility during storage after temper rolling. Aging always has a negative effect on formability and, when aging leads to the redevelopment of an upper yield point, can result in renewed susceptibility to fluting.

X1.2 Aging can occur when interstitial solute atoms, carbon or nitrogen, are present in the steel. Solute carbon or nitrogen atoms are those not chemically combined with other elements in the steel (as carbides or nitrides, for example). Over time, these carbon or nitrogen interstitial solute atoms diffuse to crystalline imperfections within the steel and, in so doing, give rise to aging. The extent to which aging occurs depends on the interstitial solute level and the combination of temperature and time to which the steel is exposed after temper rolling. In general, higher interstitial solute levels result in larger strength increases during storage; the rate of aging increases with increasing temperature. As described as follows, the final interstitial solute level and aging characteristics depend on the chemical composition of the steel as well as specific sheet-processing methods used by the steel producer.

X1.3 Low-Carbon Steels — In conventional aluminum-killed low-carbon steels, the level of interstitial solute is affected mainly through the formation of aluminum nitride and iron carbides within the steel during processing, which is influenced by the manner in which annealing is performed.

X1.3.1 Many sheet products are annealed in batches of large, tightly wound coils. During heating, any solute nitrogen present in the full-hard sheet combines with aluminum to form aluminum nitride. Subsequent cooling is very slow and allows essentially all of the carbon to precipitate as iron carbide. Final interstitial solute levels are very low

and, as a result, batch-annealed low-carbon steels have excellent resistance to aging.

X1.3.1.1 Deep drawing steel (DDS) sheet typically is batch-annealed and has excellent aging resistance. With temper rolling, DDS sheet is suitable for use in many exposed applications with severe forming requirements.

X1.3.2 Cold-rolled low-carbon steels are sometimes processed in a continuous annealing line, in which the full-hard sheet is uncoiled, passed through an annealing furnace, and then rewound in a continuous manner. Heating and cooling rates are much higher than those found in batch annealing. The faster cooling, in particular, results in higher levels of interstitial solute in the product as compared with batch annealing. The manner in which the sheet is cooled can be controlled to minimize the solute carbon level, and temper rolling is effective for reducing fluting tendencies. However, continuous-annealed low-carbon steels are more prone to subsequent aging than batch-annealed steels.

X1.3.2.1 Low-carbon commercial steel (CS) and drawing steel (DS) sheet are available as either batch- or continuous-annealed products, depending on the facilities of a given producer. To minimize aging effects in continuous-annealed products, rotation of stock by fabricating the oldest material first is recommended.

X1.4 Interstitial-Free Steels — Interstitial-free steels have essentially no interstitial solutes and, as a result, are nonaging. Processing involves vacuum degassing during refining of the liquid steel, as well as additions of elements that form very stable carbides and nitrides, such as titanium or columbium (niobium). These steps ensure that total interstitial levels are very low, and that the interstitials are all chemically combined (or stabilized) in the form of alloy carbides or nitrides. Interstitial-free steels are nonaging regardless of whether annealing is conducted in a continuous or batch manner.

X1.4.1 Extra-deep drawing steel (EDDS) must be vacuum degassed and stabilized. This nonaging, interstitial-free product is suitable for exposed applications with the most severe forming requirements.

X1.5 Bake-Hardenable Steels — Bake-hardenable steels are a special product class with controlled interstitial solute levels and aging behavior. These steels are processed to have moderate aging resistance, to permit forming while the steel is in its most ductile condition. Aging occurs

largely during a subsequent thermal treatment (for example, paint-curing), which results in desirable hardening of the final part for better durability.

X1.5.1 Continuous-annealed low-carbon steels can exhibit significant bake-hardening, as well as certain vacuum-degassed and batch-annealed steels.

X2. STANDARD CHEMICAL RANGES AND LIMITS

X2.1 Standard chemical ranges and limits are prescribed for carbon steels in Table X2.1 and Table X2.2.

X3. PROCEDURE FOR DETERMINING BREAKAGE ALLOWANCE LEVELS (APPLICABLE TO CARBON STEEL SHEET ONLY)

X3.1 In spite of the many extra precautions exercised in making sheet for drawing purposes, certain manufacturing variables may be encountered, all beyond the manufacturer's reasonable control, which may contribute to breakage in fabrication and must be considered as part of the normal hazard of the purchaser's use. The manufacturer will undertake to establish with the purchaser's concurrence a breakage allowance level.

X3.2 Breakage, for the purpose of this proposal, is defined as unrepairable parts, broken during drawing and classed as scrap. Parts showing laminations, resulting from pipe, may be excluded provided they are separately identified. Broken parts that can be salvaged are not covered in this procedure.

X3.3 This procedure is intended to establish a breakage allowance without the need for reinspection of each broken stamping. It will apply to overall breakage on a given part (as calculated by the method outlined below) in excess of 1% up to and including 8%. Inherent variations in steel and normal variables in the stamping operation preclude 100% satisfactory performance. Therefore, it is accepted that practical perfection is attained when 99% of the stampings are produced without breakage. When the overall breakage is in excess of 8%, it is considered to be the result of abnormal stamping conditions, and this method does not apply.

X3.4 When there are two or more suppliers, the recommended procedure for determining a breakage allowance for an identified part is based on the average percentage of breakage of at least 75% of the blanks run on that part, on one set of dies, during at least one month (3000 piece minimum). The total production of all suppliers used to obtain this 75% minimum is to be included in the calculation starting with the best performance. The average breakage thus determined shall be considered the allowance for the part.

X3.4.1 Example:

Vendor	Parts Produced	Parts Scrap	% Scrap
A	32 466	630	1.94
B	27 856	579	2.08
C	67 120	1477	2.20
D	56 200	1349	2.40
E	40 900	1125	2.75
F	850	60	7.05
11	225 392 total	5220 total	2.32 avg

X3.4.2 Seventy-five percent of 225 392 equals to 169 044; therefore, it is necessary to include the total production of vendors A, B, C, and D ($A + B + C + D =$ total production of 183 642 parts) since the total of A, B, and C is only 127 442, which is less than 75% of the total. Total production of 183 642 parts ($A + B + C + D$) with 4035 parts being rejected, results in a percentage allowance of 2.20%. On this basis, vendors D, E, and F exceed the allowance.

X4. PROCEDURES FOR DETERMINING THE EXTENT OF PLASTIC DEFORMATION ENCOUNTERED IN FORMING OR DRAWING

X4.1 Introduction

X4.1.1 The preferred method for determining plastic strain is the circle grid and forming limit curve. The scribed square and change in thickness methods may also be used to evaluate deformation during the forming of a flat sheet into the desired shape.

X4.2 Circle Grid Method

X4.2.1 The test system employs photographic or electro-chemically etched circle patterns on the surface of a sheet metal blank of known "quality" and a forming limit curve for the evaluation of strains developed by forming in press operations. It is useful in the laboratory and in the press room. Selection from the various steels that are commercially available can be done effectively by employing this technique. In addition, corrective action in die or part design to improve performance is indicated.

X4.2.2 The forming limit curve in Fig. X4.1 has been developed from actual measurements of the major (e_1) and associated minor (e_2) strains found in critical areas of production type stampings. Strain combinations that locate below this curve are safe, while those that fail above the curve are critical. For analysis of metal strain on production stampings, one must recognize that day-to-day variations of material, lubrication, and die settings will affect the strain level. To ensure trouble-free press performance a zone below the forming limit curve bounded by the dashed and solid lines is designated as the "safety band." Therefore, strain combinations falling below the dashed lines should not exceed the forming limit curve in normal

production operations. The left of zero portion of the curve defines the limiting biaxial tension-compression strain combination while the right side defines the forming limit curve. Because the production stampings used to develop for forming limit curve represented all qualities of low-carbon light-gauge sheet steel, this single forming limit curve can be used successfully for these products.

X4.2.3 The circle grid method can also be used for other low-carbon sheet categories if the following adjustments to the forming limit curve are made:

X4.2.3.1 Material Thickness — As the metal thickness increases the forming limit curve shifts upwards in a parallel manner, 0.2% (e_1) strain for each 0.025 mm increase in metal thickness above 0.75 mm.

X4.2.3.2 Material Properties — When material properties are considerably different from that of conventional low-carbon sheet steel (for example, higher strength-low ductility), the forming limit curve is lower. The magnitude of the downgrade displacement is specific to each material; therefore, current material information should be consulted to determine placement of the forming limit curve.

X4.3 Procedure

X4.3.1 Obtain a sheet sample of “known quality,” the sheet quality being established by either supplier designation, consumer purchase order, or most preferred tensile data obtained from a companion sheet sample.

X4.3.2 Obtain or prepare a negative on stencil with selected circles in a uniform pattern. The circles may be 2.5 to 25.0 mm in diameter; the most convenient diameter is 5.0 mm because it is easy to read and the gauge spacing is short enough to show the maximum strain in a specific location on the part.

X4.3.3 The sheet metal blanks should be cleaned to remove excess oil and dirt; however, some precoated sheets can be etched without removing the coating. The area(s) to be etched should be determined from observation of panels previously formed; generally, the area that has a split problem is selected for etching. Normally, the convex side of the radius is gridded. If sufficient time is available, the entire blank may be etched, since valuable information can be obtained about the movement of metal in stamping a part when strains can be evaluated in what may appear to be noncritical areas. Additionally, for complex shapes it may be desirable to etch both surfaces of blanks so that the strains that occur in reverse draws can be determined.

X4.3.4 The sheet metal blanks may be etched by a photographic or electrochemical method. In the former method of photosensitive solution, for example, 50% Kodak Photo Resist (KPR) emulsion and 50% KPR-thinner, is sprayed onto the sheet. The emulsion is dried by baking the sheet at 65°C for 15 min or by just standing it

for several hours at room temperature in a dark room. The latter should be employed in materials that age and, hence, become stronger when baked at 65°C. The negative is placed on the emulsion, held intimately in contact with the sheet, and exposed to a strong ultraviolet light source for 1 to 1½ min. The sheet is developed for 30 to 45 s in KPR developer, rinsed with water, and sprayed with alcohol to set the resist. It is again rinsed with water and then sprayed with KPR black dye to reveal the etched circles.

X4.3.5 In the electrochemical method, the etch pad is saturated with an appropriate electrolyte. Various electrolytes are available from suppliers of the etching equipment. Some electrolytes are more effective than others for etching certain surfaces, such as terne plate and other metallic coated steels. A rust-inhibiting solution is preferred for steel sheets.

X4.3.6 A ground clamp for the transformer of suitable amperage (10 to 50 A is usually used) is fastened to the blank and the second lead is attached to the etch pad. Although the current may be turned on at this time, caution should be taken not to lay the pad on the sheet blank as it will arc. It is advisable to refrain from touching the metal of the etch pad and the grounded sheet blank.

X4.3.7 The stencil is placed with the plastic coating against the sheet surface in the area to be etched. Wetting the stencil with a minimum amount of electrolyte will assist in smoothing out the wrinkles and gives a more uniform etch. The etch pad is now positioned on the stencil and the current turned on, if it is not already on. Apply suitable pressure to the pad. Only the minimum time necessary to produce a clear etched pattern should be used. The etching time will vary with the amperage available from the power source and the stencil area, as well as the pad area in contact with the stencil. Rocker-type etch pads give good prints and require less amperage than flat-surfaced pads. Excessive current causes stencil damage.

X4.3.8 The etching solution activates the surface of the metal and may cause rusting unless it is inhibited. After the desired area has been etched, the blank should be wiped or rinsed, dried, and neutralized.

X4.3.9 The etched blank is now ready for forming. The lubricants and press conditions should simulate production situations. If a sequence of operations is used in forming a part, it is desirable to etch sufficient blanks so that each operation can be studied.

X4.4 Measurement of Strain After Forming

X4.4.1 After forming, the circles are generally distorted into elliptical shapes (Fig. X4.2). These ellipses have major and minor strain axes. The major strain (e_1) is always defined to be the direction in which the greatest positive strain has occurred without regard to original blank edges or the sheet rolling direction. The minor strain (e_2) is defined to be 90° to the major strain direction.

X4.4.2 There are several methods for determining the major and minor strains of the formed panel. Typical tools are a pair of dividers and a scale ruled in 0.5 mm. For sharp radii, a thin plastic scale that can follow the contour of the stamping can be used to determine the dimensions of the ellipses. (Scales are available to read the percent strain directly.)

X4.5 Evaluation of Strain Measurements

X4.5.1 The e_1 strain is always positive while the e_2 strain may be zero, positive, or negative, as indicated on the forming limit curve chart (Fig. X4.1). The maximum e_1 and associated e_2 values measured in critical areas on the formed part are plotted on the graph paper containing the forming limit curve by locating the point of intersections of the e_1 , e_2 strains.

X4.5.2 If this point is on or below the “safety band” of the forming limit curve, the strain should not cause breakage. Points further below the curve indicate that a less ductile material of a lower grade may be applied. Points above the “safety band” show that fabrication has induced strains that could result in breakage. Therefore, in evaluation on stampings exhibiting these strains, efforts should be made to provide an e_1 , e_2 strain combination that would lie on or below the “safety band” of the forming limit curve. A different e_1 , e_2 strain combination can be obtained through changes of one or more of the forming variables such as die conditions, lubricants, blank size, thickness, or material grade. It should be noted at this time that these conclusions are derived from a reference base being the steel “quality” used to fabricate the grid stamping.

X4.5.3 When attempting to change the relationship of e_1 and e_2 strains, it should be noted that on the forming limit curve the most severe condition for a given e_1 strain is at 0% e_2 strain. This means the metal works best when it is allowed to deform in two dimensions, e_1 and e_2 , rather than being restricted in one dimension. A change in e_2 to decrease the severity can be made by changing one of the previously mentioned forming variables of the die design, for example, improving lubrication on the tension-tension side will increase e_2 and decrease the severity.

X4.5.4 In addition to the forming limit curve, the e_1e_2 strain measurements may be used to evaluate the material requirements on the basis of strain gradients, as illustrated in Fig. X4.3, or by plotting contours of equivalent strain levels on the surface of the formed part. Even when the level of strain is relatively low, parts in which the e_1 strain is changing rapidly either in magnitude or direction over a short span on the surface may require more ductile grades of sheet metal, change in lubrication, or change in part design.

X4.6 Example of Major and Minor Strain Distribution

X4.6.1 A formed panel (Fig. X4.4) with a cross section as shown in Fig. X4.3 is used to illustrate major and minor strain combinations. A plot of the major strain distribution should be made by finding the ellipse with the largest major strain (circle 7) and measuring both the major and minor strains in the row of ellipses running in the direction of the major strain. The solid dots (Fig. X4.3) are the measured major strains for each ellipse. The Xs are the critical major strains as determined from the forming limit curve at the corresponding minor strain (intersection of the measured minor strain and the severity curve).

X4.6.2 Usually a single row of ellipses will suffice to determine the most severe strain distribution. The resulting strain distribution plot (Fig. X4.3) illustrates both severity of the strain compared to the critical strain limits and the concentration of strain in the stamping. Steep strain gradients should be avoided because they are inherent to fracture sites.

X4.7 Example for Reducing Splitting Tendency

X4.7.1 In an area such as that represented in Fig. X4.3, the splitting tendency can be reduced as follows:

X4.7.1.1 If the radius of the part in the region of circle 1 is increased, some strain can be induced to take place in this area which will allow the major strain in circle 7 to be reduced sufficiently to bring the strain combination below the critical limit. This course of action requires no binding nor reshaping of the punch, only grinding in the radius.

X4.7.1.2 The total average major strain required to make this formation is only 17.5%; yet in a 5.0 mm circle the strain is as high as 40%. The strain distribution curve puts forth graphically the need to distribute the strain over the length of the time by some means as described above.

X4.7.1.3 Change in lubrication can also improve the strain distribution of a stamping. If the strain over the punch is critical, the amount of stretch (strain) required to make the shape can be reduced by allowing metal to flow in over the punch by decreasing the friction through the use of a more effective lubricant in the hold-down era.

X4.7.1.4 If the part is critical, a change in material may help. That is, a material having a better uniform elongation will distribute the strain more uniformly or a material having a higher “r” value will make it possible to “draw” in more metal from the hold-down area so that less stretch is necessary to form the part.

X4.8 Scribed Square Method

X4.8.1 The basic technique is to draw a panel from a blank that has been scribed both longitudinally and transversely with a series of parallel lines spaced at 25.0 mm

intervals. The lines on the panel are measured after drawing and the stretch or draw calculated as the percent increase in area of a 25.0 mm square. This is a fairly simple procedure for panels having generous radii and fairly even stretch or draw. Many major panels fall in this category, and in these instances it is quite easy to pick out the square area exhibiting the greatest increase.

X4.8.2 If the square or line to be measured is no longer a flat surface, place a narrow strip of masking (or other suitable tape) on the formed surface and mark the points which are to be measured. Remove the tape, place on a plane surface, and determine the distance between the points with a steel scale.

X4.8.3 There will be cases of minor increase in area with major elongation in the one direction. In these instances, the percent elongation should be recorded.

X4.9 Thickness Method

X4.9.1 There are instances when the maximum stretch is continued to an area smaller than 645 mm² or the shape of the square has been distorted irregularly, making measurements difficult and calculation inaccurate. When either of these conditions exists, an electronic thickness gauge may be used at the area in question or this area may be sectioned and the decrease in metal thickness measured with a ball-point micrometer. The increase in unit area can be calculated by dividing the original thickness by the final thickness.

X4.9.2 Example: Assuming the blank thickness to be 0.80 mm and the final thickness to be 0.60 mm, the increase in unit area would be a $[(0.80 - 0.60)/0.80] \times 100 = 25\%$ increase.

X5.1 Introduction and Definitions

X5.1.1 In addition to the conventional expression of flatness, the “maximum deviation from a horizontal flat surface,” at least two other flatness parameters have been developed and are in use for characterizing sheet with longitudinal waves or buckles. These are *steepness index* and *flatness index* (or “I-unit”), that are illustrated using the example in Fig. X5.1.

X5.1.2 Steepness Index—Fig. X5.1(a) shows a representation of a sheet sample exhibiting edge waves of height, H , and interval, L . The steepness index value for this sample is defined as:

$$\text{steepness index} = H/L$$

Often, the steepness value is expressed as a percentage:

$$\% \text{ steepness} = S = (H/L) \times 100$$

X5.1.3 I-Units—Making a series of lengthwise cuts to the sample in Fig. X5.1(a) relaxes elastic stresses present

in the sheet and results in narrow strips of differing lengths, as shown in Fig. X5.1(b). Using the length of one of these strips as a reference (L_{ref}), the I-unit value (I) for an individual strip is defined as:

$$I = (DL/L_{ref}) \times 10^5$$

where:

ΔL = is the difference between the length of a given strip and the reference strip

X5.1.4 For the special case of waves/buckles that are perfectly sinusoidal in character, the following relationship applies:

$$I = \left[\left(\frac{\pi}{2} \right) \left(\frac{H}{L} \right) \right]^2 \times 10^5$$

or:

$$I = 24.7S^2$$

Table X5.1 provides I-unit values based on the sinusoidal approximation for wave heights up to $\frac{1}{2}$ in. (increments of $\frac{1}{32}$ in.) and intervals between 10 and 40 in. (increments of 1 in.). Mathematical relationships between the three representations of flatness described here are given in Table X5.2; these relationships can be used to convert between I-unit, % steepness, and wave height values (see examples in Table X5.2).

X5.2 Flatness Evaluation Example and Determination of I-Unit or % Steepness Value

X5.2.1 While the strip is on an inspection table, find the locations on the strip that are not lying flat on the table. If no flatness deviation can be found, that portion of the coil (head/middle/tail) can be described as flat (that is, zero I-unit or zero % steepness).

X5.2.2 If the coil is not totally flat, the height of the deviation must be determined and recorded. If the coil has edge waves, a step gauge (incremented in intervals of $\frac{1}{16}$ or $\frac{1}{32}$ in.) can be inserted under a wave to determine the height. If the coil exhibits flatness deviation in the center of the strip, a lightweight straight edge can be placed on the highest portion of the buckle and on the highest portion of the next repeating buckle. The height can then be determined by inserting a step gauge between the straight edge and the strip.

X5.2.3 Along with the height, the wave period or wave interval must also be determined. The wave interval can be obtained by using a standard tape measure or straight edge to measure the distance between the highest point of one flatness deviation to the highest point of the next repeating flatness deviation.

X5.2.4 After determining height and wave interval, either the I-unit or % steepness value can be obtained. To determine the I-unit flatness, locate the appropriate height and wave interval in Table X5.1 and read the I-unit value

at the intersection of the two measurements. To determine % steepness, divide the height by the wave interval and multiply the result by 100.

TABLE X5.2
FLATNESS CONVERSION FACTORS⁴

	<i>I</i> Unit	Height	% Steepness
<i>I</i> Unit (<i>I</i>)	1	$\frac{2L}{\pi} \sqrt{I 10^{-5}}$	$\frac{2}{\pi} \sqrt{I 10^{-1}}$
Height (<i>H</i>) (peak to peak)	$\left(\frac{H\pi}{2L}\right)^2 10^5$	1	$\frac{(100H)}{L}$
% Steepness (<i>S</i>)	$2.5 (\pi S)^2$	$\frac{(LS)}{100}$	1

⁴ Examples — (1) Assume % steepness is given as 1.5 and the corresponding I-unit value is desired. From Table X5.2, $I = 2.5(\pi S)^2 = 2.5[(3.14)(1.5)]^2 = 55.5$.

(2) Assume an I-unit value of 25 is given and the corresponding % steepness is desired. From Table X5.2, $S = 2/\pi(I \times 10^{-1})^{1/2} = 2/3.14 (25 \times 10^{-1})^{1/2} = 1.0$.

NOTE 1 — “L” is the wave interval as defined in Fig. X5.1(a).

SPECIFICATION FOR HIGH-STRENGTH LOW-ALLOY COLUMBIUM-VANADIUM STRUCTURAL STEEL

SA-572/SA-572M

(Identical with ASTM Specification A 572/A 572M-06.)

1. Scope

1.1 This specification covers five grades of high-strength low-alloy structural steel shapes, plates, sheet piling, and bars. Grades 42 [290], 50 [345], and 55 [380] are intended for riveted, bolted, or welded structures. Grades 60 [415] and 65 [450] are intended for riveted or bolted construction of bridges, or for riveted, bolted, or welded construction in other applications.

1.2 For applications, such as welded bridge construction, where notch toughness is important, notch toughness requirements are to be negotiated between the purchaser and the producer.

1.3 The use of columbium, vanadium, titanium, nitrogen, or combinations thereof, within the limitations noted in Section 5, is required; the selection of type (1, 2, 3, or 5) is at the option of the producer, unless otherwise specified by the purchaser. (See Supplementary Requirement S90.)

1.4 The maximum thicknesses available in the grades and products covered by this specification are shown in Table 1.

1.5 When the steel is to be welded, a welding procedure suitable for the grade of steel and intended use or service is to be utilized. See Appendix X3 of Specification A 6/A 6M for information on weldability.

1.6 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system is to be used independently of the other, without combining values in any way.

1.7 The text of this specification contains notes or footnotes, or both, that provide explanatory material. Such notes and footnotes, excluding those in tables and figures, do not contain any mandatory requirements.

1.8 For structural products produced from coil and furnished without heat treatment or with stress relieving only, the additional requirements, including additional testing requirements and the reporting of additional tests, of A 6/A 6M apply.

2. Referenced Documents

2.1 ASTM Standards:

- A 6/A 6M Specification for General Requirements for Rolled Structural Steel Bars, Plates, Shapes, and Sheet Piling
- A 36/A 36M Specification for Carbon Structural Steel
- A 514/A 514M Specification for High-Yield-Strength, Quenched and Tempered Alloy Steel Plate, Suitable for Welding

3. General Requirements for Delivery

3.1 Structural products furnished under this specification shall conform to the requirements of the current edition of Specification A 6/A 6M, for the specific structural product ordered, unless a conflict exists in which case this specification shall prevail.

3.2 Coils are excluded from qualification to this specification until they are processed into a finished structural product. Structural products produced from coil means structural products that have been cut to individual lengths from a coil. The processor directly controls, or is responsible for, the operations involved in the processing of a coil into a finished structural product. Such operations include decoiling, leveling or straightening, hot-forming or cold-forming (if applicable), cutting to length, testing, inspection, conditioning, heat treatment (if applicable), packaging, marking, loading for shipment, and certification.

NOTE 1 — For structural products produced from coil and furnished without heat treatment or with stress relieving only, two test results are

to be reported for each qualifying coil. Additional requirements regarding structural products produced from coil are described in A 6/A 6M.

4. Materials and Manufacture

4.1 The steel shall be semi-killed or killed.

5. Chemical Composition

5.1 The heat analysis shall conform to the requirements prescribed in Table 2 and Table 3.

5.2 The steel shall conform on product analysis to the requirements prescribed in Table 2 and Table 3, subject to the product analysis tolerances in Specification A 6/A 6M.

6. Mechanical Properties

6.1 Tensile Properties:

6.1.1 The material as represented by the test specimens shall conform to the tensile properties given in Table 4.

7. Keywords

7.1 bars; bolted construction; bridges; buildings; columbium-vanadium; high-strength; low-alloy; plates; riveted construction; shapes; sheet piling; steel; structural steel; welded construction

TABLE 1
MAXIMUM PRODUCT THICKNESS OR SIZE

Grade	Yield Point, min		Maximum Thickness or Size				Sheet Piling	Zees and Rolled Tees
	ksi	[MPa]	Plates and Bars		Structural Shapes Flange or Leg Thickness			
			in.	[mm]	in.	[mm]		
42 [290] ^A	42	[290]	6	[150]	all	all	all	all
50 [345] ^A	50	[345]	4 ^B	[100] ^B	all	all	all	all
55 [380]	55	[380]	2	[50]	all	all	all	all
60 [415] ^A	60	[415]	1¼ ^C	[32] ^C	2	[50]	all	all
65 [450]	65	[450]	1¼	[32]	2	[50]	not available	all

^A In the above tabulation, Grades 42, 50, and 60 [290, 345, and 415], are the yield point levels most closely approximating a geometric progression pattern between 36 ksi [250 MPa], min, yield point steels covered by Specification A 36/A 36M and 100 ksi [690 MPa], min yield strength steels covered by Specification A 514/A 514M.

^B Round bars up to and including 11 in. [275 mm] in diameter are permitted.

^C Round bars up to and including 3½ in. [90 mm] in diameter are permitted.

TABLE 2
CHEMICAL REQUIREMENTS^A
(Heat Analysis)

Diameter, Thickness, or Distance Between Parallel Faces, in. [mm] Plates and Bars	Structural Shapes Flange or Leg Thickness in. [mm]	Grade	Carbon, max, %	Manganese, ^B max, %	Phosphorus, max, %	Sulfur, max, %	Silicon	
							Plates to 1½ in. [40 mm] Thick, Shapes with Flange or Leg Thickness to 3 in. [75 mm] Inclusive, Sheet Piling, Bars, Zees, ^C and Rolled Tees ^C , max, %	Plates Over 1½ in. [40 mm] Thick and Shapes with Flange Thickness Over 3 in. [75 mm], range, %
6 [150]	all	42 [290]	0.21	1.35 ^D	0.04	0.05	0.40	0.15–0.40
4 [100] ^E	all	50 [345]	0.23	1.35 ^D	0.04	0.05	0.40	0.15–0.40
2 [50] ^F	all	55 [380]	0.25	1.35 ^D	0.04	0.05	0.40	0.15–0.40
1¼ [32] ^F	≤2 [50]	60 [415]	0.26	1.35 ^D	0.04	0.05	0.40	^G
>1½ – 1¼ [13–32]	>1–2 [25–50]	65 [450]	0.23	1.65	0.04	0.05	0.40	^G
≤1½ [13] ^H	≤1 ^H	65 [450]	0.26	1.35	0.04	0.05	0.40	^G

^A Copper when specified shall have a minimum content of 0.20% by heat analysis (0.18% by product analysis).

^B Manganese, minimum, by heat analysis of 0.80% (0.75% by product analysis) shall be required for all plates over ⅜ in. [10 mm] in thickness; a minimum of 0.50% (0.45% by product analysis) shall be required for plates ⅜ in. [10 mm] and less in thickness, and for all other products. The manganese to carbon ratio shall not be less than 2 to 1.

^C Bars over 1½ in. [40 mm] in diameter, thickness, or distance between parallel faces shall be made by a killed steel practice.

^D For each reduction of 0.01 percentage point below the specified carbon maximum, an increase of 0.06 percentage point manganese above the specified maximum is permitted, up to a maximum of 1.60%.

^E Round bars up to and including 11 in. [275 mm] in diameter are permitted.

^F Round bars up to and including 3½ in. [90 mm] in diameter are permitted.

^G The size and grade is not described in this specification.

^H An alternative chemical requirement with a maximum carbon of 0.21% and a maximum manganese of 1.65% is permitted, with the balance of the elements as shown in Table 2.

TABLE 3
ALLOY CONTENT

Type ^A	Elements	Heat Analysis, %
1	Columbium ^B	0.005–0.05 ^C
2	Vanadium	0.01–0.15
3	Columbium ^B	0.005–0.05 ^C
	Vanadium	0.01–0.15
	Columbium plus vanadium	0.02–0.15 ^D
5	Titanium	0.006–0.04
	Nitrogen	0.003–0.015
	Vanadium	0.06 max

^A Alloy content shall be in accordance with Type 1, 2, 3, or 5 and the contents of the applicable elements shall be reported on the test report.

^B Columbium shall be restricted to the following thicknesses and sizes unless killed steel is furnished. Killed steel shall be confirmed by a statement of killed steel on the test report, or by a report on the presence of a sufficient quantity of a strong deoxidizing element, such as silicon at 0.10% or higher, or aluminum at 0.015% or higher. See table below.

^C Product analysis limits = 0.004 to 0.06%.

^D Product analysis limits = 0.01 to 0.16%.

Grades	Maximum Plate, Bar, Sheet Piling, Zees, and Rolled Tee Thicknesses, in. [mm]		Maximum Structural Shape Flange or Leg Thickness, in. [mm]	
42, 50, and 55	$\frac{3}{4}$		1.5	
[290, 345, and 380]	[20]		[40]	
60 and 65	$\frac{1}{2}$		1	
[415 and 450]	[13]		[25]	

TABLE 4
TENSILE REQUIREMENTS^A

Grade	Yield Point, min		Tensile Strength, min		Minimum Elongation, % ^{B, C, D}	
	ksi	[MPa]	ksi	[MPa]	in 8 in. [200 mm]	in 2 in. [50 mm]
42 [290]	42	[290]	60	[415]	20	24
50 [345]	50	[345]	65	[450]	18	21
55 [380]	55	[380]	70	[485]	17	20
60 [415]	60	[415]	75	[520]	16	18
65 [450]	65	[450]	80	[550]	15	17

^A See specimen Orientation under the Tension Tests section of Specification A 6/A 6M.

^B Elongation not required to be determined for floor plate.

^C For wide flange shapes over 426 lb/ft [634 kg/m], elongation in 2 in. [50 mm] of 19% minimum applies.

^D For plates wider than 24 in. [600 mm], the elongation requirement is reduced two percentage points for Grades 42, 50, and 55 [290, 345, and 380], and three percentage points for Grades 60 and 65 [415 and 450]. See elongation requirement adjustments in the Tension Tests Section of Specification A 6/A 6M.

SUPPLEMENTARY REQUIREMENTS

Supplementary requirements shall not apply unless specified in the order or contract. Standardized supplementary requirements for use at the option of the purchaser are listed in Specification A 6/A 6M. Those that are considered suitable for use with this specification are listed by title:

S5. Charpy V-Notch Impact Test

S30. Charpy V-Notch Impact Test for Structural Shapes: Alternate Core Location

S18. Maximum Tensile Strength

S32. Single Heat Bundles

In addition, the following supplementary requirements are suitable for use:

S81. Tensile Strength

S81.1 For Grade 50 [345] steel of thicknesses $\frac{3}{4}$ in. [20 mm] and less, the tensile strength shall be a minimum of 70 ksi [485 MPa].

S90. Type

S90.1 The specific type of steel shall be as specified by the purchaser in the order or contract.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR ALLOY STEEL SOCKET-HEAD CAP SCREWS

SA-574

(Identical with ASTM Specification A 574-04^{e1} except that Table 1 on chemical requirements has been deleted and Supplementary Requirement S1 is now mandatory. Paragraphs 6.1 and 6.2 have been revised to refer to Table S1.1 and para. 6.3 has been deleted.)

1. Scope

1.1 This specification covers the requirements for quenched and tempered alloy steel hexagon socket-head cap screws, 0.060 through 4 in. in diameter where high strength is required.

NOTE 1 — A complete metric companion to Specification A 574 has been developed—A 574M; therefore no metric equivalents are presented in this specification.

1.2 The following hazard caveat pertains only to the test method portion, Section 12, of this specification. *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

2. Referenced Documents

- B18.3 Socket Cap, Shoulder, and Set Screws
- B18.24 Part Identifying Number (PIN) Code System Standard for B18 Fastener Products

2.3 Federal Standard:

H-28 Handbook of Thread Dimensions

3. Terminology

3.1 Definitions:

3.1.1 Definitions of discontinuities covered by 10.2 follow:

3.1.2 *crack* — clean crystalline break passing through the grain or grain boundary without inclusion of foreign elements.

3.1.3 *inclusions* — particles of nonmetallic impurities, usually oxides, sulfides, silicates, and such, which are mechanically held in the steel during solidification.

3.1.4 *nicks or pits* — depressions or indentations in the surface of the metal.

3.1.5 *seam or lap* — noncrystalline break through the metal which is inherently in the raw material.

4. Ordering Information

4.1 Orders for socket head cap screws under this specification shall include the following:

- 4.1.1** ASTM designation and year of issue.
- 4.1.2** Quantities (number of pieces by size).
- 4.1.3** Size and length.

4.2 Orders for socket head cap screws may include the following optional requirements:

- 4.2.1** Inspection at point of manufacture.
- 4.2.2** Coating, if a protective finish other than black oxide (thermal or chemical) is required, it must be specified.
- 4.2.3** Certified test reports (see 11.2).
- 4.2.4** Additional testing (see 11.3).
- 4.2.5** Special packaging (see 16.1.2).
- 4.2.6** Supplementary requirements (see S1).
- 4.2.7** Special requirements.

4.2.8 For establishment of a part identifying system, see ASME B18.24

5. Materials and Manufacture

5.1 The screws shall be fabricated from a steel which has been made by the open-hearth, basic-oxygen, or electric-furnace process.

5.2 The screws shall be fabricated from alloy steel made to a fine grain practice. In the event of controversy over grain size, referee tests on finished screws conducted in accordance with Test Methods E 112 shall prevail.

5.3 Unless otherwise specified, the heads of screws through 1.500 in. diameter shall be fabricated by hot or cold forging. Over 1.500 in. diameter, the heads may be fabricated by hot or cold forging or by machining. Sockets may be forged or machined.

5.4 Unless otherwise specified, threads of screws shall be rolled for diameters through 0.625 in. and for screw lengths through 4 in. For diameters and lengths other than this, threads may be rolled, cut, or ground.

5.5 The screws shall be heat treated by oil quenching from above the transformation temperature and then tempering at a temperature not lower than 650°F.

5.6 Standard Finishes — Unless otherwise specified, the screws shall be furnished with one of the following “standard surfaces as manufactured” at the option of the manufacturer: (1) bright uncoated, (2) thermal black oxide, or (3) chemical black oxide. Hydrogen embrittlement tests shall not be required for screws furnished in these conditions.

5.7 Protective Coatings:

5.7.1 When a protective finish other than as specified in 5.6 is required, it shall be specified on the purchase order with the applicable finish specification.

5.7.2 When protective or decorative coatings are applied to the screws, precautions specified by the coating requirements to minimize embrittlement shall be exercised.

6. Chemical Composition

6.1 The analysis of the screw material shall conform to the chemical composition specified in Table S1.1.

6.2 Product analyses may be made by the purchaser from finished material representing each lot. The chemical composition, thus determined, shall conform to the requirements prescribed for product analysis in Table S1.1.

6.3 DELETED

6.4 Application of heats of steel to which bismuth, selenium, tellurium, or lead has been intentionally added shall not be permitted.

6.5 Chemical analyses shall be performed in accordance with Test Methods, Practices, and Terminology A 751.

7. Mechanical Properties

7.1 The hardness of finished screws shall be 39 to 45 HRC for 0.500 in. and smaller and 37 to 45 HRC for 0.625 in. and larger. This shall be only the mechanical requirements for screws that are shorter than three times the diameter or that have insufficient threads for tension testing.

7.2 Screws, other than those exempted in 7.1 and 7.3, shall meet the proof load and tensile requirements in Table 2 and Table 3. The screws shall be tension tested with a wedge of the angle specified in Table 4 under the head. To meet the requirements of the wedge test, there must be a tensile failure in the body or thread section. For the purpose of this test, failure means separation into two pieces. Screws threaded to the head shall pass the requirements for this test if the fracture that caused failure originated in the thread area, even though it may have propagated into the fillet area or the head before separation.

7.3 Screws having a diameter larger than 1.500 in. shall be preferably tested in full size and shall meet the requirements of Table 2 and Table 3. When equipment of sufficient capacity is not readily available, screws shall meet 170 ksi, min, tensile strength, 153 ksi, min, yield strength at 0.2% offset, and 10% elongation on specimens machined in accordance with Test Methods F 606.

8. Metallurgical Requirement

8.1 Carburization or Decarburization:

8.1.1 There shall be no evidence of carburization or total decarburization on the surfaces of the heat-treated screws when measured in accordance with 12.3.

8.1.2 The depth of partial decarburization shall be limited to the values in Table 5 when measured as shown in Fig. 1 and in accordance with 12.3.

9. Dimensions

9.1 Unless otherwise specified, the product shall conform to the requirements of B18.3.

9.2 Unless otherwise specified, threads shall be Unified standard: Class 3A, UNRC and UNRF series for screw sizes 0.060 through 1 in. inclusive; Class 2A, UNRC and UNRF series for sizes over 1 in. to 1.500 in. inclusive; and Class 2A UNRC series for sizes larger than 1.500 in. in accordance with B1.1.

10. Workmanship, Finish, and Appearance

10.1 Discontinuities — The surface discontinuities for these products shall conform to Specification F 788/F 788M and the additional limitations specified herein.

10.2 Socket Discontinuities:

10.2.1 Depth of discontinuities in the socket area will be permissible within the limits of Condition 1 provided they do not affect the usability and performance of the screw. Discontinuities exceeding these limits are not acceptable.

10.2.2 Longitudinal discontinuities must not exceed 0.25T in length. Permissible and nonpermissible discontinuities are shown in Fig. 2.

NOTE 2 — T = actual key engagement.

10.3 Permissible Head and Body Discontinuities — Discontinuities as defined above are permitted in the locations illustrated in Fig. 3 to the depths shown in 10.4. These discontinuities are permitted, provided they do not affect the usability and performance of the screw. All discontinuities are to be measured perpendicular to indicated surfaces.

10.4 Conditions for Permissible Discontinuity Depths:

10.4.1 Condition 1 — For bearing area, fillet, and other surfaces, max depth = 0.03D or 0.005 in. (whichever is greater).

NOTE 3 — D = nominal diameter of screw.

10.4.2 Condition 2 — For peripheral discontinuities, max depth = 0.06D, but not to exceed 0.064.

10.5 Thread Discontinuities — Threads shall have no laps at the root or on the flanks located below the pitch line. Laps are permissible at the thread crest to a depth of 25% of the basic thread height and on the thread flanks beyond the pitch diameter. Longitudinal seams in the threads are acceptable within the limits of Condition 1 (10.4.1).

11. Number of Tests and Retests

11.1 The requirements of this specification shall be met in continuous mass production for stock, and the manufacturer shall make sample inspections to ensure that the product conforms to the specified requirements. Additional tests of individual shipments of material are not ordinarily contemplated. A record of individual heats of steel in each test lot shall be maintained. The container shall be coded to permit identification of the lot.

11.2 When specified in the order, the manufacturer shall furnish a test report certified to be the last complete set of mechanical tests for each stock size in each shipment.

11.3 When additional tests are specified on the purchase order, a lot, for purposes of selecting test samples, shall consist of all screws offered for inspection at one time of one diameter and length. From each lot, the number of samples for each requirement shall be as follows:

Number of Pieces in Lot	Number of Samples
800 and less	1
Over 800 to 8 000, incl.	2
Over 8 000 to 22 000, incl.	3
Over 22 000	5

11.4 Should any sample fail to meet the requirements of a specified test, double the number of samples from the same lot shall be retested for the requirement(s) in which it failed. All of the additional samples shall conform to the specification or the lot shall be rejected.

12. Test Methods

12.1 Test the finished screws and specimens, as applicable, for mechanical properties and hardness requirements of Section 7. Testing shall be in accordance with Test Methods F 606 at room temperature. The minimum required length for tension testing shall be 3D. The angle used in wedge tests shall be as specified in Table 4.

12.2 The speed of testing, as determined with a free running crosshead, shall be a maximum of 1 in./min for the tension tests of screws.

12.3 Decarburization and carburization tests shall be conducted as follows:

12.3.1 Section the thread area of the bolt longitudinally through the axis, mount, and polish it in accordance with Practice E 3. Take measurements (1) at the minor diameter in the center of the thread ridge, and (2) 0.75h toward the thread crest on the perpendicular bisector of the thread ridge. Take a measurement (3) on the thread flank approximately at the pitch line at a depth of 0.003 in. Use one of the two methods for carburization/decarburization evaluation either optical or microhardness measurements. The microhardness measurement shall constitute a referee method in case of dispute.

12.3.2 For optical measurement, etch the section in 2 to 4% nital. Examine the surface of the etched samples under a microscope at 100× using a measuring eyepiece graduated in 0.001-in. increments. The width of any light etching band normally defines the decarburization depth. A dark etching band indicates the possibility of carburization.

12.3.3 Measure microhardness in accordance with Test Method E 384 on unetched specimens using a DPH 136° indenter or a Knoop indenter using the following load application:

Number of Threads per Inch	Load
Less than 40	500 gf
40, 44, and 48	200 gf
Over 48	Use optical evaluation in 12.3.2

12.3.3.1 Take measurements at minor diameter (Reading No. 1) on the thread crest bisector to determine base metal hardness. Take measurements (Reading No. 2) on the bisector $0.75h$ from the minor measurement toward the thread crest. Also take measurements (Reading No. 3) on the thread flank at the pitch line at a depth within 0.003 from the surface. Reading No. 3 may be taken on the same or an adjacent thread.

12.3.4 Interpret microhardness readings as follows:

12.3.4.1 A decrease of more than 30 hardness points from Reading No. 1 to Reading No. 2 shall be regarded as decarburization and indicates the screw does not conform to specification requirements.

12.3.4.2 An increase of more than 30 hardness points from Reading No. 1 to Reading No. 3 shall be regarded as carburization and indicates that the screw does not conform to specification requirements.

13. Inspection

13.1 If the additional tests described in 11.3 are required by the purchaser it shall be specified in the inquiry, order, or contract.

13.2 The inspector representing the purchaser shall have free entry to all parts of the manufacturer's works that concern the manufacture of the material ordered. The manufacturer shall afford the inspector all reasonable facilities to satisfy him that the material is being furnished in accordance with this specification. All tests and inspections

required by the specification that are requested by the purchaser's representative shall be made before shipment, and shall be conducted as not to interfere unnecessarily with the operation of the works.

14. Responsibility

14.1 The party responsible for the fastener shall be the organization that supplies the fastener to the purchaser.

15. Rejection and Rehearing

15.1 Rejections based on requirements herein shall be reported to the manufacturer within 30 days after receipt of material by the purchaser.

16. Packaging and Package Marking

16.1 Packaging:

16.1.1 Unless otherwise specified, packaging shall be in accordance with Practice D 3951.

16.1.2 When special packaging requirements are required, they shall be defined at the time of the inquiry and order.

16.2 Package Marking:

16.2.1 Each shipping unit shall include or be plainly marked with the following information:

16.2.1.1 ASTM designation,

16.2.1.2 Size,

16.2.1.3 Name and brand or trademark of the manufacturer,

16.2.1.4 Number of pieces,

16.2.1.5 Purchase order number, and

16.2.1.6 Country of origin.

SUPPLEMENTARY REQUIREMENTS

The following Supplementary Requirement shall apply only when specified by the purchaser in the contract or purchase order. Supplementary requirements shall in no way negate any requirement of the specification itself.

S1. Specific Grade Chemical Compositions

S1.1 When Supplementary Requirement S1 is specified on the order, the chemical composition shall conform to

one of the compositions in Table S1.1 at the option of the supplier, unless a specific composition (Grade) has been specified on the purchase order.

SPECIFICATION FOR ULTRASONIC ANGLE-BEAM EXAMINATION OF STEEL PLATES

SA-577/SA-577M

[Identical with ASTM Specification A 577/A 577M-90(R07).]

1. Scope

1.1 This specification covers an ultrasonic angle-beam procedure and acceptance standards for the detection of internal discontinuities not laminar in nature and of surface imperfections in a steel plate. This specification is intended for use only as a supplement to specifications which provide straight-beam ultrasonic examination.

NOTE — An internal discontinuity that is laminar in nature is one whose principal plane is parallel to the principal plane of the plate.

1.2 Individuals performing examinations in accordance with this specification shall be qualified and certified in accordance with the requirements of the latest edition of ASNT SNT-TC-1A or an equivalent accepted standard. An equivalent standard is one which covers the qualification and certification of ultrasonic nondestructive examination candidates and which is acceptable to the purchaser.

1.3 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification.

2. Referenced Document

2.1 *ASNT Standard:*
SNT-TC-1A

3. Ordering Information

3.1 The inquiry and order shall indicate any additions to the provisions of this specification as prescribed in 14.1.

4. Examination Conditions

4.1 The examination shall be conducted in an area free of operations that interfere with proper performance of the examination.

4.2 The surface of the plate shall be conditioned as necessary to provide a clear, easily interpreted trace pattern on the screen. Any specified identification which is removed to achieve proper surface smoothness shall be restored.

5. Apparatus

5.1 The amplitude linearity shall be checked by positioning the transducer over the depth resolution notch in the IIW or similar block so that the signal from the notch is approximately 30% of the screen height, and the signal from one of the back surfaces is approximately 60% of the screen height (two times the height of the signal from the notch). A curve is then plotted showing the deviations from the above established 2:1 ratio that occurs as the amplitude of the signal from the notch is raised in increments of one scale division until the back reflection signal reaches full scale, and then is lowered in increments of one scale division until the notch signal reaches one scale division. At each increment the ratio of the two signals is determined. The ratios are plotted on the graph at the position corresponding to the larger signal. Between the limits of 20% and 80% of the screen height the ratio shall be within 10% of 2:1. Instrument settings used during inspection shall not cause variation outside the 10% limits established above.

5.2 The search unit shall be a 45-deg (in steel) angle-beam type with active transducer length and width dimensions of a minimum of $\frac{1}{2}$ in. [12.5 mm] and a maximum of 1 in. [25 mm]. Search units of other sizes and angles may be used for additional exploration and evaluation.

6. Examination Frequency

6.1 The ultrasonic frequency selected for the examination shall be the highest frequency that permits detection

of the required calibration notch, such that the amplitude of the indication yields a signal-to-noise ratio of at least 3:1.

7. Calibration Reflector

7.1 A calibration notch, the geometry of which has been agreed upon by the purchaser and the manufacturer, with a depth of 3% of the plate thickness, shall be used to calibrate the ultrasonic examination. The notch shall be at least 1 in. [25 mm] long.

7.2 Insert the notch or notches on the surface of the plate so that they are perpendicular to the long axis at a distance of 2 in. [50 mm] or more from the short edge of the plate. Locate the notch not less than 2 in. [50 mm] from the long edges of the plate.

7.3 When the notch cannot be inserted in the plate to be tested, it may be placed in a calibration plate of ultrasonically similar material. The calibration plate will be considered ultrasonically similar if the height of the first back reflection through it is within 25% of that through the plate to be tested at the same instrument calibration. The calibration plate thickness shall be within 1 in. [25 mm] of the thickness of plates to be tested, for plates of 2 in. [50 mm] thickness and greater and within 10% of plates whose thickness is less than 2 in. [50 mm].

7.4 For plate thicknesses greater than 2 in. [50 mm], insert a second calibration notch as described in 7.2, on the opposite side of the plate.

8. Calibration Procedure

8.1 Plate 2 in. [50 mm] and Under in Thickness:

8.1.1 Place the search unit on the notched surface of the plate with the sound beam directed at the broad side of the notch and position to obtain maximum amplitude from the first vee-path indication which is clearly resolved from the initial pulse. Adjust the instrument gain so that this reflection amplitude is at least 50 but not more than 75% of full screen height. Record the location and amplitude of this indication on the screen.

8.1.2 Move the search unit away from the notch until the second vee-path indication is obtained. Position the search unit for maximum amplitude and record the indication amplitude. Draw a line between the peaks from the two successive notch indications on the screen. This line is the distance amplitude curve (DAC) for this material and shall be a 100% reference line for reporting indication amplitudes.

8.2 Plate Over 2 to 6 in. [50 to 150 mm] Inclusive in Thickness:

8.2.1 Place the search unit on the test surface aimed at the broad side of the notch on the opposite surface of

the plate. Position the search unit to obtain a maximum one-half vee-path indication amplitude. Adjust the instrument gain so that this amplitude is at least 50% but not more than 80% of full screen height. Record the location and amplitude on the screen. Without adjusting the instrument settings, repeat this procedure for the 1½ vee-path indication.

8.2.2 Without adjusting the instrument settings, reposition the search unit to obtain a maximum full vee-path indication from the notch on the test surface. Record the location and amplitude on the screen.

8.2.3 Draw a line on the screen connecting the points established in 8.2.1 and 8.2.2. This curve shall be a DAC for reporting indication amplitudes.

8.3 Plate over 6 in. [150 mm] in Thickness:

8.3.1 Place the search unit on the test surface aimed at the broad side of the notch on the opposite surface of the plate. Position the search unit to obtain a maximum one-half vee-path indication amplitude. Adjust the instrument gain so that this amplitude is at least 50% but not more than 80% of full screen height. Record the location and amplitude on the screen.

8.3.2 Without adjusting the instrument settings, reposition the search unit to obtain a maximum full vee-path indication from the notch on the test surface. Record the location and amplitude on the screen.

8.3.3 Draw a line on the screen connecting the points established in 8.3.1 and 8.3.2. This line shall be a DAC for reporting indication amplitudes.

9. Examination Procedure

9.1 Scan one major surface of the plate on grid lines perpendicular and parallel to the major rolling direction. Grid lines shall be on 9 in. [225 mm] centers. Use a suitable couplant such as water, oil, or glycerin. Scan by placing the search unit near one edge with the ultrasonic beam directed toward the same edge and move the search unit along the grid line in a direction perpendicular to the edge to a location two plate thicknesses beyond the plate center. Repeat this scanning procedure on all grid lines from each of the four edges.

9.2 Measure grid lines from the center or one corner of the plate.

9.3 Position the search unit to obtain a maximum indication amplitude from each observed discontinuity.

9.4 For each discontinuity indication that equals or exceeds the DAC, record the location and length, and the amplitude to the nearest 25%. No indication with an amplitude less than the DAC shall be recorded.

9.5 At each recorded discontinuity location, conduct a 100% examination of the mass under a 9 in. [225 mm] square which has the recorded discontinuity position at its center. Conduct the examination in directions perpendicular and parallel to the major rolling direction.

10. Acceptance Standard

10.1 Any discontinuity indication that equals or exceeds the DAC shall be considered unacceptable unless additional exploration by the longitudinal method indicates it is laminar in nature.

11. Rehearing

11.1 The manufacturer reserves the right to discuss unacceptable ultrasonically examined plate with the purchaser with the object of possible repair of the ultrasonically indicated discontinuity before rejection of the plate.

12. Inspection

12.1 The purchaser's representative shall have access, at all times while work on the contract of the purchaser is being performed, to all parts of the manufacturer's works that concern the ultrasonic examination of the material ordered. The manufacturer shall afford the representative

all reasonable facilities to satisfy him that the material is being furnished in accordance with this specification. All examinations and verifications shall be so conducted as not to interfere unnecessarily with the manufacturer's operations.

13. Marking

13.1 Plates accepted in accordance with this specification shall be identified by metal stamping or stencilling "UT A 577" in one corner of the plate, at a location within 6 in. [150 mm] of the heat number.

14. Report

14.1 Unless otherwise agreed upon between the purchaser and manufacturer, the manufacturer shall report the following data:

14.1.1 Plate identity including pin-pointed recordable indication locations, lengths, and amplitudes.

14.1.2 Examination parameters, including: couplant; search unit type, angle, frequency, and size; instrument make, model, and serial number; and calibration plate description.

14.1.3 Date of examination and name of operator.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR STRAIGHT-BEAM ULTRASONIC EXAMINATION OF ROLLED STEEL PLATES FOR SPECIAL APPLICATIONS

SA-578/SA-578M

(Identical with ASTM Specification A 578/A 578M-07.)

1. Scope

1.1 This specification covers the procedure and acceptance standards for straight-beam, pulse-echo, ultrasonic examination of rolled carbon and alloy steel plates, $\frac{3}{8}$ in. [10 mm] in thickness and over, for special applications. The method will detect internal discontinuities parallel to the rolled surfaces. Three levels of acceptance standards are provided. Supplementary requirements are provided for alternative procedures.

1.2 Individuals performing examinations in accordance with this specification shall be qualified and certified in accordance with the requirements of the latest edition of ASNT SNT-TC-1A or an equivalent accepted standard. An equivalent standard is one which covers the qualification and certification of ultrasonic nondestructive examination candidates and which is acceptable to the purchaser.

1.3 The values stated in either SI units or inch-pound units are to be regarded separately as standard. The values stated in each system may not be exact equivalents; therefore, each system shall be used independently of the other. Combining values from the two systems may result in nonconformance with the standard.

1.4 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

A 264 Specification for Stainless Chromium-Nickel Steel-Clad Plate

A 265 Specification for Nickel and Nickel-Base Alloy-Clad Steel Plate

2.2 ANSI Standard:
B 46.1 Surface Texture

2.3 ASNT Standard:
SNT-TC-1A

3. Ordering Information

3.1 The inquiry and order shall indicate the following:

3.1.1 Acceptance level requirements (Sections 7, 8, and 9). Acceptance Level B shall apply unless otherwise agreed to by purchaser and manufacturer.

3.1.2 Any additions to the provisions of this specification as prescribed in 5.2, 13.1, and Section 10.

3.1.3 Supplementary requirements, if any.

4. Apparatus

4.1 The amplitude linearity shall be checked by positioning the transducer over the depth resolution notch in the IIW or similar block so that the signal from the notch is approximately 30% of the screen height, and the signal from one of the back surfaces is approximately 60% of the screen height (two times the height of the signal from the notch). A curve is then plotted showing the deviations from the above established 2:1 ratio that occurs as the amplitude of the signal from the notch is raised in increments of one scale division until the back reflection signal reaches full scale, and then is lowered in increments of one scale division until the notch signal reaches one scale division. At each increment the ratio of the two signals is determined. The ratios are plotted on the graph at the position corresponding to the larger signal. Between the

limits of 20 and 80% of the screen height, the ratio shall be within 10% of 2:1. Instrument settings used during inspection shall not cause variation outside the 10% limits established above.

4.2 The transducer shall be 1 or $1\frac{1}{8}$ in. [25 or 30 mm] in diameter or 1 in. [25 mm] square.

4.3 Other search units may be used for evaluating and pinpointing indications.

5. Procedure

5.1 Perform the inspection in an area free of operations that interfere with proper performance of the test.

5.2 Unless otherwise specified, make the ultrasonic examination on either major surface of the plate.

5.3 The plate surface shall be sufficiently clean and smooth to maintain a first reflection from the opposite side of the plate at least 50% of full scale during scanning. This may involve suitable means of scale removal at the manufacturer's option. Condition local rough surfaces by grinding. Restore any specified identification which is removed when grinding to achieve proper surface smoothness.

5.4 Perform the test by one of the following methods: direct contact, immersion, or liquid column coupling. Use a suitable couplant such as water, soluble oil, or glycerin. As a result of the test by this method, the surface of plates may be expected to have a residue of oil or rust or both.

5.5 A nominal test frequency of $2\frac{1}{4}$ MHz is recommended. When testing plates less than $\frac{3}{4}$ in. [20 mm] thick a frequency of 5 MHz may be necessary. Thickness, grain size or microstructure of the material and nature of the equipment or method may require a higher or lower test frequency. Use the transducers at their rated frequency. A clean, easily interpreted trace pattern should be produced during the examination.

5.6 Scanning:

5.6.1 Scanning shall be along continuous perpendicular grid lines on nominal 9 in. [225 mm] centers, or at the option of the manufacturer, shall be along continuous parallel paths, transverse to the major plate axis, on nominal 4 in. [100 mm] centers, or shall be along continuous parallel paths parallel to the major plate axis, on 3 in. [75 mm] or smaller centers. Measure the lines from the center or one corner of the plate with an additional path within 2 in. [50 mm] of all edges of the plate on the searching surface.

5.6.2 Conduct the general scanning with an instrument adjustment that will produce a first reflection from the opposite side of a sound area of the plate from 50 to 90% of full scale. Minor sensitivity adjustments may be made to accommodate for surface roughness.

5.6.3 When a discontinuity condition is observed during general scanning adjust the instrument to produce a first reflection from the opposite side of a sound area of the plate of $75 \pm 5\%$ of full scale. Maintain this instrument setting during evaluation of the discontinuity condition.

6. Recording

6.1 Record all discontinuities causing complete loss of back reflection.

6.2 For plates $\frac{3}{4}$ in. [20 mm] thick and over, record all indications with amplitudes equal to or greater than 50% of the initial back reflection and accompanied by a 50% loss of back reflection.

NOTE 1 — Indications occurring midway between the initial pulse and the first back reflection may cause a second reflection at the location of the first back reflection. When this condition is observed it shall be investigated additionally by use of multiple back reflections.

6.3 Where grid scanning is performed and recordable conditions as in 6.1 and 6.2 are detected along a given grid line, the entire surface area of the squares adjacent to this indication shall be scanned. Where parallel path scanning is performed and recordable conditions as in 6.1 and 6.2 are detected, the entire surface area of a 9 by 9 in. [225 by 225 mm] square centered on this indication shall be scanned. The true boundaries where these conditions exist shall be established in either method by the following technique: Move the transducer away from the center of the discontinuity until the height of the back reflection and discontinuity indications are equal. Mark the plate at a point equivalent to the center of the transducer. Repeat the operation to establish the boundary.

7. Acceptance Standard — Level A

7.1 Any area where one or more discontinuities produce a continuous total loss of back reflection accompanied by continuous indications on the same plane (within 5% of plate thickness) that cannot be encompassed within a circle whose diameter is 3 in. [75 mm] or $\frac{1}{2}$ of the plate thickness, whichever is greater, is unacceptable.

8. Acceptance Standards — Level B

8.1 Any area where one or more discontinuities produce a continuous total loss of back reflection accompanied by continuous indications on the same plane (within 5% of plate thickness) that cannot be encompassed within a circle whose diameter is 3 in. [75 mm] or $\frac{1}{2}$ of the plate thickness, whichever is greater, is unacceptable.

8.2 In addition, two or more discontinuities smaller than described in 8.1 shall be unacceptable unless separated by a minimum distance equal to the greatest diameter of

the larger discontinuity or unless they may be collectively encompassed by the circle described in 8.1.

9. Acceptance Standard — Level C

9.1 Any area where one or more discontinuities produce a continuous total loss of back reflection accompanied by continuous indications on the same plane (within 5% of plate thickness) that cannot be encompassed within a 1 in. [25 mm] diameter circle is unacceptable.

10. Report

10.1 Unless otherwise agreed to by the purchaser and the manufacturer, the manufacturer shall report the following data:

10.1.1 All recordable indications listed in Section 6 on a sketch of the plate with sufficient data to relate the geometry and identity of the sketch to those of the plate.

10.1.2 Test parameters including: Make and model of instrument, test frequency, surface condition, transducer (type and frequency), and couplant.

10.1.3 Date of test.

11. Inspection

11.1 The inspector representing the purchaser shall have access at all times, while work on the contract of the purchaser is being performed, to all parts of the manufacturer's works that concern the ultrasonic testing of the material

ordered. The manufacturer shall afford the inspector all reasonable facilities to satisfy him that the material is being furnished in accordance with this specification. All tests and inspections shall be made at the place of manufacture prior to shipment, unless otherwise specified, and shall be conducted without interfering unnecessarily with the manufacturer's operations.

12. Rehearing

12.1 The manufacturer reserves the right to discuss rejectable ultrasonically tested plate with the purchaser with the object of possible repair of the ultrasonically indicated defect before rejection of the plate.

13. Marking

13.1 Plates accepted according to this specification shall be identified by stenciling (stamping) "UT A 578—A" on one corner for Level A, "UT A 578—B" for Level B, and "UT A 578—C" for Level C. The supplement number shall be added for each supplementary requirement ordered.

14. Keywords

14.1 nondestructive testing; pressure containing parts; pressure vessel steels; steel plate for pressure vessel applications; steel plates; ultrasonic examinations

SUPPLEMENTARY REQUIREMENTS

These supplementary requirements shall apply only when individually specified by the purchaser. When details of these requirements are not covered herein, they are subject to agreement between the manufacturer and the purchaser.

S1. Scanning

S1.1 Scanning shall be continuous over 100% of the plate surface along parallel paths, transverse or parallel to the major plate axis, with not less than 10% overlap between each path.

S2. Acceptance Standard

S2.1 Any recordable condition listed in Section 6 that (1) is continuous, (2) is on the same plane (within 5% of the plate thickness), and (3) cannot be encompassed by a 3 in. [75 mm] diameter circle, is unacceptable. Two or more recordable conditions (see Section 5), that (1) are on the same plane (within 5% of plate thickness), (2) individually can be encompassed by a 3 in. [75 mm] diameter circle, (3) are separated from each other by a distance less than the greatest dimension of the smaller indication, and (4) collectively cannot be encompassed by a 3 in. [75 mm] diameter circle, are unacceptable.

S2.2 An acceptance level more restrictive than Section 7 or 8 shall be used by agreement between the manufacturer and purchaser.

S3. Procedure

S3.1 The manufacturer shall provide a written procedure in accordance with this specification.

S4. Certification

S4.1 The manufacturer shall provide a written certification of the ultrasonic test operator's qualifications.

S5. Surface Finish

S5.1 The surface finish of the plate shall be conditioned to a maximum 125 μ in. [3 μ m] AA (see ANSI B46.1) prior to test.

S6. Withdrawn

See Specifications A 263, A 264, and A 265 for equivalent descriptions for clad quality level.

S7. Withdrawn

See Specifications A 263, A 264, and A 265 for equivalent descriptions for clad quality level.

S8. Ultrasonic Examination Using Flat Bottom Hole Calibration (for Plates 4 in. [100 mm] Thick and Greater)

S8.1 Use the following calibration and recording procedures in place of 5.6.2, 5.6.3, and Section 6.

S8.2 The transducer shall be in accordance with 4.2.

S8.3 Reference Reflectors — The $T/4$, $T/2$, and $3T/4$ deep flat bottom holes shall be used to calibrate the equipment. The flat bottom hole diameter shall be in accordance with Table S8.1. The holes may be drilled in the plate to be examined if they can be located without interfering with the use of the plate, in a prolongation of the plate to be examined, or in a reference block of the same nominal composition, and thermal treatment as the plate to be examined. The surface of the reference block shall be no better to the unaided eye than the plate surface to be examined. The reference block shall be of the same nominal thickness (within 75 to 125% or 1 in. [25 mm] of the examined plate, whichever is less) and shall have acoustical properties similar to the examined plate. Acoustical similarity is presumed when, without a change in instrument setting, comparison of the back reflection signals between the reference block and the examined plate shows a variation of 25% or less.

S8.4 Calibration Procedure:

S8.4.1 Couple and position the search unit for maximum amplitudes from the reflectors at $T/4$, $T/2$, and $3T/4$. Set the instrument to produce a $75 \pm 5\%$ of full scale indication from the reflector giving the highest amplitude.

S8.4.2 Without changing the instrument setting, couple and position the search unit over each of the holes and mark on the screen the maximum amplitude from each hole and each minimum remaining back reflection.

S8.4.3 Mark on the screen half the vertical distance from the sweep line to each maximum amplitude hole mark. Connect the maximum amplitude hole marks and extend the line through the thickness for the 100% DAC (distance amplitude correction curve). Similarly connect

and extend the half maximum amplitude marks for the 50% DAC.

S8.5 Recording:

S8.5.1 Record all areas where the remaining back reflection is smaller than the highest of the minimum remaining back reflections found in S8.4.2.

S8.5.2 Record all areas where indications exceed 50% DAC.

S8.5.3 Where recordable conditions listed in S8.5.1 and S8.5.2 are detected along a given grid line, continuously scan the entire surface area of the squares adjacent to the condition and record the boundaries or extent of each recordable condition.

S8.6 Scanning shall be in accordance with 5.6.

S8.7 The acceptance levels of Section 7 or 8 shall apply as specified by the purchaser except that the recordable condition shall be as given in S8.5.

S9. Ultrasonic Examination of Electroslag Remelted (ESR) and Vacuum-Arc Remelted (VAR) Plates, from 1 to 16 in. [25 to 400 mm] in Thickness, Using Flat-Bottom Hole Calibration and Distance-Amplitude Corrections

S9.1 The material to be examined must have a surface finish of 200 $\mu\text{in.}$ [5 μm] as maximum for plates up to 8 in. [200 mm] thick, inclusive, and 250 $\mu\text{in.}$ [6 μm] as maximum for plates over 8 to 16 in. [200 to 400 mm] thick.

S9.2 Use the following procedures in place of 5.6.1, 5.6.2, 5.6.3, and Section 6.

S9.3 The transducer shall be in accordance with 4.2.

S9.4 Reference Reflectors — The $T/4$, $T/2$, and $3T/4$ deep flat bottom holes shall be used to calibrate the equipment. The flat bottom hole diameter shall be in accordance with Table S9.1. The flat bottoms of the holes shall be within 1° of parallel to the examination surface. The holes may be drilled in the plate to be examined if they can be located without interfering with the use of the plate, in a prolongation of the plate to be examined, or in a reference block of the same nominal composition and thermal treatment as the plate to be examined. The surface of the reference block shall be no better to the unaided eye than the

plate surface to be examined. The reference block shall be of the same nominal thickness (within 75 to 125% or 1 in. [25 mm] of the examined plate, whichever is less) and shall have acoustical properties similar to the examined plate. Acoustical similarity is presumed when, without a change in instrument setting, comparison of the back reflection signals between the reference block and the examined plate shows a variation of 25% or less.

S9.5 Calibration Procedure:

S9.5.1 Couple and position the search unit for maximum amplitudes from the reflectors at $T/4$, $T/2$, and $3T/4$. Set the instrument to produce a $75 \pm 5\%$ of full-scale indication from the reflector giving the highest amplitude.

S9.5.2 Without changing the instrument setting, couple and position the search unit over each of the holes and mark on the screen the maximum amplitude from each of the holes.

S9.5.3 Mark on the screen half the vertical distances from the sweep line to each maximum amplitude hole mark. Connect the maximum amplitude hole marks and extend the line through the thickness for the 100% DAC (distance amplitude correction curve). Similarly connect and extend the half maximum amplitude marks for the 50% DAC.

S9.6 Scanning — Scanning shall cover 100% of one major plate surface, with the search unit being indexed between each pass such that there is at least 15% overlap of adjoining passes in order to assure adequate coverage for locating discontinuities.

S9.7 Recording — Record all areas where the back reflection drops below the 50% DAC. If the drop in back reflection is not accompanied by other indications on the screen, recondition the surface in the area and reexamine ultrasonically. If the back reflection is still below 50% DAC, the loss may be due to the metallurgical structure of the material being examined. The material shall be held for metallurgical review by the purchaser and manufacturer.

S9.8 Acceptance Standards — Any indication that exceeds the 100% DAC shall be considered unacceptable. The manufacturer may reserve the right to discuss rejectable ultrasonically examined material with the purchaser, the object being the possible repair of the ultrasonically indicated defect before rejection of the plate.

SPECIFICATION FOR ELECTRIC-RESISTANCE- WELDED LOW-CARBON STEEL PIPE FOR THE CHEMICAL INDUSTRY

SA-587

(Identical with ASTM Specification A 587-93 except for the deletion of 1.5.)

1. Scope

1.1 This specification covers electric-resistance-welded low-carbon steel pipe intended for use as process lines.

1.2 Pipe ordered under this specification shall be suitable for severe forming operations involving flanging in all sizes and bending to close radii up to and including NPS 4.

1.3 This specification covers NPS $\frac{1}{2}$ through 10, plus additional sizes. The corresponding outside diameters and wall thicknesses for NPS $\frac{1}{2}$ through 10 are listed in Table 4, as are the dimensions for the additional sizes.

NOTE—The dimensionless designator NPS (nominal pipe size) has been substituted in this standard for such traditional terms as “nominal diameter,” “size,” and “nominal size.”

1.4 The values stated in inch-pound units are to be regarded as the standard.

1.5 DELETED

2. Referenced Documents

2.1 ASTM Standards:

- A 53 Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated Welded and Seamless
- A 370 Test Methods and Definitions for Mechanical Testing of Steel Products

- A 751 Test Methods, Practices, and Terminology for Chemical Analysis of Steel Products
- E 213 Practice for Ultrasonic Inspection of Metal Pipe and Tubing
- E 273 Practice for Ultrasonic Examination of Longitudinal Welded Pipe and Tubing

- E 309 Practice for Eddy-Current Examination of Steel Tubular Products Using Magnetic Saturation
- E 570 Practice for Flux Leakage Examination of Ferromagnetic Steel Tubular Products

3. Ordering Information

3.1 Orders for material under this specification should include the following as required to describe the desired material adequately:

3.1.1 Quantity (feet or number of pieces).

3.1.2 Name of material (electric-resistance-welded steel pipe).

3.1.3 Size (NPS or outside diameter and wall thickness).

3.1.4 Length (definite cut length or random).

3.1.5 Test report required (see 14.2).

3.1.6 Specification number.

3.1.7 Special requirements.

4. Materials and Manufacture

4.1 Process — The steel shall be aluminum killed steel made by one or more of the following processes: open-hearth, basic-oxygen, or electric-furnace.

4.2 Steel may be cast in ingots or may be strand cast. When steels of different grades are sequentially strand cast, identification of the resultant transition material is required. The producer shall remove the transition material by any established procedure that positively separates the grades.

4.3 Manufacture — The pipe shall be made by electric resistance welding.

4.4 Heat Treatment — Pipe furnished in the as-welded condition shall be normalized at a temperature above the upper critical temperature. Cold-drawn pipe shall be normalized after the final cold-draw pass.

5. Chemical Composition

5.1 Heat Analysis — An analysis of each heat of steel shall be made to determine the percentages of the elements specified. The chemical composition thus determined shall conform to the requirements specified in Table 1 and the chemical analysis shall be in accordance with Test Methods, Practices, and Terminology A 751.

5.2 Product Analysis — When requested on the purchase order, a product analysis shall be made by the supplier from one pipe or coil of steel per heat. The chemical composition thus determined shall be reported to the purchaser or the purchaser's representative and shall conform to the requirements specified in Table 1.

5.3 Retests — If the original test for product analysis fails, retests of two additional lengths of flat-rolled stock or pipe shall be made. Both retests for the elements in question shall meet the requirements of the specification; otherwise, all remaining material in the heat shall be rejected or, at the option of the producer, each length of flat-rolled stock or pipe may be individually tested for acceptance. Lengths of flat-rolled stock or pipe which do not meet the requirements of the specification shall be rejected.

5.4 Supplying an alloy grade of steel that specifically requires the addition of any element other than those listed in Table 1 is not permitted.

6. Mechanical Requirements

6.1 Tensile Properties:

6.1.1 The material shall conform to the requirements as to tensile properties prescribed in Table 2.

6.1.2 The yield strength shall be determined by the drop of the beam, by the halt in the gage of the testing machine, by the use of dividers, or by other approved methods. When a definite yield point is not exhibited, the yield strength corresponding to a permanent offset of 0.2% of the gage length of the specimen, or to a total extension of 0.5% of the gage length under load, shall be determined.

6.1.3 If the percentage of elongation of any test specimen is less than that specified and any part of the fracture is more than $\frac{3}{4}$ in. (19 mm) from the center of the gage length, as indicated by scribe marks on the specimen before testing, a retest shall be allowed.

6.2 Flattening Test:

6.2.1 A section of pipe not less than 4 in. (102 mm) in length shall be flattened cold between parallel plates in

two steps. The weld shall be placed 90° from the direction of the applied force. During the first step, which is a test for ductility, no cracks or breaks, except as provided for in 6.2.5, shall occur on the inside or outside surfaces until the distance between the plates is less than the value of H , calculated by the following equation:

$$H = [(1 + e)t]/[e + t/D]$$

where:

- H = distance between flattening plates, in.,
- t = specified wall thickness of the pipe, in.,
- D = specified outside diameter of the pipe, in., and
- e = deformation per unit length (0.09 for low-carbon steel).

6.2.2 During the second step, which is a test for soundness, the flattening shall be continued until the specimen breaks or the opposite walls of the pipe meet. Evidence of laminated or unsound material, or of incomplete weld that is revealed during the entire flattening test shall be cause for rejection.

6.2.3 Surface imperfections in the test specimens before flattening, but revealed during the first step of the flattening test, shall be judged in accordance with the finish requirements.

6.2.4 Superficial ruptures resulting from surface imperfections shall not be cause for rejection.

6.2.5 When low D -to- t ratio tubulars are tested, because the strain imposed due to geometry is unreasonably high on the inside surface at the 6 and 12 o'clock locations, cracks at these locations shall not be cause for rejection if the D -to- t ratio is less than 10.

6.3 Reverse Flattening Test — A section 4 in. (102 mm) in length of pipe in sizes down to and including $\frac{13}{16}$ in. (20.6 mm) in outside diameter shall be split longitudinally 90° on each side of the weld and the sample opened and flattened with the weld at the point of maximum bend. There shall be no evidence of cracks or lack of penetration or overlaps resulting from flash removal in the weld.

6.4 Flange Test — A section of pipe not less than 4 in. (102 mm) in length shall be capable of having a flange turned over at a right angle to the body of the pipe without cracking or showing flaws. This flange, as measured from the outside of the pipe, shall be not less than $\frac{1}{8}$ in. (3.2 mm) nor more than $\frac{1}{2}$ in. (12.7 mm). Within these limits, the width of the flange shall be not less than the percentages specified in Table 3.

7. Dimensions and Permissible Variations

7.1 Permissible Variations in Outside Diameter and Wall Thickness — The outside diameter and wall thickness variations shall not exceed the limits prescribed in Table 4.

7.2 Permissible Variations in Straightness — Each pipe shall be straight within 0.030 in. (0.76 mm) maximum deflection in any 3 ft (0.91 m) length to 8 NPS. For 8 NPS and above, pipe shall be straight within 0.060 in. (1.52 mm) maximum deflection in any 3 ft (0.91 m) length. Galvanized pipe shall be reasonably straight.

7.3 Lengths:

7.3.1 Pipe may be ordered in definite cut lengths or in random lengths as provided herein.

7.3.2 When ordered in definite cut lengths, the variation in length shall not exceed the amounts prescribed in Table 5.

7.3.3 If definite lengths are not required, pipe may be ordered in single random lengths of 16 to 22 ft (4.9 to 6.7 m) with 5% 12 to 16 ft (3.7 to 4.9 m), or in double random lengths with a minimum average of 35 ft (10.7 m) and a minimum length of 22 ft (6.7 m) with 5% 16 to 22 ft (4.9 to 6.7 m).

8. Workmanship, Finish, and Appearance

8.1 The finished pipe shall be free of injurious defects and shall have a workman-like finish. Minor defects may be removed by grinding, provided the wall thickness is not reduced to less than the minimum thickness permitted for the ordered nominal wall thickness.

8.2 The pipe shall have smooth ends free of burrs and free of scale except that the pipe may have a superficial “blue” oxide film on the surfaces.

8.3 For NPS $\frac{1}{2}$ to $1\frac{1}{2}$ inclusive, the inside diameter welding flash shall be removed so that the remaining flash does not exceed 0.006 in. (0.15 mm). For NPS over $1\frac{1}{2}$, the remaining inside diameter welding flash shall not exceed 0.010 in. (0.25 mm).

8.4 For all nominal sizes, the outside diameter welding flash shall be removed flush with the outside diameter contour.

8.5 Undercut flash must be smoothly blended into the pipe wall.

8.6 The intent of the flash conditions as prescribed in 8.3, 8.4, and 8.5 is to obtain a surface contour suitable for flanging.

9. Number of Tests

9.1 Two tensile tests as specified in 6.1 shall be made from each heat.

9.2 The flattening test as specified in 6.2 shall be made on two lengths of pipe from each lot of 250 lengths or fraction thereof.

9.3 The reverse flattening test specified in 6.3 shall be made on one length of pipe from each lot of 250 lengths or fraction thereof.

9.4 The flange test as specified in 6.4 shall be made on specimens from two lengths of pipe from each lot of 250 lengths or fraction thereof.

10. Retests

10.1 If the results of the mechanical tests of any heat or lot do not conform to the requirements specified, retests may be made on additional pipe of double the original number from the same heat or lot, each of which shall conform to the requirements specified.

11. Retreatment

11.1 If a heat or lot fails to conform to the test requirements, that heat or lot may be reheat treated and resubmitted for tests. Not more than one reheat treatment shall be permitted.

12. Test Specimens and Methods of Testing

12.1 The test specimens and the tests required by this specification shall conform to those described in Test Methods and Definitions A 370.

12.2 Test specimens shall be taken from the ends of finished pipe prior to upsetting, swaging, expanding, or other forming operations, or being cut to length. They shall be smooth on the ends and free from burrs and flaws.

12.3 If any test specimen shows flaws or defective machining, it may be discarded and another specimen substituted.

13. Nondestructive Test

13.1 The nondestructive test shall be made instead of the hydrostatic test.

13.1.1 The test shall provide a 360° inspection for sizes up to and including $3\frac{1}{2}$ in. (88.9 mm) outside diameter.

13.1.2 For pipe larger than $3\frac{1}{2}$ in. (88.9 mm) outside diameter, nondestructive inspection of the weld and heat affected zone is required.

13.2 Each pipe shall be tested with a nondestructive test in accordance with Practices E 213, E 273, E 309, or E 570. Except as provided in 13.6.2, it is the intent of this test to reject pipe with imperfections that produce test signals equal to or greater than that of the calibration standard. In order to accommodate the various types of nondestructive testing equipment and techniques in use, and

manufacturing practices employed, any one of the following calibration standards may be used, at the option of the producer, to establish a minimum sensitivity level for rejection:

13.3 For eddy-current testing, the calibration pipe shall contain, at the option of the producer, any one of the following discontinuities to establish a minimum sensitivity level for rejection. For welded pipe, they shall be placed in the weld if visible.

13.3.1 Drilled Hole — A hole not larger than 0.031 in. (0.79 mm) in diameter shall be drilled radially and completely through the pipe wall, taking care to avoid distortion of the pipe while drilling.

13.3.2 Transverse Tangential Notch — Using a round tool or file with a $\frac{1}{4}$ in. (6.4 mm) diameter, a notch shall be filed or milled tangential to the surface and transverse to the longitudinal axis of the pipe, preferably in the weld area. Said notch shall have a depth not exceeding $12\frac{1}{2}\%$ of the specified wall thickness of the pipe or 0.004 in. (0.10 mm), whichever is greater.

13.3.3 Longitudinal Notch — A notch 0.031 in. (0.79 mm) or less in width shall be machined in a radial plane parallel to the pipe axis on the outside surface of the pipe, to a depth not exceeding $12\frac{1}{2}\%$ of the specified wall thickness of the pipe or 0.004 in. (0.102 mm), whichever is greater. The length of the notch shall be compatible with the testing method.

13.4 For ultrasonic testing, the longitudinal calibration reference notches shall be at the option of the producer, any one of the three common notch shapes shown in Practices E 213 or E 273. The depth of the notch shall not exceed $12\frac{1}{2}\%$ of the specified wall thickness of the pipe or 0.004 in. (0.102 mm), whichever is greater. For welded pipe, the notch shall be placed in the weld, if visible.

13.5 For flux leakage testing, each of the longitudinal calibration notches shall be a straight sided notch not over $12\frac{1}{2}\%$ of the wall thickness in depth and not over 1.0 in. (25 mm) in length. Both outside diameter and inside diameter notches shall be placed in the tube located sufficiently apart to enable separation and identification of the signals.

13.6 Pipe producing a signal equal to or greater than the calibration defect shall be subject to rejection. The area producing the signal may be examined.

13.6.1 Test signals produced by imperfections that cannot be identified, or produced by cracks or crack-like defects shall result in rejection of the pipe subject to rework and retest.

13.6.2 Test signals produced by imperfections such as those listed below may be judged as injurious or noninjurious depending on visual observation or their severity or

the type of signal they produce on the testing equipment used, or both:

13.6.2.1 Dinges.

13.6.2.2 Straightener marks.

13.6.2.3 Loose inside diameter bead and cutting chips.

13.6.2.4 Scratches.

13.6.2.5 Steel die stamps.

13.6.2.6 Chattered flash trim.

13.6.2.7 Stop marks, or

13.6.2.8 Tube reducer ripple.

13.6.3 Any imperfection of the above type exceeding 0.004 in. (0.102 mm) or $12\frac{1}{2}\%$ of the specified wall thickness (whichever is greater) in depth shall be considered injurious.

13.6.3.1 If the imperfection is judged as injurious, the pipe shall be rejected but may be reconditioned and retested providing the dimensional requirements are met.

13.6.3.2 If the imperfection is explored to the extent that it can be identified as noninjurious, the pipe may be accepted without further test providing the imperfection does not encroach on the minimum wall thickness.

14. Inspection

14.1 The inspector shall have entry at all times while work on an order is being done to all parts of the manufacturer's works that concern the manufacture of the pipe ordered. The manufacturer shall afford the inspector, without charge, all reasonable facilities to satisfy the inspector that the material is being furnished in accordance with this specification. All tests and inspection shall be made prior to shipment.

14.2 When inspection at the place of manufacture has been waived by the customer, the manufacturer shall furnish a statement that the material has been tested and has met all the requirements of this specification. A certificate or report shall be made available to the customer when all the requirements of this specification have been met. When Supplementary Requirement S1 is furnished, certificates or reports furnished shall bear the notation "S-1."

15. Rejection

15.1 Each length of pipe received from the manufacturer may be inspected by the purchaser and, if it does not meet the requirements of this specification based on the inspection and test method as outlined in the specification, the length may be rejected and the manufacturer shall be notified. Disposition of rejected pipe shall be a matter of agreement between the manufacturer and the purchaser.

15.2 Pipe found in fabrication or in installation to be unsuitable for the intended use, under the scope and requirements of this specification, may be set aside and the manufacturer notified. Such pipe shall be subject to mutual investigation as to the nature and severity of the deficiency and the forming or installation, or both, conditions involved. Disposition shall be a matter for agreement.

16. Product Marking

16.1 Each length of pipe NPS 1½ and larger shall be legibly marked by either stenciling or stenciling and light die marking. The die marking shall include the manufacturer's logo or symbol and the stenciling shall include the name or brand of the manufacturer, size, heat number, and the specification number. Such marking shall be applied starting within 8 in. (203 mm) of the end of each length.

16.2 For NPS under 1½, the markings prescribed in 16.1 may be applied to tags and securely attached to the bundle, bale, or other unit, prepared for shipment.

16.3 A tag shall be securely attached to each bundle of pipe shipped indicating the name of the manufacturer, size, wall thickness, length, and specification.

16.4 Bar Coding — In addition to the requirements in 16.1, 16.2, and 16.3, bar coding is acceptable as a supplementary identification method. Bar coding should be consistent with the Automotive Industry Action Group (AIAG) standard prepared by the Primary Metals Subcommittee of the AIAG Bar Code Project Team.

17. Packaging

17.1 The manufacturer, at his option, will box, crate, carton, or package in secured lifts, or bundle to ensure safe delivery. Special packaging requiring extra operations other than those normally used by the manufacturer must be specified on the order.

TABLE 1
CHEMICAL COMPOSITION REQUIREMENTS

Element	Composition, %

TABLE 5
PERMISSIBLE VARIATIONS IN LENGTH⁴

Outside Diameter, in.	Cut Length, in. (mm)	
	Over	Under
Under 2	1/8 (3.2)	0
2 and over	3/16 (4.8)	0

⁴ These permissible variations in length apply to pipe before bending. They apply to cut lengths up to and including 24 ft (7.3 m). For lengths over 24 ft, an additional over-tolerance of 1/8 in. for each 10 ft (3.0 m) or fraction thereof shall be permissible, up to a maximum of 1/2 in. (12.7 mm).

SUPPLEMENTARY REQUIREMENTS

One or more of the supplementary requirements described below may be included in the purchaser's order or contract. When so included, a supplementary requirement shall have the same force as if it were in the body of the specification. Supplementary requirements details not fully described shall be agreed upon between the purchaser and the supplier, but shall not negate any of the requirements in the body of the specification.

S1. Hydrostatic Testing

S1.1 Hydrostatic testing shall be in accordance with Specification A 530/A 530M. When this supplement is furnished the pipe shall be marked "S-1."

S2. Galvanizing

S2.1 Galvanizing shall be in accordance with Specification A 53, except that the rate of application shall be 1.3 minimum to 1.7 maximum oz per ft^2 .

S3. Surface Coatings

S3.1 All surfaces shall be coated; the exterior with a hard drying lacquer, and the interior with a suitable rust inhibitor.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR HIGH-STRENGTH QUENCHED AND TEMPERED LOW-ALLOY STEEL FORGED FITTINGS AND PARTS FOR PRESSURE VESSELS

SA-592/SA-592M

[Identical with ASTM Specification A 592/A 592M-04(R09).]

1. Scope

1.1 This specification covers high-strength quenched and tempered low-alloy steel forged fittings and parts for pressure vessels. The maximum thickness of forgings under this specification shall be 1½ in. [38 mm] for Grade A, and 4 in. [100 mm] for Grades E and F.

NOTE 1— These grades are similar to corresponding grades in Specification A 517/A 517M.

1.2 Although no provision is made for supplementary requirements in this standard, the supplementary requirements in Specification A 788 may be considered by the purchaser.

1.3 Welding technique is of fundamental importance and it is presupposed that welding procedures will be in accordance with approved methods for the class of material used.

1.4 The values stated in either inch-pound units or SI (metric) units are to be regarded separately as the standard; within the text and tables, the SI units are shown in [brackets]. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification.

1.5 Unless the order specifies the applicable “M” specification designation, the material shall be furnished to the inch-pound units.

2. Referenced Documents

2.1 ASTM Standards:

A 370 Test Methods and Definitions for Mechanical Testing of Steel Products
A 517/A 517M Specification for Pressure Vessel Plates, Alloy Steel, High-Strength, Quenched and Tempered

A 788 Specification for Steel Forgings, General Requirements

E 112 Test Methods for Determining the Average Grain Size

3. Ordering Information and General Requirements

3.1 In addition to the ordering information required by Specification A 788, the purchaser shall include with the inquiry and order the following information:

3.1.1 A detailed drawing, a sketch, or written description of the forging.

3.1.2 The Charpy impact test temperature if a test temperature lower than 32°F [0°C] is required.

3.1.3 Additional heat treatment cycles to be applied to the mechanical test specimens following removal from the heat-treated forging or special forged test block.

3.1.4 Required supplementary requirement(s) from specification A 788.

3.2 Material supplied to this specification shall conform to the requirements of Specification A 788, which outlines additional ordering information, manufacturing requirements, testing and retesting methods and procedures, marking, certification, product analysis variations, and additional supplementary requirements. Failure to comply with the requirements of Specification A 788 constitutes non-conformance with this specification.

3.3 If the requirements of this specification are in conflict with the requirements of Specification A 788, the requirements of this specification shall prevail.

4. Materials and Manufacture

4.1 Melting Process — The steel shall be made in accordance with the Melting Process Section of Specification A 788.

4.2 Grain Size — The steel shall be fully killed, fine grained (ASTM No. 5 or finer), as determined in accordance with Test Methods E 112, Plate IV.

4.3 Discard — Sufficient discard shall be made from each ingot to ensure freedom from piping and excessive segregation.

4.4 The finished product shall be a hot-worked forging as defined by Specification A 788, and shall be forged as close as practicable to the finished shape and size.

5. Heat Treatment

5.1 After forging and before reheating, the forgings shall be cooled to provide substantially complete transformation of austenite. Heat treatment for properties shall consist of heating the forgings to not less than 1650°F [900°C], quenching in a liquid medium, and tempering at 1150°F [620°C] minimum, with a holding time of 1 h/in. [1 h/25 mm] minimum, but in no case less than ½ h.

6. Chemical Requirements

6.1 Heat Analysis — The heat analysis obtained from sampling in accordance with Specification A 788 shall comply with Table 1.

6.2 Product Analysis — The purchaser may use the product analysis provision of Specification A 788 to obtain a product analysis from a forging representing each heat or multiple heat.

7. Mechanical Requirements

7.1 The forgings as represented by tension tests shall conform to the requirements prescribed in Table 2, and to Table 3 for lateral expansion opposite the notch in Charpy V-notch impact tests. In addition, for the Charpy impact test, the values of energy absorption in foot-pounds [or joules] and the fracture appearance in percent shear shall be recorded and reported for information.

7.2 Sampling:

7.2.1 Samples for mechanical test specimens shall be removed after the quenching and tempering heat treatment. The purchaser shall specify any additional thermal treatments that shall be given to the heat treated test specimens.

(This is intended to simulate subsequent thermal treatments which may be performed by the fabricator.)

7.2.2 Samples shall be removed so that the test specimens will have their major axes parallel to the direction of major working of the forging.

7.2.3 Test specimens may be machined from a production forging, or prolongation thereof, or from special forged blocks suitably worked and heat treated with the production forgings. Such special blocks shall be obtained from an ingot, slab, or billet from the same heat as the forgings they represent and shall be reduced by forging in a manner similar to that for the products to be represented. The forging reduction for a special test block shall not exceed the minimum forging reduction of the forgings represented, and its thickness shall not be less than the maximum thickness of the forgings represented. If a forging is tested, the tests must represent the maximum section thickness in the lot. All test specimens shall be located at the mid-plane of the thickness and, the mid length position of the gauge length for tension test specimens, or the notch of the Charpy V-notch impact test specimens shall be at least *T* from any second surface of the production forging or test block, where *T* equals the maximum heat treated thickness of the forging.

7.3 Number of Tests and Retests:

7.3.1 Number of Tests, and Test Temperature:

7.3.1.1 One room-temperature tension test and one set of three Charpy V-notch specimens shall be made to represent the maximum section from each heat in each heat-treatment charge. Impact tests shall be conducted at the temperature specified on the order, but no higher than 32°F [0°C].

7.3.1.2 One grain size test shall be made from each heat.

7.3.2 Retests of Tension Specimens — If the results of tension tests do not conform to the requirements specified, retests are permitted, as outlined in Test Method A 370 and Specification A 788.

7.3.3 Retests of Impact Specimens:

7.3.3.1 If the lateral expansion value for one specimen is below 0.015 in. [0.38 mm] but not below 0.010 in. [0.25 mm] and the average equals or exceeds 0.015 in. [0.38 mm], a retest of three additional specimens may be made. Each of the three retest specimens must equal or exceed the specified minimum value of 0.015 in. [0.38 mm].

7.4 Test Methods — Tension and impact tests shall be made in accordance with the latest issue of Test Methods and Definitions A 370.

8. Repair Welding

8.1 Repair welding of forgings may be permitted but only at the option of the purchaser. Such repair welds shall be made in accordance with Section IX of the ASME Boiler and Pressure Vessel Code.

9. Test Reports

9.1 The certification requirements of Specification A 788 shall apply.

10. Product Marking

10.1 Each forging shall be identified in accordance with the Marking Section of Specification A 788.

11. Keywords

11.1 high-strength low-alloy steel; fittings—steel; pressure vessel service; quenched and tempered steel; steel forgings—alloy

SPECIFICATION FOR CASTINGS, CARBON, LOW-ALLOY, AND MARTENSITIC STAINLESS STEEL, ULTRASONIC EXAMINATION THEREOF

SA-609/SA-609M

[Identical with ASTM Specification A 609/A 609M-91(R07).]

1. Scope

1.1 This practice covers the standards and procedures for the pulse-echo ultrasonic examination of heat-treated carbon, low-alloy, and martensitic stainless steel castings by the longitudinal-beam technique.

1.2 This practice is to be used whenever the inquiry, contract, order, or specification states that castings are to be subjected to ultrasonic examination in accordance with Practice A 609/A 609M.

1.3 This practice contains two procedures for ultrasonic inspection of carbon, low-alloy, and martensitic stainless steel castings, that is, Procedure A and Procedure B. Procedure A is the original A 609/A 609M practice and requires calibration using a series of test blocks containing flat bottomed holes. It also provides supplementary requirements for angle beam testing. Procedure B requires calibration using a back wall reflection from a series of solid calibration blocks.

NOTE 1 — Ultrasonic examination and radiography are not directly comparable. This examination technique is intended to complement Guide E 94 in the detection of discontinuities.

1.4 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with this practice.

1.5 *This standard does not purport to address all of the safety problems, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

2. Referenced Documents

2.1 ASTM Standards:

- A 217/A 217M Specification for Steel Castings, Martensitic Stainless and Alloy, for Pressure-Containing Parts, Suitable for High-Temperature Service
- E 94 Guide for Radiographic Testing
- E 317 Practice for Evaluating Performance Characteristics of Ultrasonic Pulse-Echo Testing Systems Without the Use of Electronic Measurement Instruments

2.2 Other Document:

- SNT-TC-1A Recommended Practice for Nondestructive Testing Personnel Qualification and Certification

3. Ordering Information

3.1 The inquiry and order should specify which procedure is to be used. If a procedure is not specified, Procedure A shall be used.

3.2 Procedure A — Flat-Bottomed Hole Calibration Procedure:

3.2.1 When this practice is to be applied to an inquiry, contract, or order, the purchaser shall furnish the following information:

3.2.1.1 Quality levels for the entire casting or portions thereof.

3.2.1.2 Sections of castings requiring longitudinal-beam examination.

3.2.1.3 Sections of castings requiring dual element examination.

3.2.1.4 Sections of castings requiring supplementary examination, using the angle-beam procedure described in Supplementary Requirement S1 in order to achieve more complete examination.

3.2.1.5 Any requirements additional to the provisions of this practice.

3.3 Procedure B: Back-Wall Reflection Calibration Procedure — When this procedure is to be applied to an inquiry, contract, or order, the purchaser shall designate the quality levels for the entire casting or applicable portions.

PROCEDURE A — FLAT-BOTTOMED HOLE CALIBRATION PROCEDURE

4. Apparatus

4.1 Electronic Apparatus:

4.1.1 An ultrasonic, pulsed, reflection type of instrument that is capable of generating, receiving, and amplifying frequencies of at least 1 to 5 MHz.

4.1.2 The ultrasonic instrument shall provide linear presentation (within $\pm 5\%$) for at least 75% of the screen height (sweep line to top of screen). Linearity shall be determined in accordance with Practice E 317 or equivalent electronic means.

4.1.3 The electronic apparatus shall contain a signal attenuator or calibrated gain control that shall be accurate over its useful range to $\pm 10\%$ of the nominal attenuation or gain ratio to allow measurement of signals beyond the linear range of the instrument.

4.2 Search Units:

4.2.1 Longitudinal Wave, internally grounded, having a $\frac{1}{2}$ to $1\frac{1}{8}$ in. [13 to 28 mm] diameter or 1 in. [25 mm] square piezo-electric elements. Based on the signals-to-noise ratio of the response pattern of the casting, a frequency in the range from 1 to 5 MHz shall be used. The background noise shall not exceed 25% of the distance amplitude correction curve (DAC). Transducers shall be utilized at their rated frequencies.

4.2.2 Dual-Element, 5 MHz, $\frac{1}{2}$ by 1 in. [13 by 25 mm], 12° included angle search units are recommended for sections 1 in. [25 mm] and under.

4.2.3 Other frequencies and sizes of search units may be used for evaluating and pinpointing indications.

4.3 Reference Blocks:

4.3.1 Reference blocks containing flat-bottom holes shall be used to establish test sensitivity in accordance with 8.2.

4.3.2 Reference blocks shall be made from cast steels that give an acoustic response similar to the castings being examined.

4.3.3 The design of reference blocks shall be in accordance with Fig. 1, and the basic set shall consist of those blocks listed in Table 1. When section thicknesses over 15 in. [380 mm] are to be inspected, an additional

block of the maximum test thickness shall be made to supplement the basic set.

4.3.4 Machined blocks with $\frac{3}{32}$ in. [2.4 mm] diameter flat-bottom holes at depths from the entry surface of $\frac{1}{8}$ in. [3 mm], $\frac{1}{2}$ in. [13 mm], or $\frac{1}{2}t$ and $\frac{3}{4}$ in. [19 mm], or $\frac{3}{4}t$ (where t = thickness of the block) shall be used to establish the DAC for the dual-element search units (see Fig. 2).

4.3.5 Each reference block shall be permanently identified along the side of the block indicating the material and the block identification.

4.4 Couplant — A suitable couplant having good wetting characteristics shall be used between the search unit and examination surface. The same couplant shall be used for calibrations and examinations.

5. Personnel Requirements

5.1 The manufacturer shall be responsible for assigning qualified personnel to perform ultrasonic examination in conformance with the requirements of this practice.

5.2 Personnel performing ultrasonic examinations in accordance with this practice shall be familiar with the following:

5.2.1 Ultrasonic terminology.

5.2.2 Instrument calibration.

5.2.3 Effect of transducer material, size, frequency, and mode on test results.

5.2.4 Effect of material structure (grain size, cleanliness, etc.) on test results.

5.2.5 Effect of test distance on test results.

5.2.6 Effect of nonlinearity on test results.

5.2.7 Effect of thickness and orientation of discontinuities on test results.

5.2.8 Effect of surface roughness on test results.

5.3 A qualification record (see Note 2) of personnel considered suitable by the manufacturer to perform examinations in accordance with this practice shall be available upon request.

NOTE 2 — SNT-TC-1A, Ultrasonic Testing Method, provides a recommended procedure for qualifying personnel. Other personnel qualification requirement documents may be used when agreed upon between the purchaser and the supplier.

6. Casting Conditions

6.1 Castings shall receive at least an austenitizing heat treatment before being ultrasonically examined.

6.2 Test surfaces of castings shall be free of material that will interfere with the ultrasonic examination. They may be as cast, blasted, ground, or machined.

6.3 The ultrasonic examination shall be conducted prior to machining that prevents an effective examination of the casting.

7. Test Conditions

7.1 To assure complete coverage of the specified casting section, each pass of the search unit shall overlap by at least 10% of the width of the transducer.

7.2 The rate of scanning shall not exceed 6 in./s (150 mm/s).

7.3 The ultrasonic beam shall be introduced perpendicular to the examination surface.

8. Procedure

8.1 Adjust the instrument controls to position the first back reflection for the thickness to be tested at least one half of the distance across the cathode ray tube.

8.2 Using the set of reference blocks spanning the thickness of the casting being inspected, mark the flat-bottom hole indication height for each of the applicable blocks on the cathode ray tube shield. Draw a curve through these marks on the screen or on suitable graph paper. The maximum signal amplitude for the test blocks used shall peak at approximately three-fourths of the screen height above the sweep by use of the attenuator. This curve shall be referred to as the 100% distance amplitude correction (DAC) curve. If the attenuation of ultrasound in the casting thickness being examined is such that the system's dynamic range is exceeded, segmented DAC curves are permitted.

8.3 The casting examination surface will normally be rougher than that of the test blocks; consequently, employ a transfer mechanism to provide approximate compensation. In order to accomplish this, first select a region of the casting that has parallel walls and a surface condition representative of the rest of the casting as a transfer point. Next, select the test block whose overall length, *C* (Fig. 1), most closely matches the reflection amplitude through the block length. Place the search unit on the casting at the transfer point and adjust the instrument gain until the back reflection amplitude through the casting matches that through the test block. Using this transfer technique, the examination sensitivity in the casting may be expected to be within $\pm 30\%$ or less of that given by the test blocks.

8.4 Do not change those instrument controls and the test frequency set during calibration, except the attenuator, or calibrated gain control, during acceptance examination of a given thickness of the casting. Make a periodic calibration during the inspection by checking the amplitude of response from the $\frac{1}{4}$ in. (6.4 mm) diameter flat-bottom hole in the test block utilized for the transfer.

NOTE 3 — The attenuator or calibrated gain control may be used to change the signal amplitude during examination to permit small amplitude signals to be more readily detected. Signal evaluation is made by returning the attenuator or calibrated gain control to its original setting.

8.5 During examination of areas of the casting having parallel walls, recheck areas showing 75% or greater loss of back reflection to determine whether loss of back reflection is due to poor contact, insufficient couplant, misoriented discontinuity, etc. If the reason for loss of back reflection is not evident, consider the area questionable and further investigate.

9. Report

9.1 The manufacturer's report of final ultrasonic examination shall contain the following data and shall be furnished to the purchaser:

9.1.1 The total number, location, amplitude, and area when possible to delineate boundaries by monitoring the movement of the center of the search unit of all indications equal to or greater than 100% of the DAC.

9.1.2 Questionable areas from 8.5 that, upon further investigation, are determined to be caused by discontinuities.

9.1.3 The examination frequency, type of instrument, types of search units employed, couplant, manufacturer's identifying numbers, purchaser's order number, and data and authorized signature.

9.1.4 A sketch showing the physical outline of the casting, including dimensions of all areas not inspected due to geometric configuration, with the location and sizes of all indications in accordance with 9.1.1 and 9.1.2.

10. Acceptance Standards

10.1 This practice is intended for application to castings with a wide variety of sizes, shapes, compositions, melting processes, foundry practices, and applications. Therefore, it is impractical to specify an ultrasonic quality level that would be universally applicable to such a diversity of products. Ultrasonic acceptance or rejection criteria for individual castings should be based on a realistic appraisal of service requirements and the quality that can normally be obtained in production of the particular type of casting.

10.2 Acceptance quality levels shall be established between the purchaser and the manufacturer on the basis of one or more of the following criteria:

10.2.1 No indication equal to or greater than the DAC over an area specified for the applicable quality level of Table 2.

10.2.2 No reduction of back reflection of 75% or greater that has been determined to be caused by a discontinuity over an area specified for the applicable quality level of Table 2.

10.2.3 Indications producing a continuous response equal to or greater than the DAC with a dimension exceeding the maximum length shown for the applicable quality level shall be unacceptable.

10.2.4 Other criteria agreed upon between the purchaser and the manufacturer.

10.3 Other means may be used to establish the validity of a rejection based on ultrasonic inspection.

NOTE 4 — The areas for the ultrasonic quality levels in Table 2 of Practice A 609/A 609M refer to the surface area on the casting over which a continuous indication exceeding the DAC is maintained.

NOTE 5 — Areas are to be measured from dimensions of the movement of the search unit by outlining locations where the amplitude of the indication is 100% of the DAC or where the back reflection is reduced by 75%, using the center of the search unit as a reference point to establish the outline of the indication area.

NOTE 6 — In certain castings, because of very long metal path distances or curvature of the examination surfaces, the surface area over which a given discontinuity is detected may be considerably larger or smaller than the actual area of the discontinuity in the casting; in such cases, other criteria that incorporate a consideration of beam angles or beam spread must be used for realistic evaluation of the discontinuity.

PROCEDURE B — BACK-WALL REFLECTION CALIBRATION PROCEDURE

11. Apparatus

11.1 Apparatus shall be kept on a regular six month maintenance cycle during which, as a minimum requirement, the vertical and horizontal linearities, sensitivity, and resolution shall be established in accordance with the requirements of Practice E 317.

11.2 *Search Units* — Ceramic element transducers not exceeding 1.25 in. [82 mm] diameter or 1 in.² [25 mm²] shall be used.

11.3 *Search Units Facing* — A soft urethane membrane or neoprene sheet, approximately 0.025 in. [0.64 mm] thick, may be used to improve coupling and minimize transducer wear caused by casting surface roughness.

11.4 *Calibration/Testing* — The same system, including the urethane membrane, used for calibration shall be used to inspect the casting.

11.5 *Other Inspections* — Other frequencies and type search units may be used for obtaining additional information and pinpointing of individual indications.

11.6 *Couplant* — A suitable liquid couplant, such as clean SAE 30 motor oil or similar commercial ultrasonic couplant, shall be used to couple the search unit to the test surface. Other couplants may be used when agreed upon between the purchaser and supplier.

11.7 *Reference Standards* — Reference standards in accordance with Fig. 3 shall be used to calibrate the instrument for inspecting machined and cast surfaces. Reference standards shall be flaw free and machined within tolerances indicated.

12. Ultrasonic Instrument

12.1 *Type* — Pulsed ultrasonic reflection instrument capable of generating, receiving, and amplifying frequencies of 1 MHz to 5 MHz shall be used for testing.

12.2 *Voltage* — Line voltage shall be suitably regulated by constant voltage equipment and metal housing must be grounded to prevent electric shock.

12.3 *Linearity* — The instrument must provide a linear presentation (within $\pm 5\%$) of at least 1.5 in. [40 mm] sweep to peak (S/P).

12.4 *Calibrated Gain Control of Attenuator* — The instrument shall contain a calibrated gain control or signal attenuator (accurate within $\pm 10\%$) which will allow indications beyond the linear range of the instrument to be measured.

12.5 *Time-Corrected Gain* — The instrument shall be equipped to compensate for signal decay with distance. A method should be available to equalize signal response at different depths.

13. Qualification

13.1 The requirements for pre-production qualification are as follows:

13.1.1 *Personnel* — The personnel qualification requirements of SNT-TC-1A are applicable. Other personnel qualification requirement documents may be used when agreed upon between the purchaser and the supplier. Records of all personnel shall be available to customers upon request.

13.1.2 *Equipment* — The equipment shall be capable of meeting the requirements in Section 12.

14. Preparation

14.1 *Time of Inspection* — The final ultrasonic acceptance inspection shall be performed after at least an austenitizing heat treatment and preferably after machining. In order to avoid time loss in production, acceptance inspection of cast surfaces may be done prior to machining. Machined surfaces shall be acceptance inspected as soon as possible after machining. Repair welds may be inspected before the postweld heat treatment.

14.2 Surface Finish:

14.2.1 Machined Surfaces — Machined surfaces subject to ultrasonic inspection shall have a finish that will produce an ultrasonic response equivalent to that obtained from a 250 $\mu\text{in.}$ (6.3 μm) surface. The surface finish shall also permit adequate movement of search units along the surface.

14.2.2 Casting Surfaces — Casting surfaces to be ultrasonically inspected shall be suitable for the intended type and quality level (Tables 3 and 4) of inspection as judged acceptable by a qualified individual as specified in 13.1.1.

14.2.3 Surface Condition — All surfaces to be inspected shall be free of scale, machining or grinding particles, excessive paint thickness, dirt, or other foreign matter that may interfere with the inspection.

14.3 Position of Casting — The casting shall be positioned such that the inspector has free access to the back wall for the purpose of verifying change in contour.

15. Calibration

15.1 Calibration Blocks — Determine the thickness of the material to be ultrasonically inspected. For material thickness of 3 in. [75 mm] or less, use the series of 3 blocks, $\frac{1}{2}$, 2, 5 in. [13, 50, 125 mm] (Fig. 3, B dimension) for calibration. For a material thickness greater than 3 in., use the series of 3 blocks, 2, 5, 10 in. [50, 125, 250 mm] (Fig. 3, B dimension) for calibration.

15.2 Calibration of Search Units — For the thickness of material to be inspected, as determined in 15.1, use the following search units:

15.2.1 For materials 3 in. [75 mm] or less in thickness, use a 2 $\frac{1}{4}$ MHz, $\frac{1}{2}$ in. [13 mm] diameter search unit.

15.2.2 For material greater than 3 in. [75 mm] in thickness, use a 2 $\frac{1}{4}$ MHz, 1 in. [25 mm] diameter search unit.

15.3 Calibration Procedure:

15.3.1 Set the frequency selector as required. Set the reject control in the "OFF" position.

15.3.2 Position the search unit on the entrant surface of the block that completely encompasses the metal thickness to be inspected (Fig. 3) and adjust the sweep control such that the back reflection signal appears approximately, but not more than three-quarters along the sweep line from the initial pulse signal.

15.3.3 Position the search unit on the entrant surface of the smallest block of the series of 3 blocks selected for calibration and adjust the gain until the back reflection signal height (amplitude) is 1.5 in. [40 mm] sweep to peak (S/P). Draw a line on the cathode-ray screen (CRT),

parallel to the sweep line, through the peak of the 1.5 in. (S/P) amplitude.

15.3.4 Position the search unit on the entrant surface of the largest block of the series of 3 blocks selected for calibration, and adjust the distance amplitude control to provide a back reflection signal height of 1.5 in. [40 mm] (S/P).

15.3.5 Position the search unit on the entrant surface of the intermediate calibration block of the series of 3 blocks being used for calibration and confirm that the back reflection signal height is approximately 1.5 in. [40 mm] (S/P). If it is not, obtain the best compromise between this block and the largest block of the series of 3 blocks being used for calibration.

15.3.6 Draw a line on the cathode ray tube screen parallel to the sweep line at 0.5 in. [13 mm] (S/P) amplitude. This will be the reference line for reporting discontinuity amplitudes.

15.3.7 For tests on *machined surfaces*, position the search unit on a machined surface of casting where the walls are reasonably parallel and adjust the gain of the instrument until the back reflection signal height is 1.5 in. [40 mm] (S/P). Increase the inspection sensitivity by a factor of three times (10 dB gain) with the calibrated attenuator. Surfaces that do not meet the requirements of 14.2.1 shall be inspected as specified in 15.3.8.

15.3.8 For inspections on *cast surfaces*, position the search unit on the casting to be inspected at a location where the walls are reasonably parallel and smooth (inside and outside diameter) and the surface condition is representative of the surface being inspected. Adjust the gain of the instrument until the back reflection signal height is 1.5 in. [40 mm] (S/P). Increase the inspection sensitivity by a factor of six times (16 dB) by use of the calibrated control or attenuator. A significant change in surface finish requires a compensating adjustment to the gain.

15.3.8.1 Rejectable indications on as-cast surfaces may be reevaluated by surface preparation to 250 $\mu\text{in.}$ [6.3 μm] finish or better, and re-inspected in accordance with 15.3.7 of this practice.

15.3.8.2 It should be noted that some instruments are equipped with decibel calibrated gain controls, in which case the decibel required to increase the sensitivity must be added. Other instruments have decibel calibrated attenuators, in which case the required decibel must be removed. Still other instruments do not have calibrated gains or attenuators. They require external attenuators.

16. Scanning

16.1 Grid Pattern — The surface of the casting shall be laid out in a 12 by 12 in. [300 by 300 mm] or any

similar grid pattern for guidance in scanning. Grid numbers shall be stenciled on the casting for record purposes and for grid area identity. The stenciled grid number shall appear in the upper right hand corner of the grid. When grids are laid out on the casting surface and they encompass different quality levels, each specific area shall be evaluated in accordance with the requirements of the specific quality level designated for that area.

16.2 Overlap — Scan over the surface allowing 10% minimum overlap of the working diameters of the search unit.

16.3 Inspection Requirements — All surfaces specified for ultrasonic (UT) shall be completely inspected from both sides, whenever both sides are accessible. The same search unit used for calibration shall be used to inspect the casting.

17. Additional Transducer Evaluation

17.1 Additional information regarding any ultrasonic indication may be obtained through the use of other frequency, type, and size search unit.

18. Acceptance Criteria

18.1 Rejectable Conditions — The locations of all indications having amplitudes greater than the 0.5 in. [13 mm] line given in 15.3.6, when amplitude three times (machined surfaces) or six times (cast surfaces) shall be marked on the casting surface. The boundary limits of the indication shall be determined by marking a sufficient number of marks on the casting surfaces where the ultrasonic signal equals one half the reference amplitude, 0.25 in. [6 mm]. To completely delineate the indication, draw a line around the outer boundary of the center of the number of marks to form the indication area. Draw a rectangle or other regular shape through the indication in order to form a polygon from which the area may be easily computed. It is not necessary that the ultrasonic signal exceed the amplitude reference line over the entire area. At some locations within the limits of the indication, the signal may be less than the reference line, but nevertheless still present such that it may be judged as a continuous, signal indication. Rejectable conditions are as follows and when any of the conditions listed below are found, the indications shall be removed and repair welded to the applicable process specification.

18.2 Linear Indications — A linear indication is defined as one having a length equal to or greater than three times its width. An amplitude of $\frac{1}{2}$ in. [13 mm], such as would result from tears or stringer type slag inclusion, shall be removed.

18.3 Non-Linear Indications:

18.3.1 Isolated Indications — Isolated indications shall not exceed the limits of the quality level designated by the customer's purchase order listed in Table 3. An isolated indication may be defined as one for which the distance between it and an adjacent indication is greater than the longest dimension of the larger of the adjacent indications.

18.3.2 Clustered Indications — Clustered indications shall be defined as two or more indications that are confined in a 1 in. [25 mm] cube. Clustered indications shall not exceed the limits of the quality level designated by the customer purchase order in Table 4. Where the distance between indications is less than the lowest dimension of the largest indication in the group, the cluster shall be repair welded.

18.3.3 The distance between two clusters must be greater than the lowest dimension of the largest indication in either cluster. If they are not, the cluster having the largest single indication shall be removed.

18.3.4 All indications, regardless of their surface areas as indicated by transducer movement on the casting surface and regardless of the quality level required, shall not have a through wall distance greater than $\frac{1}{3}T$, where T is the wall thickness in the area containing the indication.

18.3.5 Repair welding of cluster-type indications need only be the extent necessary to meet the applicable quality level for that particular area. All other types of rejectable indications shall be completely removed.

18.3.6 Repair welds of castings shall meet the quality level designated for that particular area of the casting.

18.3.7 Any location that has a 75% or greater loss in back reflection and exceeds the area of the applicable quality level, and whose indication amplitudes may or may not exceed the 0.5 in. [13 mm] rejection line, shall be rejected unless the reason for the loss in back reflection can be resolved as not being caused by an indication. If gain is added and back echo is achieved without indication percent amplitude exceeding the 0.5 in. [13 mm] rejection line, the area should be accepted.

19. Records

19.1 Stenciling — Each casting shall be permanently stenciled to locate inspection zones or grid pattern for ease in locating areas where rejectable indications were observed.

19.2 Sketch — A report showing the exact depth and surface location in relation to the stencil numbers shall be made for each rejectable indicator found during each inspection.

19.2.1 The sketch shall also include, but not be limited to, the following:

19.2.1.1 Part identification numbers.

19.2.1.2 Purchase order numbers.

19.2.1.3 Type and size of supplemental transducers used.

19.2.1.4 Name of inspector.

19.2.1.5 Date of inspection.

20. Product Marking

20.1 Any rejectable areas (those indications exceeding the limits of Section 19) shall be marked on the casting as the inspection progresses. The point of marking shall be the center of the search unit.

FIG. 1 ULTRASONIC STANDARD REFERENCE BLOCK

NOTE 1—Opposite ends of reference block shall be flat and parallel within 0.001 in. [0.025 mm].

NOTE 2—Bottom of flat-bottom hole shall be flat within 0.002-in. [0.051 mm] and the finished diameter shall be $\frac{1}{4} + 0.002$ in. [6.4 + 0.050 mm].

NOTE 3—Hole shall be straight and perpendicular to entry surface within 0°, 30 min and located within $\frac{1}{32}$ in. [0.80 mm] of longitudinal axis.

NOTE 4—Counter bore shall be $\frac{1}{2}$ in. [15.0 mm] diameter by $\frac{1}{8}$ in. [5 mm] deep.

FIG. 2 ULTRASONIC STANDARD REFERENCE BLOCK FOR DUAL-SEARCH UNIT CALIBRATION

NOTE 1—Entrant surface shall be 250 μ in. [6.3 μ m] or finer.

NOTE 2—The 3/32-in. [2.4 mm] flat-bottom hole must be flat within 0.002 in. [0.05 mm]. Diameter must be within +0.005 in. [0.13 mm] of the required diameter. Hole axis must be perpendicular to the block and within an angle of 0°, 30 min.

NOTE 3—Hole shall be plugged following checking for ultrasonic response.

in.	[mm]	in.	[mm]
1/8	[3]	1 1/4	[32]
1/4	[6]	1 1/2	[38]
1/2	[13]	1 3/4	[44]
3/4	[19.0]	2	[50]
1	[25]	10	[254]

FIG. 3 CALIBRATION BLOCKS

Dimensions, in. [mm]		Material
2 [50]	1/2 [13]	Specification A 217/A 217M, Grade WC6 or acoustically similar within $\pm 20\%$ or 2 dB.
2 [50]	2 [50]	
3 [75]	5 [125]	
6 [150]	10 [250]	

Tolerance

All sides to be flat within 0.0002 in. [0.01 mm] and parallel with 0.001 in. [0.03 mm].

FIG. 4 BASIC CALIBRATION BLOCK FOR ANGLE BEAM EXAMINATION

- L = length of block determined by the angle of search unit and the vee-path used,
 T = thickness of basic calibration block (see Table 5),
 D = depth of side-drilled hole (see Table 5),
 d = diameter of side-drilled hole (see Table 5),
 t = nominal production material thickness.

TABLE 1
DIMENSIONS AND IDENTIFICATION OF REFERENCE BLOCKS IN THE BASIC SET
(SEE FIG. 1)

Hole Diameter in $\frac{1}{64}$ ths, in. [mm]	Metal Distance (B), in. ^A [mm]	Overall Length (C), in. ^A [mm]	Width or Diameter (D), min, in. [mm]	Block Identification Number
16 [0.70]	1 [25]	$1\frac{3}{4}$ [45]	2 [50]	16-0100
16 [0.70]	2 [50]	$2\frac{3}{4}$ [70]	2 [50]	16-0200
16 [0.70]	3 [75]	$3\frac{3}{4}$ [95]	2 [50]	16-0300
16 [0.70]	6 [150]	$6\frac{3}{4}$ [170]	3 [75]	16-0600
16 [0.70]	10 [255]	$10\frac{3}{4}$ [275]	4 [100]	16-1000
16 [0.70]	B	$B + \frac{3}{4}$ [B + 20]	5 [125]	16-B00 ^B

^A Tolerance $\pm \frac{1}{8}$ in. [3 mm].

^B Additional supplemental blocks for testing thickness greater than 10 in. [250 mm], see 4.3.3.

TABLE 2
REJECTION LEVEL

Ultrasonic Testing Quality Level	Area, in. ² [cm ²] (see 10.2.1 and 10.2.2)	Length, max, in. [mm]
1	0.8 [5]	1.5 [40]
2	1.5 [20]	2.2 [55]
3	3 [20]	3.0 [75]
4	5 [30]	3.9 [100]
5	8 [50]	4.8 [120]
6	12 [80]	6.0 [150]
7	16 [100]	6.9 [175]

NOTE 1 — The areas in the table refer to the surface area on the casting over which a continuous indication exceeding the amplitude reference line or a continuous loss of back reflection of 75% or greater is maintained.

NOTE 2 — Areas shall be measured from the center of the search unit.

NOTE 3 — In certain castings, because of very long test distances or curvature of the test surface, the casting surface area over which a given discontinuity is detected may be considerably larger or smaller than the actual area of the discontinuity in the casting; in such cases a graphic plot that incorporates a consideration of beam spread should be used for realistic evaluation of the discontinuity.

TABLE 3
ACCEPTANCE CRITERIA FOR SINGLE ISOLATED INDICATIONS

Quality Level	Maximum Non-Linear Indication, Area, in. ² [cm ²]	Position of Indication
1	0	E
2	1 [6]	E
3	1 [6]	O
	2 [13]	C
4	3 [19]	E
5	3 [19]	O
	5 [32]	C
6	5 [32]	E
7	5 [32]	O
	7 [45]	C
8	7 [45]	E
9	7 [45]	O
	9 [58]	C
10	9 [58]	E
11	9 [58]	O
	11 [71]	C

NOTES:

(1) The area measured by movement of the center of the transducer over the casting surface.

(2) O = outer wall $\frac{1}{3}$, or inner wall $\frac{1}{3}$.

C = mid wall $\frac{1}{3}$.

E = entire wall.

TABLE 4
ACCEPTANCE CRITERIA FOR CLUSTERED INDICATIONS

Quality Level	Cumulative Area of Indications, in. ² [cm ²] ^{A,B}	Minimum Area in Which Indications Must be Dispersed, in. ² [cm ²] ^C
1	0	0
2-3	2 [13]	36 [232]
4-5	4 [26]	36 [232]
6-7	6 [39]	36 [232]
8-9	8 [52]	36 [232]
10-11	10 [64]	36 [232]

^A Regardless of wall location, that is midwall $\frac{1}{3}$, innermost $\frac{1}{3}$, or outermost $\frac{1}{3}$.

^B Each indication that equals or exceeds the 0.5 in. [18 mm] reference line shall be traced to the position where the indication is equal to 0.25 in. [6 mm]. The area of the location, for the purpose of this evaluation, shall be considered the area that is confined within the outline established by the center of the transducer during tracing of the flaw as required. Whenever no discernible surface tracing is possible, each indication which equals or exceeds the 0.5 in. reference amplitude shall be considered 0.15 in.² [1 cm²] (three times the area of the $\frac{1}{4}$ diameter [6 mm] flat bottomed hole to compensate for reflectivity degradation of natural flaw) for the cumulative area estimates.

^C The indications within a cluster with the cumulative areas traced shall be dispersed in a minimum surface area of the casting equal to 36 in.² [230 cm²]. If the cumulative areas traced are confined with a smaller area of distribution, the area shall be repair welded to the extent necessary to meet the applicable quality level.

TABLE 5
DIMENSIONS OF CALIBRATION BLOCKS FOR ANGLE-BEAM EXAMINATION

Nominal Production Material Thickness (<i>t</i>), in. [mm]	Basic Calibration Block Thickness (<i>T</i>), in. [mm]	Hole Diameter (<i>d</i>), in. 1.002 [mm $\pm$ 0.05]	Minimum Depth (<i>D</i>), in. [mm]
Up to 1 [25] incl	1 [25] or <i>t</i>	$\frac{3}{32}$ [2.4]	1 $\frac{1}{2}$ [40]
Over 1 to 2 [25-50]	2 [50] or <i>t</i>	$\frac{1}{8}$ [3.2]	1 $\frac{1}{2}$ [40]
Over 2 to 4 [50-100]	4 [100] or <i>t</i>	$\frac{3}{16}$ [4.8]	1 $\frac{1}{2}$ [40]
Over 4 to 6 [100-150]	6 [150] or <i>t</i>	$\frac{1}{4}$ [6.3]	1 $\frac{1}{2}$ [40]
Over 6 to 8 [150-200]	8 [200] or <i>t</i>	$\frac{5}{16}$ [7.9]	1 $\frac{1}{2}$ [40]
Over 8 to 10 [200-250]	10 [250] or <i>t</i>	$\frac{3}{8}$ [9.5]	1 $\frac{1}{2}$ [40]
Over 10 [250]	<i>t</i>	See Note 1	1 $\frac{1}{2}$ [40]

NOTE 1 — For each increase in thickness of 2 in. [50 mm], or a fraction thereof, the hole diameter shall increase $\frac{1}{16}$ in. [1.6 mm].

NOTE 2 — For block sizes over 3 in. [75 mm] in thickness, *T*, the distance from the hole to the end of the block shall be $\frac{1}{2}$ *T*, min, to prevent coincident reflections from the hole and the corner. Block fabricated with a 2 in. [50 mm] minimum dimension need not be modified if the corner and hole indications can be easily resolved.

SUPPLEMENTARY REQUIREMENTS

The following supplementary requirement shall be applied only when agreed upon between the purchaser and the supplier to achieve an effective examination of a critical casting area that cannot be effectively examined using a longitudinal beam as a result of casting design or possible discontinuity orientation.

S1. Angle Beam Examination of Steel Castings

S1.1 Equipment:

S1.1.1 Examination Instrument — Examination shall be conducted with an ultrasonic, pulsed-reflection type of system generating frequencies of at least 0.4 to 5 MHz. Properties of the electronic apparatus shall be the same as those specified in 4.1.

S1.1.2 Search Units — Angle-beam search units shall produce an angle beam in steel in the range from 30 to 75° inclusive, measured to the perpendicular of the entry surface of the casting being examined. It is preferred that search units shall have frequency of 0.4 to 5 MHz.

S1.1.3 Calibration Blocks — A set of blocks, as shown in Fig. 4, with as cast surface equivalent to SCRATA Comparator A3 and of a thickness comparable to the sections being examined with side-drilled holes at $\frac{1}{4}t$, $\frac{1}{2}t$, and $\frac{3}{4}t$ (where t = thickness of the block) shall be used to establish an amplitude reference line (ARL).

S1.2 Calibration of Equipment:

S1.2.1 Construct the distance amplitude correction curve by utilizing the responses from the side-drilled holes in the basic calibration block for angle beam examination as shown in Fig. 4 and Table 5.

S1.2.1.1 Resolve and mark the amplitudes of the $\frac{1}{4}t$ and $\frac{1}{2}t$ side-drilled holes from the same surface. The side-drilled hole used for the $\frac{1}{4}t$ amplitude may be used to establish the $\frac{3}{4}t$ amplitude from the opposite surface or a separate hole may be used.

S1.2.1.2 Connect the $\frac{1}{4}t$, $\frac{1}{2}t$, and $\frac{3}{4}t$ amplitudes to establish the applicable DAC.

S1.2.2 The basic calibration blocks shall be made of material that is acoustically similar to the casting being examined.

S1.2.3 Do not use basic calibration blocks with as cast surface equivalent to SCRATA Comparator A3 to

examine castings with surface rougher than SCRATA Comparator A3. Use a machined calibration block for machined surfaces.

S1.2.4 The search unit and all instrument control settings remain unchanged except the attenuator or calibrated gain control.

S1.2.4.1 The attenuator or calibrated gain control may be used to change the signal amplitude during examination to permit small amplitude signals to be more readily detected. Signal evaluation is made by returning the attenuator or calibrated gain control to its original setting.

S1.3 Data Reporting — The supplier's report of final ultrasonic examination shall contain the following data:

S1.3.1 The total number, location, amplitude, and area of all indications equal to or greater than 100% of the distance amplitude curve.

S1.3.2 The examination frequency, type of instrument, type, and size of search units employed, couplant, transfer method, examination operator, supplier's identifying numbers, purchase order number, date, and authorized signature.

S1.3.3 A sketch showing the physical outline of the casting, including dimensions of all areas not examined due to geometric configuration, with the location of all indications in accordance with S1.3.1.

S1.4 Acceptance Standards — Acceptance quality levels shall be established between the purchaser and the manufacturer on the basis of one or more of the following criteria:

S1.4.1 No indication equal to or greater than the DAC over an area specified for the applicable quality level of Table 2.

S1.4.2 Other criteria agreed upon between the purchaser and the manufacturer.

SPECIFICATION FOR PRESSURE VESSEL PLATES, CARBON STEEL, HIGH STRENGTH, FOR MODERATE AND LOWER TEMPERATURE SERVICE

SA-612/SA-612M

[Identical with ASTM Specification A 612/A 612M-03(R07).]

1. Scope

1.1 This specification covers killed carbon-manganese-silicon steel plates intended for welded pressure vessels in service at moderate and lower temperatures.

1.2 The maximum thickness of plates supplied under this specification is 1 in. [25 mm].

1.3 For plates produced from coil and furnished without heat treatment or with stress relieving only, the additional requirements, including additional testing requirements and the reporting of additional test results, of Specification A 20/A 20M apply.

1.4 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification.

2. Referenced Documents

2.1 ASTM Standards:

- A 20/A 20M Specification for General Requirements for Steel Plates for Pressure Vessels
- A 435/A 435M Specification for Straight-Beam Ultrasonic Examination of Steel Plates
- A 577/A 577M Specification for Ultrasonic Angle-Beam Examination of Steel Plates
- A 578/A 578M Specification for Straight-Beam Ultrasonic Examination of Plain and Clad Steel Plates for Special Applications

3. General Requirements and Ordering Information

3.1 Plates supplied to this product specification shall conform to Specification A 20/A 20M, which outlines the testing and retesting methods and procedures, permissible variations in dimensions and mass, quality and repair of defects, marking, loading, and so forth.

3.2 Specification A 20/A 20M also establishes the rules for ordering information that should be complied with when purchasing material to this specification.

3.3 In addition to the basic requirements of this specification, certain supplementary requirements are available where additional control, testing, or examination is required to meet end use requirements.

3.4 The purchaser is referred to the listed supplementary requirements in this specification and to the detailed requirements in Specification A 20/A 20M.

3.5 Coils are excluded from qualification to this specification until they are processed into finished plates. Plates produced from coil means plates that have been cut to individual lengths from coil. The processor directly controls, or is responsible for, the operations involved in the processing of coils into finished plates. Such operations include decoiling, leveling, cutting to length, testing, inspection, conditioning, heat treatment (if applicable), packaging, marking, loading for shipment, and certification.

NOTE 1 — For plates produced from coil and furnished without heat treatment or with stress relieving only, three test results are reported for each qualifying coil. Additional requirements regarding plates from coil are described in Specification A 20/A 20M.

3.6 If the requirements of this specification are in conflict with the requirements of Specification A 20/A 20M, the requirements of this specification shall prevail.

4. Materials and Manufacture

4.1 *Steelmaking Practice*— The steel shall be killed and shall conform to the fine austenitic grain size requirement of Specification A 20/A 20M.

5. Heat Treatment

5.1 Plates are normally supplied in the as-rolled condition. Plates may be ordered normalized or stress relieved, or both.

6. Chemical Composition

6.1 The steel shall conform to the requirements as to chemical composition given in Table 1 unless otherwise modified in accordance with Supplementary Requirement S17, Vacuum Carbon-Deoxidized Steel, in Specification A 20/A 20M.

7. Mechanical Properties

7.1 *Tension Test*— The plates, as represented by the tension test specimens, shall conform to the requirements given in Table 2.

TABLE 1
CHEMICAL REQUIREMENTS

Elements	Composition, %
Carbon, max:	
Heat analysis	0.25
Product analysis	0.29

Elongation in 2 in. [50 mm], min, % ^B	22	22

^A Determined by either the 0.2% offset method or the 0.5% extension-under-load method.

^B See Specification A 20/A 20M for elongation adjustments.

SUPPLEMENTARY REQUIREMENTS

Supplementary requirements shall not apply unless specified in the purchase order.

A list of standardized supplementary requirements for use at the option of the purchaser are included in Specification A 20/A 20M. Those that are considered suitable for use with this specification are listed by title.

SPECIFICATION FOR PRECIPITATION HARDENING IRON BASE SUPERALLOY BARS, FORGINGS, AND FORGING STOCK FOR HIGH-TEMPERATURE SERVICE

SA-638/SA-638M

[Identical with ASTM Specification A 638/A 638M-00(R04) except for an editorial correction in 6.2.]

1. Scope

1.1 This specification covers hot-finished or cold-finished precipitation hardening iron base superalloy bars, forgings, and forging stock for high-temperature service. The mechanical properties of these alloys are developed by suitable solution treating and precipitation hardening treatments.

1.2 Two grades of iron base alloy are covered. Selection will depend upon design, service conditions, mechanical properties, and elevated temperature characteristics.

1.3 The values stated in either inch-pound units or SI (metric) units are to be regarded separately as standards; within the text and tables, the SI units are shown in [brackets]. The values stated in each system are not exact equivalents; therefore, each system must be used independent of the other. Combining values from the two systems may result in nonconformance with the specification.

1.4 Unless the order specifies an “M” designation, the material shall be furnished to inch-pound units.

2. Referenced Documents

2.1 *ASTM Standards:*

- A 484/A 484M Specification for General Requirements for Stainless Steel Bars, Billets, and Forgings
- A 751 Test Methods, Practices, and Terminology for Chemical Analysis of Steel Products
- E 30 Test Methods for Chemical Analysis of Steel, Cast Iron, Open-Hearth Iron, and Wrought Iron

3. Ordering Information

3.1 It is the responsibility of the purchaser to specify all requirements that are necessary for material ordered

under this specification. Such requirements may include, but are not limited to, the following:

3.1.1 Quantity (weight or number of pieces).

3.1.2 Name of material (precipitation hardening iron base superalloy).

3.1.3 Form (bars, forgings, and forging stock).

3.1.4 Dimensions (in the case of rough or finished forgings the order shall be accompanied by a print or drawing or otherwise adequately described as to the shape and dimension).

3.1.5 Grade designation (Table 1).

3.1.6 Condition (Section 5).

3.1.7 Finish (Section 3).

3.1.8 Mechanical requirements (Section 8).

3.1.9 ASTM designation.

3.1.10 Special requirements.

4. General Requirements

4.1 In addition to the requirements of this specification, all requirements of the current edition of Specification A 484/A 484M shall apply. Failure to comply with the general requirements of Specification A 484/A 484M constitutes nonconformance with this specification.

5. Condition

5.1 The product forms covered in this specification may be furnished in one of the following conditions:

5.1.1 Hot-finished.

5.1.2 Solution treated (Grade 660 only — Type 1 or Type 2 solution treatment as specified).

5.1.3 Solution and precipitation treated (Grade 660 only — Type 1 or Type 2 solution treatment as specified), or

5.1.4 Other as specified.

6. Heat Treatment

6.1 Samples cut from bars, forgings, or a sample forged from the forging stock shall conform to the mechanical properties of Tables 1 and 2 when heat treated as prescribed in Table 3.

6.2 When a sample cut from the forging stock and heat treated as prescribed in Table 3 conforms to the properties in Tables 1 and 2, it shall be accepted as equivalent to a forged coupon.

7. Chemical Composition

7.1 The steel shall conform to the requirements for chemical composition specified in Table 4.

7.2 Methods and practices relating to chemical analysis required by this specification shall be in accordance with Test Methods, Practices, and Terminology A 751, except that for remelt material, product analysis tolerances may be used to determine conformance to this specification.

7.3 For referee purposes, Test Methods E 30 shall be used.

7.4 Methods and practices relating to chemical analysis required by this specification shall be in accordance with Test Methods, Practices, and Definitions A 751, except that for remelt material, product analysis tolerances may be used to determine conformance to this specification.

8. Mechanical Properties

8.1 The material shall conform to the mechanical property requirements specified in Table 1 after heat treatment as described in Table 3.

8.2 The material shall meet the requirements as to stress-rupture properties specified in Table 2 at the test temperature indicated after heat treatment as described in Table 3.

8.3 When specified in the ordering information (3.1.8), material may be ordered without stress-rupture testing. Material not stress-rupture tested shall be permanently stamped NR (See Section 10).

9. Metallurgical Properties

9.1 When specified, the grain size shall be 1 or finer.

10. Product Marking

10.1 Unless otherwise specified on the purchase order, each bundle shall be properly tagged with metal tags showing the purchase order number, heat number, name of alloy (or grade), *“NR” when material has not been stress-rupture tested*, specification number, and size.

10.1.1 Bars 1 in. [25 mm] and over in diameter, or 1 in. [25 mm] and over in thickness between parallel sides, shall be stamped with the heat number, *and if not stress-rupture tested, with the letters “NR”* within approximately 2 in. [50 mm] of one end. Smaller sizes shall be boxed or bundled and identified with metal tags as described in 10.1.

10.1.2 Forgings shall be identified as agreed upon between the seller and the purchaser.

11. Keywords

11.1 precipitation hardening superalloy steel; superalloy steel bars; superalloy steel billets; superalloy steel forgings; temperature service applications – high

TABLE 1
MECHANICAL PROPERTY REQUIREMENTS

SPECIFICATION FOR PRESSURE VESSEL PLATES, 5% AND 5½% NICKEL ALLOY STEELS, SPECIALLY HEAT TREATED

SA-645/SA-645M

(Identical with ASTM Specification A 645/A 645M-05.)

1. Scope

1.1 This specification covers specially heat treated 5% and 5½% nickel alloy steel plates intended primarily for welded pressure vessels for service at low or cryogenic temperatures.

1.2 The maximum thickness of plates which can be supplied under this specification is limited only by the capacity of the material to meet the specified requirements.

1.3 This material is susceptible to magnetization. Use of magnets in handling after heat treatment should be avoided if residual magnetism would be detrimental to subsequent fabrication or service.

1.4 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification.

2. Referenced Documents

2.1 ASTM Standards:
A 20/A 20M Specification for General Requirements for Steel Plates for Pressure Vessels

3. General Requirements and Ordering Information

3.1 Plates supplied to this product specification shall conform to Specification A 20/A 20M, which outlines the testing and retesting methods and procedures, permissible variations in dimensions and mass, quality and repair of defects, marking, loading, and so forth.

3.2 Specification A 20/A 20M also establishes the rules for the ordering information that should be complied with when purchasing plates to this specification.

3.3 In addition to the basic requirements of this specification, certain supplementary requirements are available when additional control, testing, or examination is required to meet end use requirements.

3.4 The purchaser is referred to the listed supplementary requirements in this specification and to the detailed supplementary requirements in Specification A 20/A 20M.

3.5 If the requirements of this specification are in conflict with the requirements of Specification A 20/A 20M, the requirements of this specification shall prevail.

4. Materials and Manufacture

4.1 Steelmaking Practice — The steel shall be killed and shall conform to the fine austenitic grain size requirements of Specification A 20/A 20M.

5. Heat Treatment

5.1 Grade A plates shall be heat treated in accordance with 5.2. Grade B plates shall be heat treated in accordance with 5.3. Shell plates and other parts, including heads and reinforcing pads that are heated above 1125°F [605°C] for forming, shall be heat treated after forming,

5.2 Grade A, Procedure and Sequence:

5.2.1 Hardening — The plates shall be heated to a temperature within the range from 1575 to 1675°F [855 to 915°C], held within that temperature range for a minimum of 1 h/in. [2.4 min/mm] of thickness, but in no case less than 15 min, and then water-quenched to below 300°F [150°C].

5.2.2 Intermediate Heat Treatment — The plates shall be reheated to a temperature within the range from 1275 to 1400°F [690 to 760°C], held within that temperature range for a minimum of 1 h/in. [2.4 min/mm] of thickness, but in no case less than 15 min, and then water-quenched to below 300°F [150°C].

5.2.3 Tempering — The plates shall be reheated to a temperature within the range from 1150 to 1225°F [620 to 665°C], held within that temperature range for a minimum of 1 h/in. [2.4 min/mm] of thickness, but in no case less than 15 min, and then water-quenched or air cooled to below 300°F [150°C].

5.3 Grade B, Procedure and Sequence:

5.3.1 Hardening — The plates shall be heated to a temperature within the range from 1470 to 1600°F [800 to 870°C], held within that temperature range for a sufficient time to obtain uniform temperature throughout the plate thickness, and then quenched in a liquid medium.

5.3.2 Intermediate Heat Treatment — The plates shall be reheated to a temperature within the range from 1200 to 1330°F [650 to 720°C], held within that temperature range for a minimum of 1 h/in. [2.4 min/mm] of thickness, but in no case less than 15 min, and then water-quenched to below 300°F [150°C] for nominal plate thicknesses over $\frac{5}{8}$ in. [16 mm], or cooled in air or water-quenched to below 300°F [150°C] for nominal plate thicknesses of $\frac{5}{8}$ in. [16 mm] and under.

5.3.3 Tempering — The plates shall be reheated to a temperature within the range from 1020 to 1150°F [550 to 620°C], held within that temperature range for a minimum of 30 min/in. [1.2 min/mm] of thickness, but in no case less than 15 min, and then water-quenched to below 300°F [150°C].

6. Chemical Requirements

6.1 The steel shall conform to the chemical requirements given in Table 1 unless otherwise modified in accordance with Supplementary Requirement S17, Vacuum Carbon-Deoxidized Steel, in Specification A 20/A 20M.

7. Mechanical Requirements

7.1 Tension Tests — The plates as represented by the tension test specimens shall conform to the requirements given in Table 2.

7.1.1 For nominal plate thicknesses of $\frac{3}{4}$ in. [20 mm] and under, the $1\frac{1}{2}$ in. [40 mm] wide rectangular specimen may be used for the tension test, and the elongation may be determined in a 2 in. [50 mm] gage length that includes the fracture and that shows the greatest elongation.

7.2 Impact Tests:

7.2.1 Charpy V-notch tests shall be made in accordance with the general requirements of Specification A 20/A 20M.

7.2.2 The longitudinal axis of the test specimens shall be transverse to the final direction of rolling of the plate.

7.2.3 Unless otherwise agreed, the plates shall be impact tested at the following temperatures:

7.2.3.1 Grade A: -220°F [-140°C].

7.2.3.2 Grade B: -320°F [-195°C].

7.2.4 Each specimen shall have a lateral expansion opposite the notch of not less than 0.015 in. [0.38 mm].

7.2.5 The values of energy absorption in foot-pounds-force [joules] and the fracture appearance in percent shear shall be recorded and reported for information.

8. Keywords

8.1 alloy steel; alloy steel plate; pressure containing parts; pressure vessel steels; steel plates; steel plates for pressure vessel applications

SUPPLEMENTARY REQUIREMENTS

A list of standardized supplementary requirements for use at the option of the purchaser is included in Specification A 20/A 20M. Supplementary requirements shall not apply unless specified in the order. Those which are considered suitable for use with this specification are listed below by title. Others enumerated in Specification A 20/A 20M may be used with this specification subject to agreement by the supplier.

ADDITIONAL SUPPLEMENTARY REQUIREMENTS

Also listed below are additional supplementary requirements which are considered suitable for use with this specification.

S64. Longitudinal Charpy Impact Energy Absorption Requirement

S64.1 When required, the purchaser may specify longitudinal Charpy V-notch impact testing to energy-absorption acceptance criteria.

S64.2 Tests shall be conducted in accordance with the general requirements of Specification A 20/A 20M.

S64.3 The longitudinal Charpy V-notch impact properties shall not be less than those shown in Table S1.

S64.4 The impact values obtained on subsize specimens shall not be less than the values listed in Table S1.

S65. Transverse Charpy Impact Energy Absorption Requirement

S65.1 When required, the purchaser may specify transverse Charpy V-notch impact testing to energy-absorption acceptance criteria.

S65.2 Tests shall be conducted in accordance with the general requirements of Specification A 20/A 20M.

S65.3 The transverse Charpy V-notch impact properties shall not be less than those shown in Table S2.

S65.4 The impact values obtained on subsize specimens shall not be less than the values listed in Table S2.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR FORGED STEEL ROLLS USED FOR CORRUGATING PAPER MACHINERY

SA-649/SA-649M

(Identical with ASTM Specification A 649/A 649M-04)

1. Scope

1.1 This specification covers two kinds of rolls used in machinery for producing corrugated paperboard. Rolls are fabricated of forged bodies and trunnions. The trunnions may be bolted or shrink assembled on one or both ends of the body. A seal weld may be made at the body/trunnion interface. Roll shells are made of carbon/manganese, or low alloy steel as hereinafter described, and are heat treated prior to assembly. Pressure rolls are surface hardened. Provision is made in Supplementary Requirement S1 for the optional surface hardening of corrugating rolls.

1.2 Corrugating and pressure rolls made to this specification shall not exceed 30 in. [760 mm] in inside diameter. The wall thickness of the roll body shall not be less than $\frac{1}{12}$ of the inside diameter or 1 in. [25 mm], whichever is greater, but shall not exceed 4 in. [100 mm]. The wall thickness of the corrugating roll is measured at the bottom of the corrugations in the location of the trunnion fit. The maximum design temperature (MDT) of the roll is 600°F [315°C] and the maximum allowable working pressure (MAWP) is 250 psi [1.7 MPa]. The minimum design temperature shall be 40°F [4°C] for roll wall thicknesses up to 3 in. [75 mm]. For roll wall thicknesses over 3 in. [75 mm] to 4 in. [100 mm], the minimum design temperature shall be 120°F [50°C]. The maximum stresses on the roll bodies from the combined internal and external loading are limited to 18 750 psi [129 MPa] for the Class 2 pressure roll bodies, and 20 000 psi [138 MPa] for Class 1A, 1B, or 5 pressure or corrugating roll bodies in Grades 1 or 2. For the trunnions, the maximum stresses from the combined internal and external loading are limited to 15 000 psi [103.4 MPa] for Classes 3 or 4, or 20 000 psi [138 MPa] for Classes 1A, 1B, or 5 in Grade 2 only. The Grade 1 strength level is not permissible for trunnions.

1.3 Referring to Table 1, material to Classes 1A, 1B, or 5 shall be used for the manufacture of corrugating or

pressure roll shells, and Class 2 shall be used only for pressure roll shells. Trunnions shall be made from forgings in Classes 1A, 1B, or 5 in Grade 2 strength level as restricted by Footnote B in Table 2 or in forgings in either Class 3 or 4.

1.4 The values stated in either inch-pound units or SI [metric] units are to be regarded separately as standards. Within the text and tables, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independent of the other. Combining values from the two systems may result in nonconformance with the specification.

1.5 Unless the order specifies the applicable “M” specification designation, the material shall be furnished to the inch-pound units.

1.6 Except as specifically required in this standard, all of the provisions of Specification A 788 apply.

2. Referenced Documents

2.1 ASTM Standards:

- A 275/A 275M Test Method for Magnetic Particle Examination of Steel Forgings
- A 370 Test Methods and Definitions for Mechanical Testing of Steel Products
- A 788 Specification for Steel Forgings, General Requirements
- E 165 Practice for Liquid Penetrant Examination

3. Ordering Information

3.1 Material supplied to this specification shall conform to the requirements of Specification A 788, which outlines additional ordering information, manufacturing requirements, testing and retesting methods and procedures, marking, certification, product analysis variations and additional supplementary requirements.

3.2 In addition to the ordering requirements of Specification A 788, the purchaser shall include the maximum design temperature (MDT), if lower than 600°F [315 °C], and the maximum allowable working pressure (MAWP), if lower than 250 psi [1.7 MPa] as allowed in 1.2 of the Scope.

3.3 If the requirements of this specification are in conflict with the requirements of Specification A 788, then the requirements of this specification shall prevail.

4. Materials and Manufacture

4.1 Forging Process:

4.1.1 Roll body forgings may be made as solid forgings and subsequently bored.

4.1.2 Trunnions or gudgeons which are to be subsequently assembled to form the roll shall be made as a solid forging or where practical upset from segments cut from billets or bars.

4.2 Heat Treatment:

4.2.1 Heat Treatment for Mechanical Properties (*Requirements do not apply to surface treatment*):

4.2.1.1 Machining — The forged roll body shall have all surfaces rough machined, including boring, prior to heat treatment for mechanical properties.

4.2.1.2 Roll bodies shall be normalized, liquid quenched, and tempered to produce the required mechanical properties, except that for Class 2 forgings, and when Grade 2 strength requirements are specified, a normalize and temper heat treatment may be applied.

4.2.1.3 The trunnions shall be normalized and tempered or annealed to produce the required mechanical properties.

4.2.2 Surface Hardening of Pressure Roll Forgings — The working face of pressure rolls shall be surface hardened either before or after fitting the trunnions, at the manufacturer's option.

4.3 Assembly and Weld — Except for integrally forged or bolted-on trunnions, the assembly shall be made by shrink fitting trunnions into the prepared body ends. If used, welding of the trunnion to the roll body is restricted to a $\frac{3}{8}$ in. [9.5 mm] max. seal weld, made with low hydrogen materials. A minimum preheat of 400°F [205°C] and a minimum post weld heat treatment of 850°F [455°C] for 8 h shall be used. The maximum post weld heat treatment shall be not higher than $t - 50^\circ\text{F}$ [$t - 28^\circ\text{C}$] where t is the final tempering temperature. All welds shall be machined or ground for the final magnetic particle or liquid penetrant examination.

5. Chemical Composition

5.1 The steel shall conform to the requirements for chemical composition prescribed in Table 1.

6. Mechanical Properties

6.1 Tensile Requirements:

6.1.1 The material shall conform to the requirements for tensile properties prescribed in Table 2 when tested in accordance with Test Methods and Definitions A 370. Tension test specimens shall be the standard round $\frac{1}{2}$ in. [12.5 mm] diameter, 2 in. [50 mm] gage length. The yield strength prescribed in Table 2 shall be determined by the 0.2% offset method.

6.1.1.1 Tests for acceptance shall be made after the heat treatment of the forgings, for mechanical properties in accordance with 4.2.1.

6.1.2 Number, Location, and Orientation of Test Specimens:

6.1.2.1 Roll Body Forgings — A full-size prolongation shall be provided on a roll body forging representing each heat of steel in each heat-treatment furnace charge. One longitudinal tension test specimen shall be taken from the prolongation and the axis of the specimen shall be located midway between the inner and outer surfaces of the wall body.

6.1.2.2 Trunnions — Test material shall be provided from each heat of steel in each heat-treatment furnace charge. One longitudinal tension specimen shall be taken from each test piece and the axis of the specimen shall be located at any point midway between the center and surface of the solid forging.

6.2 Hardness:

6.2.1 Roll body forgings shall have a Brinell hardness from 352 HB to 415 HB (Grade 1) or 207 HB to 285 HB (Grade 2). No less than three hardness determinations shall be made on each roll. The hardness readings are to be taken on the outside of the roll bodies using care to prepare locations for tests that are free of decarburization but not so deep as to affect the usefulness of the material.

6.2.2 The surface hardened pressure roll body forgings shall have a hardness of 58 HRC to 65 HRC or equivalent. No less than three hardness determinations shall be made on each roll. The hardness depth shall not exceed $\frac{1}{4}$ [6 mm].

7. Retreatment

7.1 If the results of the mechanical tests of any forging do not conform to the specified requirements, the manufacturer may retreat the forging one or more times, but not

more than three additional times without approval of the purchaser.

8. Magnetic Particle Examination

8.1 The entire surface of the roll, including the seal weld area, shall be examined by either a wet continuous method in accordance with Test Method A 275/A 275M or by a liquid penetrant method in accordance with Practice E 165 after machining or grinding. The use of prods in the magnetic particle method is not permitted.

8.2 Only indications with major dimensions greater than $\frac{1}{8}$ in. [3.2 mm] are considered relevant.

8.3 Acceptance Standards — The following relevant indications are unacceptable:

8.3.1 Any linear indications greater than $\frac{3}{16}$ in. [4.8 mm] long.

8.3.2 Rounded indications greater than $\frac{3}{16}$ in. [4.8 mm].

8.3.3 Four or more indications in a line separated by $\frac{1}{16}$ in. [1.6 mm] or less edge to edge.

8.3.4 Ten or more indications in any 6 in.² [38.71 cm²] of surface.

9. Hydrostatic Testing

9.1 The machined roll assembly shall be hydrostatic tested at $1\frac{1}{2}$ times the maximum allowable working pressure (MAWP). The MAWP pressure shall be furnished by the purchaser.

9.2 The recommended minimum hydrostatic test temperature is 70°F [21°C].

10. Marking, Packaging, and Loading

10.1 In addition to the marking requirements of Specification A 788, the MDT and the MAWP shall be included together with any required application code marking.

10.2 Packaging and loading shall be done so that the forging is not damaged during shipment to the purchaser.

11. Keywords

11.1 internal pressure; machinery—corrugating; roll assembly—forged; rolls—corrugating; rolls—pressure; steel forgings—alloy; steel forgings—carbon; steel rolls; surface-hardened; trunnions—bolted; trunnions—shrink-fitted

NOTE:

(A) When vacuum carbon deoxidation (VCD) is used the silicon content shall be 0.10% maximum.

TABLE 2
TENSILE REQUIREMENTS

Class	Grade	Yield Strength, min (A)		Tensile Strength, min		Elongation in 2 in. or 50 mm, %, min	Reduction of Area, %, min
		ksi	MPa	ksi	MPa		
1A, 1B or 5	1	130	890	150	1030	12.0	30
1A, 1B or 5	2 (B)	65	450	100	690	14.0	30
2	...	37.5	260	75	515	20.0	50.0
3 or 4	...	30	205	60	415	22.0	55

NOTES:

(A) 0.2% offset.

(B) For trunnion application, a maximum tensile strength of 125 ksi [860 MPa] applies for Grade 2 of Classes 1A, 1B, or 5.

SUPPLEMENTARY REQUIREMENTS

The following supplementary requirements shall apply only when specified by the purchaser on the order and agreed to by the manufacturer:

S1. Surface-Hardened Corrugating Rolls

S1.1 After all surfaces have been machined, the outer surface of the corrugating rolls may be surface-hardened to a surface hardness of Rockwell 53 HRC to 65 HRC. The depth of hardness shall not exceed $\frac{3}{8}$ in. [9.5 mm]. A minimum of three hardness determinations shall be made on the surface. Additional hardness tests shall be made to establish the depth of hardness. The hardened surface shall be magnetic particle tested (see Section 8).

S2. Notch Toughness

S2.1 For applications where minimum notch toughness limits are required, impact testing shall be specified for

both roll bodies and trunnions. The following requirements shall be specified:

S2.1.1 Type of impact specimen and test standard (for example, ASTM Test Methods and Definitions A 370 specimen Type A or B).

S2.1.2 Minimum value for absorbed energy or lateral expansion.

S2.1.3 Test temperature.

S2.1.4 Frequency of testing.

S2.2 Trunnion and pressure rolls may be liquid quenched and tempered instead of the heat treatments specified in 4.2 when impact testing is required.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR HOT-ROLLED STRUCTURAL STEEL, HIGH-STRENGTH LOW-ALLOY PLATE WITH IMPROVED FORMABILITY

SA-656/SA-656M

(Identical with ASTM Specification A 656/A 656M-00a.)

1. Scope

1.1 This specification covers high-strength low-alloy, hot rolled structural steel plate for use in truck frames, brackets, crane booms, rail cars, and similar applications. Steels that conform to this specification offer improved formability. These steels are normally furnished as rolled. The product is furnished in two types and four strength grades as agreed upon between the producer and purchaser. These types and strength level grades are shown in the tables.

1.2 The maximum thickness of plates shall be as follows:

Grade	Plate Thickness, max in. [mm]
50	2 [50]
60	1½ [40]
70	1 [25]
80	¾ [20]

1.3 The values stated in either inch-pound units or SI units are to be regarded as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with this specification. See Appendix X3 of Specification A 6/A 6M for information on weldability.

1.4 For plate produced from coil, the additional requirements, including additional testing requirements and the reporting of additional test results, of Specification A 6/A 6M apply.

2. Referenced Documents

2.1 ASTM Standards:

A 6/A 6M Specification for General Requirements for Rolled Structural Steel Bars, Plates, Shapes, and Sheet Piling

3. Materials and Manufacture

3.1 The steel shall be made to fine grain practice.

3.2 Coiled product is excluded from qualification to this specification until it is decoiled, leveled and cut to length. Plate produced from coil means plate that have been cut to individual lengths from a coil product and are furnished without heat treatment. The processor decoils, levels, cut to length, and marks the product. The processor is responsible for performing and certifying all tests, examinations, repairs, inspections, or operations not intended to affect the properties of the material. For plate produced from coils, two test results shall be reported for each qualifying coil.

NOTE 1 — Additional requirements regarding plate produced from coil are described in Specification A 6/A 6M.

4. Chemical Composition

4.1 Heat or cast analyses shall conform to the chemical requirements listed in Table 1. Depending on thickness, grade, and intended application, variations in the chemical composition might be used within the limits of the type specified in Table 1. Where it is of particular importance, the producer should be consulted for specific chemical composition.

4.2 Product Analysis — If a product analysis is made, the material shall conform to the requirements of Table 1 subject to the product analysis tolerances of Specification A 6/A 6M.

4.3 When steel is to be welded, it is presupposed that a welding procedure suitable for the grade of steel and intended use or service will be utilized.

4.4 Unless specifically ordered, the type is at the discretion of the producer.

5. Tension Test

5.1 The material as represented by the test specimens shall conform to the requirements listed in Table 2.

6. General Requirements for Delivery

6.1 Material furnished under this specification shall conform to the requirements of the current edition of Specification A 6/A 6M, for the ordered material, unless a conflict exists in which case this specification shall prevail.

TABLE 1 CHEMICAL REQUIREMENTS

Elements	Composition, %	
	Type 3	Type 7
Carbon, max	0.18	0.18
Manganese, max	1.65	1.65
Phosphorus, max	0.025	0.025
Sulfur, max	0.035	0.035
Silicon, max	0.60	0.60
Vanadium	0.08	0.15 ^A
Nitrogen	0.020	0.020
Columbium	0.008–0.10	0.10 max ^A

^A The contents of columbium and vanadium shall additionally be in accordance with one of the following:
columbium 0.008–0.10% with vanadium < 0.008%;
columbium < 0.008% with vanadium 0.008–0.15%; or
columbium 0.008–0.10% with vanadium 0.008–0.15% and columbium plus vanadium not in excess of 0.20%.

TABLE 2 TENSILE REQUIREMENTS^A

	Grade 50 [345]	Grade 60 [415]	Grade 70 [485]	Grade 80 [550]
Yield point, min, ksi [MPa]	50 [345]	60 [415]	70 [485]	80 [550]
Tensile strength, min, ksi [MPa]	60 [415]	70 [485]	80 [550]	90 [620]
Elongation in 8 in. [200 mm], min, % ^B	20	17	14	12
Elongation in 2 in. [50 mm], min, % ^B	23	20	17	15

^A See Specimen Orientation under the Tension Tests section of Specification A 6/A 6M.

^B For plates wider than 24 in. [600 mm], the elongation requirement is reduced two percentage points for Grade 50 [345] and three percentage points for Grades 60, 70, and 80 [415, 485, and 550]. See Elongation Requirement Adjustments in the Tension Tests section of Specification A 6/A 6M.

SPECIFICATION FOR CENTRIFUGALLY CAST CARBON STEEL PIPE FOR HIGH-TEMPERATURE SERVICE

SA-660

[Identical with ASTM Specification A 660-96 (R05).]

1. Scope

1.1 This specification covers carbon steel pipe made by the centrifugal casting process intended for use in high-temperature, high-pressure service. Pipe ordered under this specification shall be suitable for fusion welding, bending, and other forming operations.

1.2 Several grades of carbon steels are covered. Their compositions are given in Table 1.

1.3 Supplementary requirements (S1 to S9) of an optional nature are provided. The supplementary requirements call for additional tests to be made, and when desired shall be so stated in the order, together with the number of such tests required.

1.4 The values stated in inch-pound units are to be regarded as the standard.

3. Ordering Information

3.1 Orders for material under this specification should include the following, as required, to describe the desired material adequately:

3.1.1 Quantity (feet, metres, or number of lengths),

3.1.2 Name of material (centrifugally cast pipe),

3.1.3 Grade (Table 1),

3.1.4 Size (outside or inside diameter and minimum wall thickness),

3.1.5 Length (specific or random), (Permissible Variations in Length Section of Specification A 530/A 530M),

3.1.6 End finish (Ends Section of Specification A 530/A 530M),

3.1.7 Optional Requirements (Sections 7.2, 8.2, 8.3, 11.1, Section 12 and S1 to S9 (Supplementary Requirements),

3.1.8 Test report required (Certification Section of Specification A 530/A 530M),

3.1.9 Specification designation, and

3.1.10 Special requirements.

4. General Requirements

4.1 Material furnished under this specification shall conform to the applicable requirements of the current edition of Specification A 530/A 530M unless otherwise provided herein.

5. Materials and Manufacture

5.1 *Machining:*

5.1.1 All centrifugally cast pipe shall have both the inner and outer surfaces machined.

5.1.2 After heat treatment, the pipe shall be machined to a finish with a roughness value no greater than 250 μin . (6.35 μm) arithmetical average deviation (AA), terms as defined in ANSI B46.1 unless otherwise specified.

5.2 *Heat Treatment:*

5.2.1 All pipe shall receive a heat treatment proper for its design and chemical composition.

5.2.2 Castings shall be heat treated after they have been allowed to cool below the transformation range.

6. Temperature Control

6.1 Furnace temperatures for heat treating shall be effectively controlled by pyrometers.

7. Chemical Requirements

7.1 The steel shall conform to the requirements as to chemical composition prescribed in Table 1.

7.2 *Product Analysis:*

7.2.1 At the request of the purchaser, a product analysis shall be made by the manufacturer on every heat.

7.2.2 The results of these analyses shall be reported to the purchaser or his representative, and shall conform to the requirements specified in Table 1.

7.2.3 If the analysis of one of the tests specified in 7.2.1 does not conform to the requirements specified, an analysis of each pipe from the same heat may be made, and all pipes conforming to the requirements shall be accepted.

8. Mechanical Requirements

8.1 *Tensile Properties:*

8.1.1 The material shall conform to the requirements as to tensile properties prescribed in Table 2.

8.1.2 *Transverse or Longitudinal Tension Test* — One test shall be made on a specimen from one end of one length of pipe representing each heat in each heat-treatment lot.

8.2 *Flattening Test:*

8.2.1 A flattening test shall be performed when requested by the purchaser or when stated by the purchaser on the order that the pipe is to be upset, swaged, expanded, bent, or formed by some other operation.

8.2.2 A flattening test need not be performed on heavy wall pipe which is not to be upset, swaged, expanded, bent, or formed in some other manner.

8.2.3 When required by 8.2, a test shall be made on specimens cut from one end of each length of pipe.

8.2.4 A flattening test when required shall be performed in accordance with the requirements for seamless and centrifugally cast pipe in the Flattening Test Requirements Section of Specification A 530/A 530M.

NOTE 1 — In heavy-walled small-diameter tubing the flattening test specimen may be bored out so that the OD/t ratio will be greater than 11.0.

8.3 *Hydrostatic Test:*

8.3.1 Each length of pipe shall be hydrostatically tested in accordance with the Hydrostatic Test Requirements Section of Specification A 530/A 530M when requested by the purchaser and stated on the order. If performance of the hydrostatic test is not required by the purchaser, the manufacturer shall guarantee pipe to pass the test and mark each length of pipe with the letters "NH" immediately following the specification number, indicating that the pipe has not been hydrostatically tested.

8.3.2 When required by 8.3, each length of pipe shall be subjected to the hydrostatic test. The test pressure shall be maintained for not less than 5 min.

9. Permissible Variation in Wall Thickness

9.1 The wall thickness shall not vary over the specified minimum wall thickness by more than 10%. There shall be no variation under the specified minimum wall thickness.

NOTE 2 — A system of standard pipe sizes has been approved by the American National Standards Institute, as ANSI B36.10. This system may be used for obtaining pipe under this specification.

10. Workmanship and Finish

10.1 The pipe shall have a finish as provided in 5.2 and it shall be reasonably straight and free from injurious defects.

11. Rework and Retreatment

11.1 *Imperfections* — The surface of the casting shall be inspected visually for cracks and hot tears. These imperfections shall be removed, and their removal verified by visual inspection of the resultant cavities. Imperfections located by inspecting with Supplementary Requirements

S7, S8, or S9 shall be removed or reduced to an acceptable size.

11.2 Blending — If removal of the imperfection does not infringe upon the minimum wall thickness, the depression may be blended uniformly into the surrounding surface.

11.3 Repair by Welding — Imperfections that infringe upon the minimum wall thickness may be repaired by welding subject to approval by the purchaser. Only qualified operators and procedures in accordance with ASME Boiler and Pressure Vessel Code, Section IX, shall be used. All weld repairs shall be inspected to the same quality standards used to inspect the pipe.

11.4 Reheat Treatment — Local or full heat treatment in accordance with 5.2 shall follow welding. Local grinding

following welding and retreating shall be considered as meeting the requirements of 5.1.

12. Product Marking

12.1 In addition to the marking prescribed in Specification A 530/A 530M, the marking shall include the wall thickness, piece mark, length and additional symbol “S” if the pipe conforms to one or more of the supplementary requirements specified in S1 to S9, and the heat number or manufacturer’s number by which the heat can be identified. Identification stamping instead of stenciling will be permitted only with the written approval of the purchaser.

12.2 Bar Coding — In addition to the requirements in 12.1, bar coding is acceptable as a supplemental identification method. The purchaser may specify in the order a specific bar coding system to be used.

TABLE 1
CHEMICAL REQUIREMENTS

	Composition, max, %		
	Grade WCA	Grade WCB	Grade WCC
Carbon	0.25 ^A	0.30	0.25 ^B
Manganese	0.70 ^A	1.00	1.20 ^B
Phosphorus	0.035	0.035	0.035
Sulfur	0.035	0.035	0.035
Silicon	0.60	0.60	0.60

^A For each reduction of 0.01% below the specified maximum carbon content, an increase of 0.04% manganese above the specified maximum will be permitted up to a maximum of 1.10%.

^B For each reduction of 0.01% below the specified maximum carbon content, an increase of 0.04% manganese above the specified maximum will be permitted to a maximum of 1.40%.

TABLE 2
TENSILE REQUIREMENTS

	WCA		WCB		WCC	
	ksi	MPa	ksi	MPa	ksi	MPa
Tensile strength, min	60	414	70	483	70	483
Yield Strength, min	30	207	36	248	40	276

Reduction of area, min, %		35		35		35

SUPPLEMENTARY REQUIREMENTS

One or more of the following supplementary requirements shall apply only when specified in the purchase order. The purchaser may specify a different frequency of test or analysis than is provided in the supplementary requirement. Subject to agreement between the purchaser and manufacturer, retest and retreatment provisions of these supplementary requirements may also be modified.

S1. Product Analysis

S1.1 Product analysis shall be made on each length of pipe. Individual lengths failing to conform to the chemical composition requirements shall be rejected.

S2. Additional Tension Tests

S2.1 An additional tension test shall be made on a specimen from one or each end of each pipe. If this supplementary requirement is specified, the number of tests per pipe required shall be specified. If a specimen from any length fails to meet the required tensile properties (tensile, yield, and elongation), that length shall be rejected subject to retreatment in accordance with Specification A 530/A 530M and satisfactory retest.

S3. Additional Flattening Tests

S3.1 The flattening test of Specification A 530/A 530M shall be made on a specimen from one end or both ends of each pipe. Crop ends may be used. If this supplementary requirement is specified, the number of tests per pipe shall also be specified. If a specimen from any length fails because of lack of ductility prior to satisfactory completion of the first step of the flattening test requirement that pipe shall be rejected subject to retreatment in accordance with Specification A 530/A 530M and satisfactory retest. If a specimen from any length of pipe fails because of a lack of soundness that length shall be rejected, unless subsequent retesting indicates that the remaining length is sound.

S4. Metal Structure and Etching Tests

S4.1 The steel shall be homogeneous as shown by etching tests conducted in accordance with the appropriate portions of Method E 381. Etching tests shall be made on a cross section from one end or both ends of each pipe and shall show sound and reasonably uniform material free from injurious laminations, cracks, and similar objectionable defects. If this supplementary requirement is specified, the number of tests per pipe required shall also be specified. If a specimen from any length shows objectionable defects, the length shall be rejected, subject to removal of the

defective end and subsequent retests indicating the remainder of the length to be sound and reasonably uniform material.

S5. Photomicrographs

S5.1 The manufacturer shall furnish one photomicrograph at 100 diameters from a specimen of pipe in the as-finished condition representing each heat in each heat-treatment lot. Such photomicrographs shall be suitably identified as to pipe size, wall thickness, and heat. No photomicrographs for the individual pieces purchased shall be required except as specified in Supplementary Requirement S6. Such photomicrographs are for information only, to show the actual metal structure of the pipe as furnished.

S6. Photographs for Individual Pieces

S6.1 In addition to the photomicrographs required in accordance with Supplementary Requirement S5, the purchaser may specify that photomicrographs shall be furnished from one or both ends of each pipe. All photomicrographs required shall be properly identified as to heat number, size, and wall thickness of pipe from which the section was taken. Photomicrographs shall be further identified to permit association of each photomicrograph with the individual length of pipe it represents.

S7. Radiographic Inspection

S7.1 The pipe shall be examined for internal defects by means of X rays or gamma rays. The inspection procedure shall be in accordance with Practice E 94 or Method E 142 and the types and severity levels of discontinuities considered shall be judged by Reference Radiographs E 446, or Reference Radiographs E 186. The extent of examination and the basis for acceptance shall be subject to agreement between the manufacturer and the purchaser. A specification which may be used as a basis for such agreement is "Quality Standard for Steel Castings for Valves, Flanges and Fittings and Other Piping Components (Radiographic Inspection Method SP-54)" of the Manufacturer's Standardization Society of the Valve and Fittings Industry.

S8. Ultrasonic Tests

S8.1 Each pipe shall be ultrasonically tested to determine its soundness throughout the entire length of the pipe. Evidence of the existence of defects in excess of 5% of the wall thickness shall be cause for rejection or repair.

S8.2 The ultrasonic test shall be made in accordance with Practice E 114, or by any other established method mutually agreed upon between the manufacturer and the purchaser.

S9. Magnetic Particle or Fluid Penetrant Examination

S9.1 Each pipe along outside and inside surfaces shall be subjected, after machining, to examination by a magnetic particle method or a penetrant fluid and powder method.

S9.2 The extent of examination and the basis for acceptance shall be subject to agreement between the manufacturer and the purchaser. Reference Photographs E 125 may be used to define acceptance criteria.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR PRESSURE VESSEL PLATES, CARBON-MANGANESE-SILICON STEEL, FOR MODERATE AND LOWER TEMPERATURE SERVICE

SA-662/SA-662M

[Identical with ASTM Specification A 662/A 662M-03(R07).]

1. Scope

1.1 This specification covers three grades of carbon-manganese-silicon steel plates intended primarily for service in welded pressure vessels where improved low temperature notch toughness is important.

1.2 The maximum thickness of plates is limited only by the capacity of the composition to meet the specified mechanical property requirements; however, current practice normally limits the maximum thickness of plates furnished under this specification to 2 in. [50 mm].

1.3 Grades A, B, and C comply substantially with the requirements of ISO Pressure Vessel Steels P9, P15, and P18, respectively.

1.4 For plates produced from coil and furnished without heat treatment or with stress relieving only, the additional requirements, including additional testing requirements and the reporting of additional test results, of Specification A 20/A 20M apply.

1.5 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification.

2. Referenced Documents

2.1 ASTM Standards:

A 20/A 20M Specification for General Requirements for Steel Plates for Pressure Vessels

A 435/A 435M Specification for Straight-Beam Ultrasonic Examination of Steel Plates

A 577/A 577M Specification for Ultrasonic Angle-Beam Examination of Steel Plates

A 578/A 578M Specification for Straight-Beam Ultrasonic Examination of Plain and Clad Steel Plates for Special Applications

3. General Requirements and Ordering Information

3.1 Plates supplied to this product specification shall conform to Specification A 20/A 20M, which outlines the testing and retesting methods and procedures, permissible variations in dimensions and mass, quality, and repair of defects, marking, loading, etc.

3.2 Specification A 20/A 20M also establishes the rules for ordering information that should be complied with when purchasing plates to this specification.

3.3 In addition to the basic requirements of this specification certain supplementary requirements are available when additional control, testing, or examination is required to meet the end use requirements.

3.4 The purchaser is referred to the listed supplementary requirements in this specification and to the detailed requirements in Specification A 20/A 20M.

3.5 Coils are excluded from qualification to this specification until they are processed into finished plates. Plates produced from coil means plates that have been cut to individual lengths from coil. The processor directly controls, or is responsible for, the operations involved in the processing of coils into finished plates. Such operations

include decoiling, leveling, cutting to length, testing, inspection, conditioning, heat treatment (if applicable), packaging, marking, loading for shipment, and certification.

NOTE 1 — For plates produced from coil and furnished without heat treatment or with stress relieving only, three test results are reported for each qualifying coil. Additional requirements regarding plates from coil are described in Specification A 20/A 20M.

3.6 If the requirements of this specification are in conflict with the requirements of Specification A 20/A 20M, the requirements of this specification shall prevail.

4. Manufacture

4.1 Steelmaking Practice —The steel shall be killed and shall conform to the fine austenitic grain size requirement of Specification A 20/A 20M.

5. Heat Treatment

5.1 All plates of Grade A and plates of Grades B and C over 1½ in. [40 mm] in thickness shall be normalized.

5.2 Plates of Grades B and C, 1½ in. [40 mm] and under in thickness, are normally supplied in the as-rolled condition. The plates may be ordered normalized or stress relieved, or both.

6. Chemical Requirements

6.1 The steel shall conform to the requirements as to chemical composition given in Table 1 unless otherwise modified in accordance with Supplementary Requirement S17, Vacuum Carbon-Deoxidized Steel, in Specification A 20/A 20M.

7. Mechanical Requirements

7.1 Tension Test Requirements —The plates, as represented by the tension test specimens, shall conform to the requirements given in Table 2.

TABLE 1
CHEMICAL REQUIREMENTS

Element	Composition, %					
	Grade A		Grade B		Grade C	
	Heat Analysis	Product Analysis	Heat Analysis	Product Analysis	Heat Analysis	Product Analysis
Carbon, max	0.14	0.17	0.19	0.22	0.20	0.24
Manganese	0.90–1.35	0.84–1.46	0.85–1.50	0.79–1.62	1.00–1.60	0.92–1.72

|--|---|

APPENDIX

(Nonmandatory Information)

X1. NOTCH TOUGHNESS

X1.1 When Charpy V-notch testing is required, the minimum values listed in Table X1.1 will be guaranteed on normalized material for the temperature specified by the purchaser.

TABLE X1.1
CHARPY V-NOTCH REQUIREMENTS^A

Testing Temperature, °F [°C]	Grade A		Grades B and C	
	Longitudinal Specimens, ft-lbf [J]	Transverse Specimens, ft-lbf [J]	Longitudinal Specimens, ft-lbf [J]	Transverse Specimens, ft-lbf [J]
−75 [−60]	20 [27]	15 [20]	15 [20]	...
−60 [−50]	30 [41]	18 [24]	20 [27]	...
−50 [−45]	35 [47]	19 [26]	22 [30]	15 [20]
−40 [−40]	40 [54]	20 [27]	25 [34]	20 [27]
−25 [−32]	45 [61]	25 [34]	30 [41]	20 [27]
0 [18]	55 [75]	30 [41]	35 [47]	25 [34]
32 [0]	70 [95]	35 [47]	40 [54]	25 [34]
75 [25]	75 [102]	40 [54]	50 [68]	30 [41]

^A The above values apply to the average of three full size specimens. Values for subsize specimens are denoted as listed in Specification A 20/A 20M.

SUMMARY OF CHANGES

The Committee has identified the location of selected changes to this specification since the last issue that may impact the use of this specification.

(1) 1.4, 3.5, and Note 1 were revised to be consistent with the terminology and requirements of Specification A 20/A 20M.

(2) 3.3 was revised to be more general.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR ANNEALED OR COLD-WORKED AUSTENITIC STAINLESS STEEL SHEET, STRIP, PLATE, AND FLAT BAR

SA-666

(Identical with ASTM Specification A 666-03)

1. Scope

1.1 This specification covers austenitic stainless steels in the annealed and normally required cold-worked conditions for various structural, architectural, pressure vessel, magnetic, cryogenic, and heat-resisting applications. (This revision of Specification A 666 replaces prior Specifications A 412 and A 177.)

1.2 The application of this specification, or the use of material covered by this specification does not automatically allow usage in pressure vessel applications. Only annealed conditions of grades specifically approved by the ASME code are permitted for pressure vessel use.

1.3 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are for information only.

2. Referenced Documents

- 2.1 ASTM Standards:**
- A 240/A 240M Specification for Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels and for General Applications
 - A 370 Test Methods and Definitions for Mechanical Testing of Steel Products
 - A 480/A 480M Specification for General Requirements for Flat-Rolled Stainless and Heat-Resisting Steel Plate, Sheet, and Strip
 - A 484/A 484M Specification for General Requirements or Stainless Steel Bars, Billets, and Forgings

3. Material Test Report and Certification

3.1 In addition to the requirements of Specification A 480/A 480M, the cold-worked condition (annealed, $\frac{1}{4}$ H, $\frac{1}{2}$ H, and so forth) shall be noted.

4. Chemical Composition

4.1 The steel shall conform to the requirements as to chemical composition specified in Table 1, and shall conform to applicable requirements specified in the current edition of Specification A 480/A 480M.

5. Mechanical Properties

5.1 The material shall conform to the mechanical properties specified in Table 2 and Table 3, or Table 2 and Table 4.

6. General Requirements

6.1 The following requirements for orders for material furnished under this specification shall conform to the applicable requirements of the current edition of Specification A 480/A 480M or A 484/A 484M:

- 6.1.1** Definitions,
- 6.1.2** General requirements for delivery,
- 6.1.3** Ordering information,
- 6.1.4** Process,
- 6.1.5** Special tests,
- 6.1.6** Heat treatment,
- 6.1.7** Dimensions and permissible variations,
- 6.1.8** Workmanship, finish and appearance,
- 6.1.9** Number of tests/test methods,
- 6.1.10** Specimen preparation,
- 6.1.11** Retreatment,
- 6.1.12** Inspection,
- 6.1.13** Rejection and reheating,
- 6.1.14** Material test report,

6.1.15 Certification, and**6.1.16** Packaging, marking, and loading.**7. Sampling**

7.1 Tension and bend-test specimens of sheet, strip, and plate products shall be selected from finished material and shall be selected in the transverse direction, except in the case of strip under 9 in. (229 mm) in width, in which case tension test specimens shall be selected in the longitudinal direction.

7.2 Flat bar tension and bend-test specimens shall be selected from the finished material and shall be in the longitudinal direction.

7.3 Corrosion samples, if required, shall be taken from material after final annealing and descaling and prior to cold working.

8. Number of Tests

8.1 For cold-worked product produced in coil form, one tension test shall be made from each end of each coil. One bend test shall be made from one end of each coil.

8.2 For cold-worked flat bar and plate products, two tension test and one bend test shall be made on each size of flat bar and each thickness of plate from each heat in a lot annealed in a single charge or under the same conditions in a continuous furnace.

8.3 Annealed material produced to Table 2 requirements shall be tested in accordance with Specification A 480/A 480M.

9. Test Methods**9.1** *Tension Test:*

9.1.1 The yield strength shall be determined by the offset method as described in Test Methods and Definitions A 370. An alternative method of determining field strength may be used based on the following total extension under load:

Yield Strength, min. psi	Total Extension under Load in 2 in. Gage Length, incl.
45 000	0.0071
75 000	0.0098
110 000	0.0125
135 000	0.0144
140 000	0.0148

9.1.2 The requirement of this specification for yield strength will be considered as having been fulfilled if the extension under load for the specified yield strength does not exceed the specified values. The values obtained in this manner should not, however, be taken as the actual yield strength for 0.2%. In case of dispute, the offset method of determining yield strength shall be used.

9.2 *Bend Test:*

9.2.1 Bend-test specimens shall withstand cold bending without cracking when subjected to either the free-bend method or the controlled-bend (V-block) method at the condition specified by Table 3 or Table 4, respectively. Specimens shall be bent around a diameter equal to the product of the bend factor times the specified thickness of the test specimen. The choice of test method for materials in conditions other than annealed shall be at the option of the seller.

9.2.2 Free-bend test specimens shall be bent cold, either by pressure or by blows. However, in the case of dispute, tests shall be made by pressure.

9.2.3 Controlled-bend (V-block) test specimens shall be bent cold by means of V-blocks or a mating punch and die having an included angle of 45° and with proper curvature of surface at the bend areas to impart the desired shape and diameter of bend to the specimen.

10. Keywords

10.1 austenitic stainless steel; cold-worked stainless steel; stainless steel flat bar; stainless steel plate; stainless steel sheet; stainless steel strip

NOTES:

(A) Types XM-10 and XM-19, which appeared in Specification A 412, do not appear as XM-10 is no longer produced and XM-19 is covered in Specification A 240/A 240M.

(B) Maximum unless otherwise indicated.

NOTES:

- (A) This specification defines minimum properties only and does not imply a range. Depending on the work hardening characteristics of the particular grade, either the yield or the tensile strength can be the controlling factor in meeting the properties. The noncontrolling factor normally will exceed considerably the specified minimum.
- (B) Type 201 is generally produced with a chemical composition balanced for rich side (Type 201-1) or lean side (Type 201-2) austenite stability depending on the properties required for specific applications.
- (C) Annealed material that naturally meets mechanical properties may be applied.
- (D) PSS means plate, strip, sheet.
- (E) FB means flat bar.

SPECIFICATION FOR CENTRIFUGALLY CAST DUAL METAL (GRAY AND WHITE CAST IRON) CYLINDERS

SA-667/SA-667M

[Identical with ASTM Specification A 667/A 667M-87(R08).]

1. Scope

1.1 This specification covers centrifugally cast cylinders with an outer layer of white cast iron and the remainder of the material of gray cast iron. These castings are suitable for pressure containing parts the design strength of which is based on the gray iron portion of the cylinder. These castings are suitable for service at temperatures up to 450°F [230°C].

1.2 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independent of the other. Combining values from the two systems may result in nonconformance with the specification.

2. Referenced Documents

2.1 ASTM Standards:

- A 278 Specification for Gray Iron Castings for Pressure-Containing Parts for Temperatures Up to 650°F
- A 278M Specification for Gray Iron Castings for Pressure-Containing Parts for Temperatures Up to 345°C [Metric]

3. Materials and Manufacture

3.1 The melting procedures shall be optional with the foundry.

3.2 The white iron portion of the cylinder shall be made to a minimum hardness of 55 Scleroscope "C". The gray iron portion of the cylinder shall conform to Specification A 278, Class 20 [A 278M, Class 150].

3.3 The casting process shall be controlled to produce a metallurgical bond between the two metal layers.

4. Physical Requirements

4.1 Tensile Requirements — Tension test specimens removed from the casting shall have a tensile strength not less than 80% of that specified in 3.2.

4.2 Thickness of White Cast Iron:

4.2.1 The thickness of the white cast iron shall be not less than 5% nor more than 30% of the total finished wall thickness.

4.2.2 The thickness of the white cast iron shall be determined by ultrasonic testing.

5. Finish

5.1 All surfaces shall be machined prior to the cylinders being placed into service.

6. Number of Tests

6.1 The number of tension tests shall be in conformance with Specifications A 278 and A 278M.

7. Specimen Preparation

7.1 Separately cast test bars may be used to represent the gray iron portion of the castings. The test bars shall be cast in core sand and have a nominal diameter of 2 in. [50 mm]. Tension test specimens shall be machined from test bars to the dimensions given for Specimen C in Specifications A 278 and A 278M.

7.2 At the option of the manufacturer he may substitute test bars taken from the gray iron portion of the casting. The test bars shall be taken midway between the inside diameter of the casting and the interface between the two layers. Tension test specimens machined from these test bars shall conform to the dimensions shown for Specimen C in Specifications A 278 and A 278M.

8. Test Method

8.1 Tension test specimens shall fit the holders of the testing machine in such a way that the load shall be axial. The use of self-aligning shackles is suggested. After reaching a stress equivalent to 15 000 psi [100 MPa] the speed of the moving head of the testing machine shall not exceed $\frac{1}{8}$ in. [3.2 mm]/min.

9. Inspection

9.1 The inspector representing the purchaser shall have free entry at all times while work on the contract of the purchaser is being performed to all parts of the manufacturer's works that concern the manufacture of the material ordered. The manufacturer shall afford the inspector without charge all reasonable facilities to satisfy him that the material is being furnished in accordance with this specification. All tests and inspections shall be made at the place of manufacture prior to the shipment unless otherwise specified and shall be so conducted as not to interfere unnecessarily with the operation of the works.

10. Acceptance and Certification

10.1 Final acceptance of the casting shall follow complete machining of the casting. Upon request of the purchaser and when so specified in the purchase order, a certification shall be made on the basis of acceptance of the material. This shall consist of a copy of the manufacturer's test report or a statement by the supplier accompanied by a copy of the test results that the material has been sampled, tested, and inspected in accordance with the provisions of this specification. Each certification so furnished shall be signed by an authorized agent of the supplier or manufacturer.

11. Product Marking

11.1 Pressure containing castings made in accordance with this specification shall have the name of the manufacturer or his recognized trademark and the class of iron to which it conforms cast or indelibly stamped on the surface indicated by the purchaser or in such a position as not to injure the usefulness of the casting.

SPECIFICATION FOR ELECTRIC-FUSION-WELDED STEEL PIPE FOR ATMOSPHERIC AND LOWER TEMPERATURES

SA-671

(Identical to ASTM Specification A 671-94 except that the following additional requirements apply.)

All products furnished under this SA specification are intended for application under the rules of Section III of the ASME Boiler and Pressure Vessel Code. Manufacture of such products is limited to manufacturers who hold the appropriate ASME Certificate of Authorization and Code Symbol Stamp. In addition to conforming to this specification, the manufacturer shall meet all applicable requirements of Section III of the Code. The plate used to fabricate the pipe shall conform to the applicable SA specification in ASME Boiler and Pressure Vessel Code, Section II. The joints shall be full penetration butt welds as obtained by double welding or by other means which will obtain the same quality of deposited and weld metal on the inside and outside. Welds using metal backing strips which remain in place are excluded. The product is subject to all requirements of Section III of the Code including welding, heat treatment, nondestructive examination, authorized inspection at the point of manufacture, and application of the Code Symbol Stamp.

The applicable ASME Partial Data Report Form, signed by an Authorized Inspector, and a certified mill test report shall be furnished for each lot of pipe as defined by requirement S14 of this specification. Each length of pipe shall be marked in such a manner as to identify each piece with the lot and the certified mill test report

1. Scope

1.1 This specification covers electric-fusion-welded steel pipe with filler metal added, fabricated from pressure vessel quality plate of several analyses and strength levels and suitable for high-pressure service at atmospheric and lower temperatures. Heat treatment may or may not be required to attain the desired properties or to comply with applicable code requirements. Supplementary requirements are provided for use when additional testing or examination is desired.

1.2 The specification nominally covers pipe 16 in. (405 mm) in outside diameter or larger and of $\frac{1}{4}$ in. (6.4 mm) wall thickness or greater. Pipe having other dimensions may be furnished provided it complies with all other requirements of this specification.

1.3 Several grades and classes of pipe are provided.

1.3.1 Grade designates the type of plate used as listed in Table 1.

1.3.2 Class designates the type of heat treatment performed during manufacture of the pipe, whether the

weld is radiographically examined, and whether the pipe has been pressure tested as listed in 1.3.3.

1.3.3 Class designations are as follows (Note):

Class	Heat Treatment on Pipe	Radiography, see Section	Pressure Test, see:
10	none	none	none
11	none	9	none
12	none	9	8.3
13	none	none	8.3
20	stress relieved, see 5.3.1	none	none
21	stress relieved, see 5.3.1	9	none
22	stress relieved, see 5.3.1	9	8.3
23	stress relieved, see 5.3.1	none	8.3
30	normalized, see 5.3.2	none	none

Class	Heat Treatment on Pipe	Radiography, see Section	Pressure Test, see:
43	normalized and tempered, see 5.3.3	none	8.3
50	quenched and tempered, see 5.3.4	none	none
51	quenched and tempered, see 5.3.4	9	none
52	quenched and tempered, see 5.3.4	9	8.3
53	quenched and tempered, see 5.3.4	none	8.3
60	normalized and precipitation heat treated	none	none
61	normalized and precipitation heat treated	9	none
62	normalized and precipitation heat treated	9	8.3
63	normalized and precipitation heat treated	none	8.3
70	quenched and precipitation heat treated	none	none
71	quenched and precipitation heat treated	9	none
72	quenched and precipitation heat treated	9	8.3
73	quenched and precipitation heat treated	none	8.3

NOTE—Selection of materials should be made with attention to temperature of service. For such guidance, Specification A 20/A 20M may be consulted.

1.4 The values stated in inch-pound units are to be regarded as the standard.

2. Referenced Documents

2.1 ASTM Standards:

2.1.1 General:

- A 20/A 20M Specification for General Requirements for Steel Plates for Pressure Vessels
- A 370 Test Methods and Definitions for Mechanical Testing of Steel Products
- A 435/A 435M Specification for Straight-Beam Ultrasonic Examination of Steel Plates
- A 530/A 530M Specification for General Requirements for Specialized Carbon and Alloy Steel Pipe

- E 110 Test Method for Indentation Hardness of Metallic Materials by Portable Hardness Testers
- E 165 Practice for Liquid Penetrant Inspection Method

E 350 Method for Chemical Analysis of Carbon Steel, Low-Alloy Steel, Silicon Electrical Steel, Ingot Iron, and Wrought Iron

E 709 Practice for Magnetic Particle Examination

2.1.2 Plate Steels:

A 203/A 203M Specification for Pressure Vessel Plates, Alloy Steel, Nickel

A 285/A 285M Specification for Pressure Vessel Plates, Carbon Steel, Low- and Intermediate-Tensile Strength

A 299/A 299M Specification for Pressure Vessel Plates, Carbon Steel, Manganese-Silicon

A 353/A 353M Specification for Pressure Vessel Plates, Alloy Steel, 9 Percent Nickel, Double-Normalized and Tempered

A 442/A 442M Specification for Pressure Vessel Plates, Carbon Steel, Improved Transition Properties

A 515/A 515M Specification for Pressure Vessel Plates, Carbon Steel, for Intermediate- and Higher-Temperature Service

A 516/A 516M Specification for Pressure Vessel Plates, Carbon Steel, for Moderate- and Lower-Temperature Service

A 517/A 517M Specification for Pressure Vessel Plates, Alloy Steel, High-Strength, Quenched and Tempered

A 537/A 537M Specification for Pressure Vessel Plates, Heat-Treated, Carbon-Manganese-Silicon Steel

A 553/A 553M Specification for Pressure Vessel Plates, Alloy Steel, Quenched and Tempered 8 and 9 Percent Nickel

A 645/A 645M Specification for Pressure Vessel Plates, 5 Percent Nickel Alloy Steel, Specially Heat Treated

A 736/A 736M Specification for Pressure Vessel Plates, Low-Carbon Age-Hardening, Nickel-Copper-Chromium-Molybdenum-Columbium Alloy Steel

2.2 ASME Boiler and Pressure Vessel Code:

Section II, Material Specifications

Section III, Nuclear Vessels

Section VIII, Unfired Pressure Vessels

Section IX, Welding Qualifications

3. Terminology

3.1 Description of a Term Specific to This Standard:

3.1.1 lot —a lot shall consist of 200 ft (61 m) or fraction thereof of pipe from the same heat of steel.

3.1.2 The description of a lot may be further restricted by the use of Supplementary Requirement S14.

4. Ordering Information

4.1 The inquiry and order for material under this specification shall include the following information:

4.1.1 Quantity (feet, metres, or number of lengths).

4.1.2 Name of material (steel pipe, electric-fusion-welded).

4.1.3 Specification number.

4.1.4 Grade and class designations (see 1.3).

4.1.5 Size (inside or outside diameter, nominal or minimum wall thickness).

4.1.6 Length (specific or random).

4.1.7 End finish (11.4).

4.1.8 Purchase options, if any (see 5.2.3, 11.3, 14.1 of this specification and Sections 16, 20.1, 21, and 22 of Specification A 530/A 530M).

4.1.9 Supplementary requirements, if any.

5. Materials and Manufacture

5.1 Materials —The steel plate material shall conform to the requirement of the applicable plate specification for the pipe grade ordered as listed in Table 1.

5.2 Welding:

5.2.1 The joints shall be double-welded, full-penetration welds made in accordance with procedures and by welders or welding operators qualified in accordance with the ASME Boiler and Pressure Vessel Code, Section IX.

5.2.2 The welds shall be made either manually or automatically by an electric process involving the deposition of filler metal.

5.2.3 As welded, the welded joint shall have positive reinforcement at the center of each side of the weld, but no more than $\frac{1}{8}$ in. (3.2 mm). This reinforcement may be removed at the manufacturer's option or by agreement between the manufacturer and purchaser. The contour of the reinforcement shall be smooth and the deposited metal shall be fused smoothly and uniformly into the plate surface.

5.2.4 When radiographic examination in accordance with 9.1 is to be used, the weld reinforcements shall be governed by the more restrictive provision UW-51 of Section VIII of the ASME Boiler and Pressure Vessel Code instead of 5.2.3 of this specification.

5.3 Heat Treatment —All classes other than 10, 11, 12, and 13 shall be heat treated in furnace controlled to $\pm 25^\circ\text{F}$ ($\pm 14^\circ\text{C}$) and equipped with a recording pyrometer so that heating records are available. Heat treating after forming and welding shall be to one of the following:

5.3.1 Classes 20, 21, 22, and 23 pipe shall be uniformly heated within the post-weld heat-treatment temperature range indicated in Table 2 for a minimum of 1 h/in. of thickness or for 1 h, whichever is greater.

5.3.2 Classes 30, 31, 32, and 33, pipe shall be uniformly heated to a temperature in the austenitizing range

and not exceeding the maximum normalizing temperature indicated in Table 2 and subsequently cooled in air at room temperature.

5.3.3 Classes 40, 41, 42, and 43 pipe shall be normalized in accordance with 5.3.2. After normalizing, the pipe shall be reheated to the tempering temperature indicated in Table 2 as a minimum and held at temperature for a minimum of $\frac{1}{2}$ h/in. of thickness or for $\frac{1}{2}$ h, whichever is greater, and air cooled.

5.3.4 Classes 50, 51, 52, and 53 pipe shall be uniformly heated to a temperature in the austenitizing range, and not exceeding the maximum quenching temperature indicated in Table 2 and subsequently quenched in water or oil. After quenching, the pipe shall be reheated to the tempering temperature indicated in Table 2 as a minimum and held at that temperature for a minimum of $\frac{1}{2}$ h/in. of thickness or for $\frac{1}{2}$ h, whichever is greater, and air cooled.

5.3.5 Classes 60, 61, 62, and 63 pipe shall be normalized in accordance with 5.3.2. After normalizing, the pipe shall be precipitation heat treated in the range shown in Table 2 for a time to be determined by the manufacturer.

5.3.6 Classes 70, 71, 72, and 73 pipe shall be uniformly heated to a temperature in the austenitizing range, not exceeding the maximum quenching temperature indicated in Table 2, and subsequently quenched in water or oil. After quenching the pipe shall be reheated into the precipitation heat treating range indicated in Table 2 for a time to be determined by the manufacturer.

6. General Requirements for Delivery

6.1 Only the following sections of Specification A 530/A 530M shall apply: 1, 2, 7, 8, 14, 16, 17, 19, 20, 21, and 22. Section 6 of Specification A 530/A 530M shall apply only for classes requiring hydrostatic testing.

7. Chemical Composition

7.1 Product Analysis of Plate —The pipe manufacturer shall make an analysis of each mill heat of plate material. The product analysis so determined shall meet the requirements of the plate specification to which the material was ordered.

7.2 Product Analyses of Weld —The pipe manufacturer shall make an analysis of finished deposited weld material from each 200 ft (61 m) or fraction thereof. Analyses shall conform to the welding procedure for deposited weld metal.

7.3 Analysis may be taken from the mechanical test specimens. The results of the analyses shall be reported to the purchaser.

8. Mechanical Requirements

8.1 Tension Test:

8.1.1 Requirements —Transverse tensile properties of the welded joint shall meet the minimum requirements for ultimate tensile strength of the specified plate material. In addition for Grades CD and CJ, when these are of Class 3x, 4x, or 5x, and Grade CP of Class 6x and 7x, the transverse tensile properties of the base plate shall be determined on specimens cut from the heat-treated pipe. These properties shall meet the mechanical test requirements of the plate specification.

8.1.2 Number of Tests —One test specimen of weld metal and one specimen of base metal, if required by 8.1.1, shall be made and tested to represent each lot of finished pipe.

8.1.3 Test Specimen Location and Orientation —The test specimens shall be taken transverse to the weld at the end of the finished pipe and may be flattened cold before final machining to size.

8.1.4 Test Method —The test specimen shall be made in accordance with QW-150 in Section IX of the ASME Boiler and Pressure Vessel Code. The test specimen shall be tested at room temperature in accordance with Methods and Definitions A 370.

8.2 Transverse Guided Weld Bend Test:

8.2.1 Requirements —The bend test shall be acceptable if no cracks or other defects exceeding $\frac{1}{8}$ in. (3.2 mm) in any direction are present in the weld metal or between the weld and the base metal after bending. Cracks that originate along the edges of the specimen during testing, and that are less than $\frac{1}{4}$ in. (6.4 mm) measured in any direction shall not be considered.

8.2.2 Number of Tests —One test (two specimens) shall be made to represent each lot of finished pipe.

8.2.3 Test Specimen Location and Orientation —Two bend test specimens shall be taken transverse to the weld at the end of the finished pipe. As an alternative, by agreement between the purchaser and the manufacturer, the test specimens may be taken from a test plate of the same material as the pipe, the test plate being attached to the end of the cylinder and welded as a prolongation of the pipe longitudinal seam.

8.2.4 Test Method —The test requirements of A 370, S9.1.7 shall be met. For wall thicknesses over $\frac{3}{8}$ in. (9.5 mm) but less than $\frac{3}{4}$ in. (19.0 mm) side-bend tests may be made instead of the face and root-bend tests. For wall thicknesses $\frac{3}{4}$ in. and over both specimens shall be subjected to the side-bend test.

8.3 Pressure Test —Classes X2 and X3 pipe shall be tested in accordance with Specification A 530/A 530M, Section 6.

9. Radiographic Examination

9.1 The full length of each weld of Classes X1 and X2 shall be radiographically examined in accordance with and meet the requirements of ASME Boiler and Pressure Vessel Code, Section VIII, Paragraph UW-51.

9.2 Radiographic examination may be performed prior to heat treatment.

10. Rework

10.1 Elimination of Surface Imperfections —Unacceptable surface imperfections shall be removed by grinding or machining. The remaining thickness of the section shall be no less than the minimum specified in Section 11. The depression after grinding or machining shall be blended uniformly into the surrounding surface.

10.2 Repair of Base Metal Defects by Welding:

10.2.1 The manufacturer may repair, by welding, base metal where defects have been removed, provided the depth of the repair cavity as prepared for welding, does not exceed $\frac{1}{2}$ of the nominal thickness and the requirements of 10.2.2, 10.2.3, 10.2.4, 10.2.5, and 10.2.6, are met. Base metal defects in excess of these may be repaired with prior approval of the customer.

10.2.2 The defect shall be removed by suitable mechanical or thermal cutting or gouging methods and the cavity prepared for repair welding.

10.2.3 The welding procedure and welders or welding operators are to be qualified in accordance with Section IX of the ASME Boiler and Pressure Vessel Code.

10.2.4 The full length of the repaired pipe shall be heat treated after repair in accordance with the requirements of the pipe class specified.

10.2.5 Each repair weld of a defect where the cavity, prepared for welding, has a depth exceeding the lesser of $\frac{3}{8}$ in. (9.5 mm) or 10% of the nominal thickness shall be examined by radiography in accordance with the methods and the acceptance standards of Section 9.

10.2.6 The repair surface shall be blended uniformly into the surrounding base metal surface and examined and accepted in accordance with Supplementary Requirements S6 or S8.

10.3 Repair of Weld Metal Defects by Welding:

10.3.1 The manufacturer may repair weld metal defects if he meets the requirements of 10.2.3, 10.2.4, 10.3.2, 10.3.3, and 10.4.

10.3.2 The defect shall be removed by suitable mechanical or thermal cutting or gouging methods and the repair cavity examined and accepted in accordance with Supplementary Requirements S7 or S9.

10.3.3 The weld repair shall be blended uniformly into the surrounding metal surfaces and examined and accepted in accordance with 9.1 and with Supplementary Requirements S7 or S9.

10.4 Retest —Each length of repaired pipe of a class requiring a pressure test shall be hydrostatically tested following repair.

11. Dimensions, Mass, and Permissible Variations

11.1 The wall thickness and weight for welded pipe furnished to this specification shall be governed by the requirements of the specification to which the manufacturer ordered the plate.

11.2 Permissible variations in dimensions at any point in a length of pipe shall not exceed the following:

11.2.1 Outside Diameter —Based on circumferential measurement + 0.5% of the specified outside diameter.

11.2.2 Out-of-Roundness —Difference between major and minor outside diameters, 1%.

11.2.3 Alignment —Using a 10 ft (3 m) straight edge placed so that both ends are in contact with the pipe, $\frac{1}{8}$ in. (3.2 mm).

11.2.4 Thickness —The minimum wall thickness at any point in the pipe shall not be more than 0.01 in. (0.25 mm) under the specified nominal thickness.

11.3 Circumferential welded joints of the same quality as the longitudinal joints shall be permitted by agreement between the manufacturer and the purchaser.

11.4 Lengths with unmachined ends shall be within $-0, +\frac{1}{2}$ in. ($-0, +13$ mm) of that specified. Lengths with machined ends shall be as agreed between the manufacturer and the purchaser.

12. Workmanship, Finish, and Appearance

12.1 The finished pipe shall be free of injurious defects and shall have a workmanlike finish. This requirement is to mean the same as the identical requirement that appears in Specification A 20/A 20M with respect to steel plate surface finish.

13. Product Marking

13.1 In addition to the marking provision of Specification A 530/A 530M, class marking in accordance with 1.3.3 shall follow the grade marking, for example, CC 70-10.

13.2 Bar Coding —In addition to the requirements in 13.1, bar coding is acceptable as a supplementary identification method. Bar coding should be consistent with the Automotive Industry Action Group (AIAG) standard prepared by the Primary Metals Subcommittee of the AIAG Bar Code Project Team.

TABLE 1
PLATE SPECIFICATIONS

Pipe Grade	Type of Steel	ASTM Specification	
		No.	Grade
CA 55	plain carbon	A 285/A 285M	C
CB 60	plain carbon, killed	A 515/A 515M	60
CB 65	plain carbon, killed	A 515/A 515M	65
CB 70	plain carbon, killed	A 515/A 515M	70
CC 60	plain carbon, killed, fine grain	A 516/A 516M	60
CC 65	plain carbon, killed, fine grain	A 516/A 516M	65
CC 70	plain carbon, killed, fine grain	A 516/A 516M	70

^A Numbers indicate minimum tensile strength in ksi.

^B In no case shall the post-weld heat-treatment temperature exceed the mill tempering temperature.

^C Per ASME Section VIII Specification A 517/A 517M specified 1650 (900) minimum quenching temperature.

^D Tempering range 1100 to 1300, if accelerated cooling utilized per Specification A 516/A 516M.

SUPPLEMENTARY REQUIREMENTS

One or more of the following supplementary requirements shall be applied only when specified by the purchaser in the inquiry, contract, or order. Details of these supplementary requirements shall be agreed upon in writing by the manufacturer and purchaser. Supplementary requirements shall in no way negate any requirement of the specification itself.

S1. Tension and Bend Tests

S1.1 Tension tests in accordance with 8.1 and bend tests in accordance with 8.2 shall be made on specimens representing each length of pipe.

S2. Charpy V-Notch Test

S2.1 Requirements —The acceptable test energies for material shown in Specification A 20/A 20M shall conform to the energy values shown in Specification A 20/A 20M.

S2.1.1 Materials not listed in Specification A 20/A 20M shall be in accordance with the purchase order requirements.

S2.2 Number of Specimens —Each test shall consist of at least three specimens.

S2.2.1 One base metal test shall be made from one pipe length per heat-treat charge per nominal wall thickness.

S2.2.2 One weld-metal test shall be made in accordance with UG-84 of Section VIII of the ASME Boiler and Pressure Vessel Code.

S2.2.3 One heat-affected-zone test shall be made in accordance with UG-84 of Section VIII of the ASME Boiler and Pressure Vessel Code.

S2.3 Test Specimen Location and Orientation:

S2.3.1 Specimens for base-metal tests in Grades CA, CB, CC, and CE in the stress relieved or normalized condition (classes of the 20, 30, and 40 series) shall be taken so that the longitudinal axis of the specimen is parallel to the longitudinal axis of the pipe.

S2.3.2 Base-metal specimens of quench and tempered pipe, when the quenching and tempering follows the welding operation, shall be taken in accordance with the provision of N330 of Section III of the ASME Boiler and Pressure Vessel Code.

S2.4 Test Method —The specimen shall be Charpy-V Type A in accordance with Methods and Definitions A 370. The specimens shall be tested in accordance with Methods and Definitions A 370. Unless otherwise indicated by the purchaser, the test temperature shall be as given in Specification A 20/A 20M for those base materials covered by

Specification A 20/A 20M. For materials not covered by Specification A 20/A 20M the test temperature shall be 10°F (−12°C) unless otherwise stated in the purchase order.

S3. Hardness Test

S3.1 Hardness tests shall be made in accordance with Methods and Definitions A 370 or Test Method E 110 across the welded joint of both ends of each length of pipe. In addition, hardness tests shall be made to include the heat-affected zone if so required by the purchaser. The maximum acceptable hardness shall be as agreed upon between the manufacturer and the purchaser.

S3.2 As an alternative to the heat-affected zone hardness, by agreement between the manufacturer and purchaser, maximum heat-affected zone hardness may be specified for the procedure test results.

S4. Product Analysis

S4.1 Product analyses in accordance with 7.1 shall be made on each 500 ft (152 m) of pipe of fraction thereof, or alternatively, on each length of pipe as designated in the order.

S5. Metallography

S5.1 The manufacturer shall furnish one photomicrograph to show the microstructure at 100× magnification of the weld metal or base metal of the pipe in the as-finished condition. The purchaser shall state in the order: the material, base metal or weld, and the number and locations of tests to be made. This test is for information only.

S6. Magnetic Particle Examination of Base Metal

S6.1 All accessible surfaces of the pipe shall be examined in accordance with Practice E 709. Accessible is defined as: All outside surfaces, all inside surfaces of pipe 24 in. (610 mm) in diameter and greater, and inside surfaces of pipe less than 24 in. in diameter for a distance of 1 pipe diameter from the ends.

S6.2 Acceptance Standards —The following relevant indications are unacceptable:

S6.2.1 Any linear indications greater than $\frac{1}{16}$ in. (1.6 mm) long for materials less than $\frac{5}{8}$ in. (15.9 mm) thick; greater than $\frac{1}{8}$ in. (3.2 mm) long for materials from $\frac{5}{8}$ in. thick to under 2 in. (51 mm) thick; and greater than $\frac{3}{16}$ in. (4.8 mm) long for materials 2 in. thick or greater.

S6.2.2 Rounded indications with dimensions greater than $\frac{1}{8}$ in. (3.2 mm) for thicknesses less than $\frac{5}{8}$ in. (15.9 mm), and greater than $\frac{3}{16}$ in. (4.8 mm) for thicknesses $\frac{5}{8}$ in. and greater.

S6.2.3 Four or more indications in any line separated by $\frac{1}{16}$ in. (1.6 mm) or less edge-to-edge.

S6.2.4 Ten or more indications in any 6 in.² (39 cm²) of surface with the major dimension of this area not to exceed 6 in. (152 mm) when it is taken in the most unfavorable orientation relative to the indications being evaluated.

S7. Magnetic Particle Examination of Weld Metal

S7.1 All accessible welds shall be examined in accordance with Practice E 709. Accessible is defined as: All outside surfaces, all inside surfaces of pipe 24 in. (610 mm) in diameter and greater, and inside surfaces of pipe less than 24 in. in diameter for a distance of one pipe diameter from the ends.

S7.2 Acceptance Criteria —The following relevant indications are unacceptable:

S7.2.1 Any cracks and linear indications.

S7.2.2 Rounded indications with dimensions greater than $\frac{3}{16}$ in. (4.8 mm).

S7.2.3 Four or more indications in any line separated by $\frac{1}{16}$ in. (1.6 mm) or less edge-to-edge.

S7.2.4 Ten or more indications in any 6 in.² (39 cm²) of surface with the major dimension of this area not to exceed 6 in. (152 mm) when it is taken in the most unfavorable orientation relative to the indications being evaluated.

S8. Liquid Penetrant Examination of Base Metal

S8.1 All accessible surfaces of the pipe shall be examined in accordance with Practice E 165. Accessible is as defined in S7.1.

S8.2 The acceptance criteria shall be in accordance with S6.2.

S9. Liquid Penetrant Examination of Weld Metal

S9.1 All accessible surfaces of the pipe shall be examined in accordance with Practice E 165. Accessible is as defined in S7.1.

S9.2 The acceptance criteria shall be in accordance with S7.2.

S10. Straight Beam Ultrasonic Examination of Flat Plate—UT 1

S10.1 The plate shall be examined and accepted in accordance with Specification A 435/A 435M except that 100% of one surface shall be scanned by moving the search unit in parallel paths with not less than 10% overlap.

S11. Straight Beam Ultrasonic Examination of Flat Plate—UT 2

S11.1 The plate shall be examined in accordance with Specification A 578/A 578M except that 100% of one surface shall be scanned and the acceptance criteria shall be as follows:

S11.1.1 Any area, where one or more discontinuities produce a continuous total loss of back reflection accompanied by continuous indications on the same plane that cannot be encompassed within a circle whose diameter is 3 in. (76.2 mm) or one half of the plate thickness, whichever is greater, is unacceptable.

S11.1.2 In addition, two or more discontinuities on the same plane and having the same characteristics but smaller than described above shall be unacceptable unless separated by a minimum distance equal to the largest diameter of the larger discontinuity or unless they may be collectively encompassed by the circle described above.

S12. Angle Beam Ultrasonic Examination [Plate Less than 2 in. (50.8 mm) Thick]—UT 3

S12.1 The plate shall be examined in accordance with Specification A 577/A 577M except that the calibration notch shall be vee shaped and the acceptance criteria shall be as follows: Any area showing one or more reflections producing indications whose amplitude exceeds that of the calibration notch is unacceptable.

S13. Repair Welding

S13.1 Repair of base metal defects by welding shall be done only with customer approval.

S14. Description of Term

S14.1 *lot* —all pipe of the same mill heat of plate material and wall thickness [within $\pm\frac{1}{4}$ in. (6.4 mm)] heat treated in one furnace charge. For pipe that is not heat treated or that is heat treated in a continuous furnace, a lot

shall consist of each 200 ft (61 m) or fraction thereof of all pipe of the same mill heat of plate material and wall thickness [within $\pm \frac{1}{4}$ in. (6.4 mm)], subjected to the same heat treatment. For pipe heat treated in a batch-type furnace

that is automatically controlled within a 50°F (28°C) range and is equipped with recording pyrometers so that heating records are available, a lot shall be defined the same as for continuous furnaces.

SPECIFICATION FOR ELECTRIC-FUSION-WELDED STEEL PIPE FOR HIGH-PRESSURE SERVICE AT MODERATE TEMPERATURES

SA-672

(Identical to ASTM Specification A 672-94 except for the deletion of pipe Grade K. The following additional requirements apply.)

All products furnished under this SA specification are intended for application under the rules of Section III of the ASME Boiler and Pressure Vessel Code. Manufacture of such products is limited to manufacturers who hold the appropriate ASME Certificate of Authorization and Code Symbol Stamp. In addition to conforming to this specification, the manufacturer shall meet all applicable requirements of Section III of the Code. The plate used to fabricate the pipe shall conform to the applicable SA specification in ASME Boiler and Pressure Vessel Code, Section II. The joints shall be full penetration butt welds as obtained by double welding or by other means which will obtain the same quality of deposited and weld metal on the inside and outside. Welds using metal backing strips which remain in place are excluded. The product is subject to all requirements of Section III of the Code including welding, heat treatment, nondestructive examination, authorized inspection at the point of manufacture, and application of the Code Symbol Stamp.

The applicable ASME Partial Data Report Form, signed by an Authorized Inspector, and a certified mill test report shall be furnished for each lot of pipe as defined by requirement S14 of this specification. Each length of pipe shall be marked in such a manner as to identify each piece with the lot and the certified mill test report.

1. Scope

1.1 This specification covers steel pipe: electric-fusion-welded with filler metal added, fabricated from pressure-vessel quality plate of any of several analyses and strength levels and suitable for high-pressure service at moderate temperatures. Heat treatment may or may not be required to attain the desired properties or to comply with applicable code requirements. Supplementary requirements are provided for use when additional testing or examination is desired.

1.2 The specification nominally covers pipe 16 in. (405 mm) in outside diameter or larger with wall thicknesses up to 3 in. (75 mm), inclusive. Pipe having other dimensions may be furnished provided it complies with all other requirements of this specification.

1.3 Several grades and classes of pipe are provided.

1.3.1 *Grade* designates the type of plate used.

1.3.2 *Class* designates the type of heat treatment performed during manufacture of the pipe, whether the weld

is radiographically examined, and whether the pipe has been pressure tested as listed in 1.3.3.

1.3.3 Class designations are as follows (Note 1):

Class	Heat Treatment on Pipe	Radiography, see Section	Pressure Test, see Section
10	none	none	none
11	none	9	none
12	none	9	8.3
13	none	none	8.3
20	stress relieved, see 5.3.1	none	none
21	stress relieved, see 5.3.1	9	none
22	stress relieved, see 5.3.1	9	8.3
23	stress relieved, see 5.3.1	none	8.3
30	normalized, see 5.3.2	none	none
31	normalized, see 5.3.2	9	none
32	normalized, see 5.3.2	9	8.3
33	normalized, see 5.3.2	none	8.3
40	normalized and tempered, see 5.3.3	none	none
41	normalized and tempered, see 5.3.3	9	none
42	normalized and tempered, see 5.3.3	9	8.3

Class	Heat Treatment on Pipe	Radiography, see Section	Pressure Test, see Section
43	normalized and tempered, see 5.3.3	none	8.3
50	quenched and tempered, see 5.3.4	none	none
51	quenched and tempered, see 5.3.4	9	none
52	quenched and tempered, see 5.3.4	9	8.3
53	quenched and tempered, see 5.3.4	none	8.3

NOTE 1 — Selection of materials should be made with attention to temperature of service. For such guidance, Specification A 20 may be consulted.

1.4 The values stated in inch-pound units are to be regarded as the standard.

- Section VIII, Unfired Pressure Vessels
- Section IX, Welding Qualifications

3. Terminology

3.1 Description of a Term Specific to This Standard:

3.1.1 A lot shall consist of 200 ft [61 m] or fraction thereof of pipe from the same heat of steel.

3.1.2 The description of a lot may be further restricted by use of Supplementary Requirement S14.

4. Ordering Information

4.1 The inquiry and order for material under this specification should include the following information:

- 4.1.1** Quantity (feet, meters, or number of lengths).
- 4.1.2** Name of material (steel pipe, electric-fusion-welded).
- 4.1.3** Specification number.
- 4.1.4** Grade and class designations (see 1.3).
- 4.1.5** Size (inside or outside diameter, nominal or minimum wall thickness).
- 4.1.6** Length [specific or random].
- 4.1.7** End finish (11.4).
- 4.1.8** Purchase options, if any (see 5.2.3, 11.3, 14.1 and Sections 16, 20.1, 21, 22 of Specification A 530).
- 4.1.9** Supplementary requirements, if any, (refer to S1 through S14).

5. Materials and Manufacture

5.1 Materials — The steel plate material shall conform to the requirements of the applicable plate specification for pipe grade ordered as listed in Table 1.

5.2 Welding:

5.2.1 The joints shall be double-welded, full-penetration welds made in accordance with procedures and

by welders or welding operators qualified in accordance with the ASME Boiler and Pressure Vessel Code, Section IX.

5.2.2 The welds shall be made either manually or automatically by an electric process involving the deposition of filler metal.

5.2.3 The welded joint shall have positive reinforcement at the center of each side of the weld, but not more than $\frac{1}{8}$ in. [3.2 mm]. This reinforcement may be removed at the manufacturer's option or by agreement between the manufacturer and purchaser. The contour of the reinforcement shall be smooth, and the deposited metal shall be fused smoothly and uniformly into the plate surface.

5.2.4 When radiographic examination in accordance with 9.1 is to be used, the weld reinforcement shall be governed by the more restrictive provisions of UW-51 of Section VIII of the ASME Boiler and Pressure Vessel Code instead of 5.2.3 of this specification.

5.3 Heat Treatment — All classes other than 10, 11, 12 and 13 shall be heat treated in furnace controlled to $\pm 25^\circ\text{F}$ [14°C] and equipped with a recording pyrometer so that heating records are available. Heat treating after forming and welding shall be to one of the following:

5.3.1 Classes 20, 21, 22, and 23 pipe shall be uniformly heated within the post-weld heat-treatment temperature range indicated in Table 2 for a minimum of 1 h/in. of thickness or 1 h, whichever is greater.

5.3.2 Classes 30, 31, 32, and 33 pipe shall be uniformly heated to a temperature in the austenitizing range and not exceeding the maximum normalizing temperature indicated in Table 2 and subsequently cooled in air at room temperature.

5.3.3 Classes 40, 41, 42, and 43 pipe shall be normalized in accordance with 5.3.2. After normalizing, the pipe shall be reheated to the tempering temperature indicated in Table 2 as a minimum and held at temperature for a minimum of $\frac{1}{2}$ h/in. of thickness or $\frac{1}{2}$ h, whichever is greater, and air cooled.

5.3.4 Classes 50, 51, 52, and 53 pipe shall be uniformly heated to a temperature in the austenitizing range, and not exceeding the maximum quenching temperature indicated in Table 2 and subsequently quenched in water or oil. After quenching the pipe shall be reheated to the tempering temperature indicated in Table 2 as a minimum and held at temperature for a minimum of $\frac{1}{2}$ h/in. of thickness or $\frac{1}{2}$ h, whichever is greater, and air cooled.

6. General Requirements for Delivery

6.1 Only the following sections of Specification A 530 shall apply: 1, 2, 7, 8, 14, 16, 17, 19, 20, 21, and 22.

Section 6 of A 530 shall apply only for classes requiring Hydrostatic Testing.

7. Chemical Composition

7.1 Product Analysis of Plate — The pipe manufacturer shall make an analysis of each mill heat of plate material. The product analysis so determined shall meet the requirements of the plate specification to which the material was ordered.

7.2 Product Analysis of Weld — The pipe manufacturer shall make an analysis of the finished deposited weld material from each 500 ft [152 m] or fraction thereof. Analysis shall conform to the welding procedure for deposited weld metal.

7.3 Analysis may be taken from the mechanical test specimens. The results of the analyses shall be reported to the purchaser.

7.4 If the analysis of one of the tests specified in 7.1 or 7.2 does not conform to the requirements specified, analyses shall be made on additional pipes of double the original number from the same lot, each of which shall conform to the requirements specified. Nonconforming pipe shall be rejected.

8. Mechanical Properties

8.1 Tension Test:

8.1.1 Requirements — Transverse tensile properties of the welded joint shall meet the minimum requirements for ultimate tensile strength of the specified plate material. In addition for Grades Dxx, Hxx, Jxx, and Nxx in Classes 3x, 4x, and 5x transverse tensile properties of the base plate, shall be determined on specimens cut from the heat-treated pipe. These properties shall meet the mechanical test requirements of the plate specification.

8.1.2 Number of Tests — One test specimen shall be made to represent each lot of finished pipe.

8.1.3 Test Specimen Location and Orientation — The test specimens shall be taken transverse to the weld at the end of the finished pipe and may be flattened cold before final machining to size.

8.1.4 Test Method — The test specimen shall be made in accordance with QW-150 in Section IX of the ASME Boiler and Pressure Vessel Code. The test specimen shall be tested at room temperature in accordance with Test Methods and Definitions A 370.

8.2 Transverse-Guided-Weld-Bend Tests:

8.2.1 Requirements — The bend test shall be acceptable if no cracks or other defects exceeding $\frac{1}{8}$ in. (3.2 mm) in any direction are present in the weld metal or between

the weld and the base metal after bending. Cracks that originate along the edges of the specimen during testing, and that are less than $\frac{1}{4}$ in. (6.4 mm) measured in any direction shall not be considered.

8.2.2 Number of Tests — One test (two specimens) shall be made to represent each lot of finished pipe.

8.2.3 Test Specimen Location and Orientation — Two bend test specimens shall be taken transverse to the weld at the end of the finished pipe. As an alternative by agreement between the purchaser and the manufacturer, the test specimens may be taken from a test plate of the same material as the pipe, the test plate being attached to the end of the cylinder and welded as a prolongation of the pipe longitudinal seam.

8.2.4 Test Method — The test requirements of Test Methods and Definitions A 370, A2.5.1.7 shall be met. For wall thickness over $\frac{3}{8}$ in. (9.5 mm) but less than $\frac{3}{4}$ in. (19.0 mm) side-bend tests may be made instead of the face and root-bend tests. For wall thicknesses $\frac{3}{4}$ in. and over both specimens shall be subjected to the side-bend test.

8.3 Pressure Test — Classes X2 and X3 pipe shall be tested in accordance with Specification A 530, Section 6.

9. Radiographic Examination

9.1 The full length of each weld of Classes X1 and X2 shall be radiographically examined in accordance with and meet the requirements of the ASME Boiler and Pressure Vessel Code, Section VIII, paragraph UW-51.

9.2 Radiographic examination may be performed prior to heat treatment.

10. Rework

10.1 Elimination of Surface Imperfections — Unacceptable surface imperfections shall be removed by grinding or machining. The remaining thickness of the section shall be no less than the minimum specified in Section 11. The depression after grinding or machining shall be blended uniformly into the surrounding surface.

10.2 Repair of Base Metal Defects by Welding:

10.2.1 The manufacturer may repair, by welding, base metal where defects have been removed, provided the depth of the repair cavity as prepared for welding does not exceed $\frac{1}{3}$ of the nominal thickness and the requirements of 10.2.2, 10.2.3, 10.2.4, 10.2.5, and 10.2.6 are met. Base metal defects in excess of these may be repaired with proper approval of the customer.

10.2.2 The defect shall be removed by suitable mechanical or thermal cutting or gouging methods and the cavity prepared for repair welding.

10.2.3 The welding procedure and welders or welding operators are to be qualified in accordance with Section IX of the ASME Boiler and Pressure Vessel Code.

10.2.4 The full length of the repaired pipe shall be heat treated after repair in accordance with the requirements of the pipe class specified.

10.2.5 Each repair weld of a defect where the cavity, prepared for welding, has a depth exceeding the lesser of $\frac{3}{8}$ in. (9.5 mm) or 10% of the nominal thickness shall be examined by radiography in accordance with the methods and the acceptance standards of Section 9.

10.2.6 The repair surface shall be blended uniformly into the surrounding base metal surface and examined and accepted in accordance with Section S6 or S8.

10.3 Repair of Weld Metal Defects by Welding:

10.3.1 The manufacturer may repair weld metal defects if he meets the requirements of 10.2.3, 10.2.4, 10.3.2, 10.3.3, and 10.4.

10.3.2 The defects shall be removed by suitable mechanical or thermal cutting or gouging methods and the repair cavity examined and accepted in accordance with Sections S7 or S9.

10.3.3 The weld repair shall be blended uniformly into the surrounding metal surfaces and examined and accepted in accordance with 9.1 and Sections S7 or S9.

10.4 Retest — Each length of repaired pipe of a class requiring a pressure test shall be hydrostatically tested following repair.

11. Dimensions, Mass and Permissible Variations

11.1 The wall thickness and weight for welded pipe furnished to this specification shall be governed by the requirements of the specification to which the manufacturer ordered the plate.

11.2 Permissible variations in dimensions at any point in a length of pipe shall not exceed the following:

11.2.1 Outside Diameter — Based on circumferential measurement $\pm 0.5\%$ of the specified outside diameter.

11.2.2 Out-of-Roundness — Difference between major and minor outside diameters, 1%.

11.2.3 Alignment — Using a 10-ft (3-m) straight-edge placed so that both ends are in contact with the pipe, $\frac{1}{8}$ in. (3.2 mm).

11.2.4 Thickness — The minimum wall thickness at any point in the pipe shall not be more than 0.01 in. (0.3 mm) under the specified nominal thickness.

11.3 Circumferential welded joints of the same quality as the longitudinal joints shall be permitted by agreement between the manufacturer and the purchaser.

11.4 Lengths with unmachined ends shall be within $-0, +\frac{1}{2}$ in. ($-0, +13$ mm) of that specified. Lengths with machined ends shall be as agreed upon between the manufacturer and the purchaser.

12. Workmanship, Finish, and Appearance

12.1 The finished pipe shall be free of injurious defects and shall have a workmanlike finish. This requirement is to mean the same as the identical requirement that appears in Specification A 20 with respect to steel plate surface finish.

13. Product Marking

13.1 In addition to the marking provision of Specification A 530, class marking in accordance with 1.3.3 shall follow the grade marking; for example, C 70 — 10.

13.2 Bar Coding — In addition to the requirements in 13.1, bar coding is acceptable as a supplementary identification method. Bar coding should be consistent with the Automotive Industry Action Group (AIAG) standard prepared by the Primary Metals Subcommittee of the AIAG Bar Code Project Team.

^A Numbers indicate minimum tensile strength in ksi.

^B Any grade may be used.

SUPPLEMENTARY REQUIREMENTS

One or more of the following supplementary requirements shall be applied only when specified by the purchaser in the inquiry, contract, or order. Details of these supplementary requirements shall be agreed upon in writing by the manufacturer and purchaser. Supplementary requirements shall in no way negate any requirement of the specification itself.

S1. Tension and Bend Tests

S1.1 Tension tests in accordance with 8.1 and bend tests in accordance with 8.2 shall be made on specimens representing each length of pipe.

S2. Charpy V-Notch Test (For pipe with nominal wall thickness of $\frac{1}{2}$ in. and greater)

S2.1 Requirements — The acceptable test energies shall be as shown in A1.15 of Specification A 20 for the applicable plate specification unless otherwise stated in the order. As an alternative, the test temperature may be 10°F (−12°C).

S2.2 Number of Specimens — Each test shall consist of at least three specimens.

S2.2.1 One base-metal test shall be made from one pipe length per heat, per heat-treat charge, and per nominal wall thickness. For pipe from Classes 10, 11, 12, and 13, one base metal test shall be made per heat per size and per wall thickness.

S2.2.2 One weld-metal and one heat-affected zone (HAZ) metal test shall be made in accordance with NB-4335 of Section III of the ASME Boiler and Pressure Vessel Code.

S2.3 Test Specimen Location and Orientation:

S2.3.1 Base-metal specimens of stress-relieved, normalized, and normalized and tempered pipe shall be taken in accordance with the provisions for tension specimens in the body of this specification.

S2.3.2 Base-metal specimens of quenched and tempered pipe shall be taken in accordance with the provisions of NB-2225 of Section III of the ASME Boiler and Pressure Vessel Code.

S3. Hardness Test

S3.1 Hardness measurements in accordance with Test Methods and Definitions A 370 or Method E 110 shall be made across the welded joint at both ends of each length of pipe. The maximum acceptable hardness shall be as agreed upon between the manufacturer and the purchaser.

S4. Product Analysis

S4.1 Product analyses in accordance with 7.1 shall be made on each 500 ft (152 m) of pipe or fraction thereof or alternatively, on each length of pipe as designated in the order.

S5. Metallography

S5.1 The manufacturer shall furnish one photomicrograph to show the microstructure of 100× magnification of the weld metal or base metal of the pipe in the as-finished condition. The purchaser shall state in the order: the material, base metal or weld, and the number and locations of tests to be made. This test is for information only.

S6. Magnetic Particle Examination of Base Metal

S6.1 All accessible surfaces of the pipe shall be examined in accordance with Methods E 109 or E 138. Accessible is defined as: All outside surfaces, all inside surfaces of pipe 24 in. (610 mm) in diameter and greater, and inside surfaces of pipe less than 24 in. in diameter for a distance of one pipe diameter from the ends.

S6.2 Acceptance Standards — The following relevant indications are unacceptable:

S6.2.1 Any linear indications greater than $\frac{1}{16}$ in. (1.6 mm) long for materials less than $\frac{5}{8}$ in. (15.9 mm) thick; greater than $\frac{1}{8}$ in. (3.2 mm) long for materials $\frac{5}{8}$ in. thick to under 2 in. (50.8 mm) thick; and greater than $\frac{3}{16}$ in. (4.8 mm) long for materials 2 in. thick or greater.

S6.2.2 Rounded indications with dimensions greater than $\frac{1}{8}$ in. (3.2 mm) for thicknesses less than $\frac{5}{8}$ in. (15.9 mm) and greater than $\frac{3}{16}$ in. (4.8 mm) for thicknesses $\frac{5}{8}$ in. and greater.

S6.2.3 Four or more indications in any line separated by $\frac{1}{16}$ in. (1.6 mm) or less edge-to-edge.

S6.2.4 Ten or more indications in any 6 in.² (39 cm²) of surface with the major dimension of this area not to exceed 6 in. (152 mm) when it is taken in the most unfavorable orientation relative to the indications being evaluated.

S7. Magnetic Particle Examination of Weld Metal

S7.1 All accessible weld shall be examined in accordance with Practice E 709. Accessible is defined as: All outside surfaces, all inside surfaces of pipe less than 24 in. (610 mm) in diameter for a distance of one pipe diameter from the ends.

S7.2 Acceptance Criteria — The following relevant indications are unacceptable:

S7.2.1 Any cracks and linear indications.

S7.2.2 Rounded indications with dimensions greater than $\frac{3}{16}$ in. (4.8 mm).

S7.2.3 Four or more indications in any line separated $\frac{1}{16}$ in. (1.6 mm) or less edge-to-edge.

S7.2.4 Ten or more indications in any 6 in.² (39 cm²) of surface with the major dimension of this area not to exceed 6 in. (152 mm) when it is taken in the most unfavorable orientation relative to the indications being evaluated.

S8. Liquid Penetrant Examination of Base Metal

S8.1 All accessible surfaces of the pipe shall be examined in accordance with Practice E 165. Accessible is as defined in S6.1.

S8.2 The acceptance criteria shall be in accordance with S6.2.

S9. Liquid Penetrant Examination of Weld Metal

S9.1 All accessible surfaces of the pipe shall be examined in accordance with Practice E 165. Accessible is as defined in S7.1.

S9.2 The acceptance criteria shall be in accordance with S7.2.

S10. Straight Beam Ultrasonic Examination of Flat Plate — UT 1

S10.1 The plate shall be examined and accepted in accordance with Specification A 435 except that 100% of one surface shall be scanned by moving the search unit in parallel paths with not less than 10% overlap.

S11. Straight Beam Ultrasonic Examination of Flat Plate — UT 2

S11.1 The plate shall be examined in accordance with Specification A 578 except that 100% of one surface shall be scanned and the acceptance criteria shall be as follows:

S11.2 Any area, where one or more discontinuities produce a continuous total loss of back reflection accompanied by continuous indications on the same plane that cannot be encompassed within a circle whose diameter is 3 in. (76.2 mm) or $\frac{1}{2}$ of the plate thickness, whichever is greater, is unacceptable. In addition, two or more discontinuities on the same plane and having the same characteristics but smaller than described above shall be unacceptable unless separated by a minimum distance equal to the largest diameter of the larger discontinuity or unless they may be collectively encompassed by the circle described above.

S12. Angle-Beam Ultrasonic Examination (Plate Less than 2 in. (50.8 mm) Thick) — UT 3

S12.1 The plate shall be examined in accordance with Specification A 577 except that the calibration notch shall be V-shaped and the acceptance criteria shall be as follows: Any area showing one or more reflectors producing indications whose amplitude exceeds that of the calibration notch is unacceptable.

S13. Repair Welding

S13.1 Repair of base metal defects by welding shall be done only with customer approval.

S14. Description of Term

S14.1 lot — all pipe of the same mill heat of plate material and wall thickness (within $\pm\frac{1}{4}$ in. (6.4 mm)) heat treated in one furnace charge. For pipe that is not heat treated or that is heat treated in a continuous furnace, a lot shall consist of each 200 ft (61 m) or fraction thereof of all pipe of the same mill heat of plate material and wall thickness (within $\pm\frac{1}{4}$ in. (6.4 mm)), subjected to the same heat treatment. For pipe heat treated in a batch-type furnace that is automatically controlled within a 50°F (28°C) range and is equipped with recording pyrometers so that heating records are available, a lot shall be defined the same as for continuous furnaces.

SPECIFICATION FOR STEEL BARS, CARBON, HOT-WROUGHT, SPECIAL QUALITY, MECHANICAL PROPERTIES

SA-675/SA-675M

[Identical with ASTM Specification A 675/A 675M-03^{e1}(R09) except that Supplementary Requirement S7 has Grades 65 and 70 added, and S7 is mandatory. Sections 4.1.9 and 10 revised to make certification mandatory.]

1. Scope

1.1 This specification covers hot-wrought special quality carbon steel bars and bar size shapes produced to mechanical property requirements and intended for general constructional applications.

1.2 The bars are available in nine strength grades designated 45, 50, 55, 60, 65, 70, 75, 80, and 90 [310, 345, 380, 415, 450, 485, 515, 550, and 620] corresponding to the minimum ultimate tensile strength in ksi [MPa]. The chemical composition is selected by the manufacturer to develop the required mechanical properties.

1.3 Hot-wrought special quality carbon steel bars subject to mechanical property requirements are hot wrought in straight lengths only. Sections and sizes available are covered in Specification A 29/A 29M.

1.4 Some applications may require one or more of the available designations shown under Supplementary Requirements.

NOTE 1 — Merchant-quality hot-wrought carbon steel bars subject to mechanical property requirements are covered in Specification A 663/A 663M.

1.5 The values stated in either inch-pound units or SI units are to be regarded separately as the standard. Within the text, the SI units are shown in brackets. The values stated in each system are not equivalents, therefore each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification.

2. Referenced Documents

2.1 ASTM Standards:

A 29/A 29M Specification for Steel Bars, Carbon and Alloy, Hot-Wrought and Cold-Finished, General Requirements for

A 370 Test Methods and Definitions for Mechanical Testing of Steel Products

A 663/A 663M Specification for Steel Bars, Carbon, Merchant Quality, Mechanical Properties

E 290 Test Method for Semi-Guided Bend Test for Ductility of Metallic Materials

3. Terminology

3.1 Definitions of Terms Specific to This Standard:

3.1.1 special quality — Special quality bars are used when end use, method of fabrication, or subsequent processing treatment requires quality characteristics not available in merchant quality. Typical applications involve bending or machining for general constructional uses. Some end uses or fabricating procedures can necessitate one or more requirements which are described in the Supplementary Requirements.

4. Ordering Information

4.1 Orders for material under this specification should include the following information:

4.1.1 Quantity (weight or number of pieces),

4.1.2 Name of material (hot-wrought special quality bars),

4.1.3 Dimensions, including length,

4.1.4 Cross section (round, square, hexagon, equal leg angle, etc.),

4.1.5 Specification designation and date of issue,

4.1.6 Grade designation (Table 1),

4.1.7 Lead steel, if required (6.2),

4.1.8 Copper bearing steel, if required (6.3),

4.1.9 Test report (Section 10),

4.1.10 Supplementary Requirements or special requirements if required, and

4.1.11 Application and processing.

NOTE 2 — A typical ordering description is as follows: 10 000 lb, [5000 kg] Hot Wrought Special Quality Carbon Steel Bars, 1 in. diameter $\times$ 10 ft, [25 m $\times$ 3 m] Round, ASTM A 675/A 675M dated _____, Grade 50, [345] Copper Bearing, Test Report Required, S3 Special Straightness, Boiler Supports.

5. Materials and Manufacture

5.1 Melting Practice — The steel shall be made by one or more of the following primary processes: open-hearth, basic-oxygen, or electric-furnace. The primary melting may incorporate separate degassing or refining and may be followed by secondary melting using electroslag remelting or vacuum-arc remelting. Where secondary melting is employed, the heat shall be defined as all of the ingots remelted from a single primary heat.

5.2 Deoxidation:

5.2.1 Unless otherwise specified, the steel shall be rimmed, capped, semi-killed, or killed at the producer's option.

5.2.2 When required, the purchaser may specify the required deoxidation practice, dependent upon strength grade specified, purchaser's methods of fabrication, and end use requirements. Killed steels can be produced to coarse or fine austenitic grain size (Supplementary Requirement S1).

5.3 Condition — Unless otherwise specified, the bars shall be furnished as-rolled and not pickled, blast cleaned, or oiled. At the producer's option, bars may be cleaned for inspection.

6. Chemical Composition

6.1 The steel shall conform to the chemical requirements specified in Table 2.

6.2 Leaded Steel — When required, lead may be specified as an added element. When lead is specified as an added element, a range from 0.15 to 0.35 % inclusive shall be furnished. Such a steel is identified by adding the letter L after the grade designation, for example 60L [415L].

6.3 Copper-Bearing Steel — When required copper may be specified as an added element. Copper-bearing steel is identified by stating "copper-bearing" on the purchase order.

6.4 When tension tests are waived in accordance with 7.1.1.2, chemistry consistent with the mechanical properties desired shall be applied.

7. Mechanical Properties

7.1 Tension Tests

7.1.1 Requirements:

7.1.1.1 The material as represented by the test specimen shall conform to the applicable requirements in Table 1.

7.1.1.2 Shapes less than 1 in.² [645 mm²] in cross section and bars (other than flats) less than $\frac{1}{2}$ in. [12.5 mm] in thickness or diameter need not be subject to tension tests by the manufacturer.

7.1.1.3 For material over $\frac{3}{4}$ in. [19 mm] in thickness or diameter, a deduction of 0.25% from the percentage of elongation in 8 in. [200 mm] specified in Table 1 shall be made for each increase of $\frac{1}{32}$ in. [0.8 mm] in the specified thickness or diameter above $\frac{3}{4}$ in. [19 mm].

7.1.1.4 For material under $\frac{5}{16}$ in. [8 mm] in thickness or diameter, a deduction of 2.00% from the percentage of elongation in 8 in. [200 mm] specified in Table 1 shall be made for each decrease of $\frac{1}{32}$ in. [0.8 mm] in the specified thickness or diameter below $\frac{5}{16}$ in. [8 mm].

7.1.1.5 For Grades 45, 50, 55, 60, and 65 [310, 345, 380, and 415] for material over 2 in. [50 mm] in thickness or diameter, a deduction of 1.00% from the percentage of elongation in 2 in. [50 mm] specified in Table 1 shall be made for each 1 in. [25 mm] of specified thickness or diameter or fraction thereof over 2 in. [50 mm] in thickness or diameter.

7.1.1.6 For Grades 70, 75, 80, and 90 [485, 515, 550 and 620] for material over 2 in. [50 mm] in thickness or diameter, a deduction of 1.00% from the percentage of elongation in 2 in. [50 mm] specified in Table 1 shall be made for each 1 in. [25 mm] of specified thickness or diameter, or fraction thereof, over 2 in. [50 mm] in diameter or thickness, to a maximum deduction of 3%.

7.1.2 Test Specimens:

7.1.2.1 Test specimens shall be prepared for testing from the material in its as-rolled condition unless otherwise specified (see Supplementary Requirements). The tension specimen may be aged as described in Test Methods and Definitions A 370.

7.1.2.2 Test specimens shall be taken longitudinally and may be tested in full thickness or section, or they may be machined to the dimensions shown in Fig. 4 or Fig. 5 of Test Methods and Definitions A 370. If test specimens are selected conforming to the dimensions of Fig. 5, they shall be machined from a position midway between the center and the surface of the bar.

7.1.2.3 Test specimens for shapes and flats may be machined to the form and dimensions shown in Fig. 4 of Test Methods and Definitions A 370 or with both edges parallel. Test specimens for material over 1 $\frac{1}{2}$ in. [40 mm]

in thickness or diameter may be machined to a thickness or diameter of at least $\frac{3}{4}$ in. [20 mm] for a length of at least 9 in. [230 mm], or they may conform to the dimensions shown in Fig. 5 of Test Methods and Definitions A 370.

7.1.3 Number of Tests — Two tension tests shall be made from each heat, unless the finished material from a heat is less than 50 tons [45 Mg], when one tension test will be sufficient. However, for material 2 in. [50 mm] and under in thickness, when the material from one heat differs $\frac{3}{8}$ in. [9.5 mm] or more in thickness, one tension test shall be made from both the thickest and the thinnest material rolled (larger than the sizes in 7.1.1.2) regardless of the weight represented. For material over 2 in. [50 mm] thick, when the material from heat differs 1 in. [25 mm] or more in thickness, one tension test shall be made from both the thickest and the thinnest material rolled that is more than 2 in. [50 mm] thick regardless of the weight represented.

7.1.4 Test Method — Tension tests shall be made in accordance with Test Methods and Definitions A 370 using the applicable method for determining yield point.

7.2 Bend Tests:

7.2.1 Requirements:

7.2.1.1 Bend requirements apply only to flat bars (all sizes), bars other than flats less than $\frac{1}{2}$ in. [12.5 mm] in thickness or diameter, and shapes less than 1 in.² [645 mm²] in cross section. When bend tests are required for other sizes, Supplementary Requirement S6 must be specified.

7.2.1.2 The bend test specimen shall stand being bent at room temperature through 180° without cracking on the outside of the bent portion, to an inside diameter which shall have the relation to the thickness or diameter of the specimen as given in Table 3.

7.2.2 Test Specimens:

7.2.2.1 Bend test specimens for material $1\frac{1}{2}$ in. [40 mm] and under in diameter or thickness may be the full thickness of the section. For flat bars over 2 in. [50 mm] in width, the width may be reduced by milling to $1\frac{1}{2}$ in. [40 mm].

7.2.2.2 Bend test specimens for material over $1\frac{1}{2}$ in. [40 mm] in diameter or thickness may be machined to a thickness or diameter of at least $\frac{3}{4}$ in. [20 mm] or to 1 by $\frac{1}{2}$ in. [25 by 12.5 mm] in section. Machined sides of bend test specimens may have the corners rounded to a radius of not over $\frac{1}{16}$ in. [1.6 mm] for material 2 in. [50 mm] and under in thickness, and not over $\frac{1}{8}$ in. [3.2 mm] in radius for material over 2 in. [50 mm] in thickness.

7.2.3 Number of Tests — When subject to bend test, two bend tests shall be made from each heat, unless the

finished material from a heat is less than 50 tons [45 Mg], when one bend test will be sufficient. However, for material 2 in. [50 mm] and under in thickness, when the material from one heat differs $\frac{3}{8}$ in. [9.5 mm] or more in thickness, one bend test shall be made from both the thickest and the thinnest material rolled regardless of the weight represented. For material over 2 in. [50 mm] thick, when the material from one heat differs 1 in. [25 mm] or more in thickness, one bend test shall be made from both the thickest and the thinnest material rolled that is more than 2 in. [50 mm] thick regardless of the weight represented.

7.2.4 Test Methods — Bend tests shall be made in accordance with Test Method E 290.

8. Workmanship, Finish, and Appearance

8.1 Bars shall be free of visible pipe, undue segregation, and injurious surface imperfections.

8.2 Surface Finish — The bars shall have a commercial hot-wrought finish obtained by conventional hot rolling. See 5.3 for producer's descaling option.

9. General Requirements

9.1 Material furnished under this specification shall conform to the applicable requirements for the current edition of Specification A 29/A 29M.

10. Certification

10.1 The manufacturer's certification that the material was manufactured and tested in accordance with this specification together with a report of the heat analysis, tensile requirements, and bend test (if applicable) test results shall be furnished. Only one test need be reported when the amount of material from a heat in a shipment is less than 10 tons [9 Mg] and when the thickness variations described in (7.1.3) and (7.2.3) are not exceeded. The report shall include the name of the manufacturer, ASTM designation number and year date and revision letter, if any, grade, heat number, and size.

10.2 The thickness of the product tested may not necessarily be the same as an individual ordered thickness since it is the heat that is tested rather than each ordered item.

10.3 When Supplementary Requirements are specified, the report shall include a statement of compliance with the requirement or the results of tests when the requirement involves measured test values.

11. Keywords

11.1 carbon steel bars; hot-wrought steel bars; steel bars

TABLE 1
TENSILE REQUIREMENTS

Grade Designation ^A	Tensile Strength		Yield Point, min. ^B		Elongation, min., % ^C	
	ksi	[MPa]	ksi	[MPa]	8 in. or [200 mm] Gage Length	2 in. or [50 mm] Gage Length
45 [310]	45 to 55	[310 to 380]	22.5	[155]	27	33
50 [345]	50 to 60	[345 to 415]	25	[170]	25	30
55 [380]	55 to 65	[380 to 450]	27.5	[190]	23	26
60 [415]	60 to 72	[415 to 495]	30	[205]	21	22
65 [450]	65 to 77	[450 to 530]	32.5	[225]	17	20
70 [485]	70 to 85	[485 to 585]	35	[240]	14	18
75 [515]	75 to 90	[515 to 620]	37.5	[260]	14	18
80 [550]	80 min.	[550 min.]	40	[275]	13	17
90 [620]	90 min.	[620 min.]	55	[380]	10	14

^A When lead is required, add the letter "L" after the grade designation, for example 45L.

^B When the tension test does not show a yield point (drop of the beam, halt of the pointer or sharp-kneed stress-strain diagram), yield strength shall be determined by either 0.5% extension-under-load or 0.2% offset. The minimum ksi (MPa) requirement does not change. The test report, if required, shall show yield strength.

^C See 7.1.1.3 through 7.1.1.6 for deduction in elongation due to section size.

TABLE 2
CHEMICAL REQUIREMENTS (HEAT ANALYSIS)

Element	
Phosphorus, max.	0.040
Sulfur, max.	0.050
Copper, when copper steel is specified, min.	0.20
Lead	^A

^A When required, lead may be specified as an added element.
See 6.2.

TABLE 3
BEND REQUIREMENTS

Grade Designation	Ratio of Bend Diameter to Thickness of Specimen for Thickness or Diameter of Bar, in. (mm)						
	$\frac{3}{4}$ [20] and Under	Over $\frac{3}{4}$ [20] to 1 [25], incl	Over 1 [25] to $1\frac{1}{2}$ [40], incl	Over $1\frac{1}{2}$ [40] to 2 [50], incl	Over 2 [50] to 3 [75], incl	Over 3 [75] to 5 [125], incl	Over 5 [125]
45 [310]	flat	flat	$\frac{1}{2}$	1	1	2	3
50 [345]	flat	$\frac{1}{2}$	1	$1\frac{1}{2}$	$2\frac{1}{2}$	3	$3\frac{1}{2}$
55 [380]	$\frac{1}{2}$	1	$1\frac{1}{2}$	3	$2\frac{1}{2}$	3	$3\frac{1}{2}$
60 [415]	$\frac{1}{2}$	1	$1\frac{1}{2}$	$2\frac{1}{2}$	3	$3\frac{1}{2}$	4
65 [450]	1	$1\frac{1}{2}$	2	3	$3\frac{1}{2}$	4	5
70 [485]	$1\frac{1}{2}$	2	$2\frac{1}{2}$	3	$3\frac{1}{2}$	4	5
75 [515]	2	2	3	$3\frac{1}{2}$	4	$4\frac{1}{2}$	6

90 [620] ^A	...	...	...	...	...	...	...

^A Bend requirements are not required for Grade 90 [620], but may be specified by agreement between purchaser and manufacturer (see Supplementary Requirement S6).

SUPPLEMENTARY REQUIREMENTS

One or more of the following supplementary requirements shall apply only when specified by the purchaser in the inquiry, contract, or order. Details of these supplementary requirements shall be agreed upon in writing by the manufacturer and purchaser. Supplementary requirements shall in no way negate any requirements of the specification itself.

S1. Grain Size

S1.1 The steel shall conform to the coarse austenitic grain size requirement, or the fine austenitic grain size requirement of Specification A 29/A 29M.

S2. Thermal Treatment

S2.1 When required, the purchaser may specify that the material be stress relieved.

S3. Special Straightness

S3.1 Bars may be specified to special straightness tolerance (refer to Specification A 29/A 29M).

S4. Cleaning

S4.1 The purchaser may specify that the surface of bars be descaled by pickling or blast cleaning.

S5. Coating

S5.1 The purchaser may specify oil on bars that have been descaled.

S6. Bend Requirement

S6.1 Bend requirements for Grade 90 [620] may be specified. The bend ratio shall be as agreed upon. Bend requirements for all other grades, when specified, shall be as specified in Table 3.

S7. Carbon Restriction

S7.1 On Grades 45 [310], 50 [345], 55 [380], 60 [415], 65 [450], and 70 [485], carbon shall be 0.35% max.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR WELDED AUSTENITIC STAINLESS STEEL FEEDWATER HEATER TUBES

SA-688/SA-688M

(Identical with ASTM Specification A 688/A 688M-04.)

1. Scope

1.1 This specification covers welded austenitic stainless steel feedwater heater tubes including those bent, if specified, into the form of U-tubes for application in tubular feed-water heaters.

1.2 The tubing sizes covered shall be $\frac{5}{8}$ to 1 in. [15.9 to 25.4 mm] inclusive outside diameter, and average or minimum wall thicknesses of 0.028 in. [0.7 mm] and heavier.

1.3 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system shall be used independently of the other. Combining values from the two systems may result in nonconformance with the specification.

2. Referenced Documents

2.1 ASTM Standards:

- A 262 Practices for Detecting Susceptibility to Intergranular Attack in Austenitic Stainless Steels
- A 480/A 480M Specification for General Requirements for Flat-Rolled Stainless and Heat-Resisting Steel Plate, Sheet, and Strip
- A 941 Terminology Relating to Steel, Stainless Steel, Related Alloys, and Ferroalloys
- A 1016/A 1016M Specification for General Requirements for Ferritic Alloy Steel, Austenitic Alloy Steel, and Stainless Steel Tubes
- E 527 Practice for Numbering Metals and Alloys (UNS)

2.2 Other Standard:

- SAE J1086 Practice for Numbering Metals and Alloys (UNS)

3. Terminology

3.1 Definitions Of Terms — For definitions of terms used in this specification, refer to Terminology A 941.

4. Ordering Information

4.1 It is the responsibility of the purchaser to specify all requirements that are necessary for material under this specification. Such requirements may include, but are not limited to, the following:

4.1.1 Quantity (length or number of pieces),

4.1.2 Material description,

4.1.3 Dimensions—Outside diameter, wall thickness (minimum or average wall), and length,

4.1.4 Grade (chemical composition) (Table 1),

4.1.5 U-bend requirements, if order specifies bending, U-bend schedules or drawings shall accompany the order,

4.1.6 Optional requirements—Purchaser shall specify if annealing of the U-bends is required or whether tubes are to be hydrotested or air tested (see 11.6)

4.1.7 Supplementary requirements—Purchaser shall specify on the purchase order if material is to be eddy current tested in accordance with Supplementary Requirements S1 or S2, and if special test reports are required under Supplementary Requirement S3, and,

4.1.8 Any special requirements.

5. General Requirements

5.1 Material furnished to this specification shall conform to the applicable requirements of the latest published edition of Specification A 1016/A 1016M unless otherwise provided herein.

6. Materials and Manufacture

6.1 The tube shall be made from flat-rolled steel by an automatic welding process with no addition of filler metal.

6.2 Subsequent to welding and prior to final heat treatment, the tubes shall be cold worked either in both the weld and base metal, or in the weld metal only. The method of cold work may be specified by the purchaser. When cold drawn, the purchaser may specify the minimum amount of reduction in cross-sectional area or wall thickness, or both.

6.3 Many surface contaminants may have detrimental effects on high temperature properties or corrosion resistance of tubing. Contamination by copper, lead, mercury, zinc, chlorides, or sulfur may be detrimental to stainless steels. The manufacturer shall employ techniques that minimize surface contamination by these elements.

7. Cleaning Before Annealing

7.1 All lubricants or coatings used in the manufacture of straight-length tube or in the bending shall be removed from all surfaces prior to any annealing treatments. U-bends on which a lubricant had been applied to the inside surface during bending shall have the cleanness of their inside surface confirmed by blowing close fitting acetone-soaked felt plugs through 10% of the tubes of each bend radius. Dry, oil-free, air or inert gas shall be used to blow the plugs through the tubes. If the plugs blown through any tube shows more than a light gray discoloration, all tubes that have had a lubricant applied to the inside surface during bending shall be recleaned. After recleaning 10% of the tubes of each bend radius whose inside surface had been subjected to bending lubricants shall be retested.

8. Heat Treatment

8.1 All finished straight tubing or straight tubing ready for U-bending shall be furnished in the solution-annealed condition. The annealing procedure, except for N08367, S31254, S32654, and N08926, shall consist of heating the material to a minimum temperature of 1900°F [1040°C] followed by a rapid cooling to below 700°F [370°C]. The cooling rate shall be sufficiently rapid to prevent harmful carbide precipitation as determined in Section 13.

8.2 UNS N08367 shall be solution annealed at 2025°F [1107°C] minimum followed by rapid quenching.

8.3 N08926 shall be heat-treated at a minimum temperature of 2010°F [1100°C] followed by quenching in water or rapidly cooling by other means.

8.4 S31254 and S32654 shall be solution annealed at 2100°F [1150°C] minimum followed by rapid quenching.

8.5 If heat treatment of U-bends is specified, it shall satisfy the annealing procedure described above, and shall be done as follows:

8.5.1 The heat treatment shall be applied to the U-bend area plus approximately 6 in. [150 mm] of each leg beyond the tangent point of the U-bend.

8.5.2 If the heat treatment specified in 8.5 is accomplished by resistance-heating methods wherein electrodes are clamped to the tubes, the clamped areas shall be visually examined for arc burns. Burn indications shall be cause for rejection unless they can be removed by local polishing without encroaching upon minimum wall thickness.

8.5.3 Temperature control shall be accomplished through the use of optical or emission pyrometers, or both. No temperature-indicating crayons, lacquers, or pellets shall be used.

8.5.4 The inside of the tube shall be purged with a protective or an inert gas atmosphere during heating and cooling to below 700°F [370°C] to prevent scaling of the inside surface. The atmosphere should be noncarburizing.

9. Surface Condition

9.1 The straight tubes, after final annealing, shall be pickled using a solution of nitric and hydrofluoric acids followed by flushing and rinsing in water. If bright annealing is performed, this requirement does not apply.

9.2 A light oxide scale on the outside surface of U-bend area shall be permitted for tubes which have been electric-resistance heat treated after bending.

10. Chemical Composition

10.1 Product Analysis:

10.1.1 When requested in the purchase order, a product analysis shall be made by the supplier from one tube or coil of steel per heat. The chemical composition shall conform to the requirements shown in Table 1.

10.1.2 A product analysis tolerance of Specification A 480/A 480M shall apply. The product analysis tolerance is not applicable to the carbon content for material with a specified maximum carbon of 0.04% or less.

10.1.3 If the original test for product analysis fails, retests of two additional lengths of flat-rolled stock or tubes shall be made. Both retests, for the elements in question, shall meet the requirements of this specification; otherwise all remaining material in the heat or lot (Note 1) shall be rejected, or at the option of the producer, each length of flat-rolled stock or tube may be individually tested for acceptance. Lengths of flat-rolled stock or tubes that do not meet the requirements of this specification shall be rejected.

NOTE 1 — For flattening and flange requirements, the term "lot" applies to 125 tube groupings, prior to cutting to length, of the same nominal

size and wall thickness, produced from the same heat of steel and annealed in a continuous furnace.

11. Mechanical Requirements

11.1 Tensile Properties:

11.1.1 The material shall conform to the tensile properties shown in Table 2.

11.1.2 One tension test shall be made on a specimen for lots of not more than 50 tubes. Tension tests shall be made on specimens from two tubes for lots of more than 50 tubes (Note 2).

11.2 Hardness:

11.2.1 Grade TP XM-29 tubes shall have a hardness number not exceeding 100 HRB or its equivalent. Tubes of all other grades shall have a hardness number not exceeding 90 HRB or its equivalent. This hardness requirement is not to apply to the bend area of U-bend tubes which are not heat treated after bending.

11.2.2 Brinell or Rockwell hardness tests shall be made on specimens from two tubes from each lot.

NOTE 2 — For tension, hardness, and corrosion test requirements, the term “lot” applies to all tubes prior to cutting to length, of the same nominal diameter and wall thickness, produced from the same heat of steel and annealed in a continuous furnace at the same temperature, time at heat, and furnace speed.

11.3 Reverse Bend Test:

11.3.1 One reverse bend test shall be made on a specimen from each 1500 ft [460 m] of finished tubing.

11.3.2 A section 4 in. [100 mm] minimum in length shall be split longitudinally 90° on each side of the weld. The sample shall then be opened and bent around a mandrel with a maximum thickness of four times the wall thickness, with the mandrel parallel to the weld and against the original outside surface of the tube. The weld shall be at the point of maximum bend. There shall be no evidence of cracks, or of overlaps resulting from the reduction in thickness of the weld area by cold working. When the geometry or size of the tubing make it difficult to test the sample as a single piece, the sample may be sectioned into smaller pieces provided a minimum of 4 in. of weld is subjected to reverse bending.

NOTE 3 — The reverse bend test is not applicable when specified wall is 10% or more of the specified outside diameter, or the wall thickness is 0.134 in. [3.4 mm] or greater, or the outside diameter size is less than 0.375 in. [9.5 mm]. Under these conditions, the reverse flattening test of Specification A 1016/A 1016M shall apply.

11.4 Flattening Test—Flattening tests shall be made on specimens from each end of one finished tube, not the one used for the flange test, from each lot (Note 1).

11.5 Flange Test — Flange tests shall be made on specimens from each end of one finished tube, not the one used for the flattening test, from each lot (Note 1).

11.6 Pressure Test:

11.6.1 Each straight tube or each U-tube after completion of the bending and post-bending heat treatment, shall be pressure tested in accordance with one of the following paragraphs as specified by the purchaser.

11.6.1.1 Hydrostatic Test — Each tube shall be given an internal hydrostatic test in accordance with Specification A 1016/A 1016M, except that the test pressure and hold time, when other than that stated in Specification A 1016/A 1016M, shall be agreed upon between purchaser and manufacturer.

11.6.1.2 Air Underwater Test — Each tube shall be air underwater tested in accordance with Specification A 1016/A 1016M.

12. Nondestructive Test (Electric Test)

12.1 Each straight tube shall be tested after the finish heat treatment by passing it through a nondestructive tester capable of detecting defects on the entire cross section of the tube, in accordance with Specification A 1016/A 1016M.

13. Corrosion Resisting Properties

13.1 One full section sample 1 in. [25.4 mm] long from the center of a sample tube of the smallest radius bend which is heat treated shall be tested in the heat treated condition in accordance with Practices A 262.

13.2 One full-section sample 1 in. [25.4 mm] long from each lot (Note 2) of straight tubes shall be tested in the finished condition in accordance with Practices A 262.

13.3 The appearance of any fissures or cracks in the test specimen when evaluated in accordance with Practices A 262 indicating the presence of intergranular attack, shall be cause for rejection of that lot.

14. Permissible Variations in Dimensions (Fig. 1)

14.1 Permissible variations from the specified outside diameter shall be in accordance with Specification A 1016/A 1016M. Those tolerances do not apply to the bent portion of the U-tubes. At the bent portion of a U-tube for $R = 2 \times D$ or greater, neither the major nor minor diameter of the tube shall deviate from the nominal diameter prior to bending by more than 10%. If less than $2 \times D$ is specified, tolerances could be greater.

14.2 Permissible Variations from the Specified Wall Thickness:

14.2.1 Permissible variations from the specified minimum wall thickness shall not exceed +20% – 0.

14.2.2 Permissible variations from the specified average wall thickness are $\pm 10\%$ of the nominal wall thickness.

14.2.3 The wall thickness of the tube in the U-bent section shall not be less than value determined by the equation:

$$t_f = \frac{4RT}{4R + D}$$

where:

t_f = wall thickness after bending, in. [mm],

T = minimum wall thickness of 14.2.1 or 14.2.2, in. [mm],

R = centerline bend radius, in. [mm], and

D = nominal outside tube diameter, in. [mm].

14.3 Permissible Variations from the Specified Length:

14.3.1 Straight Lengths — The maximum permissible variations for lengths 24 ft [7.3 m] and shorter shall be $+\frac{1}{8}$ in. [3 mm], -0 ; for lengths longer than 24 ft [7.3 m], an additional over tolerance of $+\frac{1}{8}$ in. [3 mm] for each 10 ft [3 m], or fraction thereof, shall be permitted up to a maximum of $+\frac{1}{2}$ in. [13 mm].

14.3.2 U-Bends — In the case of U-tubes, the length of the tube legs as measured from the point of tangency of the bend and the tube leg to the end of the tube leg, shall not be less than specified, but may exceed the specified values by the amount given in Table 3. The difference in lengths of the tube legs shall not be greater than $\frac{1}{8}$ in. unless otherwise specified.

14.4 The end of any tube may depart from square by not more than the amount given in Table 4.

14.5 The leg spacing measured between the points of tangency of the bend to the legs shall not vary from the value ($2R$ – specified tube outside diameter) by more than $\frac{1}{16}$ in. [1.5 mm] where R is the center-line bend radius.

14.6 The bent portion of the U-tube shall be substantially uniform in curvature, and not to exceed $\pm \frac{1}{16}$ in. [1.5 mm] of the nominal center-line radius.

14.7 Permissible deviation from the plane of bend (Fig. 1) shall not exceed $\frac{1}{16}$ in. [1.5 mm] as measured from the points of tangency.

15. Workmanship, Finish, and Appearance

15.1 Tubing purchased to this specification is intended for use in heat exchangers, and will be inserted through close-fitting holes in baffles or support plates, or both, spaced along the tube length. The tube ends will also be inserted into very close-fitting holes in a tubesheet and expanded and may be welded therein. The tubes shall be able to stand expanding and bending without showing

cracks and flaws, and shall be finished reasonably straight and suitable for the intended purpose.

15.2 The residual chloride salt contamination of the inside and outside surface of the tubing at the time of packing for shipment from the mill shall not exceed a concentration of 1 mg/ft² [10.7 mg/m²] of tube surface. One tube in each five hundred pieces shall be checked immediately prior to packing for shipment for chloride salt contamination by a procedure agreed upon by the manufacturer and purchaser.

16. Inspection

16.1 The inspector representing the purchaser shall have entry, at all times, to those areas where inspection and testing is being performed on the purchaser's ordered material. The manufacturer shall afford the inspector all reasonable facilities to satisfy him that the material is being furnished in accordance with this specification. All required tests and inspections shall be made at the place of manufacture prior to shipment, unless otherwise specified, and shall be conducted so as not to interfere unnecessarily with the operation of the works.

17. Rejection

17.1 Each length of tubing received from the manufacturer may be inspected by the purchaser, and, if it does not meet the requirements of the specification based on the inspection and test method outlined in the specification, the tubing may be rejected and the manufacturer shall be notified. Disposition of rejected tubing shall be a matter of agreement between the manufacturer and the purchaser.

17.2 Material that fails in any of the forming operations or in the process of installation and is found to be defective, shall be set aside, and the manufacturer shall be notified. Disposition of such material shall be a matter for agreement between the manufacturer and the purchaser.

18. Certification

18.1 A test report, signed by an authorized employee or representative of the manufacturer, shall be furnished to the purchaser to indicate the specification and grade, the results of the heat analysis, hardness and tensile properties. Product analysis will be reported only when requested on the purchase order as provided in 4.1.7.

19. Product Marking

19.1 All tubes shall be marked with the heat number.

19.2 Containers and packages shall be marked or tagged to show the purchaser's order number, the manufacturer's

order number, specification, grade, size and gage of tubing, number of pieces contained in the package, and item number (if appropriate).

20. Packaging

20.1 All tubing shall be packaged and blocked in such a manner as to prevent damage in ordinary handling and transportation. The boxes shall be constructed in such a manner that no nails, staples, screws, or similar fasteners are required to close and secure the box after the tubes have been placed in the box. The box shall be lined with

plastic sheet or vapor barrier materials so as to prevent chloride contamination of the tube during handling, transportation, and storage.

20.2 The U-bent tubes shall be arranged in boxes so that the smaller radius bends may be removed without disturbing larger radius bends. Tubes for an item number shall be boxed together.

21. Keywords

21.1 austenitic stainless steel; feedwater heater tubes; stainless steel tube; steel tube; welded steel tube

SUPPLEMENTARY REQUIREMENTS

The following supplementary requirement or requirements may become a part of the specification when specified in the inquiry or invitation to bid, and purchase order or contract. These requirements shall not be considered, unless specified in the order, in which event the necessary tests shall be made by the manufacturer prior to the bending or shipment of the tubing.

S1. Nondestructive Eddy-Current Test

S1.1 Each tube in the finished condition, except for bending if that is required, shall be tested by passing it through an electric nondestructive tester capable of detecting defects on the entire cross section of the tube. Suitable instrumentation shall be used to clearly distinguish the artificial defects. The outside and inside surfaces of the tubes shall be free of loose scale, metallic particles, or other material which would tend to restrict signals or create electrical noise. The tubing shall be inspected by feeding it longitudinally through an inspection coil or coils with a diameter suitable for the diameter of tubing to be inspected. The instrument calibration shall be accomplished with a reference standard prepared from an appropriate length of selected tubing of the same size, grade, and physical condition as the material to be inspected. The standard shall be fed through the coil at the same speed at which the inspection of the tubing is performed.

S1.2 The factors listed in S1.3 shall be selected or adjusted, or both, in accordance with the instrument manufacturer's instructions, for the particular instrument involved as required to achieve optimum instrument distinction between the reference defects and plain portions of the tube.

S1.3 The following as well as other factors involved shall not be used in such a manner that they detract from the overall ability of the instrument to detect defects: test frequency, direct-current saturation level, filter networks, phase-analysis circuits, coil diameter, and instrument gain.

S1.4 The reference standard shall consist of a defect-free sample of the same size, alloy, and condition (temper) as that being tested, and shall contain longitudinal and circumferential notches on the outside diameter establishing the rejection level of the tubing to be tested. Inside diameter notches, both longitudinal and transverse, shall also be a part of the reference standard. These inside notches may be larger than the outside notches, and are intended for use only to assure instrument phase settings capable of yielding optimum inside surface sensitivity.

S1.4.1 All notches shall be produced by EDM methods. The outside diameter notches shall be of the dimensions shown in Table S1.1 and Fig. S1.1.

S1.5 All tubing shall meet this specification. The instrument calibration shall be verified at the start of testing, after any shut down of the test equipment, after any test equipment adjustment, or at least every $\frac{1}{2}$ h of continuous production testing or both. Tubes generating a signal above the outside diameter calibration standard sensitivity level shall be rejected.

S1.6 Tubes may be reconditioned and retested provided reconditioning does not adversely effect the minimum wall thickness or other properties of the tube specification requirements. Upon agreement between purchaser and manufacturer, the referee method, employing ultrasonic testing, may be employed for retesting tubes rejected by the eddy-current test. The calibration standard for this test shall be identical to that required for the eddy-current test.

S2. Nondestructive Eddy-Current Testing (Select Commercial Grade)

S2.1 The manufacturer shall test the tubing using the procedure outlined in Supplementary Requirement S1, except for the notch standards, which shall be as indicated in Table S2.1.

S3. Report

S3.1 A report shall be furnished by the manufacturer to include a record of all tests performed to qualify material to this specification. This record shall include numbers of tests performed and qualitative or quantitative results as is applicable.

S4. Intergranular Corrosion Tests

S4.1 When specified, material shall pass intergranular corrosion tests conducted by the manufacturer in accordance with Practices A 262, Practice E.

NOTE S4.1 — Practice E requires testing on the sensitized condition for low carbon grades, and on the as-shipped condition for other grades.

SPECIFICATION FOR CARBON AND ALLOY STEEL PIPE, ELECTRIC-FUSION-WELDED FOR HIGH- PRESSURE SERVICE AT HIGH TEMPERATURES

SA-691

[Identical with ASTM Specification A 691-98(R02) except that the following additional requirements apply.]

All products furnished under this SA specification are intended for application under the rules of Section III of the ASME Boiler and Pressure Vessel Code. Manufacture of such products is limited to manufacturers who hold the appropriate ASME Certificate of Authorization and Code Symbol Stamp. In addition to conforming to this specification, the manufacturer shall meet all applicable requirements of Section III of the Code. The plate used to fabricate the pipe shall conform to the applicable SA specification in the ASME Boiler and Pressure Vessel Code, Section II. The joints shall be full penetration butt welds as obtained by double welding or by other means which will obtain the same quality of deposited weld metal on the inside and outside. Welds using metal backing strips which remain in place are excluded. The product is subject to all requirements of Section III of the Code including welding, heat treatment, nondestructive examination, authorized inspection at the point of manufacture, and application of the Code Symbol Stamp.

The applicable ASME Partial Data Report Form, signed by an Authorized Inspector, and a certified mill test report shall be furnished for each lot of pipe, as defined by requirement S12 of this specification. Each length of pipe shall be marked in such a manner as to identify each piece with the lot and the certified mill test report.

1. Scope

1.1 This specification covers carbon and alloy steel pipe, electric-fusion-welded with filler metal added, fabricated from pressure-vessel-quality plate of several analyses and strength levels and suitable for high-pressure service at high temperatures. Heat treatment may or may not be required to attain the desired mechanical properties or to comply with applicable code requirements. Supplementary requirements are provided for use when additional testing or examination is desired.

1.2 The specification nominally covers pipe 16 in. (405 mm) in outside diameter and larger with wall thicknesses up to 3 in. (75 mm) inclusive. Pipe having other dimensions may be furnished provided it complies with all other requirements of this specification.

1.3 Several grades and classes of pipe are provided.

1.3.1 *Grade* designates the type of plate used as listed in Table 1.

1.3.2 *Class* designates the type of heat treatment performed in the manufacture of the pipe, whether the weld is radiographically examined, and whether the pipe has been pressure tested as listed in 1.3.3.

1.3.3 Class designations are as follows (Note 1):

Class	Heat Treatment on Pipe	Radiography, see Section	Pressure Test, see Section
10	none	none	none
11	none	9	none
12	none	9	8.3
13	none	none	8.3
20	stress relieved, see 5.3.1	none	none
21	stress relieved, see 5.3.1	9	none
22	stress relieved, see 5.3.1	9	8.3
23	stress relieved, see 5.3.1	none	8.3
30	normalized, see 5.3.2	none	none
31	normalized, see 5.3.2	9	none
32	normalized, see 5.3.2	9	8.3
33	normalized, see 5.3.2	none	8.3
40	normalized and tempered, see 5.3.3	none	none
41	normalized and tempered, see 5.3.3	9	none
42	normalized and tempered, see 5.3.3	9	8.3
43	normalized and tempered, see 5.3.3	none	8.3
50	quenched and tempered, see 5.3.4	none	none

Class	Heat Treatment on Pipe	Radiography, see Section	Pressure Test, see Section
51	quenched and tempered, see 5.3.4	9	none
52	quenched and tempered, see 5.3.4	9	8.3
53	quenched and tempered, see 5.3.4	none	8.3

NOTE 1 — Selection of materials should be made with attention to temperature of service. For such guidance, Specification A 20/A 20M may be consulted.

1.4 Optional requirements of a supplementary nature are provided, calling for additional tests and control of repair welding, when desired.

1.5 The values stated in inch-pound units are to be regarded as the standard.

3. Terminology

3.1 Definitions of Terms Specific to This Standard:

3.1.1 A lot shall consist of 200 ft (61 m) or fraction thereof of pipe from the same heat of steel.

3.1.1.1 The description of a lot may be further restricted by use of Supplementary Requirement S12.

4. Ordering Information

4.1 The inquiry and order for material under this specification should include the following information:

- 4.1.1** Quantity (feet, metres, or number of lengths),
- 4.1.2** Name of the material (steel pipe, electric-fusion-welded),
- 4.1.3** Specification number,
- 4.1.4** Grade and class designations (see 1.3),
- 4.1.5** Size (inside or outside diameter, nominal or minimum wall thickness),
- 4.1.6** Length (specific or random),
- 4.1.7** End finish,
- 4.1.8** Purchase options, if any (see 5.2.3, 11.3, 11.4, 13.1), and
- 4.1.9** Supplementary requirements, if any (refer to S1 through S12).

5. Materials and Manufacture

5.1 Materials — The steel plate material shall conform to the requirements of the applicable plate specification for the pipe grade ordered as listed in Table 1.

5.2 Welding:

5.2.1 The joints shall be double-welded full-penetration welds made in accordance with procedures and by welders or welding operators qualified in accordance with the ASME Boiler and Pressure Vessel Code, Section IX.

5.2.2 The welds shall be made either manually or automatically by an electric process involving the deposition of filler metal.

5.2.3 The welded joints shall have positive reinforcement at the center of each side of the weld, but no more than $\frac{1}{8}$ in. (3.2 mm). This reinforcement may be removed at the manufacturer's option or by agreement between the manufacturer and purchaser. The contour of the reinforcement shall be smooth, and the deposited metal shall be fused smoothly and uniformly into the plate surface.

5.2.4 When radiographic examination in accordance with 9.1 is to be used, the weld reinforcement shall be governed by the more restrictive provisions of UW-51 of Section VIII of the ASME Boiler and Pressure Vessel Code instead of 5.2.3 of this specification.

5.3 Heat Treatment — All classes other than 10, 11, 12, and 13 shall be heat treated in a furnace controlled

to $\pm 25^{\circ}\text{F}$ (14°C) and equipped with a recording pyrometer so that heating records are available. Heat treating after forming and welding shall be to one of the following:

5.3.1 Classes 20, 21, 22, and 23 pipe shall be uniformly heated within the post-weld heat-treatment temperature range indicated in Table 2 for a minimum of 1 h/in. of thickness or for 1 h, whichever is greater.

5.3.2 Classes 30, 31, 32, and 33 pipe shall be uniformly heated to a temperature in the austenitizing range and not exceeding the maximum normalizing temperature indicated in Table 2 and subsequently cooled in air at room temperature.

5.3.3 Classes 40, 41, 42, and 43 pipe shall be normalized in accordance with 5.3.2. After normalizing, the pipe shall be reheated to the tempering temperature indicated in Table 2 as a minimum and held at temperature for a minimum of $\frac{1}{2}$ h/in. of thickness or for $\frac{1}{2}$ h, whichever is greater, and air cooled.

5.3.4 Classes 50, 51, 52, and 53 pipe shall be uniformly heated to a temperature in the austenitizing range, and not exceeding the maximum quenching temperature indicated in Table 2 and subsequently quenched in water or oil. After quenching, the pipe shall be reheated to the tempering temperature indicated in Table 2 as a minimum and held at that temperature for a minimum of $\frac{1}{2}$ h/in. of thickness or for $\frac{1}{2}$ h, whichever is greater, and air cooled.

5.4 Grade 91 shall be produced only to classes 4X and 5X. In addition, post-weld heat treatment is required after weld repair.

6. General Requirements

6.1 Material furnished to this specification shall conform to the applicable requirements of the current edition of Specification A 530/A 530M, unless otherwise provided herein.

7. Chemical Requirements

7.1 Product Analysis of Plate — The pipe manufacturer shall make an analysis of each mill heat of plate material. The product analysis so determined shall meet the requirements of the plate specification to which the material was ordered.

7.2 Product Analysis of Weld — The pipe manufacturer shall make an analysis of finished deposited weld metal from each 200 ft (61 m) or fraction thereof. Analysis shall conform to the welding procedure for deposited weld metal.

7.3 Analysis may be taken from the mechanical test specimens. The results of the analyses shall be reported to the purchaser.

7.4 If the analysis of one of these tests specified in 7.1 or 7.2 does not conform to the requirements specified, analyses shall be made on additional pipes of double the original number from the same lot, each of which shall conform to the requirements specified. Nonconforming pipe shall be rejected.

8. Mechanical Requirements

8.1 Tension Test:

8.1.1 Requirements — Transverse tensile properties of the welded joint shall meet the minimum requirements for ultimate tensile strength of the specified plate material.

8.1.2 Number of Tests — One test specimen shall be made to represent each lot of finished pipe.

8.1.3 Test Specimen Location and Orientation — The test specimen shall be made transverse to the weld at the end of the finished pipe and may be flattened cold before final machining to size.

8.1.4 Test Method — The test specimen shall be made in accordance with QW-150 in Section IX of the ASME Boiler and Pressure Vessel Code. The test specimen shall be tested at room temperature in accordance with Test Methods and Definitions A 370.

8.2 Transverse-Guided-Weld-Bend Tests:

8.2.1 Requirements — The bend test shall be acceptable if no cracks or other defects exceeding $\frac{1}{8}$ in. (3.2 mm) in any direction be present in the weld metal or between the weld and the pipe metal after bending. Cracks that originate along the edges of the specimens during testing, and that are less than $\frac{1}{4}$ in. (6.3 mm) in any direction shall not be considered.

8.2.2 Number of Tests — One test (two specimens) shall be made to represent each lot of finished pipe.

8.2.3 Test Specimen Location and Orientation — Two bend test specimens shall be taken transverse to the weld at the end of the finished pipe. As an alternative, by agreement between the purchaser and the manufacturer, the test specimens may be taken from a test plate of the same material as the pipe, the test plate being attached to the end of the cylinder and welded as a prolongation of the pipe longitudinal weld seam.

8.2.4 Test Method — Bend tests shall be made in accordance with Test Methods and Definitions A 370, A 2.5.1.7. For wall thicknesses over $\frac{3}{8}$ in. (9.5 mm) but less than $\frac{3}{4}$ in. (19.0 mm) side-bend tests may be made instead of the face and root-bend tests. For wall thicknesses $\frac{3}{4}$ in. and over both specimens shall be subjected to the side-bend test.

8.3 Pressure Test — Classes X2 and X3, pipe shall be tested in accordance with Section 20 of Specification A 530.

9. Radiographic Examination

9.1 The full length of each weld of classes X1 and X2 shall be radiographically examined in accordance with requirements of the ASME Boiler and Pressure Vessel Code, Section VIII, Paragraph UW-51.

9.2 Radiographic examination may be performed prior to heat treatment.

10. Rework

10.1 Elimination of Surface Imperfections — Unacceptable surface imperfections shall be removed by grinding or machining. The remaining thickness of the section shall be no less than the minimum specified in Section 11. The depression after grinding or machining shall be blended uniformly into the surrounding surface.

10.2 Repair of Base Metal Defects by Welding:

10.2.1 The manufacturer may repair, by welding, base metal where defects have been removed, provided the depth of the repair cavity as prepared for welding does not exceed $\frac{1}{3}$ of the nominal thickness, and the requirements of 10.2.2, 10.2.3, 10.2.4, 10.2.5, and 10.2.6 are met. Base metal defects in excess of these may be repaired with prior approval of the customer.

10.2.2 The defect shall be removed by suitable mechanical or thermal cutting or gouging methods and the cavity prepared for repair welding.

10.2.3 The welding procedure and welders or welding operators are to be qualified in accordance with Section IX of the ASME Boiler and Pressure Vessel Code.

10.2.4 The full length of the repaired pipe shall be heat treated after repair in accordance with the requirements of the pipe class specified.

10.2.5 Each repair weld of a defect where the cavity, prepared for welding, has a depth exceeding the lesser of $\frac{3}{8}$ in. (9.5 mm) or 10 % of the nominal thickness shall be examined by radiography in accordance with the methods and the acceptance standards of Section 9.

10.2.6 The repair surface shall be blended uniformly into the surrounding base metal surface and examined and accepted in accordance with Supplementary Requirements S6 or S8.

10.3 Repair of Weld Metal Defects by Welding:

10.3.1 The manufacturer may repair weld metal defects if he meets the requirements of 10.2.3, 10.2.4, 10.3.2, 10.3.3, and 10.4.

10.3.2 The defect shall be removed by suitable mechanical or thermal cutting or gouging methods and the repair cavity examined and accepted in accordance with Supplementary Requirements S7 or S9.

10.3.3 The weld repair shall be blended uniformly into the surrounding metal surfaces and examined and accepted in accordance with 9.1 and with Supplementary Requirements S7 or S9.

10.4 Retest — Each length of repaired pipe of a class requiring a pressure test shall be hydrostatically tested following repair.

11. Dimensions, Mass, and Permissible Variations

11.1 The wall thickness and weight for welded pipe furnished to this specification shall be governed by the requirements of the specification to which the manufacturer ordered the plate.

11.2 Permissible variations in dimensions at any point in a length of pipe shall not exceed the following:

11.2.1 Outside Diameter — Based on circumferential measurement, $\pm 0.5\%$ of the specified outside diameter.

11.2.2 Out-of-Roundness — The difference between major and minor outside diameters, 1%.

11.2.3 Alignment — Using a 10 ft (3 m) straightedge placed so that both ends are in contact with the pipe, $\frac{1}{8}$ in. (3.2 mm).

11.2.4 Thickness — The minimum wall thickness at any point in the pipe shall not be more than 0.01 in. (0.3 mm) under the specified nominal thickness.

11.3 Circumferential welded joints of the same quality as the longitudinal joints shall be permitted by agreement between the manufacturer and the purchaser.

11.4 Lengths with unmachined ends shall be within $-0, +\frac{1}{2}$ in. ($-0, +13$ mm) of that specified. Lengths with machined ends shall be as agreed between the manufacturer and the purchaser.

12. Workmanship, Finish, and Appearance

12.1 The finished pipe shall be free of injurious defects and shall have a workmanlike finish. This requirement is to mean the same as the identical requirement that appears in Specification A 20/A 20M with respect to steel plate surface finish.

13. Product Marking

13.1 The marking shall be stenciled using a suitable heat-resistant paint or metal stamped using low-stress stamps. Wall thicknesses under 0.500 in. (12.7 mm) shall not be metal stamped without prior approval. The pur-

chaser may specify that material 0.500 in. (12.7 mm) and over shall not be metal stamped.

13.2 In addition to the marking provision of Specification A 530, the class marking in accordance with 1.3.3

shall follow the grade marking, for example, 3CR-33.

13.3 Bar Coding — In addition to the requirements in 13.1 and 13.2, bar coding is acceptable as a supplemental identification method. The purchaser may specify in the order a specific bar coding system to be used.

^A Requires quenching and tempering.

^B 9 CR steel is an air-hardenable steel, at times retaining austenite down to near atmospheric temperature. Good practice is to allow the steel to cool to 150°F or lower before subjecting the steel to a tempering treatment or post-weld heat treatment.

SUPPLEMENTARY REQUIREMENTS

One or more of the following supplementary requirements shall be applied only when specified by the purchaser in the inquiry, contract, or order. Details of these supplementary requirements shall be agreed upon in writing by the manufacturer and purchaser. Supplementary requirements shall in no way negate any requirement of the specification itself.

S1. Tension and Bend Tests

S1.1 Tension tests in accordance with 8.1 and bend tests in accordance with 8.2 shall be made on specimens representing each length of pipe.

S2. Charpy V-Notch Test (for pipe with nominal wall thickness of $\frac{1}{2}$ in. (12.7 mm) and greater)

S2.1 Requirements — The acceptable test energies shall be as shown in Table A1.15 of Specification A 20/A 20M for the applicable plate specification unless otherwise stated in the order. As an alternative, the test temperature may be 10°F (−12°C).

S2.2 Number of Specimens — Each test shall consist of at least three specimens.

S2.2.1 One base-metal test shall be made from one pipe length per heat, per heat-treat charge, and per nominal wall thickness.

S2.2.2 One weld-metal and one heat-affected zone (HAZ) metal test shall be made in accordance with NB-4335 of Section III of the ASME Boiler and Pressure Vessel Code.

S2.3 Test Specimen Location and Orientation:

S2.3.1 Base-metal specimens of stress-relieved, normalized, and normalized and tempered pipe shall be taken in accordance with the provisions for tension specimens in the body of this specification.

S2.3.2 Base-metal specimens of quenched and tempered pipe shall be taken in accordance with the provisions of NB-2225 of Section III of the ASME Boiler and Pressure Vessel Code.

S3. Hardness Tests

S3.1 Hardness determination shall be made on both ends of each length of pipe to the parent metal, weld, and the heat-affected zone and must meet the hardness requirements in Table 1.

S4. Product Analysis

S4.1 Product analysis shall be made on each length of pipe. Individual lengths failing to conform to the chemical

requirements prescribed in the applicable specification listed in Table 1 shall be rejected.

S5. Metallography

S5.1 The manufacturer shall furnish one photomicrograph to show the microstructure at 100× magnification of the weld metal or base metal of the pipe in the as-finished condition. The purchaser shall state in the order: the material, base metal or weld, and the number and locations of tests to be made. This test is for information only.

S6. Magnetic Particle Examination of Base Metal

S6.1 All accessible surfaces of the pipe shall be examined in accordance with Practice E 709. Accessible is defined as: All outside surfaces, all inside surfaces of pipe 24 in. (610 mm) in diameter and greater, and inside surfaces of pipe less than 24 in. in diameter for a distance of one pipe diameter from the ends.

S6.2 Butt-weld end preparations are to be completely magnetic-particle examined in accordance with Practice E 709.

S6.3 Acceptance Standards, shall be by agreement between the manufacturer and the purchaser.

S7. Magnetic Particle Examinations of Weld Metal

S7.1 All accessible welds shall be examined in accordance with Practice E 709. Accessible is defined as: All outside surfaces, all inside surfaces of pipe 24 in. (610 mm) in diameter and greater, and inside surfaces of pipe less than 24 in. in diameter for a distance of one pipe diameter from the ends.

S7.2 Butt-weld end preparations are to be completely magnetic-particle examined in accordance with Practice E 709.

S7.3 Acceptance Standards, shall be by agreement between the manufacturer and the purchaser.

S8. Liquid Penetrant Examination of Base Metal

S8.1 All accessible surfaces of the pipe shall be examined in accordance with Practice E 165. Accessible is as defined in S7.1.

S8.2 Butt-weld end preparations are to be completely liquid penetrant examined in accordance with Practice E 165.

S8.3 *Acceptance Standards*, shall be by agreement between the manufacturer and the purchaser.

S9. Liquid Penetrant Examination of Weld Metal

S9.1 All accessible surfaces of the pipe shall be examined in accordance with Practice E 165. Accessible is as defined in S6.1.

S9.2 *Acceptance Standards*, shall be by agreement between the manufacturer and the purchaser.

S10. Ultrasonic Test**S10.1** *Plate in Flat:*

S10.1.1 One hundred percent on one surface shall be scanned.

S10.1.2 Straight search shall be used in accordance with Specification A 435/A 435M.

S10.1.3 Acceptance standards shall be in accordance with Specification A 435/A 435M or as by agreement between the manufacturer and the purchaser.

S11. Repair Welding

S11.1 Repair of base metal defects by welding shall be done only with customer approval.

S12. Description of Term

S12.1 *lot* — all pipe of the same mill heat of plate material and wall thickness (within $\pm \frac{1}{4}$ in. (6.4 mm)) heat treated in one furnace charge. For pipe that is not heat treated or that is heat treated in a continuous furnace, a lot shall consist of each 200 ft (61 m) or fraction thereof of all pipe of the same mill heat of plate material and wall thickness (within $\pm \frac{1}{4}$ in. (6.4 mm)), subjected to the same heat treatment. For pipe heat treated in a batch-type furnace that is automatically controlled within a 50°F (28°C) range and is equipped with recording pyrometers so that heating records are available, a lot shall be defined the same as for continuous furnaces.

SPECIFICATION FOR PRECIPITATION-HARDENING STAINLESS AND HEAT-RESISTING STEEL PLATE, SHEET, AND STRIP

SA-693

(Identical with ASTM Specification A 693-02^{e1} except for aligning the elongation requirements for Gr. XM-16 and correction of the max. hardness for Gr. XM-12 and 630 in Table 5. Also there is a revision to Note B of Table 1.)

1. Scope

1.1 This specification covers precipitation-hardening stainless steel plate, sheet, and strip. The mechanical properties of these steels are developed by suitable low-temperature heat treatments generally referred to as precipitation hardening.

1.2 These steels are used for parts requiring corrosion resistance and high strength at room temperature or at temperatures up to 600°F (315°C). Some of these steels are particularly suitable for moderate to severe drawing and forming in the solution-treated condition. Others are capable of mild forming only. They are suitable for machining in the solution-annealed condition, after which they may be hardened to the mechanical properties specified in this standard without danger of cracking or distortion.

1.3 The values stated in inch-pound units are to be regarded as the standard.

2. Referenced Documents

2.1 ASTM Standards:
A 480/A 480M Specification for General Requirements for Flat-Rolled Stainless and Heat-Resisting Steel Plate, Sheet, and Strip
E 527 Practice for Numbering Metals and Alloys (UNS)

2.2 SAE Standard:
SAE J 1086 Recommended Practice for Numbering Metals and Alloys (UNS)

3. General Requirements

3.1 The following requirements for orders for material furnished under this specification shall conform to the

applicable requirements of the current edition of Specification A 480/A 480M or as specified in the following:

3.1.1 Definitions,

3.1.2 General requirements for delivery.

3.1.3 Ordering Information:

3.1.3.1 In addition to the requirements of A 480/A 480M, the heat treatment (see 6) must be specified on the purchase order.

4. Materials and Manufacture

4.1 The steel shall be melted by one of the following processes:

4.1.1 Electric furnace (with separate degassing and refining optional),

4.1.2 Vacuum furnace, and

4.1.3 One of the former followed by:

4.1.3.1 Consumable remelting in vacuum, inert gas, or electroslog, or

4.1.3.2 Electron beam refining.

4.1.4 Other commercial melting methods as agreed upon between purchaser and seller are acceptable.

5. Chemical Composition

5.1 The steel shall conform to the requirements as to chemical composition specified in Table 1, and shall conform to applicable requirements specified in the current edition of Specification A 480/A 480M.

6. Heat Treatment of Product

6.1 Material shall be furnished in the solution-annealed condition as noted in Table 2 and Table 3 unless otherwise specified by the purchaser on the purchase order.

7. Mechanical Properties

7.1 The material, as represented by mechanical test specimens, shall conform to the mechanical property requirements specified in Table 4 and shall be capable of developing the properties in Table 5 when heat treated as specified in 9.1.

8. Bending Requirements

8.1 Samples cut from the solution-annealed plate, sheet, or strip shall withstand cold bending as specified in Table 6 without cracking on the outside of the bent portion.

9. Heat Treatment of Test Specimens

9.1 Samples cut from the plate, sheet, or strip shall conform to the mechanical properties of Table 5 when precipitation hardened as specified in Table 2 and Table 3.

^A Applicable to tests in the long transverse direction. Transverse to the direction of rolling and parallel to the product surface.

^B Impact test is not required unless specified on the purchase order.

TABLE 6
 BEND TEST REQUIREMENTS IN SOLUTION-TREATED CONDITION

Type	Size, in. (mm)	Cold Bend Degrees	Bend Test Mandrel
630			none required
631	0.187 (4.76) and under	180	1 T^A
	Over 0.187 to 0.275 (4.76 to 6.98)	180	3 T
632	0.187 (4.76) and under	180	1 T
	Over 0.187 to 0.275 (4.76 to 6.98)	180	3 T
633	Under 0.1875 (4.762)	180	2 T
634	0.187 to 0.249 (4.76 to 6.32)	130	3 T
	Over 0.249 to 0.750 (6.32 to 19.08)	90	3 T
635			none required
XM-9	0.109 (2.77) and under	180	9 T
XM-12			none required
XM-13			none required
XM-16	Under 0.1875 (4.762)	180	6 T
XM-25	Under 0.1875 (4.762)	180	6 T
S46500	0.140 (3.56) and under	180	6 T

^A T = thickness of sheet being tested.

SPECIFICATION FOR STEEL BARS, CARBON, HOT-WROUGHT, SPECIAL QUALITY, FOR FLUID POWER APPLICATIONS

SA-695

(Identical with ASTM Specification A 695-90b for Type B only.)

1. Scope

1.1 This specification covers hot-wrought, special quality, round carbon steel bars subject to mechanical property requirements and intended for fluid power applications.

1.2 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are for information only.

2. Referenced Documents

2.1 ASTM Standards:

A 29/A 29M Specification for Steel Bars, Carbon and Alloy, Hot-Wrought and Cold-Finished, General Requirements for
A 370 Test Methods and Definitions for Mechanical Testing of Steel Products

3. Classification

3.1 The bars are available only as hot-wrought rounds 3.0 in. [76 mm] in diameter and larger. Smaller sizes are specified and procured to a cold-finished specification.

3.2 The bars are furnished in the following types and grades:

Type	Composition, %
B	C 0.35 max., Mn 1.10 max., Si 0.15–0.35
Grade	Yield Strength, psi (MPa)
35	35,000 (240)
40	40,000 (275)

3.3 All grades are not available in all types and sizes. See Section 8.

4. Ordering Information

4.1 Orders for material under this specification should include the following information:

4.1.1 Quantity (weight or number of bars).

4.1.2 Name of material (carbon steel bars).

4.1.3 Condition (hot wrought).

4.1.4 Finish (if descaled required, so state) (Section 9 and S3).

4.1.5 Dimensions (diameter and length).

4.1.6 ASTM designation and date of issue.

4.1.7 Type and grade (Tables 1 and 2).

4.1.8 End use.

4.1.9 Additions to the specification and supplementary requirements if required.

NOTE — A typical ordering description is as follows: 10,000 lb, Carbon Steel Bars, Hot Wrought, 4.5-in. diameter by 10 ft, ASTM A 695 dated _____, Type A, Grade 40, End Use Accumulator Heads; Supplementary Requirement S1 Straightness 0.125 in. in any 5 ft.

5. General Requirements

5.1 Material furnished under this specification shall conform to the applicable requirements of the current edition of Specification A 29/A 29M unless otherwise provided herein.

6. Materials and Manufacture

6.1 Melting Practice — The steel shall be made by one or more of the following primary processes: open-hearth, basic-oxygen, or electric-furnace. The primary melting may incorporate separate degassing or refining and may be followed by secondary melting using electroslag remelting or vacuum arc remelting. Where secondary melting is employed, the heat shall be defined as all of the ingots remelted from a single primary heat.

6.2 Deoxidation — Type B steels shall be silicon killed.

6.3 Quality — The bars shall be special quality.

6.4 Hot Working — The bars shall be hot wrought, as wrought.

7. Chemical Composition

7.1 The heat analysis shall conform to the requirements for chemical composition specified in Table 1.

8. Mechanical Properties

8.1 Tensile Requirements:

8.1.1 The material, as represented by the test specimens, shall conform to the tensile requirements specified in Table 2.

8.1.2 A deduction from the percentage of elongation specified in Table 2 of 1.0% shall be made for each 1.0 in. (25.4 mm) of specified diameter over 3.0 in. (76 mm) or fraction thereof to a maximum of 3%.

8.2 Specimens — Tension test specimens shall be taken longitudinally in accordance with Test Methods and Definitions A 370.

8.3 Number of Tests — One tension test shall be made from each lot. A lot shall consist of all bars of one size from one heat processed at one time.

8.4 Test Methods — Tension tests shall be made in accordance with Test Methods and Definitions A 370. The

yield strength shall be determined by an extension under load of 0.5% of the gage length.

9. Workmanship, Finish, and Appearance

9.1 Descaling — When descaled bars are required, Supplementary Requirement S3 must be specified.

9.2 The bars shall be free of visible pipe and conditioned as necessary to remove injurious surface imperfections.

10. Certification and Test Reports

10.1 A manufacturer's certification that the material was manufactured and tested in accordance with this specification together with a report of the heat analysis and tension test results shall be furnished at the time of shipment. The report shall include the name of the manufacturer, ASTM designation number and year date and revision letter, if any, type and grade, heat number, and size.

11. Product Marking

11.1 The heat number shall be steel stamped on one end of each bar.

12. Keywords

12.1 carbon steel bars; hot-wrought steel bars; pressure-containing parts; steel bars.

TABLE 1
CHEMICAL REQUIREMENTS (HEAT ANALYSIS), %

Type B

35	B	60 (415)	35 (240)	21
40	B	70 (485)	40 (275)	17

^A Determined at 0.5% extension under load.

SUPPLEMENTARY REQUIREMENTS

One or more of the following supplementary requirements shall be applied only when specified by the purchaser in the inquiry, contract, or order. Details of these supplementary requirements shall be agreed upon in writing by the manufacturer and purchaser. Supplementary requirements shall in no way negate any requirement of the specification itself.

S1. Special Straightness

S1.1 Bars shall be furnished to special straightness tolerance.

S3. Descaling

S3.1 The surface of the bars shall be descaled by pickling or shot blasting. Descaled bars shall be oiled.

S2. Stress Relief Anneal

S2.1 Bars shall be given a stress relief anneal subsequent to all hot and cold mechanical working operations.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR STEEL BARS, CARBON, HOT-WROUGHT OR COLD-FINISHED, SPECIAL QUALITY, FOR PRESSURE PIPING COMPONENTS

SA-696

[Identical with ASTM Specification A 696-90a (R06).]

1. Scope

1.1 This specification covers hot-wrought and cold-finished special quality carbon steel bars, in straight lengths only, subject to mechanical property requirements and intended for use in manufacturing components for pressure piping and other pressure-containing applications.

1.2 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are for information only.

2. Referenced Documents

2.1 ASTM Standards:

- A 29/A 29M Specification for Steel Bars, Carbon and Alloy, Hot-Wrought and Cold-Finished, General Requirements for
- A 370 Test Methods and Definitions for Mechanical Testing of Steel Products

3. Classification

3.1 The bars are furnished in two grades as follows:

3.1.1 Grade B — Tensile strength 60 000 psi (415 MPa), min; yield strength 35 000 psi (240 MPa), min.

3.1.2 Grade C — Tensile strength 70 000 psi (485 MPa), min; yield strength 40 000 psi (275 MPa), min.

3.2 The bars are intended for machining, welding, hot forming, and threading by machining or cold rolling.

4. General Requirements

4.1 Material furnished under this specification shall conform to the applicable requirements of the current edition of Specification A 29/A 29M unless otherwise provided herein.

5. Ordering Information

5.1 Orders for material under this specification should include the following information:

5.1.1 Quantity (weight or number of bars).

5.1.2 Name of material (carbon steel bars).

5.1.3 Condition: hot wrought or cold finished (6.4.1).

5.1.4 Finish (if descaled required, so state) (9.1).

5.1.5 Dimensions (diameter, thickness, width, and length).

5.1.6 Cross section (round, square, hexagon).

5.1.7 ASTM designation and date of issue.

5.1.8 Grade (Tables 1 and 2).

5.1.9 End use.

5.1.10 Additions to the specification and supplementary requirements, if required.

NOTE — A typical ordering description is as follows: 10 000 lb, Carbon Steel Bars, Hot Wrought, Descaled, 1.000-in. diameter by 10 ft, Round, ASTM A 696 dated _____, Grade B; Supplementary Requirement S1 Straightness 0.125 in. in any 5 ft.

6. Materials and Manufacture

6.1 Melting Practice — The steel shall be made by one or more of the following primary processes: open-hearth, basic-oxygen, or electric-furnace. The primary melting may incorporate separate degassing or refining, and may be followed by secondary melting using electroslag remelting or vacuum arc remelting. Where secondary melting is employed, the heat shall be defined as all of the ingots remelted from a single primary heat.

6.2 Deoxidation — The steel shall be fully killed.

6.3 Quality — The bars shall be special quality.

6.4 Hot or Cold Working:

6.4.1 The bars shall be hot wrought or cold finished as specified by the purchaser.

6.4.2 Cold-finished bars reduced in cross-section area more than 10% by cold drawing or rolling shall be heat treated as specified in 6.5.2.

6.5 Heat Treatment:

6.5.1 Except as provided in 6.5.2, the bars shall be furnished as-hot wrought or as-cold finished.

6.5.2 Cold-finished bars cold worked in excess of 10% (see 6.4.2) shall be stress relief annealed at not less than 1200°F (649°C), normalized, or fully annealed. The specific heat treatment shall be at the option of the manufacturer.

7. Chemical Composition

7.1 The heat analysis shall conform to the requirements for chemical composition specified in Table 1.

7.2 A product analysis of the steel may be made by the purchaser and shall conform to the requirements of Table 1 subject to the product analysis tolerances specified in Specification A 29/A 29M.

8. Tensile Requirements

8.1 Requirements:

8.1.1 The material, as represented by the test specimens, shall conform to the tensile requirements specified in Table 2.

8.1.2 A deduction from the percentage of elongation specified in Table 2 of 1.0% shall be made for each 1.0 in. (25.4 mm) of specified diameter over 2.0 in. (51 mm) or fraction thereof to a maximum of 3%.

8.2 Specimens:

8.2.1 Tension test specimens shall be taken longitudinally from a position midway between the center and the surface of the bar or as close as practical to this location for small sizes.

8.2.2 When it is impractical to remove specimens in accordance with 8.2.1, they shall be taken in accordance with Test Methods and Definitions A 370.

8.3 Number of Tests — One tension test shall be made from each lot. A lot shall consist of all bars of one size

from one heat processed at one time and subjected to the same heat treatment when heat treated.

8.4 Test Methods — Tension tests shall be made in accordance with Test Methods and Definitions A 370. The yield strength shall be determined by the 0.2% offset or 0.5% extension underload methods.

9. Workmanship, Finish, and Appearance

9.1 Descaling — When descaled bars are required, Supplementary Requirement S7 must be specified.

9.2 The bars shall be free of visible pipe and conditioned as necessary to remove injurious surface imperfections.

10. Packaging and Package Marking

10.1 Bars less than 2.0 in. (51 mm) in diameter or thickness shall be tightly banded with a sufficient number of bands of adequate strength to minimize bundle breakage during handling and shipping. Larger sizes shall be packaged in accordance with Specification A 29/A 29M.

10.2 For bars less than 2.0 in. (51 mm) in diameter or thickness, each bundle shall bear a weather resistant tag showing the purchase order number, ASTM designation number and grade, heat number, size, and name of manufacturer.

10.3 Bars 2.0 in. (51 mm) and larger in diameter or thickness shall have the heat number steel stamped on one end.

11. Certification and Test Reports

11.1 A manufacturer's certification that the material was manufactured and tested in accordance with this specification together with a report of the heat analysis and tension test results shall be furnished at the time of shipment. The report shall include the name of the manufacturer, ASTM designation number and grade, shape, size, and finish.

12. Keywords

12.1 pressure piping components; special quality steel bars; steel bars.

TABLE 1
CHEMICAL REQUIREMENTS (HEAT ANALYSIS), %

Grades B and C	
Carbon, max ^B	0.32
Manganese, max	1.04
Phosphorus, max	0.035 ^A
Sulfur, max	0.045 ^A
Silicon	0.15 to 0.35
Lead	^A

^A Phosphorus, sulfur, or lead, or a combination thereof, shall not be added.

^B For each reduction of 0.01% below the specified carbon maximum, an increase of 0.06% manganese above the specified maximum will be permitted up to a maximum of 1.35%.

TABLE 2
TENSILE REQUIREMENTS

	Grade B	Grade C
Tensile strength, min ksi (MPa)	60 (415)	70 (485)
Yield strength, min, ksi (MPa)	35 (240)	40 (275)
Elongation in 2.0 in. or 50 mm, min, %	20.0	18.0
Elongation in 8.0 in. or 200 mm, min, % ^A	17.0	15.0

^A Applicable to bars 1½ in. (38 mm) in diameter tested full size.

SUPPLEMENTARY REQUIREMENTS

One or more of the following supplementary requirements shall be applied only when specified by the purchaser in the inquiry, contract, or order. Details of these supplementary requirements shall be agreed upon in writing by the manufacturer and purchaser. Supplementary requirements shall in no way negate any requirements of the specification itself.

S1. Special Straightness

S1.1 Bars shall be within the tolerances for special straightness.

Acceptance limits shall be negotiated between purchaser and seller.

S2. Stress Relief Anneal

S2.1 Bars shall be stress relief annealed (may be specified for bars that have been ordered to special straightness tolerance).

S5. Fine Grain Practice

S5.1 The steel shall conform to the fine austenitic grain size requirement of Specification A 29/A 29M.

S3. Surface Quality

S3.1 Bars shall be produced to special surface quality requirements which shall be negotiated between purchaser and supplier.

S6. Restricted Size Tolerances for Hot-Wrought Bars

S6.1 Bars shall be furnished with tolerances on dimensions more restrictive than specified in Specification A 29/A 29M. Tolerance requirements to apply shall be negotiated between purchaser and manufacturer.

S4. Special Internal Soundness

S4.1 Bars shall be produced with special internal soundness to be verified by one or more macro-etch samples.

S7. Descaling

S7.1 Bars shall be furnished descaled and oiled.

SPECIFICATION FOR STEEL CASTINGS, GENERAL REQUIREMENTS, FOR PRESSURE-CONTAINING PARTS

SA-703/SA-703M

(Identical with ASTM Specification A 703/A 703M-07.)

1. Scope

1.1 This specification covers a group of common requirements that, unless otherwise specified in an individual specification, shall apply to steel castings for pressure-containing parts under each of the following ASTM specifications:

Title of Specification	ASTM Designation
Steel Castings, Carbon, Suitable for Fusion Welding for High-Temperature Service	A 216/A 216M
Steel Castings, Martensitic Stainless and Alloy, for Pressure-Containing Parts Suitable for High-Temperature Service	A 217/A 217M
Castings, Austenitic, Austenitic-Ferritic (Duplex), Pressure-Containing Parts	A 351/A 351M
Steel Castings, Ferritic and Martensitic, for Pressure-Containing Parts Suitable for Low-Temperature Service	A 352/A 352M
Steel Castings, Alloy, Specially Heat-Treated, for Pressure-Containing Parts, Suitable for High-Temperature Service	A 389/A 389M
Steel Castings Suitable for Pressure Service	A 487/A 487M
Castings, Iron-Nickel-Chromium and Nickel Alloys, Specially Controlled for Pressure Retaining Parts for Corrosive Service	A 990
Castings, Austenitic-Ferritic (Duplex) Stainless Steel, for Pressure-Containing Parts	A 995/A 995M

1.2 This specification also covers a group of supplementary requirements which may be applied to the above specifications as indicated therein. These are provided for use when additional testing or inspection is desired and apply only when specified individually by the purchaser in the order.

1.3 In case of conflict between the requirements of the individual specification and this general specification, the former shall prevail.

1.4 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification. Inch-pound units are applicable for material ordered to Specification A 703 and SI units for material ordered to Specification A 703M.

2.2 ANSI Standard:

B16.5 Steel Pipe Flanges and Flanged Fittings

2.3 Standards of the Manufacturer's Standardization Society of the Valve and Fitting Industry:

- MSS SP 53 Quality Standard for Steel Castings for Valves, Flanges and Fittings, and Other Piping Components (Dry Powder Magnetic Particle Inspection Method)
- MSS SP 54 Quality Standard for Steel Castings for Valves, Flanges and Fittings, and Other Piping Components (Radiographic Inspection Method)

3. Terminology

3.1 Definitions:

3.1.1 The definitions in Test Methods and Definitions A 370 and Terminology A 941 are applicable to this specification and those listed in 1.1.

3.1.2 *chaplet, n* — a chaplet is a metallic support placed in a mold cavity to maintain the spacing between a core and the mold.

3.1.3 *electronic data interchange (EDI), n* — the computer-to-computer exchange of business information in a standard format such as ANSI ASC X12.

3.1.4 *heat, n* — all the molten metal poured from a single furnace or all the molten metal from two or more furnaces poured into a single ladle or casting prior to the replenishing of the furnace(s).

3.1.5 *internal chill, n* — an internal chill is a metallic device placed in a mold cavity to increase the rate of heat removal at that location.

3.1.6 *test coupon, n* — the part from which the test specimen will be extracted.

3.1.7 *test specimen, n* — the part that will be acted upon in a mechanical test.

4. Materials and Manufacture

4.1 *Melting Process* — The steel shall be made by open-hearth or electric-furnace process, with or without separate refining such as argon-oxygen-decarburization (AOD), unless otherwise designated by the individual specification.

4.2 Heat Treatment:

4.2.1 Ferritic and martensitic steel shall be cooled after pouring to provide substantially complete transformation of austenite prior to heat treatment to enhance mechanical properties.

4.2.2 Castings shall be heat treated in the working zone of a furnace that has been surveyed in accordance with Test Method A 991/A 991M.

4.2.2.1 When castings are heat treated at temperatures above 2000°F [1100°C], then the working zone shall have been established by a survey performed at not more than 25°F [15°C] below nor more than 200°F [110°C] above the minimum heat treatment temperature specified for the grade. If a minimum heat treatment temperature is not specified for the grade, then the survey temperature shall be not more than 50°F [30°C] below nor more than 175°F [100°C] above the furnace set point used.

4.2.2.2 The maximum variation in measured temperature as determined by the difference between the highest temperature and the lowest temperature shall be as agreed between the purchaser and producer except that

during production heat treatment, no portion of the furnace shall be below the minimum specified temperature nor above the maximum specified temperature for the grade being processed.

5. Chemical Composition

5.1 Chemical Analysis — Chemical analysis of materials covered by this specification shall be in accordance with Test Methods A 751.

5.2 Heat Analysis — An analysis of each heat shall be made by the manufacturer to determine the percentages of the elements specified. The analysis shall be made from a test sample preferably taken during the pouring of the heat. When drillings are used, they shall be taken not less than $\frac{1}{4}$ in. [6.4 mm] beneath the surface. The chemical composition thus determined shall be reported to the purchaser, or his representative, and shall conform to the requirements in the individual specification for the grade being poured.

5.3 Product Analysis — A product analysis may be made by the purchaser from material representing each heat, lot, or casting. The analysis shall be made on representative material. Due to the possibility of decarburization, carbon and alloy steel samples for carbon analysis shall be taken no closer than $\frac{1}{4}$ in. [6.4 mm] to a cast surface except that castings too thin for this shall be analyzed on representative material. The chemical composition thus determined shall meet the requirements specified in the applicable specification for the grade involved, or shall be subject to rejection by the purchaser, except that the chemical composition determined for carbon and low-alloy steel castings may vary from the specified limits by the amounts shown in Table 1. The product analysis tolerances of Table 1 are not applicable as acceptance criteria for heat analysis by the casting manufacturer.

5.4 Unspecified Elements — When chemical analysis for elements not specified for the grade ordered is desired, Supplementary Requirement S1 may be specified.

5.4.1 Grade substitution for stainless and nickel base alloy castings is not permitted. Grade substitution occurs when the material supplied: (1) contains an element, other than the nitrogen, that is not specified in the ordered grade, and (2) the amount of that element equals or exceeds the minimum requirement for the element in another grade for which it is specified. For this requirement, a grade is defined as an alloy described individually in a table of chemical requirements within any specification listed within the scope of this section.

5.5 The substitution of a grade or composition different from that specified by the purchaser is prohibited.

5.6 Where more than one ladle is poured into a single casting, the molten metal in each ladle must conform to the specified chemical requirements.

6. Mechanical Test Methods

6.1 All mechanical tests shall be conducted in accordance with Test Methods and Definitions A 370.

7. Tensile Requirements

7.1 One tension test shall be made from each heat, and shall conform to the tensile requirements specified. Test coupons shall be cast from the same heat as the castings represented, except that for investment castings, the test coupons shall be cast in the same type of mold as the castings.

7.2 The coupon from which the test specimen is taken shall be heat treated in production furnaces to the same procedure as the castings it represents.

7.3 Test specimens may be cut from heat-treated castings, at the producer's option, instead of from test coupons.

7.4 Investment Castings — For investment castings, the coupons may be cast to shape or machined from coupons to dimensions in accordance with Test Methods and Definitions A 370 or the ICI coupon shown in Fig. 1.

7.5 Other Castings — Unless otherwise specified by the purchaser, test coupons may be cast integrally with the castings or as separately in accordance with Fig. 2 and Table 2, with Fig. 3, or with Fig. 4, except when Supplementary Requirement S26 is specified. The test coupon in Fig. 4 shall be employed only for austenitic alloy castings with cross sections less than $2\frac{1}{2}$ in. [63.5 mm]. Tension test specimens shall be prepared in accordance with Test Methods and Definitions A 370.

7.6 If any specimen shows defective machining or develops flaws, it may be discarded and another substituted from the same heat.

7.7 To determine conformance with the tension test requirements, an observed value or calculated value shall be rounded off in accordance with Practice E 29 to the nearest 500 psi [5 MPa] for yield and tensile strength and to the nearest 1% for elongation and reduction of area.

8. Repair by Welding

8.1 Repair by welding shall be in accordance with the requirements of individual specification using procedures and welders qualified in accordance with Practice A 488/A 488M.

9. Flanges

9.1 When a flange from a flanged casting is removed to make a weld end casting, discontinuities may be observed that would not have been detrimental in a flanged

casting. The disposition of the casting shall be subject to agreement between the purchaser and manufacturer.

10. Quality

10.1 The surface of the casting shall be free of adhering sand, scale, cracks, and hot tears as determined by visual examination. Other surface discontinuities shall meet the visual acceptance standards specified in the order. Practice A 802/A 802M or other visual standards may be used to define acceptable surface discontinuities and finish. Unacceptable visual surface discontinuities shall be removed and their removal verified by visual examination of the resultant cavities.

10.2 The castings shall not be peened, plugged, or impregnated to stop leaks or disguise rejectable indications.

10.3 Internal chills and chaplets may be used in the manufacture of castings. However, the chills, chaplets, and affected cast material must be completely removed.

11. Hydrostatic Tests

11.1 Each casting shall be tested after machining to the hydrostatic shell test pressures prescribed in ANSI B16.5 for the applicable steel rating for which the casting is designed. Casting shall show no leaks. Castings ordered for working pressures other than those in the standard ANSI ratings, or those listed for which test pressures are not specified by ANSI B16.5, shall be tested at a pressure agreed upon between manufacturer and the purchaser.

11.2 It is realized that the foundry may be unable to perform the hydrostatic test prior to shipment, or that the purchaser may wish to defer testing until additional work or machining has been performed on the casting. Castings ordered in the rough state for final machining by the purchaser may be tested hydrostatically prior to shipment by the manufacturer at pressures to be agreed upon with the purchaser. However, the foundry is responsible for the satisfactory performance of the castings under the final test required in 11.1.

12. Workmanship, Finish, and Appearance

12.1 All castings shall be made in a workmanlike manner and shall conform to the dimensions on drawings furnished by the purchaser. When the pattern is supplied by the purchaser, the dimensions of the casting shall be as predicated by the pattern unless otherwise agreed upon.

12.2 Machined welding ends shall be suitably protected against damage during shipping.

13. Retests

13.1 If the results of the mechanical tests for any heat, lot, or casting do not conform to the requirements specified, retests are permitted as outlined in Test Methods and Definitions A 370. At the manufacturer's option, castings may be reheat-treated and retested. When castings are reheat-treated, they may not be re-austenitized more than three times without the approval of the purchaser. Testing after reheat treatment shall consist of the full number of specimens taken from locations complying with the specification or order.

14. Inspection

14.1 The manufacturer shall afford the purchaser's inspector all reasonable facilities necessary to satisfy that the material is being produced and furnished in accordance with the applicable specification. Foundry inspection by the purchaser shall not interfere unnecessarily with the manufacturer's operations. All tests and inspections, with the exception of product analysis (5.2), shall be made at the place of manufacture unless otherwise agreed.

15. Rejection and Rehearing

15.1 Any rejection based on test reports shall be reported to the manufacturer within 30 days from the receipt of the test reports by the purchaser.

15.2 Material that shows unacceptable discontinuities as determined by the acceptance standards specified in the order subsequent to its acceptance at the manufacturer's works will be rejected, and the manufacturer shall be notified within 30 days after discovery of the rejectable condition.

15.3 Samples that represent rejected material shall be preserved for two weeks from the date of transmission of the test report. In case of dissatisfaction with the results of the tests, the manufacturer may make claim for a rehearing within that time.

16. Certification

16.1 The manufacturer's certification shall be furnished to the purchaser stating that the material was manufactured, sampled, tested, and inspected in accordance with the material specification (including year of issue) and was found to meet the requirements.

16.2 As applicable, the certification shall also include:

16.2.1 Material specification and grade,

16.2.2 Pattern number,

16.2.3 Heat number or serial number traceable to a heat number,

16.2.4 Chemical analysis of the heat,

16.2.5 Mechanical property results required by the specification and supplementary requirements specified in the purchase order,

16.2.6 Statement of satisfactory inspection, visual, and nondestructive testing specified in the purchase order,

16.2.7 Manufacturer's name, and

16.2.8 Additional purchase order requirements.

16.3 A signature is not required on the certification. However, the document shall clearly identify the organization submitting the certification. Notwithstanding the absence of a signature, the organization submitting the certification is responsible for its content.

16.4 A manufacturer's certification printed from or used in electronic form from an electronic data interchange (EDI) transmission shall be regarded as having the same validity as a counterpart printed in the certifier's facility provided it conforms to any existing EDI agreement between the purchaser and the supplier.

17. Product Marking

17.1 Castings shall be marked for material identification with the grade symbols (WCB, WC9, CF8M, and so forth). In addition, heat numbers, or serial numbers that are traceable to heat numbers, shall be marked on all pressure-containing castings individually weighing 50 lb [22.7 kg] or more. Pressure-containing castings weighing less than 50 lb [22.7 kg] shall be marked with either the heat number or a lot number that will identify the casting as to the month in which it was poured. Marking shall be in such position as not to injure the usefulness of the casting.

17.2 On castings for which impact property requirements are specified, stamped markings using low-stress stamps shall be on a raised pad when such pad can be made a part of the castings.

17.3 Castings shall be marked with the manufacturer's identification or symbol except when other provisions have been made between the manufacturer and purchaser.

18. Keywords

18.1 castings; general requirements; pressure containing; steel

FIG. 1 DESIGN AND DIMENSIONS OF THE ICI TEST COUPON

Figure 1 consists of three technical drawings of keel block coupons, labeled (a), (b), and (c).

(a) Design for Double Keel Block Coupon: This drawing shows a side view of a coupon with a total length of $L + 2T$ and a thickness of T . The width of the coupon is L (5" Min). The height of the coupon is $2\frac{1}{4}$ " (Optional) and $1\frac{1}{4}$ ". The coupon has a central channel with a radius of $\frac{1}{2}$ " and a depth of $\frac{1}{4}$ ". The distance between the centers of the channels is $2\frac{1}{4}$ ". The coupon is labeled "Side View Keel Block Coupon".

(b) Alternate Design for Bend Bar: This drawing shows a side view of a coupon with a total length of $8\frac{3}{8} + 2T$ and a thickness of T . The width of the coupon is $8\frac{3}{8}$ ". The height of the coupon is $2\frac{1}{4}$ " (Optional) and $1\frac{1}{4}$ ". The coupon has a central channel with a radius of $\frac{1}{2}$ " and a depth of $\frac{1}{4}$ ". The distance between the centers of the channels is $2\frac{1}{4}$ ". The coupon is labeled "Alternate Design for Bend Bar".

(c) Design for "Attached" Coupon: This drawing shows a side view of a coupon with a total length of $L + 2T$ and a thickness of T . The width of the coupon is L (5" Min). The height of the coupon is $2\frac{1}{4}$ " (Optional) and $1\frac{1}{4}$ ". The coupon has a central channel with a radius of $\frac{1}{2}$ " and a depth of $\frac{1}{4}$ ". The coupon is labeled "Alternate Design for Bend Bar".

NOTE—Coupons produced in this manner are suitable for austenitic alloys only. The mold may be preheated for pouring to produce a sound coupon.

TABLE 1
PRODUCT ANALYSIS TOLERANCES FOR CARBON
AND LOW-ALLOY STEELS

Element	Range ^A	Tolerances ^{B,C} over max or under min, Limit, %
Carbon (C)	up to 0.65%	$0.03 \times \% C_L + 0.02$
	above 0.65%	0.04%
Manganese (Mn)	up to 1%	$0.08 \times \% Mn_L + 0.01$
	above 1%	0.09
Silicon (Si)	up to 0.60%	$0.22 \times \% Si_L - 0.01$
	above 0.60%	0.15%
Phosphorus (P)	all	$0.13 \times \% P_L + 0.005$
Sulfur (S)	all	$0.36 \times \% S_L + 0.001$
Nickel (Ni)	up to 2%	$0.10 \times \% Ni_L + 0.03$
	above 2%	0.25%
Chromium (Cr)	up to 2%	$0.07 \times \% Cr_L + 0.04$
	above 2%	0.18%
Molybdenum (Mo)	up to 0.6%	$0.04 \times \% Mo_L + 0.03$
	above 0.6%	0.06%
Vanadium (V)	up to 0.25%	$0.23 \times \% V_L + 0.004$
	above 0.25%	0.06%
Tungsten (W)	up to 0.10%	$0.08 \times \% W_L + 0.02$
	above 0.10%	0.02%
Copper (Cu)	up to 0.15%	$0.18 \times \% Cu_L + 0.02$
	above 0.15%	0.05%
Aluminum (Al)	up to 0.03%	0.01%
	0.03 to 0.10%, incl.	$0.08 \times \% Al_L + 0.02$
	above 0.10%	0.03%

^A The range denotes the composition limits up to which the tolerances are computed by the equation, and above which the tolerances are given by a constant.

^B The subscript _L for the elements in each equation indicates that the limits of the element specified by the applicable specification are to be inserted into the equation to calculate the tolerance for the upper limit and the lower limit, if applicable, respectively.

Examples of computing tolerances are presented in the footnote C.

^C To compute the tolerances, consider the manganese limits 0.50 – 0.80% of Grade WC4 of Specification A 217/A 217M. In accordance with Table 1, the maximum permissible deviation of a product analysis below the lower limit 0.50 is 0.05% = $(0.08 \times 0.50 + 0.01)$. The lowest acceptable product analysis of Grade WC4, therefore, is 0.45%. Similarly, the maximum permissible deviation above the upper limit of 0.80% is 0.074% = $(0.08 \times 0.80 + 0.01)$. The highest acceptable product analysis of Grade WC4, therefore, is 0.874. For Grade WCC of Specification A 216/A 216M, the maximum manganese content is 1.40% if the carbon content is 0.20%. In this case, the highest acceptable product analysis is 1.49 = $(1.40 + 0.09)$.

TABLE 2
DETAILS OF TEST COUPON DESIGN FOR CASTING (SEE FIG. 2)

Leg Design [125 mm]		Riser Design	
1. L (length)	A 5 in. [125 mm] minimum length will be used. This length may be increased at the option of the foundry to accommodate additional test specimens (see Note 1).	1. L (length)	The length of the riser at the base will be the same as the top length of the leg. The length of the riser at the top therefore depends on the amount of taper added to the riser.
2. End taper	Use of and size of end taper is at the option of the foundry.	2. Width	The width of the riser at the base of a multiple-leg coupon shall be $n, 2\frac{1}{4}$ [57 mm] — $\frac{5}{8}$ [16 mm] where n equals the number of legs attached to the coupon. The width of the riser at the top is therefore dependent on the amount of taper added to the riser.
3. Height	$1\frac{1}{4}$ in. [32 mm]	3. T (riser taper)	Use of and size is at the option of the foundry.
4. Width (at top)	$1\frac{1}{4}$ in. [32 mm] (see Note 1).		
5. Radius (at bottom)	$\frac{1}{2}$ in. [13 mm], max	4. Height	The minimum height of the riser shall be 2 in. [51 mm]. The maximum height is at the option of the foundry for the following reasons: (1) Many risers are cast open, (2) different compositions may require variation in risering for soundness, (3) different pouring temperatures may require variation in risering for soundness.
6. Spacing between legs	A $\frac{1}{2}$ in. [13 mm] radius will be used between the legs.		
7. Location of test specimens	The tensile, bend, and impact specimens will be taken from the lower portion of the leg (see Note 2).		
8. Number of legs	The number of legs at the option of the foundry providing they are equispaced in accordance with item 6.		
9. R_s	Radius from 0 to approximately $\frac{1}{16}$ in. [2 mm].		

NOTE 1 — *Test Coupons for Large and Heavy Steel Castings:* The test coupons in Fig. 2 are to be used for large and heavy steel castings. However, at the option of the foundry the cross-sectional area and length of the standard coupon may be increased as desired.

NOTE 2 — *Bend Specimen:* If a bend specimen is required, an alternate design (as shown by dotted lines in Fig. 2) is indicated.

SUPPLEMENTARY REQUIREMENTS

The following standardized supplementary requirements are for use when desired by the purchaser and when allowed by and listed in the individual specifications. They shall not apply unless specified in the order, in which event the specified tests shall be made by the manufacturer before shipment of the castings.

S1. Unspecified Elements

S1.1 Limits may be established for elements not specified for the grade ordered by agreement between the manufacturer and purchaser. The results of the analysis for the agreed-upon elements shall be reported.

S2. Destruction Tests

S2.1 Purchaser may select representative castings from each heat, and cut up and etch, or otherwise prepare, the sections for examination for internal defects. Should injurious defects be found that evidence unsound steel or faulty foundry technique, all the castings made from that particular pattern, heat, and heat treatment charge may be rejected. All the rejected castings, including those cut up, shall be replaced by the manufacturer without charge.

S3. Bend Test

S3.1 One bend test shall be made from a test coupon from each heat in accordance with Test Methods and Definitions A 370, and shall be machined to 1 by $\frac{1}{2}$ in. [25 by 13 mm] section with corners rounded to a radius not over $\frac{1}{16}$ in. [1.6 mm].

S3.2 The specimen shall withstand being bent longitudinally at room temperature through an angle of 90° about a pin, the diameter of which shall be the specimen thickness for carbon steels, and 1 in. [25 mm] for other steels. The specimen shall show no cracks on the outside of the bent portion of the specimen.

S3.3 Bend test specimens may be cut from heat-treated castings instead of from test specimens when agreed upon between manufacturer and purchaser.

S3.4 If any test specimen shows defective machining or develops flaws, it may be discarded and another specimen substituted from the same heat.

S4. Magnetic Particle Inspection

S4.1 Castings shall be examined for surface and near-surface discontinuities by magnetic particle inspection. The examination shall be in accordance with Guide E 709, and types and degrees of discontinuities considered shall be

judged by Reference Photographs E 125. Extent of examination, time of examination, and basis for acceptance shall be agreed upon between the manufacturer and purchaser. A specification which may be used as a basis for such agreement is MSS SP 53.

S4.2 Personnel performing the examination shall be qualified in accordance with an acceptable written practice.

S5. Radiographic Inspection

S5.1 Castings shall be examined for internal defects by means of X-rays or gamma rays. The procedure shall be in accordance with Guide E 94, and types and degrees of discontinuities considered shall be judged by Reference Radiographs E 446, E 186, or E 280. Extent of examination and basis for acceptance shall be agreed upon between the manufacturer and purchaser. A specification that may be used as a basis for such agreement is MSS SP 54.

S5.2 Radiographic examination of castings may be performed before or after any heat treatment.

S5.3 Personnel performing the examination shall be qualified in accordance with an acceptable written practice.

S6. Liquid Penetrant Inspection

S6.1 Castings shall be examined for surface discontinuities by means of liquid penetrant inspection. The examination shall be in accordance with Test Method E 165. Areas to be inspected, time of inspection, methods and types of liquid penetrants to be used, developing procedure, and basis for acceptance shall be agreed upon between the manufacturer and purchaser. A specification that may be used as a basis for such agreement is Specification A 903/A 903M.

S6.2 Personnel performing the examination shall be qualified in accordance with an acceptable written practice.

S7. Ultrasonic Inspection

S7.1 Castings shall be examined for internal defects by means of ultrasonic inspection. The inspection procedure shall be in accordance with Practice A 609/A 609M.

Extent of examination, methods of testing, and basis for acceptance shall be agreed upon between the manufacturer and purchaser. A practice that may be used as a basis for such agreement is Practice A 609/A 609M.

S7.2 Ultrasonic examination of castings shall be performed after at least one heat treatment above the critical temperature range but need not be repeated after subsequent heat treatment.

S7.3 Personnel performing the examination shall be qualified in accordance with an acceptable written practice.

S8. Charpy Impact Test

S8.1 Charpy impact test properties shall be determined on each heat from a set of three charpy V-notch specimens made from a test coupon in accordance with Test Methods and Definitions A 370, and tested at a test temperature agreed upon by the manufacturer and purchaser. The acceptance requirements shall be either energy absorbed, lateral expansion, or percent shear area, or all three, and shall be that agreed upon by the manufacturer and purchaser. Test specimens shall be prepared as Type A and tested in accordance with Test Methods and Definitions A 370.

S8.2 *Absorbed Energy* — Average energy value of three specimens shall be not less than specified, with not more than one value permitted to fall below the minimum specified, and no value permitted below the minimum specified for a single specimen.

S8.3 *Lateral Expansion* — Lateral expansion value shall be agreed upon by the manufacturer and purchaser.

S8.4 *Percent Shear Area* — Percent shear area shall be agreed upon by the manufacturer and purchaser.

S9. Drop Weight Tests

S9.1 Drop weight test properties shall be determined from each heat by preparing and testing either Type P1, P2, or P3 specimens in accordance with Test Method E 208. The crack starter weld shall be deposited on the surface of the specimen that was nearest to the casting surface. Each test shall consist of at least two specimens tested at a temperature agreed upon by the manufacturer and purchaser. Each specimen shall exhibit “no break” performance.

S10. Examination of Weld Preparation

S10.1 Magnetic particle or liquid penetrant examination of cavities prepared for welding shall be performed to verify removal of those discontinuities found unacceptable by the inspection method specified for the casting. The

method of performing magnetic particle or liquid penetrant examination shall be in accordance with Guide E 709 or Test Method E 165. Unless other degrees of shrinkage or types of discontinuities found in the cavities are specified, Type II, Internal Shrinkage, of Reference Photographs E 125, of Degree 2 in sections up to 2 in. [50 mm] thick and of Degree 3 in sections over 2 in. [50 mm] thick shall be acceptable.

S12. Prior Approval of Major Weld Repairs

S12.1 Major weld repairs shall be subject to the prior approval of the purchaser.

S13. Hardness Test

S13.1 A hardness test shall be made in accordance with Test Methods and Definitions A 370. The test location and the hardness requirements shall be agreed upon between the manufacturer and the purchaser.

S14. Tension Test from Each Heat and Heat Treatment Charge

S14.1 One tension test shall be made for each heat and heat treatment charge.

S15. Quench and Temper Heat Treatment

S15.1 The castings shall be quenched and tempered. Castings so treated shall be marked QT.

S17. Tension Test from Castings

S17.1 In addition to the tensile test required in Section 6, test material shall be cut from heat-treated castings. The mechanical properties and location for the test material shall be agreed upon by the manufacturer and purchaser.

S18. Tension Test for Castings Each Weighing 10 000 lb [4500 kg] or More

S18.1 Two tensile tests shall be made for each casting. The test specimens shall be prepared in accordance with Section 6. The location of the test specimens shall be agreed upon by the manufacturer and purchaser.

S20. Weld Repair Charts

S20.1 Unless other criteria are agreed upon between the manufacturer and the purchaser, weld repairs made to correct leakage on hydrostatic testing; or weld repairs for which the depth of the cavity required for welding exceeds

20% of the actual wall thickness or 1 in. [25 mm], whichever is smaller; or weld repairs for which the area of the cavity required for welding exceeds approximately 10 in.² [65 mm²] shall be documented.

S20.2 Weld repairs requiring documentation shall be documented on sketches or photographs, or both. The sketches or photographs shall show the location and major dimensions of cavities prepared for weld repair. The weld repair documentation shall be submitted to the purchaser at the completion of the order.

S21. Heat Treatment Furnace Record

S21.1 A heat treatment chart showing time and temperature shall be prepared and be available for inspection by the purchaser.

S22. Heat Treatment

S22.1 Test specimens shall be heat treated together with the castings they represent. Heat-treated specimens shall be tested and shall meet the tensile and impact properties specified.

S22.2 The remaining test specimens from Supplementary Requirement S22.1 representing the casting shall be treated thermally after the final (foundry) heat treatment to simulate heat treatments below the critical temperature that the casting may receive during fabrication, and then tested for mechanical properties. Time, temperature, and cooling rate shall be as stated in the order. In the case of postweld heat-treatment, the total time at temperature or temperatures for the test material shall be at least 80% of the total time at temperature or temperatures during actual postweld heat-treatment of the fabrication of which the casting or castings are a part. The total time at temperature or temperatures for the test material may be performed in a single cycle. When this Supplementary Requirement is specified, the welding qualification test metal must be processed in the same manner.

S23. Macroetch Test

S23.1 Apply Supplementary Requirement S1 for the spectrographic determination and reporting of the total residual aluminum content of all heats of ferritic and martensitic steels subjected to this macroetch test.

S23.2 When the heat analysis indicates a total residual aluminum content in excess of 0.08%, the manufacturer shall etch a cross section of the casting with the heaviest section for which this supplementary requirement is

invoked, or a coupon attached to that heaviest section or an area directly under a riser (Note S23.1). Cross sections, from a separately cast test block from the same heat and of a thickness representative of the heaviest section of castings purchased under this supplementary requirement, may also be used for macroetch testing. The etching shall be performed on the selected section after its heat treatment, that is, after annealing, normalizing, or quenching and tempering following the initial cooling of the steel below the transformation range.

NOTE S23.1 — High-strength martensitic castings, in particular, may be damaged beyond use if the etch is applied directly to the casting.

S23.3 The preparation of the surface and the macro-etching procedure with solution No. 1 (1:1 HCl) of Table 5 in Test Method E 340 shall be followed. The resulting etched surface shall be compared and rated with the reference photographs in Fig. S23.1 depicting 10 levels of severity of intergranular network structures indicative of the presence of aluminum nitride, or other constituents prone toward precipitating at grain boundaries during solidification and subsequent cooling. Table S23.1 relates the severity levels shown in these photographs with specific delineation widths and percent of boundary outlining in the etched structures.

S23.4 Castings represented by etched structures exhibiting a network rating in excess of Severity Level 4 shall be considered unacceptable until further evaluations are completed. The acceptability of individual castings may be determined by etching sections of each casting to ascertain the network severity level. Disposition of unacceptable castings shall be a matter of agreement between the manufacturer and purchaser. Those castings exhibiting etched severity levels greater than four may be further evaluated by any of the following agreed upon methods:

S23.4.1 Fracture testing to determine the amount of “rock candy” structure.

S23.4.2 Mechanical testing (bend, tensile, and so forth) to determine the ductility characteristics.

S23.4.3 Weld testing to determine crack susceptibility in the heat-affected zone of a circular groove welded with cellulose coated electrodes.

S23.5 Alternatively, by agreement, it is permissible to subject castings from an unacceptable heat to a high temperature solution treatment prior to the normal production heat treatment and subsequently macroetch test each casting.

S23.6 Heavy section castings (3) whose configurations are amenable to the attachment of test coupons representative of the section thickness involved and from which standard 0.505 in. [12.827 mm] diameter tension specimens may be machined are exempt from this macroetch test if

the results of the tension test on the coupon after heat treatment of the casting meet the minimum requirements specified for the grade of steel involved.

NOTE S23.2 — For purposes of this supplementary requirement, a heavy section casting is defined as one having a wall thickness of $1\frac{1}{2}$ in. [37 mm] or greater in combination with a casting weight of at least 1000 lb [455 kg].

S24. Specified Ferrite Content Range

S24.1 The chemical composition of the heat shall be controlled such that the ferrite content, as determined by the chemical composition procedure of Practice A 800/A 800M, shall be in accordance with the specified ferrite content range.

S24.2 The specified ferrite content range shall be as agreed upon between the manufacturer and the purchaser. The minimum specified ferrite content range shall be 10% with the minimum ferrite content being no lower than the percent necessary to achieve the minimum mechanical properties required for the alloy.

S24.3 Should the purchaser wish to have the ferrite content determined by either magnetic response or metallographic methods, the purchaser should impose Supplementary Requirement S1 or S2 of Practice A 800/A 800M.

S25. Heat Treatment Certification

S25.1 Heat treatment temperature and cycle times shall be shown on the certification report.

S26. Alternate Tension Test Coupons and Specimen Locations for Castings

S26.1 Test coupons may be cast integrally with the castings or separately. Separately cast coupons shall be heat treated together with the castings they represent.

S26.2 The casting thickness, T , is the maximum thickness of the pressure containing wall of the casting exclusive of padding added for directional solidification, flanges, appendages, and sections designated by the designer as noncritical. The order, inquiry, and drawing shall designate what the test dimension, T , is for the casting.

S26.3 One of the following shall apply:

S26.3.1 The longitudinal centerline of the test specimen shall be taken at least $\frac{1}{4}T$ from the T dimension surface and all of the gage length must be at least $1T$ from any other heat-treated surface, exclusive of the surface opposite the T dimension surface. (See Fig. S26.1(a).) For cylindrical castings, the longitudinal centerline of the specimens shall be taken at least $\frac{1}{4}T$ from the outside or inside and all of the gage length must be at least T from the as-heat-treated end. (See Fig. S26.1(b).)

S26.3.2 For ferritic and martensitic castings, partial severing of test coupons prior to final heat treatment is permitted.

S26.3.3 Where separately cast test coupons are used, the dimension shall not be less than $3T$ by $3T$ by T and each specimen shall meet the requirements of S26.3.1, except that when T exceeds 5 in. [125 mm], the dimension may be 15 by 15 by 5 in. [375 by 375 by 125 mm], by agreement between the manufacturer and the purchaser. The test coupon shall be of the same heat of steel and shall receive substantially the same casting practices as the production casting it represents. Centrifugal castings may be represented by statically cast coupons. (See Fig. S26.2.)

S26.3.4 When agreed upon between the manufacturer and the purchaser, castings that are cast or machined to essentially the finished configuration prior to heat treatment shall have test specimens removed from a prolongation or other stock on the casting at a location below the nearest heat-treated surface indicated on the order. The specimen location shall be at a distance below the nearest heat-treated surface equivalent to at least the greatest distance that the indicated high-tensile-stress surface will be from the nearest heat-treated surface and a minimum of twice this distance from a second heat-treated surface, except that the test specimens shall be no nearer than $\frac{3}{4}$ in. [19 mm] to a heat-treated surface and $1\frac{1}{2}$ in. [38 mm] from a second heat-treated surface. (See Fig. S26.3.)

S26.3.5 Where specimens are to be removed from the body of quenched and tempered castings, either the requirements of S26.3.1 shall be met or a steel thermal buffer pad or thermal insulation or other thermal barriers shall be used during heat treatment. Steel thermal buffer pads shall be a minimum of T by T by $3T$ in length and shall be joined to the casting surface by a partial penetration weld completely sealing the buffered surface. Test specimens shall be removed from the casting in a location adjacent to the center third of the buffer pad. They shall be located at a minimum distance of $\frac{1}{2}$ in. [13 mm] from the buffered surface and $\frac{1}{4}T$ from other heat-treated surfaces (see Fig. S26.4). When thermal insulation is used, it shall be applied adjacent to the casting surface where the test specimens are to be removed. The producer shall demonstrate that the cooling rate of the test specimen location is no faster than that of specimens taken by the method described in S26.3.1

S27. Hot Isostatic Pressing (HIPing)

S27.1 Castings shall be processed by Hot Isostatic Pressing (HIPing). The processing parameters for the HIPing process may be subject to an agreement between the manufacturer and purchaser.

S28. Cleaning of Stainless Steels

S28.1 Final cleaning of the casting surfaces shall be performed in accordance with one of the cleaning methods in Practice A 380 or Specification A 967 as agreed upon

between the purchaser and supplier. Acceptance testing shall be subject to agreement between the purchaser and supplier.

FIG. S23.1 REFERENCE PHOTOGRAPHS OF MACROETCHED CAST STEEL

NOTE—The 10 levels of severity of intergranular network structures shown are indicative of the presence of aluminum nitride precipitation in the primary austenitic grain boundaries.

FIG. S26.1 SPECIMEN FROM CASTING

Minimum length of the base — Specimen gage length + $2xT$ + $2x$ the thickness added due to the taper.

Minimum width of the base — $T + 2x$ the thickness added due to the taper.

Minimum height — $T + NxD + W_{TOT}$.

The taper is to be selected by the producer for ease of drawing the pattern from the mold.
where:

N = number of specimens to be cut from one side of the coupon,

D = diameter of the specimens, and

W_{TOT} = total width of metal required to remove the coupon from the casting, and to machine specimens from the coupon.

NOTE—Longitudinal axis and gage length of test specimen must be within shaded zone.

FIG. S26.2 SEPARATELY CAST BLOCK

NOTE — Longitudinal axis and gage length of test specimen must be within cross-hatched zone.

FIG. S26.3 PROLONGATION TEST SPECIMEN

NOTE — Longitudinal axis and gage length of test specimen must be within cross-hatched zone.

FIG. S26.4 THERMAL BUFFER PADS

NOTE—Longitudinal axis and gage length of test specimen must be within cross-hatched zone.

TABLE S23.1
DESCRIPTIVE DATA APPLICABLE TO NETWORK
STRUCTURES SHOWN IN FIG. S23.1

Rating	Delineation Width, in.	Boundary Outline, %
1	Fine-0.001	20
2	Fine-0.001	40
3	Fine-0.001	60
4	Fine-0.002	80
5	Fine-0.002	100
6	Medium-0.005	100
7	Heavy-0.010	100
8	0.020	100
9	$\frac{1}{32}$	100
10	$\frac{1}{16}$	100

NOTE 1 — These ratings are based on the physical width and continuity of the precipitate pattern developed by the acid etchant on the primary austenitic grain boundaries of the cast steel. Supplementary testing is normally conducted to determine the final disposition of castings with ratings of 5 or greater.

APPENDICES

(Nonmandatory Information)

X1. ALLOY DESIGNATIONS FOR CAST STAINLESS STEELS

X1.1 Cast stainless steels are usually specified on the basis of composition using the alloy designation system established by the Alloy Casting Institute (ACI). The ACI designations, for example, CF8M, have been adopted by ASTM and are preferred for cast alloys over the designations used by the American Iron and Steel Institute for similar wrought steels.

X1.2 This nomenclature system has served successfully to accommodate changes in old alloys and to designate new ones.

X1.2.1 Service Classification Letter — The first letter of the cast stainless steel designation system identifies the intended service application of the alloy. The letter C indicates corrosion-resistant service, and the letter H indicates the heat-resistant service at and above 1200°F [649°C].

X1.2.2 Ternary Diagram Location Letter — The second letter indicates the approximate location of the nickel and chromium contents of the alloy grade on the FeCrNi ternary diagram shown in Fig. X1.1.

X1.2.3 Carbon Content Number — For C service classifications, this single or dual digit numeral represents the maximum carbon content in units of 0.01%. For H service classifications, this number represents the midpoint of the range of carbon content in terms of 0.01% with a $\pm 0.05\%$ limit.

X1.2.4 Special Elements Letter — Additional letters following the numeral represent special chemical elements in

the alloy grade, such as M for molybdenum, C for columbium, Cu for copper, W for tungsten. There are two exceptions; the letter A indicates “Controlled Ferrite,” and the letter F indicates “Free Machining.”

X1.3 In Fig. X1.1, unlettered NiCr ranges are associated with the nearest lettered location. They may be the result of differences between corrosion and heat-resistant types or because of the influence of additional elements: for example, the precipitation hardening grade CB-7Cu.

X2. ADDITION OF NEW GRADES TO PRODUCT SPECIFICATIONS COVERED BY SPECIFICATION A 703/A 703M

X2.1 Data should be provided from a minimum of ten production heats. This data should include:

X2.1.1 Chemical composition.

X2.1.2 Mechanical properties, as applicable to the product specification being cited. These may include, but are not limited, to the following:

X2.1.2.1 Ultimate tensile strength,

X2.1.2.2 Yield strength or yield point,

X2.1.2.3 Elongation,

X2.1.2.4 Reduction of area,

X2.1.2.5 Hardness, and

X2.1.2.6 Impact properties (Charpy V-Notch).

X2.1.3 The test coupon size from which the test specimens were removed, stated for each test.

X2.1.4 Heat treatment requirements.

X2.1.5 Welding procedure. (It is desired that the welding be performed with commercially available consumables.)

X2.1.6 Whether the material is covered by any patents, and if so, the expiration dates of those patents.

X2.2 The inclusion of the proposed material should be supported by written request from at least one purchaser or user indicating the need for the new grade.

FIG. X1.1 LETTERS ASSIGNED TO CHROMIUM AND NICKEL RANGES IN ACI DESIGNATION SYSTEM

NOTE—The approximate areas of microstructures to be expected at room temperature are indicated as follows:

- I—Martensite
- II—Martensite and untransformed austenite
- III—Ferrite plus martensite and untransformed austenite
- IV—Ferrite
- V—Ferrite plus austenite
- VI—Ferrite plus austenite plus sigma
- VII—Austenite

Carbides also may be present depending on carbon content and thermal history.

SPECIFICATION FOR AGE-HARDENING STAINLESS STEEL FORGINGS

SA-705/SA-705M

[Identical with ASTM Specification A 705/A 705M-95(R09).]

1. Scope

1.1 This specification covers age-hardening stainless steel forgings for general use.

1.2 The values stated in either inch-pound units or SI (metric) units are to be regarded separately as standards; within the text and tables, the SI units are shown in [brackets]. The values stated in each system are not exact equivalents; therefore, each system must be used independent of the other. Combining values from the two systems may result in nonconformance with the specification.

1.3 Unless the order specifies an “M” designation, the material shall be furnished to inch-pound units.

NOTE 1 —Bar products are covered by Specification A 564/A 564M.

2. Referenced Documents

2.1 ASTM Standards:

- A 370 Test Methods and Definitions for Mechanical Testing of Steel Products
- A 484/A 484M Specification for General Requirements for Stainless Steel Bars, Billets, and Forgings
- A 564/A 564M Specification for Hot-Rolled and Cold-Finished Age-Hardening Stainless Steel Bars and Shapes
- A 751 Test Methods, Practices, and Terminology for Chemical Analysis of Steel Products
- E 527 Practice for Numbering Metals and Alloys (UNS)

2.2 Other Documents:

- SAE J 1086 Recommended Practice for Numbering Metals and Alloys (UNS)

3. Ordering Information

3.1 It is the responsibility of the purchaser to specify all requirements that are necessary for material ordered under this specification. Such requirements may include but are not limited to the following:

3.1.1 Quantity (weight or number of pieces),

3.1.2 Name of material (age-hardening stainless steel forgings),

3.1.3 Dimensions, including prints or sketches,

3.1.4 Type or UNS designation (Table 1),

3.1.5 Heat treated condition (Section 5),

3.1.6 Transverse properties when required (7.4),

3.1.7 ASTM designation and date of issue, and

3.1.8 Special requirements (5.3, 5.4).

3.2 If possible the intended end use of the item should be given on the purchase order, especially when the item is ordered for a specific end use or uses.

NOTE 2 — A typical ordering description is as follows: 5 age-hardening stainless steel forgings, Type 630, solution-annealed, ASTM Specification A 705 dated _____. End use: pump blocks for oil well equipment.

4. General Requirements

4.1 In addition to the requirements of this specification, all requirements of the current edition of Specification A 484/A 484M shall apply. Failure to comply with the general requirements of Specification A 484/A 484M, constitutes nonconformance with this specification.

5. Materials and Manufacture

5.1 Material for forgings shall consist of billets or bars, either forged, rolled or cast, or a section cut from an ingot. The cuts shall be made to the required length by a suitable process. This material may be specified to Specification A 564/A 564M.

5.2 The material shall be forged by hammering, pressing, rolling, extruding, or upsetting to produce a wrought structure throughout and shall be brought as nearly as possible to the finished shape and size by hot working.

5.3 When specified on the order, sample forging may be sectioned and etched to show flow lines and the condition in regard to internal imperfections. When so specified, the question of acceptable and unacceptable metal flow shall be subject to agreement between the manufacturer and the purchaser prior to order entry.

5.4 When specified on the order, the manufacturer shall submit for approval of the purchaser a sketch showing the shape of the rough forging before machining, or before heat treating for mechanical properties.

5.5 The grain size shall be as fine as practicable and precautions shall be taken to minimize grain growth.

5.6 Material of types other than XM-9 shall be furnished in the solution-annealed condition, or in the equalized and over-tempered condition, as noted in Table 2, unless otherwise specified by the purchaser.

5.6.1 Types 630, XM-16, and XM-25 may be furnished in the solution-annealed or age-hardened condition.

6. Chemical Composition

6.1 The steel shall conform to the chemical composition limits specified in Table 1.

6.2 Methods and practices relating to chemical analysis required by this specification shall be in accordance with Test Methods, Practices, and Terminology A 751.

7. Mechanical Properties

7.1 The material, as represented by mechanical test specimens, shall conform to the mechanical property requirements specified in Table 2 and shall be capable of developing the properties in Table 3 when heat treated as specified in Table 3.

7.2 The yield strength shall be determined by the offset method as described in the current edition of Test Methods and Definitions A 370. The limiting permanent offset shall be 0.2% of the gage length of the specimen.

7.3 The impact strength shall be determined at 70 to 80°F [20 to 25°C], by Charpy V-notch specimen Type A

as described in Test Methods and Definitions A 370.

7.4 Material tensile tested and, when specified, impact tested in the transverse direction (perpendicular to the forging flow lines) and meeting the requirements shown in Table 3 need not be tested in the longitudinal direction.

7.5 Samples cut from forging shall conform to the mechanical properties of Table 3 when heat treated as specified in Table 2 and Table 3 and tested in accordance with Test Methods and Definitions A 370.

8. Prolongations for Tests

8.1 Subject to Section 7, the forgings shall be produced with prolongations for testing, unless otherwise specified. The producer may elect to submit an extra forging to represent each test lot instead of prolongations, or the test specimens can be taken from the forgings themselves.

9. Number of Tests

9.1 For all classes of forgings weighing from 5000 to 7000 lb [2300 to 3200 kg] each, at least one tension test shall be made from each forging.

9.2 For all classes of forgings weighing more than 7000 lb [3200 kg] each, one tension test shall be made from each end of each forging. In the case of ring forgings, the tension test specimen shall be removed from each of two locations on the periphery, approximately 180° apart, or insofar as practicable, from opposite ends of the forging.

9.3 For forgings weighing less than 5000 lb [2300 kg] each, one tension test shall be made from each size classification for each heat in each heat treating charge. Where continuous heat treating furnaces are used, tests shall be made on 10% of the forgings of each size classification from each heat subjected to the same heat treatment practice.

10. Keywords

10.1 age-hardening stainless steel; precipitation hardening stainless steel; stainless steel forgings

					Up to 12 in. incl [300 mm] ^K (L)		125 [860]		75 [515]		55		26		262	
					Up to 12 in. incl [300 mm] ^K (T)				12		35					

^A See 6.1.^B Time refers to minimum time material is at temperature and may be extended to obtain required ductility properties.^C Unless otherwise noted, temperatures shown are suggested temperatures and may be varied to obtain required tensile properties.^D Intermediate temperatures must meet the ductility requirements of the next highest suggested hardening or aging temperature, or both. Example: Type 630 at 1050°F [565°C] must have 13% elongation and 45% reduction, same as for age hardening at 1075°F [580°C].^E (L) — Longitudinal axis of specimen parallel to direction of grain flow during rolling or forging. (T) — Transverse axis of specimen perpendicular to direction of grain flow during rolling or forging.^F See 6.2.^G Either Rockwell C hardness or Brinell is permissible. On sizes 1/2 in. (12.70 mm) and smaller, Rockwell C is preferred.^H Refer to Table 2 for details on equalize and over temper heat treatment.^I Applies to consumable electrode vacuum remelted.^J Only tensile strength applicable to sizes up to 1/2 in. (13 mm).^K Consumable electrode remelted only.

SPECIFICATION FOR ALLOY STEEL FORGINGS FOR HIGH-STRENGTH PRESSURE COMPONENT APPLICATION

SA-723/SA-723M

(Identical with ASTM Specification A 723/A 723M-02 except that for Class 2a in Table 2 the minimum elongation shall be 13.5%.)

1. Scope

1.1 This specification covers requirements for high-strength quenched and tempered alloy steel forgings for pressure vessels, isostatic presses, shock tubes, and similar components.

1.2 These materials are not intended for welded construction.

1.3 Three grades of nickel-chromium-molybdenum steels and six classes of increasing tensile strength are included. The strength class, section size, and configuration of the forging will largely dictate the applicable type(s) of steel.

1.4 The values stated in either inch-pound units or SI (metric) units are to be regarded separately as the standard. Within the text and tables, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification.

1.5 Unless the order specifies the applicable “M” specification designation, the material shall be furnished to the inch-pound units.

2. Referenced Documents

- 2.1 ASTM Standards:**
A 275/A 275M Test Method for Magnetic Particle Examination of Steel Forgings
A 370 Test Methods and Definitions for Mechanical Testing of Steel Products
A 388/A 388M Practice for Ultrasonic Examination of Heavy Steel Forgings
A 788 Specification for Steel Forgings, General Requirements

3. Ordering Information and General Requirements

3.1 In addition to the ordering information required by Specification A 788, the purchaser shall include with the inquiry and order a detailed drawing, sketch, or written description of the forging and the method of selecting test location (see 6.2). When appropriate, the areas of significant loading in the forging shall be designated.

3.2 Material supplied to this specification shall conform to the requirements of Specification A 788, which outlines additional ordering information, manufacturing requirements, testing and retesting methods and procedures, marking, certification, product analysis variations, and additional supplementary requirements.

3.3 If the requirements of this specification are in conflict with the requirements of Specification A 788, the requirements of this specification shall prevail.

4. Materials and Manufacture

4.1 Melting Practice — The steel melting procedures of Specification A 788 shall apply except that the open-hearth process shall not be used, and that the steel shall be vacuum degassed prior to or during the pouring of the ingot, in order to remove objectionable gases, particularly hydrogen.

4.1.1 Use of secondary remelting or refining operations may be considered for particularly demanding applications.

4.2 Discard — Sufficient discard shall be taken from each ingot to secure freedom from piping and excessive segregation.

4.3 Heat Treatment:

4.3.1 Forgings shall be rough-machined prior to final heat treatment if it is necessary to reduce the mass to ensure

full hardening or to meet the requirements of 6.2. The risk of cracking during heat treatment with high-hardenability steels of the type covered by this specification should be borne in mind when deciding on the degree of surface preparation before heat treatment.

4.3.2 Heat Treatment for Mechanical Properties —

Heat treatment shall consist of normalizing (which may be part of the preliminary treatment), re-austenitization, liquid quenching, and tempering. The forgings shall be quenched in a suitable liquid medium by spraying or immersion. Quenching shall be followed by tempering at a minimum temperature of 1000°F [540°C]. The minimum time at tempering temperature shall be $\frac{1}{2}$ h/in. [$\frac{1}{2}$ h/25 mm] of maximum section thickness, unless otherwise agreed between supplier and purchaser.

5. Chemical Composition

5.1 Heat Analysis — The heat analysis obtained from sampling in accordance with Specification A 788 shall comply with Table 1.

5.2 Product Analysis — The manufacturer shall use the product analysis provision of Specification A 788 to obtain a product analysis from a forging representing each heat or multiple heat. The purchaser may also make this determination in accordance with Specification A 788.

6. Mechanical Properties

6.1 General Requirements — The forging shall conform to the requirements of Table 2 and Table 3. The largest obtainable tension test specimen as specified in Test Methods and Definitions A 370 (that is, standard round 0.500 in. [12.5 mm] diameter specimen) shall be used. Charpy V-notch Type A impact specimens, as shown in Test Methods and Definitions A 370, shall be used.

6.2 Sampling — The mid-point of the gage length of tension test specimens and the area under the notch of impact specimens shall be located in accordance with one of the following methods as specified by the purchaser, or suggested by the supplier and approved by the purchaser. Wherever practical, all testing shall be from integral prolongations of the forging.

6.2.1 Method 1 — This method shall always be used when the maximum quenched thickness does not exceed 4 in. [100 mm]. Datum points of the specimens, as described in 6.2, shall be located in the forging or test forging (6.2.4) at mid-thickness and at least $\frac{2}{3}$ T (T is the maximum heat-treated thickness) from the quenched end surface or nearest adjacent surfaces.

6.2.2 Method 2 — t by $2t$, where t is the distance from the area of significant loading (3.1) to the nearest

quenched surface. However, the datum points of the specimens as described in 6.2 shall not be nearer to one quenched surface than $\frac{3}{4}$ in. [20 mm] and to the second quenched surface than $1\frac{1}{2}$ in. [40 mm]. When this method of testing is employed, forgings are usually manufactured in accordance with a purchaser-approved drawing showing pre-quenched dimensions and the location of mechanical test specimens. It is commonly used for disk-type forgings such as tube sheets and covers.

6.2.3 Method 3 — For maximum quenched thicknesses in excess of 4 in. [100 mm] as heat treated. Where this method of testing is employed, the datum points of the test specimen, as described in 6.2, shall be removed $\frac{1}{4}$ T from the nearest quenched surface and $\frac{2}{3}$ T from the quenched end surface or nearest adjacent surface.

6.2.4 Method 4 — Test specimens shall be taken from a representative separate test forging made from the same heat of steel, which shall receive substantially the same reduction and type of hot working, and have a cross section not less than the production forgings which it represents. It shall be heat treated in the same furnace charge and under the same conditions as the production forgings. The test specimen shall be removed using the Method 3 procedure.

6.3 Thermal Buffers:

6.3.1 Thermal buffer rings, at least T by T in cross section or sections of such a ring at least 3 T in length, shall be welded to the test end(s) of a forging prior to heat treatment for mechanical properties. The buffer material may be any weldable carbon or low-alloy steel and shall be joined to the forging with a partial penetration-type weld which completely seals the buffered surface. The test coupons shall be removed from the forging in the region buffered by the ring or ring segments. If the latter are used, the test coupons shall be removed from the forging in the area under the center $\frac{1}{3}$ of the buffer ring segment length. In either case, the test specimens shall be located at a minimum distance of $\frac{1}{2}$ in. [13 mm] from the buffered surface of the forging and at least $\frac{1}{4}$ T from a quenched surface of the forging. Buffered weld areas must be at least 1 in. [25 mm] from any finished machining surface of the complete forging.

6.3.2 Bearing in mind the characteristics of the base materials included in this specification, precautions should be taken, such as the use of pre- and post-weld heating and austenitic weld metal, to minimize the occurrence of crack-like defects.

6.3.3 Approval of the purchaser should be obtained for the use of this method.

6.4 Samples shall be removed from the forgings after quenching and tempering.

6.5 Orientation — For upset disk forgings, the longitudinal axis of all test specimens shall be oriented in the tangential or radial direction. For all other forgings, the longitudinal axis of the specimens shall be oriented in the direction of maximum working of the forging, or as agreed between manufacturer and purchaser.

6.6 Number of Tests:

6.6.1 For forgings weighing 1000 lb [455 kg] or less, as heat treated but not exceeding 80 in. [2030 mm] in length, excluding test material, one tension test and one set of impact tests (three specimens) shall be taken to represent each heat in each heat-treatment charge. This testing shall be repeated at the opposite end of the same test forging, if the heat-treated length excluding test material exceeds 80 in. [2030 mm]. When heat treatment is performed in continuous-type furnaces with suitable temperature control and equipped with recording pyrometers so that complete heat-treatment records are available, a heat-treatment charge shall be considered as any continuous run not exceeding 8 h in duration.

6.6.2 Forgings weighing over 1000 lb [455 kg] but not over 5000 lb [2270 kg] as heat treated and not over 80 in. [2030 mm] in length excluding test material, one tension test and one set of three impact tests shall be removed from each forging. When the length of the forging exceeds 80 in. [2030 mm] this testing shall be repeated at the opposite end of the forging.

6.6.3 Forgings exceeding 5000 lb [2270 kg] and not over 80 in. [2030 mm] in length, excluding test material, shall have one tension test and one set of three impact tests removed from each of two locations, 180° apart. For forgings with lengths exceeding 80 in. [2030 mm] this testing shall be repeated at the opposite end of the forging.

7. Nondestructive Examination Requirements

7.1 Ultrasonic Examination:

7.1.1 Forgings shall be ultrasonically examined in accordance with the procedures of Practice A 388/A 388M.

7.1.1.1 Straight-Beam Examination:

(a) Unless otherwise specified, the back-reflection method of tuning shall be used in accordance with Practice A 388/A 388M.

(b) In addition to the reportable conditions of Practice A 388, indications exceeding the resultant back-reflection shall be recorded.

(c) A forging shall be unacceptable when one or more reflections are present producing indications accompanied by a complete loss of back-reflection, not attributable to nor associated with the geometric configuration. For this purpose, a back-reflection of less than 5% of full

screen height shall be considered complete loss of back-reflection.

7.1.1.2 Angle-Beam Examination:

(a) Calibration notches shall be cut into the inside diameter and outside diameter surfaces in accordance with Practice A 388.

(b) A forging that contains a discontinuity which results in an indication exceeding the amplitude of the reference line is subject to rejection.

(c) The report of the ultrasonic test shall be in compliance with Practice A 388/A 388M.

(d) Additional nondestructive examination or trepanning may be employed to resolve questions of interpretation of ultrasonic indications. The manufacturer shall accept responsibility for injurious defects that will not be removed in final machining.

7.2 Magnetic Particle Examination:

7.2.1 Each forging shall be examined by magnetic particle methods described in Test Method A 275/A 275M. Acceptance and rejection standards shall be as follows: Only indications with major dimensions greater than $\frac{1}{16}$ in. [1.6 mm] shall be considered relevant. The following relevant indications are unacceptable:

7.2.1.1 Any linear indications greater than $\frac{1}{16}$ in. [1.6 mm] long for materials less than $\frac{5}{8}$ in. [16 mm] thick; greater than $\frac{1}{8}$ in. [3.2 mm] long for materials from $\frac{5}{8}$ in. [16 mm] to under 2 in. [50 mm] thick; and $\frac{3}{16}$ in. [4.8 mm] long for materials 2 in. [50 mm] thick and greater. A linear indication is defined as one whose length is three times its width.

7.2.1.2 Rounded indications with dimensions greater than $\frac{1}{8}$ in. [3.2 mm] for thicknesses less than $\frac{5}{8}$ in. [16 mm], and greater than $\frac{3}{16}$ in. [4.8 mm] for thicknesses $\frac{5}{8}$ in. [16 mm] and greater.

7.2.1.3 Four or more relevant indications in a line separated by $\frac{1}{16}$ in. [1.6 mm] or less, edge to edge.

7.2.1.4 Ten or more relevant indications in any 6 in.² [3870 mm²] of surface with the major dimension of this area not to exceed 6 in. [150 mm] when it is taken in the most unfavorable orientation relative to the indications being evaluated.

8. Rework and Retreatment

8.1 Repair welding shall not be permitted. For retreatment, see 7.2.1.

9. Certification and Reports

9.1 In addition to the certification requirements of Specification A 788, the manufacturer shall include the following in the certification data:

9.1.1 Results of the product analysis,

9.1.2 Method used to locate mechanical test specimens (see Section 6), and

9.1.3 Sketches or drawings as necessary to supplement the nondestructive examination report.

a separate nameplate, with the required stamping, shall be permanently affixed to the vessel in a manner that will not be injurious to the vessel.

10. Packaging and Package Marking

10.1 Marking shall be in accordance with Specification A 788 but stamping shall be permitted only in areas designated by the purchaser. If no such suitable area is available,

11. Keywords

11.1 alloy steel forgings; high pressure vessels; high strength; impact tested; isostatic presses; nonweldable; quenched and tempered; vacuum-treated steel

Reduction of area, min, %	50	45	43	40	35	30

^A Typical maximum section size of 10 in. [255 mm] for open-ended vessels, or 7 in. [180 mm] for blind-ended vessels.

^B Typical maximum section size of 6 in. [150 mm] for open-ended vessels, or 4 in. [100 mm] for blind-ended vessels.

^C Typical maximum section size of 4 in. [100 mm].

TABLE 3
CHARPY V-NOTCH IMPACT REQUIREMENTS AT 40°F [4.5°C] MAX^A

	Class 1	Class 2	Class 2a ^A	Class 3 ^B	Class 4 ^C	Class 5 ^D
Minimum average value of set of three specimens, ft·lbf (J) ^E	35 [47]	30 [41]	28 [38]	25 [34]	20 [27]	12 [16]
Minimum value of one specimen, ft·lbf (J)	30 [41]	25 [34]	23 [31]	20 [27]	15 [20]	10 [14]

^A Or such other lower temperature as is specified when supplementary requirement S2 is involved.

^B Typical maximum section size of 10 in. [255 mm] for open-ended vessels, or 7 in. [180 mm] for blind-ended vessels.

^C Typical maximum section size of 6 in. [150 mm] for open-ended vessels, or 4 in. [100 mm] for blind-ended vessels.

^D Typical maximum section size of 4 in. [100 mm].

^E Not more than one specimen from a set may be below this value.

SUPPLEMENTARY REQUIREMENTS

One or more of the following supplementary requirements shall apply only when specified by the purchaser in the inquiry or order. Details of these supplementary requirements shall be agreed upon by the manufacturer and the purchaser.

S1. Charpy V-Notch Impact Transition Curve

S1.1 Sufficient impact tests shall be made from the forging test material to establish a temperature-absorbed energy curve. The test temperature range shall be wide enough to establish the upper and lower shelf foot-pound-force energies, with sufficient testing at intermediate temperatures to permit plotting a reasonably smooth curve.

S1.2 Instead of plotting an impact transition curve, impact requirements may be specified as 50% fibrous fracture at a specified maximum temperature.

S2. Additional Charpy Data

S2.1 The percent shear fracture and mils of lateral expansion, defined in Test Methods and Definitions A370, shall be reported for each Charpy specimen tested.

S3. Charpy Impact Tests

S3.1 Charpy impact tests shall be made in accordance with the provisions of Section 6 of this specification, except

that the tests shall be at a specified temperature lower than 40°F [4.5°C]. These tests shall be instead of those specified in Section 6, and shall meet the requirements of Table 3.

S4. Impact Testing

S4.1 For Class 2a forgings, impact tests shall be made in accordance with the provisions of Section 6 of this specification except that the acceptance criteria shall be a minimum of 45 ft·lbf [61 J] and 25 mils [0.635 mm] lateral expansion at a test temperature specified by the purchaser.

S5. Mechanical Test Location Discard

S5.1 Instead of the discard of $\frac{1}{4} T \times \frac{2}{3} T$ required by 6.2.3, a minimum discard of $\frac{1}{4} T \times T$ shall be employed for Method 3.

SPECIFICATION FOR PRESSURE VESSEL PLATES, CARBON-MANGANESE-SILICON STEEL, QUENCHED AND TEMPERED, FOR WELDED PRESSURE VESSELS

SA-724/SA-724M

(Identical with ASTM Specification A 724/A 724M-04 except for an editorial correction to Note B in Table 1.)

1. Scope

1.1 This specification covers three grades of carbon-manganese-silicon steel, designated Grades A, B, and C. Grade C may be produced with a boron addition. The plates are quenched and tempered and are intended for welded-layered pressure vessels.

1.2 The maximum thickness of plates supplied under this specification is limited only by the capability of the chemical composition to meet the specified mechanical requirements. However, current practice normally limits the maximum thickness to $\frac{7}{8}$ in. [22 mm] for Grades A and B, and to 2 in. [50 mm] for Grade C.

1.3 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification.

2. Referenced Documents

2.1 ASTM Standards:

A 20/A 20M Specification for General Requirements for Steel Plates for Pressure Vessels

3. General Requirements and Ordering Information

3.1 Material supplied to this material specification shall conform to Specification A 20/A 20M. These requirements outline the testing and retesting methods and procedures,

permissible variations in dimensions and weight, quality and repair of defects, marking, loading, etc.

3.2 Specification A 20/A 20M also establishes the rules for the ordering information that should be complied with when purchasing material to this specification.

3.3 In addition to the basic requirements of this specification, certain supplementary requirements are available when additional control, testing, or examination is required to meet end use requirements. These include:

3.3.1 Vacuum treatment,

3.3.2 Additional or special tension testing,

3.3.3 Impact testing, and

3.3.4 Nondestructive examination.

3.4 The purchaser is referred to the listed supplementary requirements in this specification and to the detailed requirements in Specification A 20/A 20M.

3.5 If the requirements of this specification are in conflict with the requirements of Specification A 20/A 20M, the requirements of this specification shall prevail.

4. Manufacture

4.1 Steelmaking Process — The steel shall be killed and shall conform to the fine austenitic grain size requirement of Specification A 20/A 20M.

5. Heat Treatment

5.1 All plates shall be quenched from a temperature in the range from 1600 to 1700°F [870 to 925°C]. Grades A

and B shall then be tempered at not less than 1100°F [595°C], and Grade C shall then be tempered at not less than 1150°F [620°C]. The tempering soaking time shall be not less than $\frac{1}{2}$ h.

6. Chemical Composition

6.1 The steel shall conform to the requirements as to chemical composition prescribed in Table 1.

7. Mechanical Properties

7.1 *Tension Test Requirements:*

7.1.1 The material as represented by the tension test specimens shall conform to the requirements shown in Table 2.

7.1.2 For nominal plate thicknesses of $\frac{3}{4}$ in. [20 mm] and under, the $1\frac{1}{2}$ in. [40 mm] wide rectangular specimen may be used for the tension test, and the elongation may be determined in a 2 in. [50 mm] gage length that includes the fracture and shows the greatest elongation.

TABLE 1
CHEMICAL REQUIREMENTS

Element	Composition, %		
	Grade A	Grade B	Grade C
Carbon, max.:			
Heat analysis	0.18	0.20	0.22
Product analysis	0.22	0.24	0.26
Manganese:			
Heat analysis	1.00–1.60	1.00–1.60	1.10–1.60
Product analysis	0.92–1.72	0.92–1.72	1.02–1.72
Phosphorus, max. ^A	0.035	0.035	0.035
Sulfur, max. ^A	0.035	0.035	0.035
Silicon, max.:			
Heat analysis	0.55	0.50	0.20–0.60
Product analysis	0.60	0.55	0.18–0.65
Copper, max. ^B			
Heat analysis	0.35	0.35	0.35
Product analysis	0.38	0.38	0.38
Nickel, max. ^B			
Heat analysis	0.25	0.25	0.25
Product analysis	0.28	0.28	0.28
Chromium, max. ^B			
Heat analysis	0.25	0.25	0.25
Product analysis	0.29	0.29	0.29
Molybdenum, max. ^B			
Heat analysis	0.08	0.08	0.08
Product analysis	0.09	0.09	0.09
Vanadium, max. ^B			
Heat analysis	0.08	0.08	0.08
Product analysis	0.09	0.09	0.09
Boron, max.	...	...	0.005 ^C

^A Applies to both heat and product analyses.

^B When analysis shows that the amount of an element is 0.02% or lower, the value may be reported as <0.02%.

^C If boron is less than 0.001%, the analysis report for the element may be stated as "<0.001%."

TABLE 2
TENSILE REQUIREMENTS

	Grades A and C ksi [MPa]	Grade B ksi [MPa]
Tensile strength	90–110 [620–760]	95–115 [655–795]

^A See Specification A 20/A 20M for elongation adjustment.

^B See 7.1.2.

SUPPLEMENTARY REQUIREMENTS

Supplementary requirements shall not apply unless specified in the order.

A list of standardized supplementary requirements for use at the option of the purchaser is included in Specification A 20/A 20M. Several of those that are considered suitable for use with this specification are listed by title. Other tests may be performed by agreement between the supplier and the purchaser.

S1. Vacuum Treatment,

S2. Product Analysis,

**S3. Simulated Post-Weld Heat Treatment of
Mechanical Test Coupons,**

S5. Charpy V-Notch Impact Test,

S7. High-Temperature Tension Test,

S8. Ultrasonic Examination,

S9. Magnetic Particle Examination

SPECIFICATION FOR CARBON STEEL FORGINGS FOR PIPING COMPONENTS WITH INHERENT NOTCH TOUGHNESS

SA-727/SA-727M

[Identical with ASTM Specification A 727/A 727M-02(R07).]

1. Scope

1.1 This specification covers forged carbon steel piping components intended primarily for service in pressure piping systems from -20 to $+650$ °F [-30 to $+345$ °C] where inherent notch toughness is desired, but where notch toughness testing is not required. Included are forged or ring-rolled flanges, forged fittings, and valves made to specified dimensions, or to dimensional standards such as the ASME and API specifications referenced in Section 2.

1.2 This specification is limited to forgings with maximum finished section thicknesses no larger than 2 in. [51 mm].

1.3 It shall be the responsibility of the purchaser to determine whether material meeting the requirements of this specification is satisfactory for the service application.

1.4 Supplementary requirements are provided for use when additional testing or inspection is desired. These shall apply only when specified by the purchaser in the order.

NOTE 1 — There are no provisions for impact testing in this specification. When impact testing is required, refer to Specification A 350/A 350M.

1.5 This specification is expressed in both inch-pound units and in SI units. However, unless the order specifies the applicable “M” specification designation (SI units), the material shall be furnished to inch-pound units.

1.6 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification.

2. Referenced Documents

2.1 In addition to those reference documents listed in Specification A 961/A 961M, the following list of standards apply to this specification.

2.2 ASTM Standards:

- A 350/A 350M Specification for Carbon and Low-Alloy Steel Forgings, Requiring Notch Toughness Testing for Piping Components
- A 370 Test Methods and Definitions for Mechanical Testing of Steel Products
- A 788/A 788M Specification for Steel Forgings, General Requirements
- A 961/A 961M Specification for Common Requirements for Steel Flanges, Forged Fittings, Valves, and Parts for Piping Applications
- E 59 Practice for Sampling Steel and Iron for Determination of Chemical Composition

2.3 ASME Boiler and Pressure Vessel Codes:

- Section II, Material Specifications, Part C
- SFA 5.5 Low-Alloy Steel Covered Arc-Welding Electrodes
- B 16.5 Steel Pipe Flanges and Flanged Fittings
- B 16.10 Face-to-Face and End-to-End Dimensions of Ferrous Valves
- B 16.11 Forged Steel Fittings, Socket-Welding and Threaded
- B 16.30 Unfired Pressure Vessel Flange Dimensions

2.4 API Standards:

- 600 Steel Gate Valves with Flanged or Butt-Welding Ends
- 602 Compact Design Carbon Steel Gate Valves for Refinery Use
- 605 Large Diameter Carbon Steel Flanges

2.5 MSS Standard:

- MSS SP-25 Standard Marking System for Valves, Fittings, Flanges, and Unions

3. General Requirements and Ordering Information

3.1 Product furnished to this specification shall conform to the requirements of Specification A 961/A 961M, including any supplementary requirements that are indicated in the purchase order. Failure to comply with the requirements of Specification A 961/A 961M constitutes nonconformance with this specification. In case of a conflict between the requirements of this specification and Specification A 961/A 961M, this specification shall prevail.

3.2 It is the purchaser's responsibility to specify in the purchase order all ordering information necessary to purchase the needed material. Examples of such information include but are not limited to the following:

3.2.1 Additional requirements (see 15.1 and 15.2).

4. Materials and Manufacture

4.1 The steel shall be made by one or more of the following processes: open-hearth, basic-oxygen, or electric-furnace, and shall be fully killed, fine-grain practice.

4.2 Forgings shall be manufactured from ingots, blooms, billets, slabs, or bars. These items shall be forged, rolled, or strandcast.

4.3 A sufficient discard shall be made from the ingot to secure freedom from injurious piping and undue segregation.

4.4 The finished product shall be a forging as defined by the Terminology section of Specification A 788/A 788M.

5. Heat Treatment

5.1 Following plastic working, the forging manufacturer shall heat treat the forgings by normalizing, or normalizing and tempering, or quenching and tempering.

5.1.1 Normalizing — The procedure for normalizing shall consist of uniformly heating the forgings to a temperature between 1550 and 1700°F [845 and 925°C], holding a sufficient time to attain uniform temperature throughout, and cooling in still air. The forging shall be at a temperature below 1000°F [540°C] before heating for normalizing.

5.1.2 Quenching — The procedure for quenching shall consist of uniformly heating the forging to a temperature between 1550 and 1700°F [845 and 925°C], holding a sufficient time to attain uniform temperature throughout, and quenching into a suitable liquid medium. The forging shall be at a temperature below 1000°F [540°C] before heating for quenching.

5.1.3 Tempering — The procedure for tempering shall consist of reheating the forging subsequent to normalizing

or quenching to a temperature of at least 1100°F [595°C], but not above the lower transformation temperature, for 30 min/in. [30 min/25 mm] of maximum section thickness, with minimum holding time at tempering temperature not less than 30 min.

6. Chemical Composition

6.1 The steel shall conform to the requirements as to chemical composition prescribed in Table 1.

6.2 Steels to which lead has been added shall not be used.

7. Mechanical Requirements

7.1 Tension Tests:

7.1.1 Requirements — The material shall conform to requirements for tensile properties prescribed in Table 2.

7.1.1.1 The test specimen shall be obtained from a rough or finished production forging, or prolongation thereof, or it may be obtained from separately forged test blanks from the same heat of steel as the production forging. The test blank shall be reduced by forging in a manner similar to that for the products represented, shall receive approximately the same hot working and reduction, be of the same nominal thickness, and receive the same heat treatment as the finished products represented. The test material shall be treated in the same furnace at the same time as the forging it represents, subject to the requirements of 7.1.2.1.

7.1.2 Number of Tests — One tension test at room temperature shall be made for each nominal wall thickness $\pm \frac{1}{4}$ in. [± 6 mm] from each heat in each heat treatment charge.

7.1.2.1 If heat treatment is performed in either a continuous or a batch-type furnace controlled within $\pm 25^\circ\text{F}$ [$\pm 14^\circ\text{C}$] of the required heat-treatment temperature, and equipped with recording pyrometers so that complete records of heat treatment are available and if the same heat treating cycles are used on the forgings represented by the tension test, then one tension test per nominal wall thickness $\pm \frac{1}{4}$ in. [± 6 mm] from each heat shall be required, instead of one tension test per nominal wall thickness from each heat in each heat-treatment charge.

7.1.3 Test Locations and Orientations — The test specimen shall be removed from the midwall of the heaviest section of the forging or test blank.

7.1.3.1 The test specimen shall have its longitudinal axis located parallel to the direction of major working of the forging or test blank, except for flanges and rings the test specimen shall be in the tangential direction.

7.1.4 Test Method — Testing shall be performed in accordance with Test Methods and Definitions A 370 using the largest feasible of the round specimens. The gage length

for measuring elongation shall be four times the diameter of the test section.

7.2 Hardness Test:

7.2.1 Requirements — If the production forgings are liquid-quenched and tempered, hardness of the forgings shall not exceed 187 HB after heat treatment. The purchaser may verify that the requirement has been met by testing at any location on the forgings provided such testing does not render the forgings useless.

8. Heat Analysis

8.1 An analysis of each heat of steel shall be made from samples taken preferably during the pouring of the heat. The results shall conform to Table 1.

9. Product Analysis

9.1 A product analysis may be made by the purchaser on samples taken in accordance with Practice E 59. The results shall conform to Table 1.

10. Hydrostatic Test

10.1 Forgings manufactured under this specification shall be capable of passing a hydrostatic test compatible with the rating of the finished forging. Such tests shall be conducted by the forging manufacturer only when Supplementary Requirement S8 in Specification A 961/A 961M is specified.

11. Rework and Retreatment

11.1 If the results of mechanical tests do not conform to the requirements specified, the manufacturer may reheat treat the forgings represented, and shall retest to the applicable requirements.

11.2 Individually tested forgings meeting all requirements shall be acceptable.

12. Repair by Welding

12.1 Repair of defects by welding shall be permitted at the discretion of the forging manufacturer.

12.2 Repair by welding shall be made using welding procedures and welders qualified in accordance with Section IX of the ASME Boiler and Pressure Vessel Code. When forgings are heat treated after repair welding, the qualification test plates shall be subjected to the same heat treatment. The mechanical properties of the qualification test plates shall conform to Section 7.

12.3 Only electrode classifications with the -A1 designator shall be used (for example, E71T1-A1). SMAW,

GMAW, FCAW or GTAW may be used. The GMAW process is limited to either the spray transfer or pulsed arc process. The FCAW process is limited to repair of carbon or carbon-molybdenum base materials only. Electrodes shall conform to the applicable AWS A5 electrode specification.

12.4 Forgings repair welded in the normalized, normalized and tempered, or the quenched and tempered conditions shall be stress-relieved after repair welding at 1100°F [595°C] minimum, but not higher than the temperature previously used for tempering the base metal of the same forging, or shall be reheat treated in accordance with Section 5.

13. Inspection

13.1 All tests and inspections shall be made at the place of manufacture, unless otherwise agreed, except for product analysis (see 9.1).

14. Rejection and Reheating

14.1 Each forging that develops injurious defects during shop working or application shall be rejected and the manufacturer notified.

15. Certification

15.1 For forgings made to specified dimensions, when agreed to by the purchaser, and for forgings made to dimensional standards, application of identification marks as required in Section 16 shall be the certification that the forgings have been furnished in accordance with the requirements of this specification.

15.2 When test reports are required, they shall include certification that all requirements of this specification have been met. The reports shall show the results of all required tests, the heat number or manufacturer's heat identification, a description of the heat treatment used, and shall be traceable to the forging represented. The specification designation included on test reports shall include year of issue and revision letter, if any.

16. Product Marking

16.1 Identification marks consisting of the specification designation, manufacturer's name or symbol, (Note 2) the heat number or manufacturer's heat identification, size, and service rating, if applicable, shall be permanently placed on each forging in a position that will not affect the usefulness of the forging. When size does not permit complete marking, identification marks may be omitted in the sequence specified in SP-25, except that the word "steel" shall not be substituted for the specification designation. The specification number marked on the forgings need not include specification year of issue and revision letter.

NOTE 2 — For purposes of identification marking, the manufacturer is considered the organization that certifies the piping component was manufactured, sampled, and tested in accordance with this specification and the results have been determined to meet the requirements of this specification.

16.1.1 If the forgings have been quenched and tempered the letters “QT” shall be stamped on the forgings following the Specification designation.

16.1.2 Forgings repaired by welding shall be marked with the letter “W” following the specification designation.

16.2 When test reports are required, additional marks shall be used as necessary to identify the part with the test report.

16.3 Bar Coding — In addition to the requirements in 16.1 and 16.2, bar coding is acceptable as a supplemental identification method. The purchaser may specify in the order a specific bar coding system to be used. The bar coding system, if applied at the discretion of the supplier, should be consistent with one of the published industry standards for bar coding. If used on small parts, the bar code may be applied to the box or a substantially applied tag.

Reduction of area, min., %	30

^A Determined by either the 0.2% offset method or the 0.5% extension-under-load method.

SUPPLEMENTARY REQUIREMENTS

One or more of the following supplementary requirements shall be applied only when specified by the purchaser in the inquiry, contract, or order. Details of these supplementary requirements shall be agreed upon in writing by the manufacturer and purchaser. Supplementary requirements shall in no way negate any requirement of the specification.

S1. Carbon Equivalent

S1.1 The maximum carbon equivalent, based on heat analysis shall be 0.45 for forgings with a maximum section thickness of 2 in. or less, and 0.46 for forgings with a maximum section thickness of greater than 2 in.

S1.2 Determine the carbon equivalent (CE) as follows:

$$CE = C + Mn/6 + (Cr + Mo + V)/5 + (Ni + Cu)/15$$

S1.3 A lower maximum carbon equivalent may be agreed upon between the supplier and the purchaser.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR SEAMLESS, WELDED FERRITIC, AND MARTENSITIC STAINLESS STEEL PIPE

SA-731/SA-731M

(Identical with ASTM Specification A 731/A 731M-91 except for an editorial correction in Table 2.)

1. Scope

1.1 This specification covers seamless, welded ferritic, and martensitic stainless steel pipe intended for high-temperature and general corrosive service.

1.2 Most of the grades are commonly known as the straight chromium type and are characterized as being ferromagnetic.

1.3 High-chromium, ferritic alloys are highly sensitive to notch brittleness on slow cooling to ordinary temperatures. This feature should be recognized in the use of this material in the as-welded condition in sections thicker than 0.250 in. [6.3 mm].

1.4 Optional supplementary requirements are provided for pipe where a greater degree of testing is desired. These supplementary requirements call for additional tests to be made and, when desired, one or more of these may be specified in the order.

1.5 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification. The inch-pound units shall apply unless the "M" designation of this specification is specified in the order.

NOTE 1 — The dimensionless designator NPS (nominal pipe size) has been substituted in this standard for such traditional terms as "nominal diameter," "size," and "nominal size."

2. Referenced Documents

2.1 ASTM Standards:

A 530/A 530M Specification for General Requirements for Specialized Carbon and Alloy Steel Pipe

A 763 Practices for Detecting Susceptibility to Intergranular Attack in Ferritic Stainless Steels
E 340 Method for Macroetching Metals and Alloys
E 527 Practice for Numbering Metals and Alloys

2.2 ANSI Standards:

B1.20.1 Pipe Threads, General Purpose
B36.10 Welded and Seamless Wrought Steel Pipe
B35.19 Stainless Steel Pipe

3. General Requirements

3.1 Material furnished under this specification shall conform to the applicable requirements of the current edition of Specification A 530/A 530M, unless otherwise provide herein.

4. Ordering Information

4.1 Orders for material under this specification should include the following, as required, to describe the desired material adequately:

4.1.1 Quantity (feet, metres, or number of lengths).

4.1.2 Name of material (ferritic stainless steel pipe).

4.1.3 Process (seamless or welded).

4.1.4 Grade (see Table 1).

4.1.5 Size (NPS or outside diameter and schedule number or average wall thickness).

4.1.6 Length (specific or random, Section 11).

4.1.7 End finish (see Section on Ends of Specification A 530/A 530M).

4.1.8 Optional requirements (Section 10, and Supplementary Requirements S1 to S6).

4.1.9 Test report required (see Section on Certification of Specification A 530/A 530M).

4.1.10 Specification designation.

4.1.11 Special requirements.

5. Materials and Manufacture

5.1 Manufacture:

5.1.1 The pipe shall be made by the seamless or by an automatic welding process, with no addition of filler metal in the welding operation.

5.1.2 The pipe shall be pickled free from scale.

5.2 Heat Treatment — As a final heat treatment, pipe shall be heated to a temperature of 1400°F [760°C] or higher and cooled (as appropriate for the grade) to meet the requirements of this specification.

5.2.1 The martensitic Grade UNS S41500 shall be heated to a temperature of 950°F (510°C) or higher and cooled as appropriate to meet the requirements of this specification.

6. Chemical Composition

6.1 The steel shall conform to the requirements as to chemical composition prescribed in Table 1.

7. Product Analysis

7.1 At the request of the purchaser, an analysis of either one billet, one length of flat-rolled stock, or one tube shall be made from each heat. The chemical composition thus determined shall conform to the requirements specified.

7.2 The results of these analyses shall be reported to the purchaser or the purchaser's representative, and shall conform to the requirements specified in Section 6.

7.3 If the original test for product analysis fails, retests of two additional billets, lengths of flat-rolled stock, or tubes shall be made. Both retests for the elements in question shall meet the requirements of this specification; otherwise all remaining material in the heat or lot shall be rejected or, at the option of the producer, each billet or tube may be individually tested for acceptance. Billets, lengths of flat-rolled stock, or tubes that do not meet the requirements of this specification shall be rejected.

7.3.1 The lot size for the same NPS of each heat of steel shall be as follows:

NPS Designator	Lengths of Pipe in Lot
Under 2	400 or fraction thereof
2 to 5	200 or fraction thereof
6 and over	100 or fraction thereof

8. Tensile Requirements

8.1 The material shall conform to the tensile requirements prescribed in Table 2.

9. Mechanical Requirements

9.1 Transverse or Longitudinal Tension Test — The tension test shall be performed on 1% of the pipe from each lot.

NOTE 2 — The term "lot" for mechanical tests applies to all pipe of the same nominal size and wall thickness (or schedule) that is produced from the same heat of steel and subjected to the same finishing treatment: (1) in a continuous heat treatment furnace, or (2) in a batch-type, heat-treatment furnace, in which case the lot shall include only that pipe heat treated in the same batch furnace charge.

9.2 Flattening Test — For material heat treated in a batch-type furnace, flattening tests shall be made on 5% of the pipe from each heat-treated lot. For material heat treated by the continuous process, this test shall be made on a sufficient number of pipe to constitute 5% of the lot, but in no case less than two lengths of pipe.

9.3 Hydrostatic Test — Each length of finished pipe shall be subjected to the hydrostatic test.

10. Lengths

10.1 Pipe lengths shall be in accordance with the following regular practice:

10.1.1 Unless otherwise agreed upon, all sizes are generally available in a length up to 24 ft (Note 3) with the permissible range of 15 to 24 ft (Note 3). Short lengths are acceptable; however, the number and minimum length shall be agreed upon between the manufacturer and the purchaser.

NOTE 3 — This value(s) applies when the inch-pound designation of this specification is the basis of purchase. When the "M" designation of this specification is the basis of purchase, the corresponding metric value(s) shall be agreed upon between the manufacturer and purchaser.

10.1.2 If definite cut lengths are desired, the lengths required shall be specified in the order. No pipe shall be under the specified length and not more than $\frac{1}{4}$ in. [6 mm] over that specified.

10.1.3 No jointers are permitted unless otherwise specified.

11. Finish

11.1 The finished pipes shall be straight to within $\frac{3}{16}$ in. [5 mm] maximum bow in any 6 ft [2 m] as measured with a 6 ft [2 m] straight edge. Imperfections may be removed by grinding provided the outside diameter or the wall thickness are not decreased to less than that permitted, in accordance with the Section on Permissible Variations in Wall Thickness or the Table on Permissible Variations in Outside Diameter of Specification A 530/A 530M.

12. Product Marking

12.1 In addition to the marking specified in Specification A 530/A 530M, the marking shall include the manufacturer's private identifying mark and whether the material is seamless or welded.

12.2 The marking shall also include the heat number and heat-treatment lot identification. If specified in the purchase order, the marking for pipe larger than NPS 4 shall include the mass.

SUPPLEMENTARY REQUIREMENTS FOR PIPE REQUIRING SPECIAL CONSIDERATION

The supplementary requirements in Sections S1 to S6 shall not be considered unless specified in the order. Those specified in the order shall be made at the mill, unless otherwise agreed upon, and may be witnessed by the purchaser's inspector before shipment of the material.

S1. Product Analysis

S1.1 For all pipe NPS 5 and larger there shall be one product analysis made of a representative sample from one piece for each ten lengths or fraction thereof from each heat of steel.

S1.2 For pipe smaller than NPS 5 there shall be one product analysis made from ten lengths per heat of steel or from 10% of the number of lengths per heat of steel, whichever number is smaller.

S1.3 Individual lengths failing to conform to the chemical requirements specified in Section 6 shall be rejected.

S2. Transverse Tests

S2.1 There shall be one transverse tension test made from one end of 10% of the lengths furnished per heat of steel. This applies only to NPS 8 and larger.

S2.2 If a specimen from any length fails to conform to the tensile properties specified, that length shall be rejected.

S3. Flattening Test

S3.1 The flattening test shall be made on specimens from one end of each length of pipe. Crop ends may be used. If the specimen from any length fails to conform to the specified requirement, that length shall be rejected.

S4. Etching Tests

S4.1 An etching test shall be made on a transverse section from one end of each length and shall show sound, homogeneous, and reasonably uniform material, free from injurious laminations, cracks, and similar objectionable defects. An etching test in accordance with Method E 340 shall be made. If the specimen of any length shows objectionable defects, one retest shall be permitted from the same end. If this fails, the length shall be rejected. The rings for the flattening tests (Supplementary Requirement S3) may be used for etch tests either before or after flattening.

S5. Nondestructive Electric Test

S5.1 Each seamless or welded pipe shall be subjected to a nondestructive electric test as agreed upon between the manufacturer and purchaser.

S6. Intergranular Corrosion Test

S6.1 When specified in the purchase order, intergranular corrosion tests shall be run on ferritic stainless steel specimens as described in Practices A 763. The particular corrosion test to be used shall be as specified in Practices A 763.

APPENDIX

NOTE — The decimal thickness listed for the respective pipe sizes represents their nominal or average wall dimensions.

^A Schedules 5S and 10S wall thicknesses do not permit threading in accordance with the American National Standard for Pipe Threads (ANSI B1.20.1).

^B These do not conform to the American National Standard for Welded and Seamless Wrought Steel Pipe (ANSI B36.10-1975).

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR PRESSURE VESSEL PLATES, LOW-CARBON AGE-HARDENING NICKEL-COPPER- CHROMIUM-MOLYBDENUM-COLUMBIUM AND NICKEL-COPPER-MANGANESE-MOLYBDENUM- COLUMBIUM ALLOY STEEL

SA-736/SA-736M

[Identical with ASTM Specification A 736/A 736M-03(R07).]

1. Scope

1.1 This specification covers two grades of low-carbon age-hardening alloy steel plates for welded pressure vessels and piping components. The two grades are nickel-copper-chromium-molybdenum-columbium and nickel-copper-manganese-molybdenum-columbium steels.

1.2 Plates under this specification are available in three Classes, as follows:

1.2.1 Class 1—As-rolled and precipitation heat treated. Available in thicknesses of $\frac{3}{4}$ in. [20 mm] and under. Grade A, Class 1 has a minimum specified tensile strength of 90 ksi. Grade C, Class 1 has a minimum specified tensile strength of 100 ksi.

1.2.2 Class 2—Normalized and precipitation heat treated.

1.2.2.1 Available in Grade A only. Grade A has minimum specified tensile strength of 72 ksi for thinner plates and 65 and 60 ksi for thicker plates, with the minimum tensile strength dependent upon the plate thickness. The maximum thickness of Grade A, Class 2 is limited only by the capacity of the chemical composition and heat treatment to meet the specified mechanical property requirements; however, current practice usually limits the maximum thickness to 8 in. [200 mm].

1.2.3 Class 3—Quenched and precipitation heat treated.

1.2.3.1 Available as Grade A with a minimum specified tensile strength of 85 ksi for thinner plates and 75 and 70 ksi for thicker plates, with the minimum tensile strength dependent upon the plate thickness. The maximum

thickness of Grade A, Class 3 plates is limited only by the capacity of the chemical composition and heat treatment to meet the specified mechanical property requirements; however, current practice usually limits the maximum thickness to 8 in. [200 mm].

1.2.3.2 Available as Grade C with a specified minimum tensile strength of 95 ksi for plates $\frac{3}{4}$ in. [20 mm] and under in thickness and 90 ksi for plates over $\frac{3}{4}$ in. in thickness. The maximum thickness of Grade C, Class 3, plates is 2 in. [50 mm].

1.3 This specification is expressed in both inch-pound units and in SI units. However, unless the order specifies the applicable “M” specification designation (SI units), the material shall be furnished in inch-pound units.

1.4 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents. Therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with this specification.

2. Referenced Documents

2.1 ASTM Standards:

- A 20/A 20M Specification for General Requirements for Steel Plates for Pressure Vessels
- A 435/A 435M Specification for Straight-Beam Ultrasonic Examination of Steel Plates
- A 577/A 577M Specification for Ultrasonic Angle-Beam Examination of Steel Plates

A 578/A 578M Specification for Straight-Beam Ultrasonic Examination of Plain and Clad Steel Plates for Special Applications

3. General Requirements and Ordering Information

3.1 Plates supplied to this product specification shall conform to the requirements of Specification A 20/A 20M, which outlines the testing and retesting methods and procedures, permissible variations in dimensions and mass, quality and repair of defects, marking, loading, and so forth.

3.2 Specification A 20/A 20M also establishes the rules for ordering information that should be complied with when purchasing plates to this specification.

3.3 In addition to the basic requirements of this specification, certain supplementary requirements are available where additional control, testing, or examination is required to meet end use requirements.

3.4 The purchaser is referred to the listed supplementary requirements in this specification and to the detailed requirements in Specification A 20/A 20M.

3.5 Coils are excluded from qualification to this specification until they are processed into finished plates. Plates produced from coil means plates that have been cut to individual lengths from coil. The processor directly controls, or is responsible for, the operations involved in the processing of coils into finished plates. Such operations include decoiling, leveling, cutting to length, testing, inspection, conditioning, heat treatment (if applicable), packaging, marking, loading for shipment, and certification.

NOTE 1: For plates produced from coil and furnished without heat treatment or with stress relieving only, three test results are reported for each qualifying coil. Additional requirements regarding plates from coil are described in Specification A 20/A 20M.

3.6 If the requirements of this specification are in conflict with the requirements of Specification A 20/A 20M, the requirements of this specification shall prevail.

4. Materials and Manufacture

4.1 The steel shall be killed and shall conform to the fine austenitic grain size requirement of Specification A 20/A 20M.

5. Heat Treatment

5.1 Class 1—The plates shall be precipitation heat treated at a temperature in the range from 1000 to 1300

°F [540 to 705 °C] for a time to be determined by the manufacturer or processor.

5.2 Class 2—The plates shall be normalized at a temperature in the range from 1600 to 1700°F [870 to 930°C] and then precipitation heat treated at a temperature in the range from 1000 to 1300°F [540 to 705°C] for a time to be determined by the manufacturer or processor.

5.3 Class 3—The plates shall be quenched in a liquid medium from a temperature in the range from 1600 to 1700°F [870 to 930°C] and then precipitation heat treated at a temperature in the range from 1000 to 1300°F [540 to 705°C] for a time to be determined by the manufacturer or processor.

5.4 If the purchaser elects to perform the thermal treatment, the plates shall be accepted on the basis of mill tests made from test coupons heat treated as specified in the purchase order. If the test coupon heat treatment requirements are not specified in the purchase order, the manufacturer or processor shall heat treat the test coupons under conditions it considers appropriate. The manufacturer or processor shall inform the purchaser of the procedure followed in thermally treating the test coupons at the mill.

6. Chemical Composition

6.1 The steel shall conform to the requirements as to chemical composition given in Table 1.

7. Mechanical Properties

7.1 Tension Test:

7.1.1 The plates, as represented by the test specimens, shall conform to the requirements given in Table 2.

7.1.2 For nominal plate thicknesses of $\frac{3}{4}$ in. [20 mm] and under, the $1\frac{1}{2}$ in. [40 mm] wide rectangular test specimen may be used for the tension test, and the elongation may be determined in a 2 in. [50 mm] gage length that includes the fracture and shows the greatest elongation.

7.2 Notch-Toughness Test:

7.2.1 Charpy V-notch impact tests shall be made in accordance with Specification A 20/A 20M.

7.2.2 The test results of 10 by 10-mm specimens shall meet an average minimum value of 20 ft·lbf [27 J] at −50 °F [−45 °C].

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR PRESSURE VESSEL PLATES, HIGH-STRENGTH, LOW-ALLOY STEEL

SA-737/SA-737M

[Identical with ASTM Specification A 737/A 737M-99(R04).]

1. Scope

1.1 This specification covers high-strength low-alloy steel plates for service in welded pressure vessels and piping components.

1.2 This material is particularly intended for piping and pressure vessel applications where high strength and improved toughness are required.

1.3 Two grades, designated B and C, are covered by this specification. Grade B provides a minimum yield strength of 50 ksi [345 MPa]. Grade C provides a minimum yield strength of 60 ksi [415 MPa].

1.4 The maximum thickness of plates is limited only by the capacity of the chemical composition and heat treatment to meet the specified mechanical property requirements. Individual manufacturers should be consulted on thickness limitations since current industry limitations have not been ascertained to date.

1.5 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification.

2. Referenced Documents

2.1 ASTM Standards:

- A 20/A 20M Specification for General Requirements for Steel Plates for Pressure Vessels
- A 435/A 435M Specification for Straight-Beam Ultrasonic Examination of Steel Plates
- A 577/A 577M Specification for Ultrasonic Angle-Beam Examination of Steel Plates
- A 578/A 578M Specification for Straight-Beam Ultrasonic Examination of Plain and Clad Steel Plates for Special Applications

3. General Requirements and Ordering Information

3.1 Material supplied to this specification shall conform to the requirements of Specification A 20/A 20M. These requirements outline the testing and retesting methods and procedures, permissible variations in dimensions and mass, quality, repair of defects, marking, loading, etc.

3.2 Specification A 20/A 20M also establishes the rules for compliance to the ordering information when purchasing material to this specification.

3.3 Certain supplementary requirements considered suitable for use with this specification are listed at the end of the specification. These include some of the standardized supplementary requirements listed in Specification A 20/A 20M as well as additional ones unique to this specification.

4. Manufacture

4.1 Steelmaking Practice—The steel shall be killed and shall conform to the fine austenitic grain size requirement of Specification A 20/A 20M.

5. Heat Treatment

5.1 The material shall be normalized by heating to a suitable temperature which produces an austenitic structure, but not exceeding 1700°F [925°C], holding a sufficient time to attain uniform heat throughout the material, and cooling in air.

5.2 If approved by the purchaser, cooling rates faster than air cooling are permitted for improvement of strength or toughness, provided the plates are subsequently tempered in the temperature range from 1100 to 1300°F [595 to 705°C].

5.3 If the purchaser elects to perform the required heat treatment, the material shall be accepted on the basis of mill tests made from test coupons heat treated in accordance with the purchase order requirements. If the test coupon heat-treatment requirements are not indicated on the purchase order, the manufacturer shall heat treat the test coupons under conditions he considers appropriate. The manufacturer shall inform the purchaser of the heat-treatment procedure followed in heat treating the test coupon at the mill.

6. Chemical Requirements

6.1 The steel shall conform to the requirements as to chemical composition prescribed in Table 1 unless otherwise modified in accordance with Supplementary Require-

ment S17, Vacuum Carbon-Deoxidized Steel, in Specification A 20/A 20M.

7. Mechanical Requirements

7.1 Tension Tests—The material as represented by the tension test specimens shall conform to the requirements shown in Table 2.

7.1.1 For nominal plate thicknesses of $\frac{3}{4}$ in. [20 mm] and under, when requirements for elongation in 2 in. [50 mm] are to be determined, the $1\frac{1}{2}$ in. [40 mm] wide rectangular specimen may be used for the tension test, and the elongation may be determined in a 2 in. [50 mm] gage length that includes the fracture and that shows the greatest elongation.

TABLE 1
CHEMICAL REQUIREMENTS

Element	Composition, %			
	Grade B		Grade C	
	Heat	Product	Heat	Product
Carbon, max	0.20	0.22	0.22	0.24
Manganese	1.15–1.50 (A)	1.07–1.62 (A)	1.15–1.50	1.07–1.62
Phosphorus, max	0.035	0.035	0.035	0.035
Sulfur, max	0.030	0.035	0.030	0.035
Silicon	0.15–0.50	0.10–0.55	0.15–0.50	0.10–0.55

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR PRESSURE VESSEL PLATES, HEAT-TREATED, CARBON-MANGANESE-SILICON STEEL, FOR MODERATE AND LOWER TEMPERATURE SERVICE

SA-738/SA-738M

(Identical with ASTM Specification A 738/A 738M-03a except for a revision to 1.3 to include a maximum thickness for Grades D and E, an editorial revision to Table 2 and editorially correcting the SI temperatures in Appendix X1.)

1. Scope

1.1 This specification covers heat-treated carbon-manganese-silicon steel plates intended for use in welded pressure vessels at moderate and lower temperature service.

1.2 Material under this specification is available in four strength levels, 75 ksi [515 MPa], 85 ksi [585 MPa], 80 ksi [550 MPa], and 90 ksi [620 MPa] minimum ultimate tensile strengths.

1.3 The maximum thickness of plates is limited only by the capacity of the chemical composition and heat treatment to meet the specified mechanical property requirements; however, current practice normally limits the maximum thickness of plates furnished under this specification to 6 in. [150 mm] for Grade A, 4 in. [100 mm] for Grade B, and 6 in. [150 mm] for Grade C, and 1.5 in. [40 mm] for Grades D and E except for Grades D and E, the permitted nominal maximum thickness is 1.5 in. [40 mm].

1.4 Grade A is the material that, prior to 1984, was covered by Specification A 738 without a grade designation.

1.5 The values stated in either inch-pound units or SI units are to be regarded separately as standards. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification.

2. Referenced Document

2.1 *ASTM Standard:*

A 20/A 20M Specification for General Requirements for Steel Plates for Pressure Vessels

3. General Requirements and Ordering Information

3.1 Material supplied to this specification shall conform to the requirements of Specification A 20/A 20M. These requirements outline the testing and retesting methods and procedures, permissible variations in dimensions and mass, quality, repair of defects, marking, loading, etc.

3.2 Specification A 20/A 20M also establishes the rules for compliance to the ordering information when purchasing material to this specification.

3.3 Certain supplementary requirements considered suitable for use with this specification are listed at the end of the specification. These include some of the standardized supplementary requirements listed in Specification A 20/A 20M as well as additional ones unique to this specification.

4. Manufacture

4.1 *Steelmaking Practice* — The steel shall be killed and shall conform to the fine austenitic grain size requirement of Specification A 20/A 20M.

5. Heat Treatment

5.1 Grade A plates 2.5 in. [65 mm] and under in thickness shall be supplied in either the normalized or quenched and tempered condition.

5.2 Grade A plates over 2.5 in. [65 mm] in thickness and Grade B, Grade C, Grade D, and Grade E plates in all thicknesses shall be quenched-and-tempered.

5.3 When plates are tempered, the minimum tempering temperature shall be 1100°F [595°C].

6. Chemical Requirements

6.1 The steel shall conform to the chemical requirements shown in Table 1 unless otherwise modified in accordance with Supplementary Requirement S17, Vacuum Carbon-Deoxidized Steel in Specification A 20/A 20M.

7. Mechanical Requirements

7.1 Tension Test Requirements — The plates as represented by the tension test specimens shall conform to the requirements of Table 2.

7.1.1 For nominal plate thicknesses of $\frac{3}{4}$ in. [20 mm] and under, the 1.5 in. [40 mm] wide rectangular specimen may be used for the tension test and the elongation may be determined in a 2 in. [50 mm] gage length that includes the fracture and shows the greatest elongation.

8. Keywords

8.1 pressure-containing parts; pressure vessel steel; steel plates; steel plates for pressure vessel applications

SUPPLEMENTARY REQUIREMENTS

Supplementary requirements shall not apply unless specified in the purchase order. A list of standardized supplementary requirements for use at the option of the purchaser is included in Specification A 20/A 20M. Several of those considered suitable for use with this specification are listed by title. Other tests may be performed by agreement between the supplier and the purchaser.

APPENDIX

(Nonmandatory Information)

X1. CHARPY V-NOTCH IMPACT TEST

X1.1 The energy values below are shown only for information as to the guarantees that are generally available. Mandatory conformance to any of the values listed is a matter of agreement between the purchaser and the manufacturer.

X1.1.1 *Longitudinal* — 20 ft·lbf [27 J] at −50°F [−45°C].

X1.1.2 *Transverse* — 20 ft·lbf [27 J] at −20°F [−30°C].

SPECIFICATION FOR STEEL BARS, ALLOY, HOT-WROUGHT, FOR ELEVATED TEMPERATURE OR PRESSURE-CONTAINING PARTS, OR BOTH

SA-739

[Identical with ASTM Specification A 739-90a(R06).]

1. Scope

1.1 This specification covers hot-wrought, ferritic alloy steel bars for elevated temperature or pressure-containing parts suitable for fusion welding or both.

1.2 The bars are furnished in the following grades:

Grade B 11 1.25% chromium, 0.55% molybdenum
Grade B 22: 2.25% chromium, 1.00% molybdenum

1.3 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are for information only.

2. Referenced Documents

2.1 *ASTM Standards:*

A 29/A 29M Specification for Steel Bars, Carbon and Alloy, Hot-Wrought and Cold-Finished, General Requirements for
A 370 Test Methods and Definitions for Mechanical Testing of Steel Products

3. Ordering Information

3.1 Orders for material under this specification should include the following information:

3.1.1 Quantity (weight or number of pieces).

3.1.2 Name of material (ferritic alloy steel bars).

3.1.3 Condition (hot wrought, normalized and tempered, machine straightened and descaled).

3.1.4 Dimensions (cross-sectional shape, size, and length).

3.1.5 ASTM designation and date of issue.

3.1.6 Grade (Table 1).

3.1.7 Additions to the specification.

3.1.8 End use.

NOTE 1 — A typical description is as follows: 10 000 lb, Ferritic Alloy Steel Bars, Hot Wrought Normalized and Tempered, and Descaled, 1.000 in. diameter by 10 ft, ASTM A 739 dated _____, Grade B 11, Special Straightened, Special Machined Fittings.

4. General Requirements

4.1 Material furnished under this specification shall conform to the applicable requirements of the current edition of Specification A 29/A 29M.

5. Materials and Manufacture

5.1 *Melting Practice* — The steel shall be made by one or more of the following primary processes: open-hearth, basic-oxygen, or electric-furnace. The primary melting may incorporate separate degassing or refining and may be followed by secondary melting using electroslag remelting or vacuum arc remelting. Where secondary melting is employed, the heat shall be defined as all of the ingots remelted from a single primary heat.

5.2 *Condition* — Unless otherwise specified, bars shall be hot wrought, heat treated, and descaled.

5.3 *Heat Treatment:*

5.3.1 The bars shall be normalized and tempered.

5.3.2 Austenitizing temperature shall be within the range from 1700 to 1800°F (927 to 982°C).

5.3.3 Cooling from the austenitizing temperature may be accomplished by cooling in still air or moving air, at the producer's option. When permitted by the purchaser, cooling from the austenitizing temperature may be accelerated by spray or liquid quenching.

5.3.4 The minimum tempering temperature shall be 1200°F (649°C) for Grade B 11 and 1250°F (677°C) for Grade B 22.

6. Chemical Composition

6.1 The heat analysis shall conform to the limits for chemical composition specified in Table 1 for the grade ordered.

7. Mechanical Properties

7.1 Tensile Requirements — The bars as represented by the test specimens shall conform to the tensile requirements specified in Table 2.

7.2 Specimens — Tension test specimens shall be taken longitudinally and machined from the locations specified in Test Methods and Definitions A 370.

7.3 Number of Tests:

7.3.1 Two tension tests shall be made to represent bars of the same size from each heat in each heat treatment charge. For continuous heat-treated material, not fewer than two tension tests shall represent a lot selected on the basis of one tension test from each 10 000 lb (4500 kg).

7.3.2 When heat treated without interruption in continuous furnaces, the material in a lot shall be from the same heat, same prior condition, same size, and subjected to the same heat treatments.

7.4 Test Methods — Tension tests shall be made in accordance with Test Methods and Definitions A 370. The yield strength shall be determined by the 0.2% offset method.

8. Workmanship, Finish, and Appearance

8.1 Workmanship — The bars shall be free of pipe, cracks, and flakes. Within the limits of good manufacturing

and inspection practices the bars shall be free of injurious seams, laps, segregation, or other imperfections which, due to their nature, degree or extent, will interfere with the use of the material in machining or fabrication.

8.2 Descaling — Unless otherwise specified, the bars shall be descaled.

9. Certification and Test Reports

9.1 A manufacturer's certification that the material was manufactured and tested in accordance with this specification together with a report of the analysis and tension test results shall be furnished at the time of shipment. The report shall include the name of the manufacturer, ASTM designation number and year date and revision letter, if any, grade, heat number, and size.

10. Product Marking

10.1 The bars shall be marked in accordance with Specification A 29/A 29M except as modified or supplemented by 10.2 through 10.4 of this specification.

10.2 When specified by the purchaser, the heat number shall be permanently stamped on one end of each bar 2.50 in. and larger in nominal diameter (or equivalent cross-sectional area).

10.3 The bars shall neither be hot nor cold stamped on the sides unless approved by the purchaser on the purchase order.

10.4 Each lift, regardless of size, shall be tagged with the information required by Specification A 29/A 29M.

11. Keywords

11.1 alloy steel bars; high-temperature applications; hot-wrought steel bars; pressure-containing parts; steel bars; temperature service application — high.

INTENTIONALLY LEFT BLANK

PRACTICE FOR ULTRASONIC EXAMINATION OF AUSTENITIC STEEL FORGINGS

SA-745/SA-745M

[Identical with ASTM Specification A 745/A 745M-94(R09) except for the deletion of para. 1.5.]

1. Scope

1.1 This practice covers the standards and procedures for the contact, pulse-echo ultrasonic examination of austenitic steel forgings by the straight or angle beam techniques, or both.

1.2 This practice shall be used whenever the inquiry, proposal, contract, order, or specification states that austenitic steel forgings are to be subject to ultrasonic examination in accordance with Practice A 745/A 745M. Ultrasonic examination of nonmagnetic retaining ring forgings should be made to Practice A 531, not to this practice.

1.3 The values stated in either inch-pound or SI units are to be regarded as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the practice.

1.4 This practice and the applicable material specifications are expressed in both inch-pound units and SI units. However, unless the order specifies the applicable "M" specification designation (SI units), the material shall be furnished to inch-pound units.

1.5 DELETED

2. Referenced Documents

2.1 ASTM Standards:

- A 531 Practice for Ultrasonic Inspection of Turbine-Generator Steel Retaining Rings
- E 317 Practice for Evaluating Performance Characteristics of Ultrasonic Pulse-Echo Testing Systems Without the Use of Electronic Measurement Instruments
- E 428 Practice for Fabrication and Control of Steel Reference Blocks Used in Ultrasonic Inspection

2.2 American Society for Nondestructive Testing Document:

SNT-TC-1A Recommended Practice for Non-destructive Personnel Qualification and Certification

3. Ordering Information

3.1 When this practice is to be applied to an inquiry or purchase order, the purchaser shall furnish the following information:

3.1.1 Quality level of examination (see Section 12).

3.1.2 Additional requirements to this practice.

3.1.3 Applicability of supplementary requirements (see Supplementary Requirements section).

3.2 When specified, the manufacturer shall submit an examination procedure for purchaser approval that shall include, but not be limited to a sketch of the configuration as presented for ultrasonic examination showing the surfaces to be scanned, scanning directions, notch locations and sizes (if applicable), extent of coverage (if applicable), and an instruction listing calibration and inspection details and stage of manufacture.

4. Apparatus

4.1 An electronic, pulsed, reflection type of instrument shall be used for this examination. The system shall have a minimum capability for operating at frequencies from 0.5 to 5.0 MHz. Either video or r-f presentation is acceptable.

4.2 The ultrasonic instrument shall provide linear presentation (within $\pm 5\%$ of the signal height) for at least 75% of the screen height (sweep line to top of screen). This 5% linearity is descriptive of the screen presentation of amplitude. Instrument linearity shall be verified in accordance with the intent of Practice E 317.

4.3 Instruments with incremental gain control (accurate over its useful range to $\pm 10\%$ of the nominal attenuation ratio) shall be used when possible to allow measurement of signals beyond the linear display range of the instrument.

4.4 Search Units:

4.4.1 Search units having transducers of either quartz or other piezoelectric materials may be employed.

4.4.2 The maximum nominal active area of $1\frac{1}{2}$ in.² [970 mm²] with $\frac{1}{2}$ in. [13 mm] minimum to $1\frac{1}{8}$ in. [30 mm] maximum dimensions or $\frac{3}{4}$ in. [20 mm] diameter minimum dimension shall be used for straight-beam scanning.

4.4.3 Angle-beam scanning transducers shall have a nominal active area of $\frac{1}{2}$ to 1 in.² [325 to 650 mm²]. The search unit used for angle-beam examination shall produce a beam angle of 30 to 70° in the material.

4.4.4 Other search units, including frequencies other than those listed in Section 8, may be used for evaluating and pinpointing indications of discontinuities.

4.5 Couplant — A suitable couplant having good wetting characteristics shall be used between the transducer and the examination surface. The same couplant shall be used for calibration and examination.

4.6 Reference Blocks:

4.6.1 All ultrasonic standard reference blocks shall be in accordance with the general guidelines of Practice E 428. However, absolute conformance to Practice E 428 is not mandatory due to the nature of the material covered by this practice.

4.6.2 The reference block grain size, as measured by the relative acoustic penetrability of the reference blocks, should be reasonably similar to the forging under examination. However, it must be recognized that large austenitic forgings vary considerably in acoustic penetrability throughout their volume due to variations in grain size and structure. Reference blocks should be chosen that reasonably approximate the average penetrability of the forging under examination. Supplementary blocks of coarser or finer grain may be used for evaluation of indications as covered in Section 11.

4.6.3 As an alternative method, where practicable, the appropriate size of reference hole (or holes) or notches may be placed in representative areas of the forging for calibration and examination purposes when removed by subsequent machining. When holes or notches are not removed by subsequent machining, the purchaser must approve the location of holes or notches.

5. Personnel Requirements

5.1 Personnel performing the ultrasonic examinations to this practice shall be qualified and certified in accordance

with a written procedure conforming to Recommended Practice No. SNT-TC-1A or another national standard that is acceptable to both the purchaser and the supplier.

6. Forging Conditions

6.1 Forgings shall be ultrasonically examined after heat treating.

6.2 The surfaces of the forging to be examined shall be free of extraneous material such as loose scale, paint, dirt, etc.

6.3 The surface roughness of scanning surfaces shall not exceed 250 μ in. [6 μ m] unless otherwise stated in the order or contract.

6.4 The forgings shall be machined to a simple configuration, that is, rectangular or parallel or concentric surfaces where complete volumetric coverage can be obtained.

6.5 In certain cases, such as with contour forged parts, it may be impractical to assure 100% volumetric coverage. Such forgings shall be examined to the maximum extent possible. A procedure indicating the extent of examination coverage shall be submitted for the purchaser's approval (see 3.2).

7. Procedure

7.1 Perform the ultrasonic examination after heat treatment when the forging is machined to the ultrasonic configuration but prior to drilling holes, cutting keyways, tapers, grooves, or machining sections to final contour.

7.2 To ensure complete coverage of the forging volume when scanning, index the search unit with at least 15% overlap with each pass.

7.3 The scanning rate shall not exceed 6 in. [150 mm]/s.

7.4 Scan all regions of the forging in at least two perpendicular directions to the maximum extent possible.

7.5 Scan disk and disk-type forgings using a straight beam from at least one flat face and radially from the circumference when practicable. For the purposes of this practice, a disk is a cylindrical shape where the diameter dimension exceeds the height dimension. Disk-type forgings made as upset-forged "pancakes" shall be classified as disks for inspection purposes although at the time of inspection, the part may have a center hole, counterturned steps, or other detail configuration.

7.6 Scan cylindrical sections, ring and hollow forgings from the entire external surface (sides or circumference), using the straight-beam technique, and scan the forging in the axial direction to the extent possible. When the length divided by the diameter ratio (slenderness ratio) exceeds

6 to 1 (or axial length exceeds 24 in. [600 mm]), scan axially from both end surfaces to the extent possible. If axial penetration is not possible due to attenuation, angle-beam examination directed axially may be substituted in place of axial straight beam. Examine ring and hollow forgings having an outside-diameter to inside-diameter ratio of less than 2 to 1 and a wall thickness less than 8 in. [200 mm] by angle-beam techniques from the outside diameter or inside diameter, or both, using full node or half-node technique (see 10.1.2 and 10.1.3) as necessary to achieve either 100% volumetric coverage or the extent of coverage defined by an approved procedure (see 3.2).

8. Examination Frequency

8.1 Perform all ultrasonic examination at the highest frequency practicable (as specified in 8.1.1, 8.1.2, or 8.1.3) that will adequately penetrate the forging thickness and resolve the applicable reference standard. Include in the ultrasonic examination report the examination frequency used. Determine the test frequency at the time of actual examination by the following guidelines:

8.1.1 The nominal test frequency shall be 2.25 MHz. Use of this frequency will generally be restricted due to attenuation.

8.1.2 One megahertz is acceptable and will be the frequency generally applicable.

8.1.3 When necessary, due to attenuation, 0.5 MHz examination frequency may be used. The purchaser may request notification before this lower frequency is employed.

8.1.4 In the event that adequate penetration of certain regions is not possible even at 0.5 MHz, alternative nondestructive examination methods (such as radiography) may be employed to ensure the soundness of the forging by agreement between the purchaser and the manufacturer.

9. Straight-Beam Examination

9.1 Method of Calibration:

9.1.1 Perform calibration for straight-beam examination on the flat-bottom hole size determined by the applicable quality level (see Section 12).

9.1.2 Determine the calibration method by the test metal distance involved.

9.1.2.1 Thicknesses up to 6 in. [150 mm] may be examined using either the single-block or the distance-amplitude curve calibration method.

(a) *Single-Block Method* — Establish the test sensitivity on the reference standard representing the forging thickness. Drill flat-bottom holes normal to the examining surface, to midsection in material up to 1.5 in. [40 mm] in

thickness and at least 0.75 in. [20 mm] in depth but no deeper than midsection in thicknesses from 1.5 to 6 in. [40 to 150 mm]. Make evaluations of indications at the estimated discontinuity depth at which they are observed using supplementary reference standards, if necessary.

(b) *Distance-Amplitude-Curve Correction Method* — Establish the test sensitivity on the reference standard whose metal travel distance represents the greater metal travel distance of the part under examination, within ± 1 in. [25 mm].

9.1.2.2 Examine thicknesses from 6 to 24 in. [150 to 600 mm] using the distance-amplitude calibration method. Calibration to $\frac{1}{2}$ thickness test metal distance may be used provided examinations from two opposing surfaces are made.

9.1.2.3 For metal travel distances over 24 in. [600 mm], perform one of the following examinations:

(a) Perform a back-reflection examination from at least one surface to QL-5 (see 12.1.1) or to a purchaser-approved procedure (see 3.2).

(b) On hollow-round forgings with wall thicknesses less than 8 in. [200 mm], perform an axial angle-beam scan in place of the straight-beam scan from the end surfaces. Calibration for this scan may be established on the existing axial notches required for the circumferential scan or on transverse oriented notches installed specifically for axial angle beam.

9.2 Calibration Procedure — Over an indication-free area of the forging and with the proper test frequency, adjust the amplitude of the back reflection to the maximum limit of vertical linearity of the instrument. The adjusted instrument sensitivity display shall be the primary calibration reference for both the single-block and multiple-block calibration methods. If, at this gain setting, the amplitude response from the flat-bottom hole in the longest calibration block is not equal to or greater than 0.5 in. [13 mm] sweep-to-peak, adjust the instrument gain further to obtain a 0.5 in. [13 mm] sweep-to-peak minimum response. To complete the distance-amplitude correction curve, determine the remaining points defining the shape of the curve at this adjusted gain setting and mark the curve on the shield of the cathode ray tube or plot on a graph. At least three blocks shall be used with test metal distances of 3 in. [75 mm] $\frac{1}{2} T$, and T . However, the distance between any of the test blocks shall be $1\frac{1}{2}$ in. [40 mm] minimum. If indications closer than 3 in. [75 mm] from the initial pulse must be evaluated, an additional block with $1\frac{1}{2}$ in. [40 mm] test metal distance shall be used. This is the fixed reference against which all indications shall be evaluated at the maximum obtainable response at whatever depth the indications are observed. This will constitute an acceptable examination if there are no indications exceeding the acceptance limits. In large forgings, it is expected that a portion of

the distance-amplitude curve will be above the vertical linearity limits of the instrument. If an indication appears in this area, readjust the instrument through the use of a calibrated gain control or through recalibration to the initial calibration level to bring the appropriate portion of the presentation on screen for evaluation of that specific area.

NOTE 1 — When flat surfaced reference block calibration is used for examination of forgings with surface curvature, compensation for curvature shall be made and the method for curvature correction shall be a matter of agreement between the producer and the purchaser. For diameters 80 in. [2000 mm] and over, no correction factor is required.

10. Angle-Beam Examination

10.1 Ring and hollow round forgings, as defined in 7.6, shall be angle-beam examined from their outer periphery in both circumferential directions employing the following method of calibration:

10.1.1 Notches of 1.25 in. [30 mm] maximum surface length, with the length perpendicular to sound propagation; depth based on quality level (Section 12), either rectangular with a width not greater than twice its depth or 60° minimum to 75° maximum included angle, located in the forging so as to produce no interference with each other, shall be used as calibration standards.

10.1.2 Determine the response from the inside and outside diameter calibration notches with the search unit positioned to produce the maximum response from each notch. Adjust the sensitivity of the ultrasonic equipment so that the indication from the notch at the greatest test metal distance is at least 0.5 in. [13 mm] sweep-to-peak. Draw a straight line connecting the peaks of the responses obtained from the inside and outside diameter notches. This shall be the primary reference line. This procedure is considered full node calibration.

10.1.3 In the event that a response of at least 0.5 in. [13 mm] sweep-to-peak cannot be obtained from both the inside and outside diameter notches, calibrate from both the outer periphery (the outside diameter surface) and the inside diameter surface. Adjust the sensitivity of the ultrasonic equipment so that the indication from the notch in the opposite surface is at least 0.5 in. [13 mm] sweep-to-peak in magnitude. This procedure is considered half-node calibration. Axial angle beam may be substituted for straight beam from the end surfaces, when specified.

NOTE 2 — Long cylinders or cylinders with small inside diameters are difficult to examine from the inside diameter surface. Normally, neither inside diameters smaller than 18 in. [450 mm] nor long cylinders exceeding 36 in. [900 mm] in length are scanned from the inside diameter surface.

11. Evaluation of Material

11.1 Coarse-grained austenitic materials frequently display sweep noise, particularly when an examination is

performed at high sensitivities. For this reason, it is important to critically scrutinize reportable and rejectable indications to determine whether they result from defects or grain structure. It is desirable to have several sets of calibration blocks with varying degrees of grain coarseness so that the attenuation of the defective area can be reasonably matched with a test block for a more accurate minimum defect size estimation. Due to the normal wide variation in attenuation throughout a given large austenitic forging, it is permissible to evaluate rejectable indications on the basis of alternative calibration blocks that compare more reasonably in attenuation to the defect area. It is also permissible to insert reference holes into representative areas of the forging itself, with the approval of the purchaser, to be used for calibration and evaluation of indications. Loss of back reflection results not only from internal discontinuities but also from coarse or nonuniform grain structures, variations in coupling, nonparallel reflecting surfaces, and other factors that must be considered before concluding that loss of back reflection resulted from discontinuities.

12. Quality Levels for Acceptance

12.1 One of the following quality levels may be specified by the purchaser:

12.1.1 Straight Beam:

12.1.1.1 Material producing an indication response whose maximized amplitude equals or exceeds 100% of the primary reference or distance-amplitude correction curve at the estimated discontinuity depth shall be considered unacceptable.

(a) *QL-1* — A distance-amplitude curve shall be based upon the amplitude response from No. 8 flat-bottom hole ($\frac{8}{64}$ in. [3 mm]).

(b) *QL-2* — A distance-amplitude curve shall be based upon the amplitude response from No. 16 flat-bottom hole ($\frac{16}{64}$ in. [6 mm]).

(c) *QL-3* — A distance-amplitude curve shall be based upon the amplitude response from No. 24 flat-bottom hole ($\frac{24}{64}$ in. [10 mm]).

(d) *QL-4* — A distance-amplitude curve shall be based upon the amplitude response from No. 32 flat-bottom hole ($\frac{32}{64}$ in. [13 mm]).

(e) *QL-5* — A back reflection examination shall be performed guaranteeing freedom from complete loss of back reflection accompanied by an indication of a discontinuity. For this purpose, a back reflection of less than 5% of full screen height shall be considered complete loss of back reflection.

12.1.1.2 The applicable quality level will necessarily vary with test metal distance, purchasers' requirements, and the type and size of forging involved. Large

disks, rings, or solid forgings and complex forgings present extraordinary problems and quality level application shall be a matter of agreement between the manufacturer and the purchaser. For general guidance purposes, the following list of test metal distances versus quality level attainable is provided for general information.

- (a) *QL-1* — Generally practical for thicknesses up to 3 in. [75 mm].
- (b) *QL-2* — Generally practical for thicknesses up to 8 in. [200 mm].
- (c) *QL-3* — Generally practical for thicknesses up to 12 in. [300 mm].
- (d) *QL-4* — Generally practical for thicknesses up to 24 in. [600 mm].
- (e) *QL-5* — Frequently practical for thicknesses over 24 in. [600 mm].

12.1.2 Angle Beam — Material producing indications with amplitudes equal to or exceeding the primary reference-acceptance line (full node calibration: see 10.1.2) at the estimated discontinuity depth observed shall be considered unacceptable. When examining with only one calibration notch (half node calibration: see 10.1.3), material containing indications of discontinuities equal to or exceeding the notch indication amplitude shall be considered unacceptable.

12.1.2.1 QA-1 Angle beam reference acceptance shall be based on a notch depth of 3% of the thickness of the forging at the time of examination.

12.1.2.2 QA-2 Angle beam reference acceptance line shall be based on a notch depth of the lesser of 5% of the thickness of the forging at the time of inspection, or $\frac{3}{4}$ in. [19.05 mm].

13. Reportable Indications

13.1 A record that shows the location and orientation of all indications or groups of indications with amplitudes as defined below shall be submitted to the purchaser for information.

13.1.1 Indications accompanied by a loss of back reflection of 75% of screen height. Similar loss in back reflection without indications shall be scanned at lower frequencies; if unsuccessful, the area shall be reported as “not inspected.”

13.1.2 Indications distinct from the normal noise level and traveling to the left or right on the cathode ray tube with movement of the transducer 1.0 in. [25 mm] or more over the surface of the forging.

13.1.3 Indications equal to or exceeding 50% of the applicable reference acceptance curve (both straight and angle beam).

14. Keywords

14.1 acceptance criteria; austenitic forgings; contact method; ultrasonic examination.

SUPPLEMENTARY REQUIREMENTS

Supplementary requirements shall apply only when specified by the purchaser in the inquiry or order. Details of these supplementary requirements shall be agreed upon between the manufacturer and the purchaser.

S1. Angle Beam Calibration Based on Final Thickness

S1.1 The depth of the calibration notch (see 12.1.2) shall be based upon the final ordered thickness of the forging rather than the thickness at the time of inspection.

SPECIFICATION FOR STEEL CASTINGS, STAINLESS, PRECIPITATION HARDENING

SA-747/SA-747M

(Identical with ASTM Specification A 747/A 747M-04 except for the revision of the mandatory ordering requirements of para. 4.1.6 and the mandatory use of Supplementary Requirement S15 of SA-781/SA-781M.)

1. Scope

1.1 This specification covers iron-chromium-nickel-copper corrosion-resistant steel castings, capable of being strengthened by precipitation hardening heat treatment.

1.2 These castings may be used in services requiring corrosion resistance and high strengths at temperatures up to 600°F [315°C]. They may be machined in the solution-annealed condition and subsequently precipitation hardened to the desired high-strength mechanical properties specified in Table S14.1 with little danger of cracking or distortion.

1.3 The material is not intended for use in the solution-annealed condition.

NOTE 1 — If the service environment in which the material is to be used is considered conducive to stress-corrosion cracking, precipitation hardening should be performed at a temperature that will minimize the susceptibility of the material to this type of attack.

1.4 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification.

E 38 Methods for Chemical Analysis of Nickel-Chromium and Nickel-Chromium-Iron Alloys

E 353 Test Methods for Chemical Analysis of Stainless, Heat-Resisting, Maraging, and Other Similar Chromium-Nickel-Iron Alloys

2.2 ASME Standard:

ASME Boiler and Pressure Vessel Code, Supplementary Requirements S6, S14, and S27

3. General Conditions for Delivery

3.1 Material furnished to this specification shall be in accordance with the requirements of Specification A 781/A 781M, including any supplementary requirements that are indicated in the purchase order. Failure to comply with the general requirements of Specification A 781/A 781M constitutes nonconformance with this specification. In case of conflict between the requirements of this specification and Specification A 781/A 781M, this specification shall prevail.

4. Ordering Information

4.1 Orders for material to this specification should include the following:

4.1.1 Specification number and grade (Table 1),

4.1.2 Heat treatment condition (SA, H900, and so forth), Table 2,

4.1.3 Drawing or pattern,

4.1.4 Options in the specification, if any, in accordance with 5.2, 6.3, and Section 7, and

4.1.5 Supplementary requirements, if any, including the standards of acceptance.

4.1.6 Supplementary Requirements S6, S14, and S27 are mandatory, together with S15 from Specification

SA-781/SA-781M, and must be specified in the purchase order,

5. Materials and Manufacture

5.1 The steel shall be made by the electric furnace process with or without separate refining such as argon-oxygen decarburization (AOD).

5.2 Heat Treatment — Castings may be given a homogenization heat treatment in accordance with 5.2.1 at the producer's option or when specified by the purchaser (see S26) prior to solution heat treatment. All castings, whether homogenized or not, shall be given a solution treatment in accordance with 5.2.2 and unless ordered in the solution-annealed condition shall be precipitation hardened to the ordered condition (Table 2).

5.2.1 Homogenization heat treatment shall consist of heating the castings and test material to a minimum of 1900°F [1040°], holding for a minimum of 1½ h, and cooling to below 90°F [30°C].

5.2.2 Solution annealing heat treatment shall consist of heating the castings and test material to 1925°F ± 50°F [1050°C ± 30°C], holding the 30 min/in. [1.2 min/mm] of section but not less than 30 min, and cooling to below 90°F [30°C].

5.2.3 Temperature used for precipitation hardening shall be maintained within the range of ± 25°F [± 15°C] of that listed in Table 2 for the heat-treatment condition ordered. (See Note 1).

5.2.4 When the order of contract specifies a minimum columbium content, the minimum precipitation hardening temperature shall be 925°F [495°C].

6. Chemical Composition

6.1 The steel shall be in accordance with the requirements as to chemical composition prescribed in Table 1.

6.2 When the H900 condition is ordered, the minimum columbium content (Table 1) shall not apply. It is recommended that columbium other than that in revert material not be added.

6.3 Methods of Analysis — Analytical procedures for nitrogen analysis are not included in Methods E 38 or Test Methods E 353, so if the contract or order specifies that the nitrogen content is to be reported, the method of analysis shall be agreed upon by purchaser and producer.

7. Repair by Welding

7.1 Repairs shall be made only in one of the following conditions: homogenized, solution annealed, H1100, H1150, H1150M, H1150DBL, or stress relieved at 1150°F ± 25°F [620°C ± 15°C] for a minimum of 4 h.

7.2 Castings welded in one of the aged conditions noted in 7.1 shall be post weld heat treated by the same aging treatment used prior to welding, or, where necessary to meet mechanical property requirements, shall be solution annealed and aged after welding. Castings welded in the stress-relieved condition shall receive the specification heat treatment after welding.

8. Keywords

8.1 precipitation hardening stainless steel; stainless steel; steel castings

^A The furnace and controls used shall be calibrated and capable of uniformity of heating in order to ensure consistent results.

^B See Note 1.

^C ±25°F [15°C].

SUPPLEMENTARY REQUIREMENTS

A list of standardized supplementary requirements for use at the option of the purchaser is described in Specification A 781/A 781M. Those that are considered suitable for use with this specification are listed below by title only. Additional supplementary requirements suitable for use with this specification at the option of the purchaser are described below. One or more of the supplementary requirements indicated below may be included in the purchaser's order or contract. When so included, a supplementary requirement shall have the same force as if it were in the body of the specification. Supplementary requirements details not fully described shall be agreed upon between the purchaser and the supplier, but shall not negate any of the requirements in the body of the specification.

S1. Magnetic Particle Examination

NOTE — When CB7CU-1 alloy is inspected by magnetic particle method, false indications may be caused by ferrite stingers or traces of retained austenite in the microstructure. Liquid penetrant methods may be used to confirm the presence or absence of a discontinuity when such indications are noted.

S2. Radiographic Examination

S3. Liquid Penetrant Examination

S5. Examination of Weld Preparation

S6. Certification

S13. Hardness Test

S13.1 Brinell hardness test shall be made from each heat-treatment load for each heat. The results shall be in accordance with the requirements in Table S14.1 and shall be reported to the purchaser or his representative.

S13.2 The test may be made on the end of the tension specimen unless the order requires it to be made on a casting, in which case, where possible, the test shall be made on a boss or extension located on the casting suitable for testing in the Brinell tester.

S13.3 The test shall be conducted in accordance with Test Methods and Definitions A 370.

S14. Tension Test

S14.1 Tensile properties shall be determined from material representing each heat. The bar from which the test specimen is taken shall be heat treated with production castings to the same procedure as the castings it represents, unless the castings are ordered in the solution-annealed condition (5.2.2). The results shall be in accordance with the requirements specified in Table S14.1 and shall be reported to the purchaser or his representative.

S14.2 When the contract or order specifies that the castings are to be furnished in the solution-annealed condition, the manufacturer shall test specimens representing the castings that have been given the precipitation heat treatment specified by the purchaser in accordance with Table 2.

S14.3 Test coupons and tests shall be made in accordance with Test Methods and Definitions A 370. Where possible, the standard 2 in. [50 mm] gage length specimens shall be used, unless the purchase order is for investment castings. Standard subsize specimens may be used when a 2 in. gage length specimen is not feasible. When subsize specimens are used, the gage length shall be four times the gage diameter. When investment castings are ordered, the specimens shall be prepared in accordance with S3.2 of Specification A 732/A 732M.

S14.4 If any test specimen shows defective machining or develops flaws, it may be discarded and another specimen substituted from the same lot. A retest shall be allowed if the percentage elongation of any tension test specimen is less than that specified in Table S14.1, or if any part of the fracture is more than $\frac{3}{4}$ in. [19 mm] from the center of a standard 2 in. [50 mm] gage length established by scribe scratches on the untested specimen.

S26. Homogenization Heat Treatment

S26.1 The homogenization heat treatment shall consist of heating the castings and test material to a minimum of 1900°F [1040°C], holding for a minimum of $1\frac{1}{2}$ h, and cooling to below 90°F [30°C].

S27. Product Marking

S27.1 The manufacturer's name or identification mark and the pattern number shall be cast or stamped on all castings except those of such small size as to make such marking impractical. To minimize small defects caused by

dislodged particles of molding sand, the number of cast identification marks should be minimized. When further specified, the heat numbers shall be marked on individual castings.

castings and the required identification then placed on a tag affixed to the container in which these castings are shipped.

S27.2 When the castings are too small to mark individually, a symbol traceable to the lot shall be placed on the

TABLE S14.1
MECHANICAL PROPERTIES

Alloy Type	PH Heat Treatment	Hardness, HB	Yield Strength 0.2% Offset, min, ksi [MPa]	Tensile Strength, ksi [MPa]	Elongation in 2 in. [51 mm], min, % ⁴

SPECIFICATION FOR STATICALLY CAST CHILLED WHITE IRON-GRAY IRON DUAL METAL ROLLS FOR PRESSURE VESSEL USE

SA-748/SA-748M

[Identical with ASTM Specification A 748/A 748M-87 (R08).]

1. Scope

1.1 This specification covers statically cast dual metal rolls with the outer layer of the roll body being chilled white iron of different chemical composition than the core and journals of the roll which is gray cast iron. The castings are suitable for pressure containing parts, the design strength of which is based on the gray iron portion of the cylinder. The castings are suitable for service at temperatures up to 450°F [232°C].

1.2 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independent of the other. Combining values from the two systems may result in nonconformance with the specification.

2. Referenced Documents

2.1 ASTM Standards:

- A 278 Specification for Gray Iron Castings for Pressure-Containing Parts for Temperatures Up to 650°F
- A 278M Specification for Gray Iron Castings for Pressure-Containing Parts for Temperatures Up to 345°C [Metric]
- A 667/A 667M Specification for Centrifugally Cast Dual Metal (Gray and White Cast Iron) Cylinders

3. Ordering Information

3.1 Orders for material under this specification shall include the following information:

- 3.1.1** ASTM designation and year of issue.
- 3.1.2** Dimensions of dual rolls.
- 3.1.3** Class of gray iron in the roll core (see 4.2).

3.1.4 Inspection requirements, if different (see 10.1).

3.1.5 Certification, if required (see 11.1).

3.1.6 Special position of marking information, if required (see 12.1).

3.2 Any additional requirements not covered in this specification are subject to agreement between the manufacturer and purchaser.

4. Materials and Manufacture

4.1 The melting procedure shall be optional with the foundry.

4.2 The chilled white iron exterior of the roll body shall be made to a minimum hardness of 60 Scleroscope "C". The gray iron portion of the roll shall conform to the applicable class of Specifications A 278 and A 278M, as determined by design requirements. The scope of this specification shall include Nos. 20, 25, 30, and 35 of Specification A 278 [Nos. 150, 175, 200, and 250 of Specification A 278M].

4.3 The casting process shall be controlled to produce a metallurgical bond between the chilled white iron exterior and gray iron interior of the roll body.

5. Test Requirements

5.1 Tensile Requirements — Tensile bars removed from a prolongation at one end of the roll journal, in accordance with Specifications A 278 and A 278M, shall have a tensile strength not less than 80% of that specified by the applicable class of Specifications A 278 and A 278M.

5.2 Thickness of Chilled White Iron:

5.2.1 The thickness of the clear chilled white iron plus the mottled iron at the roll face shall not be more than 30% of the total finished wall thickness.

5.2.2 The thickness of the chilled white iron exterior of the roll body shall be determined by measuring the chill depth at the ends of the roll face.

6. Finish

6.1 All surfaces shall be machined or ground, or both, prior to the rolls being placed into service.

7. Number of Tests

7.1 The number of tension tests shall be in accordance with Specifications A 278 and A 278M.

8. Specimen Preparation

8.1 Test bars representing the gray iron portion of the roll shall be made from a prolongation at one end of the roll journal in accordance with Specifications A 278 and A 278M. Tension test specimens machined from this prolongation shall conform to the dimensions shown for Specimen "C" in Specifications A 278 and A 278M.

9. Test Method

9.1 Tension test specimens shall fit the holders of the testing machine in such a way that the load shall be axial. The use of self-aligning shackles is suggested. After reaching a stress equivalent to 15 000 psi [100 MPa], the speed of the moving head of the testing machine shall not exceed $\frac{1}{8}$ in. [3.2 mm]/min.

10. Inspection

10.1 The inspector representing the purchaser shall have free entry at all times, while work on the contract

of the purchaser is being performed, to all parts of the manufacturer's works that concern the manufacture of the material ordered. The manufacturer shall afford the inspector all reasonable facilities to satisfy him that the material is being furnished in accordance with this specification. Unless otherwise specified, all tests and inspections shall be made at the place of manufacture prior to the shipment, and shall be so conducted as not to interfere unnecessarily with the operation of the works.

11. Acceptance and Certification

11.1 Final acceptance of the casting shall follow complete machining of the casting. Upon request of the purchaser and when so specified in the purchase order, a certification shall be made on the basis of acceptance of the material. This shall consist of a copy of the manufacturer's test report or a statement by the supplier, accompanied by a copy of the test results, that the material has been sampled, tested, and inspected in accordance with the provisions of this specification. Each certification so furnished shall be signed by an authorized agent of the supplier or manufacturer.

12. Product Marking

12.1 Pressure-containing castings made in accordance with this specification shall have the name of the manufacturer or his recognized trademark and the class of iron to which it conforms, cast or indelibly stamped on the surface indicated by the purchaser or in such a position as not to injure the usefulness of the casting.

SPECIFICATION FOR STEEL, STRIP, CARBON AND HIGH-STRENGTH, LOW-ALLOY, HOT-ROLLED, GENERAL REQUIREMENTS FOR

SA-749/SA-749M

[Identical with ASTM Specification A 749/A 749M-97(R02).]

1. Scope

1.1 This specification covers the general requirements for hot-rolled steel strip in coils and cut lengths. It applies to carbon steel and high-strength, low-alloy steel furnished as hot-rolled.

1.2 This specification is not applicable to hot-rolled heavy-thickness carbon sheet and strip coils (ASTM Specification A 635/A 635M), cold-rolled carbon steel strip (ASTM Specification A 109 or A 109M), high-strength, low-alloy coldrolled steel (ASTM Specifications A 606 and A 607) or cold-rolled carbon spring steel (ASTM Specification A 682 or A 682M).

1.3 In case of any conflict in requirements, the requirements of the individual material specification shall prevail over those of this general specification.

1.4 For the purposes of determining conformance with this and the appropriate product specification referenced under 2.1, values shall be rounded to the nearest unit in the right hand place of figures used in expressing the limiting values in accordance with the rounding method of Practice E 29.

1.5 Annex A1 lists permissible variations in dimensions and mass (Note 1) in S.I. [metric] units. The values listed are not exact conversions of the values listed in the inch-pound tables, but instead are rounded or rationalized values. Conformance to Annex A1 is mandatory when the "M" specification is used.

NOTE 1 — The term "weight" is used when inch-pound units are the standard; however, under S.I., the preferred term is "mass."

1.6 The values stated in either inch-pound units or SI units are to be regarded as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values

from the two systems may result in nonconformance with the specification.

1.7 This specification and the applicable material specifications are expressed in both inch-pound units and SI units. However, unless the order specifies the applicable "M" specification designation (SI units), the material shall be furnished to inch-pound units.

MIL-STD-163 Steel Mill Products, Preparation for Shipment and Storage

2.3 Federal Standards:

Fed. Std. No. 123 Marking for Shipments (Civil Agencies)

Fed. Std. No. 183 Continuous Identification Marking of Iron and Steel Products

3. Terminology

3.1 Definitions of Terms Specific to This Standard:

Descriptions of Terms Specific to This Standard:

3.1.1 Steel Types:

3.1.2 carbon steel — the designation for steel when no minimum content is specified or required for aluminum, chromium, cobalt, columbium, molybdenum, nickel, titanium, tungsten, vanadium, zirconium, or any element added to obtain a desired alloying effect; when the specified minimum for copper does not exceed 0.40%; or when the maximum content specified for any of the following elements does not exceed the percentages noted; manganese 1.65, silicon 0.60, or copper 0.60.

Discussion — In all carbon steels small quantities of certain residual elements unavoidably retained from raw materials are sometimes found which are not specified or required, such as copper, nickel, molybdenum, chromium, etc. These elements are considered as incidental and are not normally determined or reported.

3.1.3 high-strength, low-alloy steel — a specific group of steels in which higher strength, and in some cases additional resistance to atmospheric corrosion, are obtained by moderate amounts of one or more alloying elements.

3.1.4 Product Types:

3.1.5 hot-rolled strip — manufactured by hot rolling billets or slabs to the required thickness. It may be produced single width or by rolling multiple width and slitting to the desired width. It can be supplied in coils or cut lengths as specified.

Width, in.		Thickness, in.	
Over	Through	Over	Through
...	3½	0.044	0.203
3½	6	0.044	0.203
6	12	0.044	0.230 excl

Width, mm		Thickness, mm	
Over	Through	Over	Through
...	100	1.2	5.0
100	200	1.2	5.0
200	300	1.2	6.0, excl

Hot-rolled, high-strength, low-alloy strip is commonly available by size as follows:

Width, in.		Thickness, in.		
Over	Through	From	Through	
...	6	0.054	Coils & Cut Lengths	Coils Only
6	12	0.054	0.203	0.230 excl
			0.230	0.230 excl

Width, mm		Thickness, mm		
Over	Through	Over	Through	
...	200	1.8	5.0	
200	300	1.8	6.0, excl	

4. Materials and Manufacture

4.1 Unless otherwise specified, hot-rolled material shall be furnished hot-rolled, not annealed or pickled.

5. Chemical Composition

5.1 Limits:

5.1.1 The chemical composition shall be in accordance with the applicable product specification. However, if other compositions are required for carbon steel, they shall be prepared in accordance with Appendix X1.

5.1.2 Where the material is used for fabrication by welding, care must be exercised in the selection of chemical composition or mechanical properties to ensure compatibility with the welding process and its effect on altering the properties.

5.2 Cast or Heat (Formerly Ladle) Analysis:

5.2.1 An analysis of each cast or heat of steel shall be made by the manufacturer to determine the percentage of elements specified or restricted by the applicable specification.

5.2.2 When requested, cast or heat analysis for elements listed or required shall be reported to the purchaser or to his representative.

5.3 Product, Check, or Verification Analysis:

5.3.1 Nonkilled steels (such as capped or rimmed) are not technologically suited to product analysis due to the nonuniform character of their chemical composition and therefore, the tolerances in Table 1 do not apply. Product analysis is appropriate on these types of steel only when misapplication is apparent or for copper when copper steel is specified.

5.3.2 For steels other than nonkilled (capped or rimmed), product analysis may be made by the purchaser. The chemical analysis shall not vary from the limits specified by more than the amounts in Table 1. The several

determinations of any element in a cast shall not vary both above and below the specified range.

5.4 *Sampling for Product Analysis:*

5.4.1 To indicate adequately the representative composition of a cast by product analysis, it is general practice to select samples to represent the steel, as fairly as possible, from a minimum number of pieces as follows: 3 pieces for lots up to 15 tons inclusive, and 6 pieces for lots over 15 tons [15 Mg].

5.4.2 When the steel is subject to tension test requirements, samples for product analysis may be taken either by drilling entirely through the used tension test specimens themselves or in accordance with 5.4.3.

5.4.3 When the steel is not subject to tension test requirements, the samples for analysis must be taken by milling or drilling entirely through the strip in a sufficient number of places so that the samples are representative of the entire strip. The sampling may be facilitated by folding the strip both ways, so that several samples may be taken at one drilling. Steel subjected to certain heating operations by the purchaser may not give chemical analysis results that properly represent its original composition. Therefore, users must analyze chips taken from the steel in the condition in which it is received from the steel manufacturer.

5.5 Specimen Preparation — Drillings or chips must be taken without the application of water, oil, or other lubricant, and must be free of scale, grease, dirt, or other foreign substances. They must not be overheated during cutting to the extent of causing decarburization. Chips must be well mixed, and those too coarse to pass a No. 10 (2.00 mm) sieve or too fine to remain on a No. 30 (600 μ m) sieve are not suitable for proper analysis. Sieve size numbers are in accordance with Specification E 11.

5.6 Test Methods — In case a referee analysis is required and agreed upon to resolve a dispute concerning the results of a chemical analysis, the procedure for performing the referee analysis must be in accordance with the latest issue of Test Methods, Practices, and Terminology A 751, unless otherwise agreed upon between the manufacturer and the purchaser.

6. Mechanical Properties

6.1 The mechanical property requirements, number of specimens, test locations, and specimen orientation shall be in accordance with the applicable product specification.

6.2 Unless otherwise specified in the applicable product specification, test specimens must be prepared in accordance with Test Methods and Definitions A 370.

6.3 Mechanical tests shall be conducted in accordance with Test Methods and Definitions A 370.

6.4 Bend tests, where required, shall be conducted in compliance with Test Methods E 290.

6.5 To determine conformance with the product specification, a calculated value should be rounded to the nearest 1 ksi [7 MPa] tensile strength and yield point or yield strength, and to the nearest unit in the right hand place of figures used in expressing the limiting value for other values in accordance with the rounding off method given in Practice E 29.

6.6 Structural steels are commonly fabricated by cold bending. There are many interrelated factors that affect the ability of a given steel to cold form over a given radius under shop conditions. These factors include thickness, strength level, degree of restraint, relationship to rolling direction, chemistry, and microstructure. Each of the appropriate product specifications lists in the appendix the suggested minimum inside radius for cold bending. These radii should be used as minima for 90° bends. They presuppose “hard way” bending (bend axis parallel to rolling direction) and reasonably good shop forming practices. Where possible, the use of larger radii or “easy way” bends are recommended for improved performance.

6.7 Fabricators should be aware that cracks may initiate upon bending a sheared or burned edge. This is not considered to be a fault of the steel but is rather a function of the induced cold-work or heat-affected zone.

7. Dimensions, Tolerances, and Allowances

7.1 Dimensions, tolerances, and allowances applicable to products covered by this specification are contained in Table 2 through Table 9 [Annex A1, Tables A1.1 through A1.7]. The appropriate tolerance tables shall be identified in each individual specification.

8. Workmanship

8.1 Cut lengths shall have a workmanlike appearance and shall not have imperfections of a nature or degree for the product, the grade, and the quality ordered that will be detrimental to the fabrication of the finished part.

8.2 Coils may contain some abnormal imperfections that render a portion of the coil unusable since the inspection of coils does not afford the producer the same opportunity to remove portions containing imperfections as in the case with cut lengths.

9. Finish and Condition

9.1 Hot-rolled strip has a surface with an oxide or scale resulting from the hot-rolling operation. The oxide or scale can be removed by pickling or blast cleaning when required

for press-work operations or welding. Hot-rolled and hot-rolled descaled strip are not generally used for exposed parts where surface is of prime importance. However, hot-rolled surface might be of importance, as in the case of weathering steels for exposed parts.

9.1.1 Hot-rolled strip can be supplied with mill edges, square edges, or cut (slit) edges as specified.

9.1.1.1 Mill edges are the natural edges resulting from the hot-rolling operation and are generally round and smooth without any definite contour.

9.1.1.2 Square edges are the edges resulting from rolling through vertical edging rolls during the hot-rolling operations. These edges are square and smooth, with the corners slightly rounded.

9.1.1.3 Cut (slit) edges are the normal edges that result from the shearing, slitting, or trimming of mill edges.

9.1.2 The ends of plain hot-rolled mill-edge coils are irregular in shape and are referred to as uncropped ends. Where such ends are not acceptable, the purchaser's order should so specify. Processed coils such as pickled or blast cleaned are supplied with square-cut ends.

9.2 Oiling:

9.2.1 Plain hot-rolled strip is customarily furnished not oiled. Oiling must be specified when required

9.2.2 Hot-rolled pickled or descaled strip is customarily furnished oiled. If the product is not to be oiled, it must be so specified since the cleaned surface is prone to rusting.

10. General Requirements for Delivery

10.1 Products covered by this specification are produced to inch-pound or metric decimal thickness only.

10.2 Steel may be produced as ingot-cast or strand-cast. When different grades of strand-cast steel are sequentially cast, identification and separation of the transition material is required.

11. Retests

11.1 If any test specimen shows defective machining or develops flaws, it must be discarded and another specimen substituted.

11.2 If the percentage of elongation of any tension test specimen is less than that specified and any part of the fracture is more than [nl]P in. [20 mm] from the center of the gage length of a 2 in. [50 mm] specimen or is outside the middle half of the gage length of an 8 in. [200 mm] specimen, as indicated by scribe scratches marked on the specimen before testing, a retest is allowed.

11.3 If a bend specimen fails, due to conditions of bending more severe than required by the specification, a retest is permitted either on a duplicate specimen or on a remaining portion of the failed specimen.

12. Inspection

12.1 When the purchaser's order stipulates that inspection and test (except product analyses) for acceptance on the steel be made prior to shipment from the mill, the manufacturer shall afford the purchaser's inspector all reasonable facilities to satisfy him that the steel is being produced and furnished in accordance with the specification. Mill inspection by the purchaser shall not interfere unnecessarily with the manufacturer's operation.

13. Rejection and Rehearing

13.1 Unless otherwise specified, any rejection shall be reported to the manufacturer within a reasonable time after receipt of material by the purchaser.

13.2 Material that is reported to be defective subsequent to the acceptance at the purchaser's works shall be set aside, adequately protected, and correctly identified. The manufacturer shall be notified as soon as possible so that an investigation may be initiated.

13.3 Samples that are representative of the rejected material shall be made available to the manufacturer. In the event that the manufacturer is dissatisfied with the rejection, he may request a rehearing.

14. Test Reports and Certification

14.1 When test reports are required by the purchase order or the material specification, the supplier shall report the results of all tests required by the material specification and the order.

14.2 When certification is required by the purchase order, the supplier shall furnish a certification that the material has been manufactured and tested in accordance with the requirements of the material specification.

14.3 A signature is not required on test reports or certifications. However, the document shall clearly identify the organization submitting the document. Notwithstanding the absence of a signature, the organization submitting the document is responsible for the content of the document.

14.4 When test reports are required, copies of the original material manufacturer's test report shall be included with any subsequent test report.

14.5 A material test report, certificate of inspection, or similar document printed from or used in electronic form

from an electronic data interchange (EDI) transmission shall be regarded as having the same validity as a counterpart printed in the certifier's facility. The content of the EDI transmitted document must meet the requirements of the invoked ASTM standard(s) and conform to any existing EDI agreement between the purchaser and the supplier. Notwithstanding the absence of a signature, the organization submitting the EDI transmission is responsible for the content of the report.

NOTE 2 — The industry definition as invoked here is: EDI is the computer to computer exchange of business information in an agreed upon standard format such as ANSI ASC X12.

15. Marking

15.1 As a minimum requirement, the material shall be identified by having the manufacturer's name, ASTM designation, weight, purchaser's order number, and material identification legibly stenciled on top of each lift or shown on a tag attached to each coil or shipping unit.

15.2 When specified in the contract or order, and for direct procurement by or direct shipment to the government, marking for shipment, in addition to requirements specified in the contract or order, shall be in accordance with MIL-STD-129 for military agencies and in accordance with Fed. Std. No. 123 for civil agencies.

15.3 For Government procurement by the Defense Supply Agency, strip material shall be continuously marked

for identification in accordance with Fed. Std. No. 183.

15.4 Bar coding is acceptable as a supplementary identification method. Bar coding should be consistent with the Automotive Industry Action Group (AIAG) standard prepared by the primary metals subcommittee of the AIAG bar code project team.

16. Packaging

16.1 Unless otherwise specified, the strip shall be packaged and loaded in accordance with Practices A 700.

16.2 When specified in the contract or order, and for direct procurement by or direct shipment to the government, when Level A is specified, preservation, packaging, and packing shall be in accordance with the Level A requirements of MIL-STD-163.

16.3 When coils are ordered it is customary to specify a minimum or range of inside diameter, maximum outside diameter, and a maximum coil weight, if required. The ability of manufacturers to meet the maximum coil weights depends upon individual mill equipment. When required, minimum coil weights are subject to negotiation.

17. Keywords

17.1 carbon; steel; strip

TABLE 1
TOLERANCES FOR PRODUCT ANALYSIS⁴

Element	Limit, or Maximum of Specified Element, %	Tolerances	
		Under Minimum Limit	Over Maximum Limit
Carbon	to 0.15, incl	0.02	0.03
	over 0.15 to 0.40, incl	0.03	0.04
	over 0.40 to 0.80, incl	0.03	0.05
	over 0.80	0.03	0.06
Manganese	to 0.60, incl	0.03	0.03
	over 0.60 to 1.15, incl	0.04	0.04
	over 1.15 to 1.65, incl	0.05	0.05

TABLE 6
WIDTH TOLERANCES OF HOT-ROLLED STRIP
(CARBON AND HIGH-STRENGTH, LOW-ALLOY STEEL)
(COILS AND CUT LENGTHS, INCLUDING PICKLED)

Width Tolerance, Over and Under, in.				
Specified Width, in.		Mill Edge and Square Edge Strip	Cut Edge	
			Through 0.109 in.	Over 0.109 in. Through 0.230, excl
Over	Through			
...	2	$\frac{1}{32}$	0.008	0.016
2	5	$\frac{3}{64}$	0.008	0.016
5	10	$\frac{1}{16}$	0.010	0.016
10	12	$\frac{3}{32}$	0.016	0.016

TABLE 7
LENGTH TOLERANCES OF HOT-ROLLED STRIP
(CARBON AND HIGH-STRENGTH ALLOY)
(CUT LENGTHS, INCLUDING PICKLED)

Specified Widths, in.	Length Tolerances over Specified Length, ft for Widths Given, in., No Tolerance Under					
	To 5 ft, incl	Over 5 to 10 ft, incl	Over 10 to 20 ft, incl	Over 20 to 30 ft, incl	Over 30 to 40 ft, incl	Over 40 ft, incl
To 3, incl	$\frac{1}{4}$	$\frac{3}{8}$	$\frac{1}{2}$	[n1]P	1	$1\frac{1}{2}$
Over 3 to 6, incl	$\frac{3}{8}$	$\frac{1}{2}$	$\frac{5}{8}$	[n1]P	1	$1\frac{1}{2}$
Over 6 to 12, incl	$\frac{1}{2}$	[n1]P	1	$1\frac{1}{4}$	$1\frac{1}{2}$	1[n1]P

TABLE 8
CAMBER TOLERANCES^A OF HOT-ROLLED STRIP
(CARBON AND HIGH-STRENGTH LOW-ALLOY)
(COILS AND CUT LENGTHS, INCLUDING PICKLED,
APPLICABLE TO MILL EDGE, SQUARE EDGE, AND
SLIT OR CUT EDGE)

For strip wider than $1\frac{1}{2}$ in. — $\frac{1}{4}$ in. in any 8 ft.
For strip $1\frac{1}{2}$ in. and narrower — $\frac{1}{2}$ in. in any 8 ft.

NOTE 1 — Camber is the deviation of a side edge from a straight line. The standard for measuring this deviation is based on any 8 ft length.^B It is obtained by placing an 8 ft straightedge on the concave side and measuring the maximum distance between the strip edge and the straightedge.

^A When the camber tolerances shown in the above table are not suitable for a particular purpose, hot-rolled strip is sometimes machine straightened.

^B For strip less than 8 ft tolerances are to be established in each instance. A formula for calculating camber is as follows:

$$\frac{L^2 \times C_1}{64} = C_2 \text{ in } L$$

where:

C_1 = Camber in 8 ft and

C_2 = Camber in any given length L

TABLE 9
FLATNESS TOLERANCES OF HOT-ROLLED STRIP
(CARBON AND HIGH-STRENGTH LOW-ALLOY)

It has not been practicable to formulate flatness tolerances for hot-rolled carbon strip steel because of the wide range of widths and thicknesses, and variety of chemical compositions, mechanical properties and types, produced in coils and cut lengths.

APPENDIX

(Nonmandatory Information)

X1. STANDARD CHEMICAL RANGES AND LIMITS

X1.1 Standard chemical ranges and limits are prescribed for carbon steels in Table X1.1.

TABLE X1.1
STANDARD CHEMICAL RANGES AND LIMITS

Carbon Steels Only, Cast or Heat Analysis			
Element	Minimum of Specified Element, %	Range	Lowest, max
Carbon (see Note)	to 0.15, incl	0.05	0.08
	over 0.15 to 0.30, incl	0.06	
	over 0.30 to 0.40, incl	0.07	
	over 0.40 to 0.60, incl	0.08	
	over 0.60 to 0.80, incl	0.11	
	over 0.80 to 1.35, incl	0.14	
Manganese	to 0.50, incl	0.20	0.40
	over 0.50 to 1.15, incl	0.30	
	over 1.15 to 1.65, incl	0.35	
Phosphorus	to 0.08, incl	0.03	0.030 ⁴
	over 0.08 to 0.15, incl	0.05	
Sulfur	to 0.08, incl	0.03	0.035 ⁴
	over 0.08 to 0.15, incl	0.05	
	over 0.15 to 0.23, incl	0.07	
	over 0.23 to 0.33, incl	0.10	
Silicon	to 0.15, incl	0.08	0.10
	over 0.15 to 0.30, incl	0.15	
	over 0.30 to 0.60, incl	0.30	
Copper	When copper is required 0.20 min is commonly specified.		

NOTE 1 — The carbon ranges shown in the column headed "Range" apply when the specified maximum limit for manganese does not exceed 1.00%. When the maximum manganese limit exceeds 1.00%, add 0.01 to the carbon ranges shown below.

⁴ Certain individual specifications provide for lower standard limits for phosphorus and sulfur.

ANNEX

(Mandatory Information)

A1. PERMISSIBLE VARIATIONS IN DIMENSIONS AND MASS IN SI UNITS

A1.1 Listed in Tables A1.1 through A1.7 are permissible variations in dimensions and mass expressed in the International System of Units (SI) terminology.

TABLE A1.1
THICKNESS TOLERANCES OF HOT-ROLLED STRIP^A (CARBON AND HIGH-STRENGTH, LOW-ALLOY STEEL)
ORDERED TO NOMINAL THICKNESS (COILS AND CUT LENGTHS, INCLUDING PICKLED)

Specified Width, mm		Thickness Tolerance, Over and Under, mm, for Specified Nominal Thickness, mm				
Over	Through	Through 1.5	Over 1.5 to 3.0, incl	Over 3.0 to 4.5, incl	Over 4.5 to 5.0, incl	Over 5.0 to 6.0, excl
...	100	0.08	0.10	0.13	0.15	...
100	200	0.08	0.13	0.13	0.15	...
200	300	0.10	0.13	0.13	0.15	0.15

NOTE 1 — Micrometers used for measurement of thickness shall be constructed with either flat anvils having a minimum diameter of 4.80 mm or rounded anvils having a minimum radius of curvature of 2.55 mm. Micrometers with pointed anvils are not suitable for thickness measurement.

^A Measurements for the above table are taken 10 mm from the edge of a strip on 25 mm or wider; and at any place on the strip when narrower than 25 mm. The given tolerances do not include crown and therefore the tolerances for crown as shown in Table A1.3 are in addition to tolerances in Table A1.1.

TABLE A1.2
THICKNESS TOLERANCES OF HOT-ROLLED STRIP^A (CARBON AND HIGH-STRENGTH, LOW-ALLOY STEEL)
ORDERED TO MINIMUM THICKNESS (COILS AND CUT LENGTHS, INCLUDING PICKLING)

Specified Width, mm		Thickness Tolerance, Over Only, for Specified Minimum Thickness, mm				
Over	Through	Through 1.5	Over 1.5 to 3.0, incl	Over 3.0 to 4.5, incl	Over 4.5 to 5.0, incl	Over 5.0 to 6.0, excl
...	100	0.15	0.20	0.25	0.30	...
100	200	0.15	0.25	0.25	0.30	...
200	300	0.20	0.25	0.25	0.30	0.30

NOTE 1 — Micrometers used for measurement of thickness shall be constructed with either flat anvils having a minimum diameter of 4.80 mm or rounded anvils having a minimum radius of curvature of 2.55 mm. Micrometers with pointed anvils are not suitable for thickness measurement.

^A Measurements for the above table are taken 10 mm from the edge of a strip on 25 mm or wider; and at any place on the strip when narrower than 25 mm. The given tolerances do not include crown and therefore the tolerances for crown as shown in Table A 1.3 are in addition to tolerances in Table A 1.2.

TABLE A1.3
CROWN TOLERANCES OF HOT-ROLLED STRIP
(CARBON AND HIGH-STRENGTH, LOW-ALLOY STEEL)
(COILS AND CUT LENGTHS, INCLUDING PICKLED)

Specified Width, mm		Crown Tolerance, Over Only, for Specified Minimum Thickness, mm			
		Through 3.0	Over 3.0 to 4.5, incl	Over 4.5 to 6.0, incl	Over 6.0 to 9.5, incl
Over	Through				
...	100	0.05	0.05	0.03	...
100	200	0.10	0.08	0.05	...
200	300	0.10	0.08	0.08	0.05

TABLE A1.4
WIDTH TOLERANCES OF HOT-ROLLED STRIP
(CARBON AND HIGH-STRENGTH, LOW-ALLOY STEEL)
(COILS AND CUT LENGTHS, INCLUDING PICKLED)

Specified Width, mm		Width Tolerance, Over and Under, mm		
		Mill Edge and Square Edge Strip	Cut Edge	
Over	Through		Through 2.5 mm	Over 2.5 mm
...	50	0.8	0.2	0.4
50	100	1.2	0.2	0.4
100	200	1.6	0.3	0.4
200	300	2.4	0.4	0.4

TABLE A1.5
LENGTH TOLERANCES OF HOT-ROLLED STRIP
(CARBON AND HIGH-STRENGTH, LOW-ALLOY STEEL) (CUT LENGTHS, INCLUDING PICKLED)

Specified Widths, mm		Length Tolerances Over Specified Length, for Widths Given, No Tolerance Under, mm					
		Through 1500	Over 1500 to 3000, incl	Over 3000 to 6000, incl	Over 6000 to 9000, incl	Over 9000 to 12 000, incl	Over 12 000
Over	Through						
...	100	10	10	15	20	25	40
100	200	10	15	15	20	25	40
200	300	15	20	25	30	40	45

TABLE A1.6
CAMBER TOLERANCES⁴ OF HOT-ROLLED STRIP
(CARBON AND HIGH-STRENGTH LOW-ALLOY) (COILS
AND CUT LENGTHS, INCLUDING PICKLED,
APPLICABLE TO MILL EDGE, SQUARE EDGE, AND
SLIT OR CUT EDGE)

For strip wider than 50 mm – 5.0 mm in any 2000 mm
For strip 50 mm and narrower – 10.0 mm in any 2000 mm

NOTE 1 — Camber is the deviation of a side edge from a straight line. The standard for measuring this deviation is based on any 2000 mm length.^B It is obtained by placing a 2000 mm straightedge on the concave side and measuring the maximum distance between the strip edge and the straightedge.

⁴ When the camber tolerances shown in the above table are not suitable for a particular purpose, hot-rolled strip is sometimes machine straightened.

^B For strip less than 2000 mm tolerances are to be established in each instance.

TABLE A1.7
FLATNESS TOLERANCES OF HOT-ROLLED STRIP
(CARBON AND HIGH-STRENGTH LOW-ALLOY)

It has not been practicable to formulate flatness tolerances for hot-rolled strip because of the wide range of widths and thicknesses, and variety of chemical compositions and qualities, produced in coils and cut lengths.

SPECIFICATION FOR TEST METHODS, PRACTICES, AND TERMINOLOGY FOR CHEMICAL ANALYSIS OF STEEL PRODUCTS

SA-751

[Identical with ASTM Specification A 751-01(R06) except for editorial corrections to an element designation in Tables 1 and 2.]

INTRODUCTION

This standard was prepared to answer the need for a single document that would include all aspects of obtaining and reporting the chemical analysis of steel, stainless steel, and related alloys. Such subjects as definitions of terms and product (check) analysis variations (tolerances) required clarification. Requirements for sampling, meeting specified limits, and treatment of data usually were not clearly established in product specifications.

It is intended that this standard will contain all requirements for the determination of chemical composition of steel, stainless steel, or related alloys so that product specifications will need contain only special modifications and exceptions.

1. Scope

1.1 This standard covers definitions, reference methods, practices, and guides relating to the chemical analysis of steel, stainless steel, and related alloys. It includes both wet chemical and instrumental techniques.

1.2 Directions are provided for handling chemical requirements, product analyses, residual elements, and reference standards, and for the treatment and reporting of chemical analysis data.

1.3 This standard applies only to those product standards which include this standard or parts thereof as a requirement.

1.4 In cases of conflict, the product specification requirements shall take precedence over the requirements of this standard.

1.5 Attention is directed to Practice A 880 when there may be a need for information on criteria for evaluation of testing laboratories.

1.6 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

2. Referenced Documents

2.1 ASTM Standards:

- A 880 Practice for Criteria for Use in Evaluation of Testing Laboratories and Organizations for the Examination and Inspection of Steel, Stainless Steel, and Related Alloys
- E 29 Practice for Using Significant Digits in Test Data to Determine Conformance with Specifications
- E 30 Test Methods for Chemical Analysis of Steel, Cast Iron, Open-Hearth Iron, and Wrought Iron
- E 50 Practices for Apparatus, Reagents, and Safety Considerations for Chemical Analysis of Metals, Ores, and Related Materials
- E 59 Practice for Sampling Steel and Iron for Determination of Chemical Composition
- E 60 Practice for Analysis of Metals, Ores, and Related Materials by Molecular Absorption Spectrometry
- E 212 Test Method for Spectrographic Analysis of Carbon and Low-Alloy Steel by the Rod-to-Rod Technique
- E 293 Test Method for Spectrographic Determination of Acid-Soluble Aluminum in Low-Alloy Steel By the Solution Technique
- E 322 Method for X-Ray Emission Spectrometric Analysis of Low-Alloy Steels and Cast Irons
- E 327 Test Method for Optical Emission Spectrometric Analysis of Stainless Type 18-8 Steels by the Point-to-Plane Technique
- E 350 Test Methods for Chemical Analysis of Carbon Steel, Low-Alloy Steel, Silicon Electrical Steel, Ingot Iron, and Wrought Iron

- E 352 Test Methods for Chemical Analysis of Tool Steels and Other Similar Medium- and High-Alloy Steels
- E 353 Test Methods for Chemical Analysis of Stainless, Heat-Resisting, Maraging, and Other Similar Chromium-Nickel-Iron Alloys
- E 354 Test Methods for Chemical Analysis of High-Temperature, Electrical, Magnetic, and Other Similar Iron, Nickel, and Cobalt Alloys
- E 403 Test Method for Optical Emission Spectrometric Analysis of Carbon and Low-Alloy Steel by the Point-to-Plane Technique
- E 404 Test Method for Spectrographic Determination of Boron in Carbon and Low-Alloy Steel by the Point-to-Plane Technique
- E 415 Test Method for Optical Emission Vacuum Spectrometric Analysis of Carbon and Low-Alloy Steel
- E 421 Test Method for Spectrographic Determination of Silicon and Aluminum in High-Purity Iron
- E 485 Test Method for Optical Emission Vacuum Spectrometric Analysis of Blast Furnace Iron by the Point-to-Plane Technique
- E 548 Guide for General Criteria Used for Evaluating Laboratory Competence
- E 572 Test Method for X-Ray Emission Spectrometric Analysis of Stainless Steel
- E 663 Practice for Flame Atomic Absorption Analysis
- E 743 Guide for Spectrochemical Laboratory Quality Assurance
- E 851 Practice for Evaluation of Spectrochemical Laboratories
- E 882 Guide for Accountability and Quality Control in the Chemical Analysis Laboratory
- E 1019 Test Methods for Determination of Carbon, Sulfur, Nitrogen and Oxygen in Steel and in Iron, Nickel, and Cobalt Alloys
- E 1024 Guide for Chemical Analysis of Metals and Metal Bearing Ores by Flame Atomic Absorption Spectrophotometry
- E 1063 Test Method for X-Ray Emission Spectrometric Determination of Cerium and Lanthanum in Carbon and Low-Alloy Steels
- E 1086 Test Method for Optical Emission Vacuum Spectrometric Analysis of Stainless Steel by the Point-to-Plane Excitation Technique
- E 1087 Practice for Sampling Molten Steel from a Ladle Using An Immersion Sampler to Produce a Specimen for Emission Spectrochemical Analysis
- E 1097 Guide for Direct Current Plasma Emission Spectrometry Analysis
- E 1184 Practice for Electrothermal (Graphite Furnace) Atomic Absorption Analysis
- E 1282 Guide for Specifying the Chemical Compositions and Selecting Sampling Practices and Quantitative Analysis Methods for Metals, Ores and Related Materials

- E 1329 Practice for Verification and the Use of Control Charts in Spectrochemical Analysis

3. Terminology

3.1 Definitions:

3.1.1 Pertaining to Analyses:

3.1.1.1 cast or heat (formerly ladle) analysis — applies to chemical analyses representative of a heat of steel as reported to the purchaser and determined by analyzing a test sample, preferably obtained during the pouring of the steel, for the elements designated in a specification.

3.1.1.2 product, check or verification analysis — a chemical analysis of the semifinished or finished product, usually for the purpose of determining conformance to the specification requirements. The range of the specified composition applicable to product analysis is normally greater than that applicable to heat analysis in order to take into account deviations associated with analytical reproducibility (Note 1) and the heterogeneity of the steel.

NOTE 1 — All of the chemical analysis procedures referenced in this document include precision statements with reproducibility data with the exception of Test Methods E 30.

3.1.1.3 product analysis tolerances (Note 2) — a permissible variation over the maximum limit or under the minimum limit of a specified element and applicable only to product analyses, not cast or heat analyses.

NOTE 2 — The term “analysis tolerance” is often misunderstood. It does not apply to cast or heat analyses determined to show conformance to specified chemical limits. It applies only to product analysis and becomes meaningful only when the heat analysis of an element falls close to one of the specified limits. For example, stainless steel UNS S30400 limits for chromium are 18.00 to 20.00%. A heat that the producer reported as 18.01% chromium may be found to show 17.80% chromium by a user performing a product analysis. If the product analysis tolerance for such a chromium level is 0.20%, the product analysis of 17.80% chromium would be acceptable. A product analysis of 17.79% would not be acceptable.

3.1.1.4 proprietary analytical method — a non-standard analytical method, not published by ASTM, utilizing reference standards traceable to the National Institute of Standards and Technology (NIST) (when available) or other sources referenced in Section 10.

3.1.1.5 referee analysis — performed using ASTM methods listed in 9.1.1 and NIST reference standards or methods and reference standards agreed upon between parties. The selection of a laboratory to perform the referee analysis shall be a matter of agreement between the supplier and the purchaser.

3.1.1.6 certified reference material — a specimen of material specially prepared, analyzed, and certified for chemical content under the jurisdiction of a recognized standardizing agency or group, such as the National Institute of Standards and Technology, for use by analytical

laboratories as an accurate basis for comparison. Reference samples should bear sufficient resemblance to the material to be analyzed so that no significant differences are required in procedures or corrections (for example, for interferences or inter-element effects).

3.1.1.7 working reference materials — reference materials used for routine analytical control and traceable to NIST standards and other recognized standards when appropriate standards are available.

3.1.2 Pertaining to Elements:

3.1.2.1 intentionally added unspecified element — an element added in controlled amounts at the option of the producer to obtain desirable characteristics.

3.1.2.2 residual element — a specified or unspecified element, not intentionally added, originating in raw materials, refractories, or air.

3.1.2.3 specified element — an element controlled to a specified range, maximum or minimum, in accordance with the requirements of the product specification.

3.1.2.4 trace element — a residual element that may occur in very low concentrations, generally less than 0.01 %.

4. Concerning the Specification of Chemical Composition Requirements

4.1 It is recommended that Guide E 1282 be consulted as a guide for specifying the chemical compositions for steels.

4.2 The recommended practice for specifying chemical composition limits is to limit the number of significant figures for each element so that the number of figures to the right of the decimal point conforms to the following:

Chemical Concentration	Maximum Number of Figures to the Right of the Decimal Point
Up to 0.010%	0.XXXX or may be expressed as ppm
Up to 0.10%	0.XXX
0.10 to 3.00%	0.XX
Over 3.0%	0.X

4.3 For those cases in which the composition range spans either 0.10% or 3.0%, the number of figures to the right of the decimal is to be determined by that indicated by the upper limit.

4.4 Technical considerations may dictate the employment of less than the number of figures to the right of the decimal as previously recommended.

NOTE 3 — The recommendations should be employed to reduce the number of significant figures, such as from 18.00% to 18.0%, but a significant figure should never be added unless there is a technical reason for so doing.

5. Cast or Heat Analysis

5.1 The producer shall perform analyses for those elements specified in the material specification. The results of such analyses shall conform to the requirements specified in the material specification.

5.1.1 For multiple heats, either individual heat or cast analysis or an average heat or cast analysis shall be reported. If significant variations in heat or cast size are involved, a weighted average heat or cast analysis, based on the relative quantity of metal in each heat or cast, shall be reported.

5.1.2 For consumable electrode remelted material, a heat is defined as all the ingots remelted by the same process from a primary heat. The heat analysis shall be obtained from one remelted ingot, or the product of one remelted ingot, from each primary melt. If this heat analysis does not meet the heat analysis requirements of the specification, one sample from the product of each remelted ingot shall be analyzed, and the analyses shall meet the heat analysis requirements.

5.2 If the test samples taken for the heat analysis are lost, inadequate, or not representative of the heat, a product analysis of the semifinished or finished product may be used to establish the heat analysis.

5.2.1 If a product analysis is made to establish the heat analysis, the product analysis shall meet the specified limits for heat analysis and the product analysis tolerances described in Section 6 do not apply.

6. Product Analysis Requirements

6.1 For product analysis, the range of the specified chemical composition is normally greater (designated product analysis tolerances) than that applicable to heat analyses to take into account deviations associated with analytical reproducibility and the heterogeneity of the steel. If several determinations of any element in the heat are made, they may not vary both above and below the specified range.

6.2 Product analysis tolerances may not be used to determine conformance to the specified heat or cast analysis unless permitted by the individual material specification.

6.3 Product analysis tolerances, where available, are given in the individual material specifications or in the general requirement specifications.

7. Unspecified Elements (Note 4)

7.1 Reporting analyses of unspecified elements is permitted.

NOTE 4 — All commercial metals contain small amounts of various elements in addition to those which are specified. It is neither practical

nor necessary to specify limits for every unspecified element that might be present, despite the fact that the presence of many of these elements is often routinely determined by the producer.

7.2 Analysis limits shall be established for specific elements rather than groups of elements such as “all others,” “rare earths,” and “balance.”

8. Sampling

8.1 Cast or Heat Analyses:

8.1.1 Samples shall be taken, insofar as possible, during the casting of a heat, at a time which, in the producer's judgment, best represents the composition of the cast.

8.1.2 In case the heat analysis samples or analyses are lost or inadequate, or when it is evident that the sample does not truly represent the heat, representative samples may be taken from the semifinished or finished product, in which case such samples may be analyzed to satisfy the specified requirements. The analysis shall meet the specified limits for heat analysis.

8.2 Check, Product, or Verification Analyses — Unless otherwise specified, the latest revision of Practice E 59 shall be used as a guide for sampling.

9. Test Methods

9.1 This section lists some test methods that have been found acceptable for chemical analysis of steels.

9.1.1 The following ASTM wet chemical test methods have been found acceptable as referee test methods and as a base for standardizing instrumental analysis techniques:

Test Methods	General Description
E 30	antecedent to Methods E 350 through E 354
E 350	the basic wet chemical procedure for steels
E 352	wet chemical procedure for tool steels
E 353	wet chemical procedure for stainless steels
E 354	wet chemical procedure for high nickel steels
E 1019	determination of carbon, sulfur, nitrogen, oxygen, and hydrogen, in steel and in iron, nickel, and cobalt alloys

9.1.2 The following ASTM instrumental test methods, practices, and guides may be employed for chemical analysis of steels or may be useful as a guide in the calibration and standardization of instrumental equipment for routine sampling and analysis of steels:

Standard	General Description
E 50	apparatus, reagents, and safety
E 60	photometric and spectrophotometric work
E 212	spectrographic analysis of steels (rod-to-rod technique)
E 293	spectrophotometric analysis of acid-soluble aluminum
E 322	X-ray fluorescence for steels
E 327	spectrometric analysis of stainless steels
E 403	spectrometric analysis of steels
E 404	spectrographic determination of steels for boron (point-to-plane technique)
E 415	vacuum spectrometric analysis of steels
E 421	spectrographic determination of silicon and aluminum in high-purity iron
E 485	optical emission vacuum spectrometric analysis of blast furnace iron by the point-to-plane technique
E 572	X-ray emission spectrometric analysis of stainless steels
E 663	flame atomic absorption
E 882	accountability and quality control
E 1019	determination of carbon, sulfur, nitrogen, oxygen, and hydrogen in steel and in iron, nickel, and cobalt alloys
E 1024	flame atomic absorption
E 1063	X-ray emission of spectrometric determination of cerium and lanthanum in carbon and low-alloy steels
E 1086	optical emission vacuum spectrometric analysis of stainless steel by the point-to-plane excitation technique
E 1087	sampling
E 1097	direct current plasma spectroscopy
E 1184	graphite furnace atomic absorption
E 1282	selecting sampling practices and analysis methods
E 1329	verification and use of control charts

9.2 The following are some of the commonly accepted techniques employed for routine chemical analysis of steels. These routine analyses are the basis for the producers' quality control/assurance programs. Proprietary methods are permissible provided the results are equivalent to those obtained from standard methods when applicable.

9.2.1 Analysis of stainless steels using x-ray fluorescence spectroscopy (XRF). See Table 1 for normal elements and ranges for stainless steels.

9.2.2 Analysis of stainless steels using spark emission spectroscopy (OES). See Table 2 for normal elements and ranges for stainless steels.

9.2.3 Analysis of solutions using an atomic absorption spectrophotometer.

9.2.4 Analysis of solutions using an inductively coupled plasma emission spectrometer.

9.2.5 Determination of carbon or sulfur, or both, by combustion (in oxygen) and measurement of CO₂ or SO₂, or both, by thermal conductivity or infrared detectors.

Element	Ranges %	Element	Ranges %
C	0.002–5.0	S	0.0005–0.1

9.2.6 Determination of nitrogen and oxygen by fusion (in a helium atmosphere) and measurement of N₂ by thermal conductivity and oxygen by measurement of CO by infrared or thermal conductivity detectors.

Element Ranges %

Element Ranges %	
N ₂	0.0005–0.3
O ₂	0.0008–0.02

9.2.7 Analysis of solutions using inductively coupled plasma emission spectroscopy (ICP) or direct plasma emission spectroscopy (DCP). Normal elements and ranges for stainless steels are as follows:

Element Ranges %	
B	0.0002–0.01
Ca	0.0002–0.01
Mg	0.0002–0.01
Ce	0.001–0.2
Zr	0.001–0.1
Ta	0.005–0.5
La	0.001–0.01

9.3 There are additional common techniques often used for chemical analysis of standards for instrument analysis such as: polarographic analysis, ion exchange separations, radioactivation, and mass spectrometry.

10. Reference Materials

10.1 For referee analyses, reference standards of a recognized standardizing agency shall be employed with preference given to NIST standard reference materials when applicable. (NIST does not produce reference standards suitable for all elements or all alloys.)

10.1.1 When standard reference materials for certain alloys are not available from NIST, reference materials may be produced by employing ASTM standard procedures and NIST standard reference materials to the extent that such procedures and reference standards are available. Several independent laboratories should be used for certification of these standards and their results statistically reviewed and merged.

10.1.2 Methods not published by ASTM such as a definitive analytical method may be used when the method is validated by analyzing certified reference materials along

with the candidate reference material. Examples of definitive analytical methods include gravimetric, coulometry, titrimetric based on normality, and mass spectrometry.

10.2 Working reference materials may be used for routine analytical control.

11. Significant Numbers

11.1 Laboratories shall report each element to the same number of significant numbers as used in the pertinent material specifications.

11.2 When a chemical determination yields a greater number of significant numbers than is specified for an element, the result shall be rounded in accordance with Section 12.

12. Rounding Procedure

12.1 To determine conformance with the specification requirements, an observed value or calculated value shall be rounded in accordance with Practice E 29 to the nearest unit in the last right-hand place of values listed in the table of chemical requirements.

12.2 In the special case of rounding the number “5” when no additional numbers other than “0” follow the “5”, rounding shall be done in the direction of the specification analysis limits if following Practice E 29 would cause rejection of material.

13. Records

13.1 In addition to the test data requested, the test records shall contain the following information as appropriate:

13.1.1 Description of the material tested, for example, heat number, grade of material, product specification.

13.1.2 Test method(s) or unambiguous description of the nonstandard method(s) used.

14. Keywords

14.1 cast analysis; chemical analysis; heat analysis; product analysis; reference materials

APPENDIX

(Nonmandatory Information)

X1. QUALITY ASSURANCE FOR VALIDITY OF ANALYTICAL RESULTS

X1.1 The requirements embodied in Guide E 548 and Practices A 880 and E 851, provide generic requirements for production of valid chemical-analysis results.

X1.2 Additional pertinent standards for improving the competency of chemical analysis laboratories are included in Guides E 743 and E 882.

X1.3 Keys to improving validity of chemical analytical results are as follows:

X1.3.1 Replication of sampling and testing to improve the precision of results;

X1.3.2 Use of reference materials is crucial to accurate results;

X1.3.3 Instrumentation that is appropriate and properly maintained; and

X1.3.4 Personnel who are properly trained, ethical chemists or technicians and who work with properly documented, current standards.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR CARBON STEEL AND LOW-ALLOY STEEL PRESSURE-VESSEL-COMPONENT FORGINGS WITH MANDATORY TOUGHNESS REQUIREMENTS

SA-765/SA-765M

(Identical with ASTM Specification A 765/A 765M-01.)

1. Scope

1.1 This specification covers heat-treated carbon steel and alloy steel forgings with mandatory toughness requirements. These forgings are intended for pressure vessels, feedwater heaters, and similar uses.

1.2 These forgings include tube sheets, covers, channel barrels, integral forged channels, rings, nozzles, flanges, and similar parts.

1.3 All grades are considered weldable under proper conditions.

1.4 The maximum thickness of forgings produced to this specification is limited only by the capacity of the selected grade to respond to any heat treatment specified and to meet the specified mechanical tests, including impact tests at the specified temperature.

1.5 Material supplied to this specification shall conform to the requirements of Specification A 788, which outlines additional ordering information, manufacturing requirements, testing and retesting methods and procedures, marking, certification, product analysis variations, and additional supplementary requirements.

1.6 If the requirements of this specification are in conflict with the requirements of Specification A 788, the requirements of this specification shall prevail.

1.7 The values stated in either inch-pound units or SI [metric] units are to be regarded separately as the standard; within the text and tables, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification.

1.8 Unless the order specifies the applicable “M” specification designation, the material shall be furnished to the inch-pound units.

2. Referenced Documents

2.1 ASTM Standards:

- A 275/A 275M Test Method for Magnetic Particle Examination of Steel Forgings
- A 370 Test Methods and Definitions for Mechanical Testing of Steel Products
- A 388/A 388M Practice for Ultrasonic Examination of Heavy Steel Forgings
- A 788 Specification for Steel Forgings, General Requirements
- E 112 Test Methods for Determining the Average Grain Size
- E 165 Test Method for Liquid Penetrant Examination

2.2 ASME Standards:

- Boiler and Pressure Vessel Code

3. Ordering Information

3.1 In addition to the ordering information requirements of Specification A 788, a detailed sketch or written description of the forging and the method of selecting the test location (see 6.2) should be supplied to the producer, when appropriate areas of significant in-service loading of the forging need to be designated.

3.2 The required impact test temperature should be supplied if different than the temperature listed in Table 3, otherwise the impact test shall be conducted at the temperature listed in Table 3 for the chosen grade.

3.3 If a hubbed tube sheet is to be supplied for ASME Boiler and Pressure Code Application Supplementary Requirement S12 of Specification A 788 should be specified.

4. Heat Treatment for Mechanical Properties

4.1 Heat treatment shall consist of normalizing and tempering, double normalizing and tempering, or quenching and tempering at the manufacturer's option.

5. Chemical Requirements

5.1 Heat Analysis — The heat analysis obtained from sampling in accordance with Specification A 788 shall comply with Table 1.

5.2 Product Analysis — The purchaser may use the product analysis provision of Specification A 788 to obtain a product analysis from a forging representing each heat or multiple heat.

6. Mechanical Requirements

6.1 General Requirements — The forgings shall conform to the tension test requirements of Table 2. The forgings shall also conform to the impact test requirements of Table 3. The largest obtainable round tension test specimen as specified in Test Methods and Definitions A 370 shall be used. Impact specimens shall be Charpy V-notch, Type A, as in Test Methods and Definitions A 370. The usage of subsize impact specimens must have prior purchaser approval.

6.1.1 When agreed upon between the purchaser and the producer and specified on the order, impact tests may be made at temperatures different from those shown in Table 3 provided the test temperature is at least as low as the intended service temperatures and the provided impact energy requirements of Table 3 are met. Such forgings shall be suitably marked in accordance with 8.1 to identify the test temperature.

6.2 Test Location — Test coupons shall be taken so that the longitudinal axis and mid-length of tension and impact test specimens shall be positioned in accordance with one of the following methods:

6.2.1 Method 1 — Forgings with 2 in. [50 mm] maximum thickness. The specimens shall have their longitudinal axis at the midthickness or the center of the cross section and with the midlength of the specimen at least 2 in. [50 mm] from any second surface.

6.2.2 Method 2 — Grade I and Grade II forgings with thicknesses greater than 2 in. up to 4 in. [50 to 100 mm] inclusive, or Grade III and IV forgings with thicknesses

greater than 2 in. up to 6 in. [50 to 150 mm] inclusive. The specimens shall have their longitudinal axis at least $\frac{1}{4} T$ of maximum heat-treated thickness from any surface and with the midlength of the specimen at least one T from any second surface. This is normally referred to as $\frac{1}{4} T$ by T when T is the maximum heat-treated thickness. A thermal buffer may be used to adhere to the condition in 6.3. Unless otherwise agreed upon, the following limitation for heat-treated thickness shall apply:

Grade	in. [mm], min	in. [mm], max
I	2 [50]	4 [100]
II	2 [50]	4 [100]
III	2 [50]	6 [150]
IV	2 [50]	6 [150]
V	2 [50]	6 [150]

(Classes 1 and 2)

6.2.3 Method 3 — For forgings thicker than described in Method 2 (6.2.2):

6.2.3.1 Prior to heat treatment the forging shall be machined to a purchaser supplied or approved drawing that indicates the locations of significant in-service loading in the finished part. The mechanical test specimens shall be located as an integral part of the forging such that the mid-point of the gauge length of the tension test specimen and the area under the notch of the impact specimens are located no closer than the dimension t from one heat treated surface and $2t$ from any other heat treated surface where t is the dimension from the area of significant loading to the heat treated surface, or $\frac{3}{4}$ in. [20 mm] whichever is the greater.

6.2.4 Method 4 — This method shall be limited to forgings with a rough machined weight of not more than 1000 lb [455 kg]. Separate test forging when agreed upon between the purchaser and the supplier. Test coupons representing forgings from one heat and one heat treatment lot may be taken from a separately forged piece under the following conditions:

6.2.4.1 The separate test forging shall be of the same heat of material and shall be subjected to substantially the same reduction and working as the production forging it represents.

6.2.4.2 The separate test forging shall be heat treated in the same furnace charge and under the same conditions as the production forging.

6.2.4.3 The separate test forging shall be of the same nominal thickness as the production forging.

6.2.4.4 Test coupons for small forgings as described in Method 2 shall be taken so that specimens shall have their longitudinal axes at the region midway between midthickness and the surface and with the midlength of the specimens no nearer any heat-treated edge than a distance equal to the forging thickness except when

the thickness-to-length ratio of the production forging does not permit, in which case a production forging shall be used as the test forging and the midlength of the specimens shall be at the midlength of the test forging.

6.2.4.5 Test coupons for larger forgings shall be taken in accordance with Method 3 (6.2.3).

6.3 Metal Buffers — The required distances from treated surfaces may be obtained with metal buffers instead of integral extensions. Buffer material may be carbon or low-alloy steel, and shall be joined to the forging with a partial penetration weld that seals the buffered surface. Specimens shall be located at $\frac{1}{2}$ in. [13 mm] minimum from the buffered surface of the forging. Buffers shall be removed and the welded areas subjected to magnetic particle test to assure freedom from cracks unless the welded areas are completely removed by subsequent machining.

6.4 Samples shall be removed from forgings after heat treatments. This sample material shall be subjected to a simulated post-weld heat treatment if Supplementary Requirement S6 is specified.

6.5 Test Orientation:

6.5.1 For upset disk forgings such as tube sheets the longitudinal axis of test specimens may be oriented in the radial or tangential direction, or parallel to the axis of the forging, as shown in Supplementary Requirement S12 of Specification A 788.

6.5.2 For all other forgings the longitudinal axis of test specimens may be oriented parallel to the direction of maximum hot working of the forging.

6.6 Number of Tests:

6.6.1 Forgings Under 500 lb [230 kg] As Treated— For duplicate forgings weighing less than 500 lb as treated, one tension test and one impact test (three specimens) shall be made to represent each heat in each heat-treatment charge. When heat treatment is performed in continuous-type furnaces with suitable temperature control and equipped with recording pyrometers so that complete heat-treatment records are available, a heat-treatment charge shall be considered as any continuous run not exceeding an 8 h duration.

6.6.2 Forging Weighing 500 to 10 000 lb [230 to 4500 kg] As-Heat Treated— One tension and one impact test (three specimens) shall be made for each forging.

6.6.3 Each forging weighing over 10 000 lb [4500 kg] shall require two tension tests and two impact tests (three specimens). When the length (excluding prolongs) is equal to or less than $1\frac{1}{2}$ times the diameter, the tests may be taken from one end of the forging with a tension test and one set of impact tests at each of two locations oriented 180° apart. When the length (excluding prolongs) is greater than $1\frac{1}{2}$ times the diameter, one tension test and one set of impact tests must be taken from each location from opposite ends of the forging and the locations on each end should be oriented 180° apart from each other.

7. Repair Welding

7.1 Repair welding, as permitted by the purchaser, shall be performed in accordance with the ASME Boiler and Pressure Vessel Code.

8. Product Marking

8.1 The test temperature, if different from that given in Table 3, shall be marked on the forging as a suffix to the Grade and Class designation. A prefix of 0 to the test temperature indicates that the temperature was under 0°F , or 0°C if the M designation specification is being used. For example, A765-11-075 would indicate that the impact testing for Grade 11 was done at -75°F instead of -50°F . A marking of A765M-11-10 would indicate that the impact testing was done at 10°F for a Grade 11 forging. For forgings tested under the M designation an example would be A765M-11-060 for a Grade 11 forging tested at -60°C or A765M-11-10 for a Grade 11 forging tested at 10°C .

Carbon, max	0.30	0.30	0.20	0.20	0.30
Manganese	0.60 to 1.05	0.60 to 1.35	0.90 max	1.00–1.60	0.60–1.35
Phosphorus, max	0.020	0.020	0.020	0.020	0.020
Sulfur, max	0.020	0.020	0.020	0.020	0.020
Silicon	0.15 to 0.35	0.15 to 0.35	0.15 to 0.35	0.15–0.50	0.15–0.35
Nickel ⁴	0.50 max	0.50 max	3.3 to 3.8	0.50 max	1.0–2.0
Vanadium, max	0.05	0.05	0.05	0.06	0.03
Aluminum, max	0.05	0.05	0.05	0.05	0.05
Chromium, ⁴ max	0.40	0.40	0.20	0.40	0.30
Molybdenum, ⁴ max	0.10	0.10	0.06	0.10	0.12
Copper, max	0.35	0.35	0.35	0.35	0.35

⁴ Intentional additions of Cr, Mo, and Ni up to the specified maximum are permitted to be made to Grades I, II, and IV by the manufacturer.

TABLE 2
TENSILE REQUIREMENTS

	Grade I	Grade II	Grade III	Grade IV	Grade V	
					Class 1	Class 2
Tensile strength, ksi [MPa]	60 to 85 [415 to 585]	70 to 95 [485 to 655]	70 to 95 [485 to 655]	80-105 [550-725]	60-85 [415-585]	70-95 [485-655]
Yield strength, ^A min, ksi [MPa]	30 [205]	36 [250]	37.5 [260]	50 [345]	30 [205]	37.5 [260]
Elongation in 2 in. [50 mm], min, %	25	22	22	22	25	22
Reduction of area, min, %	38	30	35	30	38	35

^A 0.2% offset or 0.5% total extension underload method.

TABLE 3
CHARPY V-NOTCH IMPACT REQUIREMENTS

	Grade I	Grade II	Grade III	Grade IV	Grade V (Classes 1 and 2)
Minimum average value of set of three specimens, ft-lbf (J)	13 [18]	15 [20]	15 [20]	28 [35] ^A	15 [20]
Minimum value of one specimen, ft-lbf (J)	10 [14]	12 [16]	12 [16]	20 [27] ^A	12 [16]
Test temperature of, ^B °F [°C]	−20 [−30]	−50 [−45]	−150 [−100]	−20 [−30]	−75 [−60]

^A Mandatory conformance to the values listed is a matter of agreement between the purchaser and the manufacturer. The energy values above are shown for information as to guarantees that are generally available.

^B Actual test temperature should be established at time of order. If no temperature is specified, tests will be made at test temperatures shown in this table.

SUPPLEMENTARY REQUIREMENTS

One or more of the following supplementary requirements shall apply only when specified by the purchaser in the order. Details of these supplementary requirements shall have been previously negotiated and mutually agreed to between the forging manufacturer and the purchaser.

S1. Product Analysis

S1.1 The manufacturer shall use the product analysis provision of Specification A 788 to obtain a product analysis from a forging representing each heat or multiple heat.

S2. Grain Size

S2.1 The forgings, subsequent to the final heat treatment, shall have prior austenitic grain size of 5 or finer as determined by the McQuaid-Ehn Test (Test Methods E 112).

S3. Impact Transition Curve

S3.1 Sufficient impact tests shall be made from the forging test material to establish a temperature versus absorbed-energy curve. The test temperature range shall be wide enough to establish the upper and the lower shelf foot-pound-force (or joules) energies, with sufficient testing at intermediate temperatures to permit plotting a reasonably smooth curve.

S4. Magnetic Particle Examination

S4.1 All accessible surfaces of the finished forging shall be examined by a magnetic particle method. This method shall be in accordance with Test Method A 275/A 275M.

S4.2 Acceptance criteria shall be specified.

S5. Liquid Penetrant Examination

S5.1 All surfaces shall be examined by a liquid penetrant method. The method shall be in accordance with Practice E 165.

S5.2 Acceptance criteria shall be specified.

S6. Simulated Post-Weld Heat Treatment of Mechanical Test Samples

S6.1 All test coupons shall be subjected to single or multiple heat treatments at subcritical temperatures prior to testing. Such treatments are intended to simulate post-weld or other treatments to which the forgings will be subjected during subsequent fabrication. The purchaser shall furnish the manufacturer with details of the desired heat treatment for the test coupons, including temperatures, times, and cooling rates.

S7. Vacuum Treatment

S7.1 The molten steel shall be vacuum treated prior to or during the pouring of the melt. Unless otherwise agreed upon with the purchaser, it is the responsibility of the manufacturer to select suitable process procedures subject to the following requirements:

S7.1.1 When the vacuum stream degassing is used, the vacuum system must be of sufficient capacity to effect a blank-off pressure low enough (usually less than 1000 $\mu\text{m Hg}$) to break up the normal tight, rope-like stream of molten metal into a wide-angled conical stream of relatively small droplets. The capacity of the system must also be sufficiently high to reduce the initial surge pressure at the start of the pour to a low level within 2 min.

S7.1.2 When the vacuum-lift process is utilized, the molten metal shall be drawn into the evacuated vessel a sufficient number of times to assure thorough mixing and degassing of the entire volume of metal. The evacuation system shall be capable of reducing the pressure surges which occur each time a new portion of steel is admitted to the vessel to increasingly lower levels until a blank-off pressure of less than 1000 $\mu\text{m Hg}$ is achieved, thus signifying the end of the degassing treatment.

S8. Ultrasonic Examination

S8.1 Forgings shall be ultrasonically examined in accordance with the procedures of Practice A 388/A 388M.

S8.2 Acceptance criteria shall be specified.

S9. Special Tension Specimens for Hubbed Flanges and Tube Sheets

S9.1 For forged-hub tube sheets and flanges to be used in ASME Code stamped vessels, a tension specimen shall

be taken as close to the hub as possible. The longitudinal axis of the specimen shall be parallel to the length of the hub (see Fig. UW 13.3, ASME Code Section VIII-1).

SPECIFICATION FOR THROUGH-THICKNESS TENSION TESTING OF STEEL PLATES FOR SPECIAL APPLICATIONS

SA-770/SA-770M

(Identical with ASTM Specification A 770/A 770M-86.)

1. Scope

1.1 This specification covers the procedures and acceptance standards for the determination of reduction of area using a tension test specimen whose axis is perpendicular to the rolled surfaces of steel plates 1 in. [25 mm] and greater in thickness. The principal purpose of the testing is to provide a measure of the resistance of a steel plate to lamellar tearing. (See Appendix X1.)

1.2 The values stated in either inch-pound units or SI units are to be regarded as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification.

1.3 This specification is expressed in both inch-pound and SI units. However, unless the order specifies the applicable "M" specification designation (SI units), the material shall be furnished to inch-pound units.

2. Applicable Document

2.1 ASTM Standard:
A 370 Methods and Definitions for Mechanical Testing of Steel Products

3. Ordering Information

3.1 The inquiry and order shall include the following, if required:

3.1.1 Supplementary requirements that are available to meet end use requirements (see S1 through S5).

3.1.2 Special requirements agreed upon between the manufacturer and the purchaser.

4. Tension Tests

4.1 Number of Tests:

4.1.1 Two tests shall be required from each plate-as-rolled, except for plates subjected to heat treatment by quenching and tempering. Two tests shall be required from each quenched-and-tempered plate. The tests shall be representative of the plate in its final condition.

4.1.2 When plates are furnished by the manufacturer in an unheat-treated condition and qualified by heat-treated specimens (including normalized, normalized and tempered, and quenched and tempered), two tests shall be required from each plate-as-rolled.

NOTE — The term "plate-as-rolled" refers to the unit plate rolled from a slab or directly from an ingot. It does not refer to the condition of the plate.

4.2 Location of Test Coupons — Take one test coupon at each end of each plate as defined in 4.1. Take the test coupons from the center of the plate width.

4.3 Orientation of Test Specimens — The longitudinal axis of the reduced section of the test specimens shall be perpendicular to the rolled surface of the plate.

4.4 Preparation of Test Specimens:

4.4.1 Welded Prolongations — When required, join welded prolongations to the surface(s) of the plate being tested. The joining method used shall be one which results in a minimal heat-affected zone in the portion of the plate to be tested. Shielded metal arc, friction, stud, or electron-beam welding methods have proven to be suitable.

4.4.2 Types of Test Specimens:

4.4.2.1 Three types of standard round tension test specimens are shown in Fig. 1 and Table 1. For Types 1 and 2 specimens, locate the center of the length of the reduced section at the approximate mid-point of the plate

thickness. For Type 3 specimens, locate the weld fusion line of one plate surface within $\frac{1}{4}$ in. [6 mm] of one end of the reduced section.

4.4.2.2 For plates from 1 in. [25 mm] to $1\frac{1}{4}$ in. [32 mm] inclusive in thickness, use either the 0.350 in. [8.75 mm] Type 1 specimen or the 0.500 in. [12.5 mm] Type 2 specimen.

4.4.2.3 For plates over $1\frac{1}{4}$ in. to 2 in. [50 mm] inclusive in thickness, use the 0.500 in. [12.5 mm] Type 2 specimen.

4.4.2.4 For plates greater than 2 in. [50 mm] in thickness, use the Type 3 specimen.

4.4.3 Alternative Test Specimens — The alternative test specimens in Fig. 2 and Table 2 may be used in place of the standard specimens in Fig. 1 and Table 1, subject to agreement between the manufacturer and the purchaser.

4.4.3.1 For plates over 2 in. [50 mm] in thickness, Type A or Type B specimens may be used. The Type A specimen provides a reduced section length greater than the plate thickness. The Type B specimen provides a reduced section length of $2\frac{1}{4}$ in. [57 mm] with its center at the mid-thickness of the plate. Over a minimum plate thickness determined by the specimen end configuration, no welded prolongations may be needed for the Type B specimen. For plates over $4\frac{1}{4}$ in. [108 mm] in thickness, the standard round tension test specimen Type C may be used. For plates over 6 in. [150 mm] in thickness, a series of two or more Type A or Type C specimens with reduced sections of 4 in. [100 mm] or less may be used to cover the full thickness of the plate. The number of tests required will depend upon the thickness of the plate being tested and the reduced section length selected.

4.4.3.2 For plates over 1 in. [25 mm] in thickness, a series of button-head specimens shown in Fig. 2 and

Table 2 may be used. The test specimen type to be used, Type D, Type E, or Type F, is determined by the nominal plate thickness as described in Table 2. A series of two or more Type F specimens may be used to cover the full thickness of the plate. The length of the reduced section (A), as shown in Fig. 2 and specified in Table 2, is the length of the reduced section excluding the machined radius (R). Within the plate thickness dimension specified for each test specimen type, either the button-head thickness, the reduced section length, or the machined radius may be varied. In all cases, the minimum length of the reduced section must be as specified in Table 2 to maintain a minimum length to diameter ratio (see Appendix X2.2).

5. Acceptance Standards

5.1 Each tension test shall have a minimum reduction of area no less than 20%. If the reduction of area of both tests is less than 20%, no retest shall be permitted. If the reduction of area of one of the two tests from a plate is less than 20%, one retest of two additional specimens taken from a location adjacent to the specimen that failed may be made, and both of these additional specimens shall have a reduction of area of 20% or more.

5.2 Failures occurring in the prolongations, the weld, or in the fusion line shall be considered as a “no-test,” and an additional specimen shall be tested.

6. Marking

6.1 Plates accepted in accordance with this specification shall be identified by stamping or stenciling ZT adjacent to the marking required by the applicable product specification.

FIG. 1 STANDARD ROUND TENSION TEST SPECIMENS

NOTE—For Type 3 only one welded prolongation may be needed, depending upon plate thickness.

FIG. 2 ALTERNATIVE TENSION TEST SPECIMENS

TABLE 1
SCHEDULE OF STANDARD TEST SPECIMENS, INCHES [MILLIMETRES]⁴

	Specimen Type		
	1	2	3
Plate thickness (t)	$1 \leq t \leq 1\frac{1}{4}$	$1 < t \leq 2$	$2 < t$
Diameter (D)	0.350 [8.75]	0.500 [12.5]	0.500 [12.5]
Radius, minimum (R)	$\frac{1}{4}$ [6]	$\frac{3}{8}$ [10]	$\frac{3}{8}$ [10]
Length of reduced section (A)	$1\frac{3}{4}$ [45]	$2\frac{1}{4}$ [60]	$2\frac{1}{4}$ [60]

⁴ See Methods and Definitions A 370 (Fig. 5 for further details and Fig. 6 for various types of ends).

TABLE 2
SCHEDULE OF ALTERNATIVE TEST SPECIMENS, INCHES [MILLIMETRES]

	Specimen Type					
	A ^A	B ^A	C ^B	D	E	F
Plate thickness(<i>t</i>)	$2 < t (50 < t)$	$2 < t (50 < t)$	$4\frac{1}{4} < t (108 < t)$	$1 \leq t \leq 1\frac{3}{4} (25 \leq t \leq 45)$	$1\frac{3}{4} < t \leq 2\frac{1}{2} (45 \leq t \leq 64)$	$2\frac{1}{2} < t (64 < t)$
Diameter(<i>D</i>)	0.500 (12.5)	0.500 (12.5)	0.500 (12.5)	$0.250 (6.25)^c \pm 0.005 (0.10)$	0.350 (8.75) ^c ± 0.007 (0.18)	0.500 (12.5) ^c ± 0.010 (0.25)
Radius, min(<i>R</i>)	$\frac{3}{8} (10)$	$\frac{3}{8} (10)$	$\frac{1}{4}_{16} (10)$	optional	optional	optional
Length of reduced section min(<i>L</i>)	$t + \frac{1}{4} \text{ min } (t + 6)$	$2\frac{1}{4} (60)$	$t - 1\frac{1}{2} (t - 38)$	0.625 (16)	0.875 (22)	1.250 (32)

^A See Methods and Definitions A 370 (Fig. 5 for further details and Fig. 6 for various types of ends).

^B See Methods and Definitions A 370 (Fig. 6, specimen 3 for further details).

^C The reduced section may have a gradual taper from the ends toward the center, with the ends not more than 1 % larger in diameter than the center (controlling dimension).

SUPPLEMENTARY REQUIREMENTS

These requirements apply only when specified by the purchaser.

S1. Tensile Strength Requirements

S1.1 Tensile strength shall conform to a minimum value which is subject to agreement between the manufacturer and purchaser.

S2. Yield Strength Requirements

S2.1 Yield strength, for plates 2 in. [50 mm] and over in thickness, shall conform to a minimum value which is subject to agreement between the manufacturer and purchaser.

S3. Reduction of Area Requirements

S3.1 A minimum reduction of area limit higher than that in 5.1 may be specified subject to agreement between the manufacturer and purchaser.

S4. Number of Tests

S4.1 A greater number of tests than indicated in 4.1 may be specified subject to agreement between the manufacturer and purchaser.

S5. Location of Test Coupons

S5.1 Test coupons from locations in addition to those specified in 4.2 may be specified subject to agreement between the manufacturer and purchaser.

APPENDICES

(Nonmandatory Information)

X1. LAMELLAR TEARING ADJACENT TO WELDS

X1.1 Introduction

X1.1.1 Lamellar tearing is a particular type of cracking that occurs under the weld of a steel plate weldment. It is generally caused by strain induced in the thickness direction resulting from shrinkage of the weld deposit and by the restraint imposed by the components that comprise the weldment. High restraint increases the possibility of lamellar tearing. However, lamellar tearing is not solely confined to highly restrained weldments. Lamellar tearing may also result from loads on the plate surface.

X1.2 Characteristics of Lamellar Tearing

X1.2.1 Lamellar tearing normally occurs in susceptible material underneath the weld, in a direction generally parallel to the plate surface and often slightly outside the heat-affected zone. Lamellar tearing generally has a step-like appearance consisting of “terraces” (cracks running parallel to the plate surface) and “walls” (cracks which connect the individual terraces). The tearing may remain completely subsurface or appear at plate edges or at weld toes.

X1.3 Inclusions

X1.3.1 The step-like cracking characteristic of lamellar tearing is usually considered to result from small elongated nonmetallic inclusions that are normally present in the steel. Strains in the through-thickness direction can cause individual inclusions to fracture or decohere from the surrounding steel matrix, thus initiating a void. Further strain can cause the remaining metallic ligaments to shear or rupture, resulting in the step-like fracture appearance.

X1.3.2 A high or concentrated inclusion content in the steel produces planer regions of poor ductility parallel to the steel surface. On the other hand, a reduction in the magnitude and concentration of these inclusions to a low level tends to preclude any easy fracture path along the low ductility inclusions and the steel exhibits improved ductility in a through-thickness direction.

X1.3.3 The extent of nonmetallic inclusions depends on the type of steel. In silicon semikilled or fully killed steels, these inclusions are primarily oxides (present as silicates) and sulfides (present as manganese sulfides). For aluminum-silicon killed steels, these inclusions are primarily sulfides (manganese sulfides). To improve the through-thickness ductility and thus the resistance of the steel to

lamellar tearing, it is necessary to reduce the level of the nonmetallic inclusions. To provide a high resistance to lamellar tearing may require the use of special steel-making processes that can reduce the oxygen and sulfur contents in the steel to very low levels.

X1.4 Steel Manufacturing Processes

X1.4.1 Special steel-making processes are available for improving the through-thickness ductility. The more common processes, used singly or in combination, are: (1) low sulfur practices; (2) inclusion shape control; (3) electroslag or vacuum are remelting; and (4) vacuum degassing. The steel-making processes are not all intended for the same purpose, but will improve the through-thickness ductility to various degrees depending on the process used.

X1.5 Through-Thickness Ductility Requirements

X1.5.1 Susceptibility to lamellar tearing depends on many factors (for example, restraint, welding conditions, etc.) and, consequently a specific through-thickness ductility requirement does not provide a guarantee against lamellar tearing. The most widely accepted method of measuring the material ductility factor of susceptibility to lamellar tearing is the reduction of area of a round tension test specimen oriented perpendicular to the rolled surface of a plate.

X2. TESTING PARAMETERS AFFECTING REDUCTION OF AREA VALUES

X2.1 Variability of Through-Thickness Properties

X2.1.1 Through-thickness tension test results, and in particular the reduction of area determination as provided for in this specification, are subject to substantially greater scatter than would normally be expected from standard tension tests of a plate in the longitudinal or transverse direction. This scatter of test results is due in part to the inherent variability of the distribution of the nonmetallic inclusions discussed in X1.3. For example, those nonmetallic inclusions that form during the solidification phase of the steelmaking process tend to occur with a higher frequency in the area of final solidification.

X2.1.2 Test specimen design may also have an effect on the test results. Some of these factors are discussed in X2.2. Operator technique will also be a factor in increasing scatter, particularly in the measurement of the final diameter of the test specimen. Because of the effect of inclusions

on the fracture process, the appearance of the final fracture may be quite different than the classical cup-cone fractures common to longitudinal and transverse tension testing. For those materials with approximately 20% reduction of area, the final diameter measurement may require a substantial amount of judgment on the part of the test operator.

X2.1.3 In view of the potential variability of the through-thickness reduction of area test results, it is recognized that two tests per plate are not sufficient to fully characterize the through-thickness ductility of that plate. The number of tests and test positions have not been established that would provide a good estimate of both the mean and the variability of through-thickness tensile reduction of values of a plate. Therefore, an average value requirement is not included in this specification. The intent of this specification is to qualify a plate according to the described testing procedures using only a minimum value requirement. The potential variability of the test results also increases the possibility that subsequent testing of a steel plate qualified according to this specification may produce results that do not meet the specified acceptance standard.

X2.2 Effects of Test Specimen Design

X2.2.1 Two main factors considered in the selection of test specimen geometry were the diameter and the slen-

derness ratio. It is generally accepted that there is a diameter effect on reduction-of-area values such that a smaller diameter specimen generally yields a higher average reduction in area value. It is also accepted that smaller diameter test specimens will tend to give greater variability to the resulting reduction in area values. Because these relationships between the test specimen diameter and the average and variability of the test result have not been satisfactorily quantified at this time, the same minimum requirement has been applied to all test specimen diameters.

X2.2.2 The slenderness ratio (reduced section length/reduced section diameter) is known to affect the reduction in area values when below a minimum value. This minimum value may be from 1.5 to 2.5, depending on the material. Below this minimum value, the reduction at the failure point in the reduced section is restrained by the larger cross section away from the reduced section. A minimum slenderness ratio of 2 was selected for the standard Type 2 specimen to allow a 0.500 in. [12.5 mm] diameter specimen to be used on a 1 in. [25 mm] plate. A minimum slenderness ratio of 2.5 was selected for the collar-button specimens (Types D, E, and F) to ensure that this effect is minimized for these test specimens.

SPECIFICATION FOR CASTINGS, STEEL AND ALLOY, COMMON REQUIREMENTS, FOR GENERAL INDUSTRIAL USE

SA-781/SA-781M

(Identical with ASTM Specification A 781/A 781M-06.)

1. Scope

1.1 This specification covers a group of requirements that are mandatory requirements of the following steel casting specifications issued by ASTM. If the product specification specifies different requirements, the product specification shall prevail.

ASTM Designation	Title of Specification
A 27/A 27M	Steel Castings, Carbon, for General Application
A 128/A 128M	Steel Castings, Austenitic Manganese
A 148/A 148M	Steel Castings, High-Strength, for Structural Purposes
A 297/A 297M	Steel Castings, Iron-Chromium and Iron-Chromium-Nickel, Heat-Resistant for General Application
A 447/A 447M	Steel Castings, Chromium-Nickel-Iron Alloy (25-12 Class), for High-Temperature Service
A 494/A 494M	Castings, Nickel and Nickel Alloy
A 560/A 560M	Castings, Chromium-Nickel Alloy
A 743/A 743M	Castings, Iron-Chromium, Iron-Chromium-Nickel, Corrosion Resistant, for General Application
A 744/A 744M	Castings, Iron-Chromium-Nickel, Corrosion Resistant, for Severe Service
A 747/A 747M	Steel Castings, Stainless, Precipitation Hardening
A 890/A 890M	Castings, Iron-Chromium-Nickel-Molybdenum Corrosion-Resistant, Duplex (Austenitic/Ferritic) for General Application
A 915/A 915M	Steel Castings, Carbon and Alloy Chemical Requirements Similar to Standard Wrought Grades
A 958	Steel Castings, Carbon and Alloy, with Tensile Requirements, Chemical Requirements Similar to Standard Wrought Grades
A 1002	Castings, Nickel-Aluminum Ordered Alloy

1.2 This specification also covers a group of supplementary requirements that may be applied to the above specifications as indicated therein. These are provided for use when additional testing or inspection is desired and apply only when specified individually by the purchaser in the order.

1.3 The requirements of the individual material specification, and this general specification shall prevail in the sequence named.

1.4 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification. Inch-pound units are applicable for material ordered to Specification A 781 and SI units for material ordered to Specification A 781M.

3. Terminology

3.1 Definitions:

3.1.1 The definitions in Test Methods and Definitions A 370, Test Methods, Practices, and Terminology A 751, and Terminology A 941 are applicable to this specification and those listed in 1.1.

3.1.2 *test coupon, n* — the part from which the test specimen will be extracted.

3.1.3 *test specimen, n* — the part that will be acted upon in a test.

4. Materials and Manufacture

4.1 *Melting Process* — The steel shall be made by open-hearth or electric furnace process with or without separate refining, such as argon-oxygen-decarburization (AOD), unless otherwise specified in the individual specification.

4.2 Heat Treatment:

4.2.1 Castings shall be heat treated in the working zone of a furnace that has been surveyed in accordance with Test Method A 991/A 991M.

4.2.2 When castings are heat treated at temperatures above 2000°F [1100°C], then the working zone shall have been established by a survey performed at not more than 25°F [15°C] below nor more than 200°F [110°C] above the minimum heat treatment temperature specified for the grade. If a minimum heat treatment temperature is not specified for the grade, then the survey temperature shall be not more than 50°F [30°C] below nor more than 175°F [100°C] above the furnace set point used.

4.2.3 The maximum variation in measured temperature as determined by the difference between the highest temperature and the lowest temperature shall be as agreed between the purchaser and producer except that during production heat treatment, no portion of the furnace shall be below the minimum specified temperature nor above the maximum specified temperature for the grade being processed.

5. Chemical Composition

5.1 *Chemical Analysis* — Chemical analysis of materials covered by this specification shall be in accordance with Test Methods, Practices, and Terminology A 751.

5.2 *Heat Analysis* — An analysis of each heat shall be made by the manufacturer to determine the percentages of

the elements specified in the individual specification for the grade being poured. The analysis shall be made from a test sample preferably taken during the pouring of the heat. When drillings are used, they shall be taken not less than $\frac{1}{4}$ in. [6.4 mm] beneath the surface. The chemical composition thus determined shall conform to the requirements in the individual specification for the grade being poured.

5.3 Product Analysis — A product analysis may be made by the purchaser from material representing each heat, lot, or casting. The analysis shall be made on representative material. Samples for carbon analysis of carbon and alloy steel shall be taken no closer than $\frac{1}{4}$ in. [6 mm] to a cast surface, except that castings too thin for this shall be analyzed on representative material. The chemical composition thus determined shall meet the requirements specified in the applicable specification for the grade involved, or shall be subject to rejection by the purchaser, except that the chemical composition determined for carbon and low alloy steel castings may vary from the specified limits by the amounts shown in Table 1. The product analysis tolerances of Table 1 are not applicable as acceptance criteria for heat analysis by the casting manufacturer. When comparing product and heat analysis for other than carbon and low alloy steels, the reproducibility Data R_2 , in Test Methods E 353 or E 354, as applicable, shall be taken into consideration.

5.4 Unspecified Elements — When chemical analysis for elements not specified for the grade ordered is desired, Supplementary Requirement S13 may be specified.

5.4.1 Grade substitution, for stainless steel or nickel base alloy castings, is not permitted. Grade substitution occurs when the material supplied:

- (1) contains an element, other than nitrogen, that is not specified in the ordered grade; and,
- (2) the amount of that element equals or exceeds the minimum requirement for the element in another grade for which it is specified.

For this requirement, a grade is defined as an alloy described individually in a table of chemical requirements within any specification listed within the scope of A 781/A 781M.

6. Mechanical Test Requirements

6.1 The individual product specifications vary as to whether mechanical tests are required; for this reason, and to determine specific test requirements, the individual product specification should be reviewed.

6.2 Unless otherwise specified by the purchaser, when mechanical properties are required by the product specification, test coupons may be cast integrally with the castings, or as separate blocks, in accordance with Fig. 1, Fig. 2, or Fig. 3, except when Supplementary Requirement S15 is specified. The test coupon in Fig. 3 shall be

employed only for austenitic alloy castings with cross sections less than $2\frac{1}{2}$ in. [65 mm].

7. Workmanship, Finish, and Appearance

7.1 All castings shall be made in a workmanlike manner and shall conform to the dimensions on drawings furnished by the purchaser before manufacture is started. If the pattern is supplied by the purchaser, the dimensions of the casting shall be as predicated by the pattern.

8. Quality

8.1 The surface of the casting shall be free of adhering sand, scale, cracks, and hot tears as determined by visual examination. Other surface discontinuities shall meet the visual acceptance standards specified in the order. Practice A 802/A 802M or other visual standards may be used to define acceptable surface discontinuities and finish. Unacceptable visual surface discontinuities shall be removed and their removal verified by visual examination of the resultant cavities.

8.2 When additional inspection is desired, Supplementary Requirements S1, S2, S3, S4, or S5 may be specified.

8.3 Rejectable indications shall not be peened, plugged, or impregnated.

9. Repair

9.1 Repair by welding shall be in accordance with the requirements of the individual specification using procedures and welders qualified in accordance with Practice A 488/A 488M.

10. Inspection

10.1 The manufacturer shall afford the purchaser's inspector all reasonable facilities necessary to satisfy that the material is being produced and furnished in accordance with the applicable specification. Foundry inspection by the purchaser shall not interfere unnecessarily with the manufacturer's operations. All tests and inspections, with the exception of product analysis (5.3), shall be made at the place of manufacture unless otherwise agreed.

11. Rejection

11.1 Subsequent to acceptance at the manufacturer's works, material that is found to be unacceptable as determined by requirements specified in the order may be rejected by the purchaser. The manufacturer should be notified of such rejection. If the manufacturer is dissatisfied with the results of any tests performed by the purchaser, he may make claim for a reheating.

12.1 castings; common requirements; steel and alloy

FIG. 1 TEST COUPONS FOR CASTINGS WITH DETAILS OF DESIGN

GENERAL NOTE: Radius of casting coupon interface at option of foundry.

Metric Equivalents

in.	$\frac{3}{16}$	$\frac{1}{2}$	$1\frac{1}{4}$	$1\frac{3}{4}$	2	$2\frac{1}{4}$	$3\frac{7}{8}$	5	$8\frac{3}{8}$
[mm]	[4.8]	[13]	[32]	[45]	[51]	[57]	[98]	[127]	[213]

Leg Design [125 mm]

1. L (length)	A 5 in. [125 mm] minimum length will be used. This length may be increased at the option of the foundry to accommodate additional test specimens (see Note 1).
2. End Taper	Use of and size of end taper is at the option of the foundry.
3. Height	$1\frac{1}{4}$ in. [32 mm]
4. Width (at top)	$1\frac{1}{4}$ in. [32 mm] (see Note 1).
5. Radius (at bottom)	$\frac{1}{2}$ in. [13 mm], max
6. Spacing between legs	A $\frac{1}{2}$ in. [13 mm] radius will be used between the legs.
7. Location of test specimens	The tensile, bend, and impact specimens will be taken from the lower portion of the leg (see Note 2).
8. Number of legs	The number of legs is at the option of the foundry providing they are equi-spaced according to item 6.
9. R_s	Radius from 0 to approximately $\frac{1}{16}$ in. [2 mm].

Riser Design

1. L (length)	The length of the riser at the base will be the same as the top length of the leg. The length of the riser at the top therefore depends on the amount of taper added to the riser.
2. Width	The width of the riser at the base of a multiple-leg coupon shall be $n(2\frac{1}{4})$ [57 mm] - $\frac{5}{8}$ [16 mm] where n equals the number of legs attached to the coupon. The width of the riser at the top is therefore dependent on the amount of taper added to the riser.
3. T (riser taper) height	Use of and size is at the option of the foundry. The minimum height of the riser shall be 2 in. [51 mm]. The maximum height is at the option of the foundry for the following reasons: (a) many risers are cast open. (b) different compositions may require variation in risering for soundness. (c) different pouring temperatures may require variation in risering for soundness.

NOTE 1 — *Test Coupons for Large and Heavy Steel Castings*: The test coupons in Fig. 1 are to be used for large and heavy steel castings. However, at the option of the foundry the cross-sectional area and length of the standard coupon may be increased as desired.

NOTE 2 — *Bend Specimen*: If a bend specimen is required, an alternate design (as shown by dotted lines in Fig. 1) is indicated.

FIG. 2 TEST COUPON FOR TENSION TEST

Metric Equivalents

in.	(mm)	in.	(mm)
1/8	(3.2)	3 1/2	(88.9)
1/2	(12.7)	4	(101.6)
1 1/16	(27.0)	4 1/16	(103.2)
1 1/2	(38.1)	5	(127.0)
3	(76.2)	11	(279.4)

GENERAL NOTE: Pour through head; cover molten head with powdered charcoal, coke dust, etc., immediately after pouring, in order to keep head fluid as long as possible.

FIG. 3 CAST-TO-SHAPE TEST COUPON FOR TENSION SPECIMEN

GENERAL NOTE: Coupons produced in this manner are suitable for austenitic alloys only. The mold may be preheated for pouring to produce a sound coupon.

TABLE 1
PRODUCT ANALYSIS TOLERANCES

Element	Range, % ^A	Tolerances ^{B,C} Over Maximum or Under Minimum Limit, %
C	up to 0.65	$0.03 \times \% C_L + 0.02$
	above 0.65	0.04
Mn	up to 1	$0.08 \times \% Mn_L + 0.01$
	above 1	0.09
Si	up to 0.60	$0.22 \times \% Si_L - 0.01$
	above 0.60	0.15
P	all	$0.13 \times \% P_L + 0.005$
S	all	$0.36 \times \% S_L + 0.001$
Ni	up to 2	$0.10 \times \% Ni_L + 0.03$
	above 2	0.25
Cr	up to 2	$0.07 \times \% Cr_L + 0.04$
	above 2	0.18
Mo	up to 0.6	$0.04 \times \% Mo_L + 0.03$
	above 0.6	0.06
V	up to 0.25	$0.23 \times \% V_L + 0.004$
	above 0.25	0.06
W	up to 0.10	$0.08 \times \% W_L + 0.02$
	above 0.10	0.02
Cu	up to 0.15	$0.18 \times \% Cu_L + 0.02$
	above 0.15	0.05
Al	up to 0.10	$0.08 \times \% Al_L + 0.02$
	above 0.10	0.03

^A The range denotes the composition limits up to which tolerances are computed by the equation, and above which the tolerances are given by a constant.

^B The subscript _L for the elements in each equation indicates that the limits of the element specified by the applicable specification are to be inserted into the equation to calculate the tolerance for the upper limit and the lower limit (if applicable), respectively. Examples of computing tolerances are presented in footnote C.

^C To illustrate the computation of the tolerance, consider the manganese maximum of 0.70 for an 0.30 carbon grade 65–35 in Specification A 27/A 27M. The maximum permissible deviation is $(0.08 \times 0.70 + 0.01) = 0.066$. Therefore, the highest acceptable product analysis is 0.766. Similarly, for a 0.20 carbon grade 70–40 in Specification A 27/A 27M, the maximum manganese content is 1.40; thus, the highest acceptable product analysis is $(1.40 + 0.09) = 1.49$.

SUPPLEMENTARY REQUIREMENTS

Supplementary requirements shall be applied only when specified by the purchaser. Details of the supplementary requirements shall be agreed upon by the manufacturer and purchaser. The specified tests shall be performed by the manufacturer prior to shipment of the castings.

S1. Magnetic Particle Examination

S1.1 Castings shall be examined for surface and near surface discontinuities by magnetic particle examination. The examination shall be in accordance with Guide E 709. Extent of examination and the basis for acceptance shall be agreed upon between the manufacturer and purchaser.

S2. Radiographic Examination

S2.1 Castings shall be examined for internal defects by means of X rays or gamma rays. The procedure shall be in accordance with Guide E 94, and types and degrees of discontinuities considered shall be judged by Reference Radiographs E 446, E 186, or E 280. Extent of examination and basis for acceptance shall be agreed upon between the manufacturer and purchaser.

S3. Liquid Penetrant Examination

S3.1 Castings shall be examined for surface discontinuities by means of liquid penetrant examination. The examination shall be in accordance with Test Method E 165. Areas to be inspected, methods and types of liquid penetrants to be used, developing procedure, and basis for acceptance shall be agreed upon between the manufacturer and purchaser.

S4. Ultrasonic Examination

S4.1 Castings shall be examined for internal defects by means of ultrasonic examination. The examination procedure shall be in accordance with Practice A 609/A 609M. Extent of examination, methods of testing, and basis for acceptance shall be agreed upon between the manufacturer and purchaser.

S5. Examination of Weld Preparation

S5.1 Magnetic particle or liquid penetrant examination of cavities prepared for welding shall be performed to verify removal of those discontinuities found unacceptable by the examination method specified for the casting. Unless other degrees of shrinkage or types of discontinuities found in the cavities are specified, Type II, Internal Shrinkage, of Reference Photographs E 125, of Degree 2 in sections

up to 2 in. [50.8 mm] thick and of Degree 3 in sections over 2 in. thick shall be acceptable.

S6. Certification

S6.1 The manufacturer's certification shall be furnished to the purchaser stating that the material was manufactured, sampled, tested, and inspected in accordance with the material specification (including year date) and was found to meet the requirements.

S6.2 A manufacturer's certification printed from or used in electronic form from an electronic data interchange (EDI) transmission shall be regarded as having the same validity as a counterpart printed in the certifier's facility provided it conforms to any existing EDI agreement between the purchaser and the supplier.

S7. Prior Approval of Major Weld Repairs

S7.1 Major weld repairs as defined and agreed upon between the manufacturer and purchaser shall be subject to the prior approval of the purchaser.

S8. Marking

S8.1 The manufacturer's name or identification mark and the pattern number shall be cast or stamped on all castings. When further specified, the heat numbers or serial numbers shall be marked on individual castings.

S9. Charpy Impact Test

S9.1 Charpy impact test properties shall be determined by testing a set of three Charpy V-notch specimens made from each heat at a test temperature agreed upon by the manufacturer and purchaser. The material from which the test specimens are prepared shall be cast in accordance with 6.2. The acceptance requirements shall be either energy absorbed, lateral expansion, or percent shear area, or all three, and shall be that agreed upon between the manufacturer and purchaser. Test specimens shall be prepared as Type A and tested in accordance with Test Methods and Definitions A 370.

S9.2 Absorbed Energy — Average energy value of three specimens shall be not less than specified, with not more

than one value permitted to fall below the minimum specified and no value permitted below the minimum specified for a single specimen.

S9.3 Lateral Expansion — Lateral expansion value shall be agreed upon between the manufacturer and purchaser.

S9.4 Percent Shear Area — Percent shear area shall be agreed upon between the manufacturer and purchaser.

S10. Hardness Test

S10.1 Hardness measurements at specified locations on the castings shall be made in accordance with Test Methods and Definitions A 370 and reported.

S11. Specified Ferrite Content Range

S11.1 The chemical composition of the heat shall be controlled such that the ferrite content, as determined by the chemical composition procedure of Practice A 800/A 800M, shall be in conformance with the specified ferrite content range.

S11.2 The specified ferrite content range shall be as agreed upon between the manufacturer and the purchaser. The minimum specified ferrite content range shall be 10% with the minimum ferrite content being no lower than the percent necessary to achieve the minimum mechanical properties required for the alloy.

S11.3 Should the purchaser wish to have the ferrite content determined by either magnetic response or metallographic methods, the purchaser should impose Supplementary Requirement S1 or S2 of Practice A 800/A 800M.

S12. Test Report

S12.1 The manufacturer shall supply a test report to the purchaser giving the results of all tests performed including chemical analysis.

S13. Unspecified Elements

S13.1 Chemical analysis and limits for elements not specified for the grade ordered shall be as agreed upon between the manufacturer and purchaser.

S14. Tension Test from Castings

S14.1 In addition to the tension test required by the material specification, test material shall be cut from the casting. The mechanical properties and location for the test material shall be agreed upon by the manufacturer and purchaser.

S15. Alternate Mechanical Test Coupons and Specimen Locations for Castings

S15.1 Test coupons may be cast integrally with the castings or separately. Separately cast coupons shall be heat-treated together with the castings they represent.

S15.2 In the following, the casting thickness, T , is the maximum thickness of the casting exclusive of padding added for directional solidification, flanges, appendages, and sections designated by the designer as noncritical. The order, inquiry, and drawing shall designate what the test dimension, T , is for the casting.

S15.3 One of the following shall apply:

S15.3.1 The longitudinal centerline of the test specimen shall be taken at least $\frac{1}{4} T$ from the T dimension surface and all of the gage length must be at least $1T$ from any other heat treated surface, exclusive of the surface opposite the T dimension surface. [See Fig. S15.1(a).] For cylindrical castings, the longitudinal centerline of the specimens shall be taken at least $\frac{1}{4} T$ from the outside or inside and all of the gage length must be at least T from the as-heat-treated end. [See Fig. S15.1(b).] For ferritic and martensitic castings, partial severing of test coupons prior to final heat treatment is permitted.

S15.3.2 Where separately cast test coupons are used, the dimension shall not be less than $3T$ by $3T$ by T and each specimen shall meet the requirements of S15.3.1, except that when T exceeds 5 in. [125 mm], the dimension may be 15 by 15 by 5 in. [375 by 375 by 125 mm], by agreement between the manufacturer and the purchaser. The test coupon shall be of the same heat of steel and shall receive substantially the same casting practices as the production casting it represents. Centrifugal castings may be represented by statically cast coupons. (See Fig. S15.2.)

S15.3.3 When agreed upon by the manufacturer and the purchaser, castings that are cast or machined to essentially the finished configuration prior to heat-treatment shall have test specimens removed from a prolongation or other stock on the casting at a location below the nearest heat-treated surface indicated on the order. The specimen location shall be at a distance below the nearest heat-treated surface equivalent to at least the greatest distance that the indicated high-tensile-stress surface will be from the nearest heat-treated surface and a minimum of twice this distance from a second heat-treated surface, except that the test specimens shall be no nearer than $\frac{3}{4}$ in. [19 mm] to a heat-treated surface and $1\frac{1}{2}$ in. [38 mm] from a second heat-treated surface. (See Fig. S15.3.)

S15.3.4 Where specimens are to be removed from the body of quenched and tempered castings, either the requirements of S15.3.1 shall be met or a steel thermal buffer pad or thermal insulation or other thermal barriers shall be used during heat-treatment. Steel thermal buffer

pads shall be a minimum of T by T by $3T$ in length and shall be joined to the casting surface by a partial penetration weld completely sealing the buffered surface. Test specimens shall be removed from the casting in a location adjacent to the center third of the buffer pad. They shall be located at a minimum distance of $\frac{1}{2}$ in. [13 mm] from the buffered surface and $\frac{1}{4} T$ from other heat-treated surfaces (see Fig. S15.4). When thermal insulation is used, it shall be applied adjacent to the casting surface where the test specimens are to be removed. The producer shall demonstrate that the cooling rate of the test specimen location is no faster than that of specimens taken by the method described in S15.3.1.

S16. Weld Repair Charts

S16.1 Major weld repairs shall be documented by means of sketches or photographs, or both, showing the location and major dimensions of cavities prepared for welding. Documentation shall be submitted to the purchaser at the completion of the order.

S16.2 A weld repair shall be considered major when it is made to correct leakage on hydrostatic testing, or when the depth of the cavity prepared for welding exceeds 20% of the actual wall thickness or 1 in. [25 mm], whichever is smaller, or when the extent of the cavity exceeds approximately 10 in.² [65 cm²].

S17. Macroetch Test

S17.1 Apply Supplementary Requirement S13 for the spectrographic determination and reporting of the total residual aluminum content of all heats of ferritic and martensitic steels subjected to this macroetch test.

S17.2 When the heat analysis indicates a total residual aluminum content in excess of 0.08%, the manufacturer shall etch a cross section of the casting with the heaviest section for which this supplementary requirement is invoked, or a coupon attached to that heaviest section or an area directly under a riser (see Note S17.1). Cross sections from a separately cast test block from the same heat and of a thickness representative of the heaviest section of castings purchased under this supplementary requirement may also be used for macroetch testing. The etching shall be performed on the selected section after its heat treatment, that is, after annealing, normalizing, or quenching and tempering following the initial cooling of the steel below the transformation range.

NOTE S17.1 — High strength martensitic castings, in particular, may be damaged beyond use if the etch is applied directly to the casting.

S17.3 The preparation of the surface and the macro-etching procedure with Solution No. 1 (1:1 HCl) of Table 5 in Test Method E 340 shall be followed. The resulting etched surface shall be compared and rated with the reference photographs in Fig. S17.1 depicting ten levels of severity of intergranular network structures indicative of the presence of aluminum nitride or other constituents prone toward precipitating at grain boundaries during solidification and subsequent cooling. Fig. S17.1 relates the severity levels shown in these photographs with specific delineation widths and percent of boundary outlining in the etched structures.

S17.4 Castings represented by etched structures exhibiting a network rating in excess of Severity Level 4 shall be considered unacceptable until further evaluations are completed. The acceptability of individual castings may be determined by etching sections of each casting to ascertain the network severity level. Disposition of unacceptable castings shall be a matter of agreement between the manufacturer and purchaser. Those castings exhibiting etched severity levels greater than four may be evaluated further by any of the following agreed-upon methods:

S17.4.1 Fracture testing to determine the amount of “rock candy” structure.

S17.4.2 Mechanical testing (for example, bend, tensile) to determine the ductility characteristics.

S17.4.3 Weld testing to determine crack susceptibility in the heat-affected zone of a circular groove welded with cellulose-coated electrodes.

S17.5 Alternatively, by agreement, it is permissible to subject castings from an unacceptable heat to a high temperature solution treatment prior to the normal production heat-treatment and subsequently macroetch test each casting.

S17.6 Heavy section castings (see Note S17.2) whose configurations are amenable to the attachment of test coupons representative of the section thickness involved and from which standard 0.505 in. [12.827 mm] diameter tension specimens may be machined are exempt from this macroetch test if the results of the tension test on the coupon after heat-treatment of the casting meet the minimum requirements specified for the grade of steel involved.

NOTE S17.2 — For purposes of this supplementary requirement, a heavy section casting is defined as one having a wall thickness of $1\frac{1}{2}$ in. [37 mm] or greater, in combination with a casting weight of at least 1000 lb [455 kg].

S18. Hot Isostatic Pressing (HIPing)

S18.1 Castings shall be processed by Hot Isostatic Pressing (HIPing). The processing parameters for the HIPing process may be subject to an agreement between the manufacturer and purchaser.

S19. Cleaning of Stainless Steels

S19.1 Final cleaning of the casting surfaces shall be performed in accordance with one of the cleaning methods in Practice A 380 or Specification A 967 as agreed upon

between the purchaser and the supplier. Acceptance testing shall be subject to agreement between the purchaser and supplier.

FIG. S15.1 SPECIMEN FROM CASTING

Minimum length of the base—Specimen gage length + 2xT + 2x the thickness due to the taper.

Minimum width of the base— $T + 2 \times$ the thickness added due to the taper.

Minimum height— $T + N \times D + W_{tot}$

The taper is to be selected by the producer for ease of drawing the pattern from the mold.

where:

N = number of specimens to be cut from one side of the coupon,

D = diameter of the specimens, and

W_{tot} = the total width of metal required to remove the coupon from the casting, and to machine specimens from the coupon.

GENERAL NOTE: Longitudinal axis and gage length of test specimen must be within shaded zone.

FIG. S15.4 THERMAL BUFFER PAD

GENERAL NOTE: Longitudinal axis and gage length of test specimen must be within cross-hatched zone.

FIG. S17.1 REFERENCE PHOTOGRAPHS OF MACROETCHED CAST STEEL

GENERAL NOTE: The ten levels of severity of intergranular network structures shown are indicative of the presence of aluminum nitride precipitation in the primary austenitic grain boundaries.

APPENDIXES

(Nonmandatory Information)

X1. ALLOY DESIGNATIONS FOR CAST STAINLESS STEELS

X1.1 Cast stainless steels are usually specified on the basis of composition using the alloy designation system established by the Alloy Casting Institute (ACI). The ACI designations, for example, CF8M, have been adopted by ASTM and are preferred for cast alloys over the designations used by the American Iron and Steel Institute for similar wrought steels.

X1.2 This nomenclature system has served successfully to accommodate changes in old alloys and to designate new ones.

X1.2.1 Service Classification Letter — The first letter of the cast stainless steel designation system identifies the intended service application of the alloy. The letter C indicates corrosion-resistant service, and the letter H indicates the heat-resistant service at and above 1200°F [649°C].

X1.2.2 Ternary Diagram Location Letter — The second letter indicates the approximate location of the nickel and chromium contents of the alloy grade on the FeCrNi ternary diagram shown in Fig. X1.1.

X1.2.3 Carbon Content Number — For C service classifications, this single or dual digit numeral represents the maximum carbon content in units of 0.01%. For H service classifications, this number represents the midpoint of the range of carbon content in terms of 0.01% with a $\pm 0.05\%$ limit.

X1.2.4 Special Elements Letter — Additional letters following the numeral represent special chemical elements in the alloy grade, such as M for molybdenum, C for columbium, Cu for copper, W for tungsten. There are two exceptions; the letter A indicates Controlled Ferrite, and the letter F indicates Free Machining.

X1.3 In Fig. X1.1, unlettered Ni-Cr ranges are associated with the nearest lettered location. They may be the

result of differences between corrosion and heat-resistant types, or because of the influence of additional elements, for example, the precipitation hardening grade CB-7Cu-1 and CB-7Cu-2.

**X2. WROUGHT ALLOYS SIMILAR TO CASTING ALLOYS IN SPECIFICATIONS
A 494/A 494M, A 743/A 743M, A 744/A 744M,
A 747/A 747M, AND A 890/A 890M**

X2.1 Table X2.1 is provided for the user of the above listed specifications as an aid in selecting cast alloys that are similar in chemical composition to wrought alloys. It is not intended to imply that the cast alloy would have the same mechanical, physical or corrosion properties as the indicated wrought alloy.

X3. ADDITION OF NEW GRADES TO PRODUCT SPECIFICATIONS COVERED BY A 781/A 781M

X3.1 Information required for the inclusion of new material grades in product specifications covered by A 781/A 781M:

1. At least one user should support the request.
2. A set of data from ten production heats, this data should include:

X3.1.1 Chemical composition.

X3.1.2 Mechanical properties as applicable to the product specification being cited. These may include but are not limited to the following:

X3.1.2.1 Ultimate tensile strength,

X3.1.2.2 Yield strength,

X3.1.2.3 Reduction in area,

X3.1.2.4 Elongation, and

X3.1.2.5 Impact properties (Charpy V).

X3.2 The test coupon size from which the test pieces are removed should be stated for each test.

X3.2.1 Heat treatment requirements.

X3.2.2 Weld procedure (welding should be carried out using commercially available consumables).

FIG. X1.1 LETTERS ASSIGNED TO CHROMIUM AND NICKEL RANGES IN ACI DESIGNATION SYSTEM

GENERAL NOTES:

(a) The approximate areas of microstructures to be expected at room temperature are indicated as follows:

- I — Martensite
- II — Martensite and untransformed austenite
- III — Ferrite plus martensite and untransformed austenite
- IV — Ferrite
- V — Ferrite plus austenite
- VI — Ferrite plus austenite plus sigma
- VII — Austenite

(b) Carbides also may be present depending on carbon content and thermal history.

SPECIFICATION FOR STEEL FORGINGS, GENERAL REQUIREMENTS

SA-788/SA-788M

(Identical with ASTM Specification A 788/A 788M-06)

1. Scope

1.1 This specification covers a group of common requirements that, unless otherwise specified in the individual product specification, shall apply to steel forgings under any of the following specifications issued by ASTM:

ASTM Designation	Title
A 266/A 266M	Carbon Steel Forgings for Pressure Vessel Components
A 288	Carbon and Alloy Steel Forgings for Magnetic Retaining Rings for Turbine Generators
A 289/A 289M	Alloy Steel Forgings for Nonmagnetic Retaining Rings for Generators
A 290/A 290M	Carbon and Alloy Steel Forgings for Rings for Reduction Gears
A 291	Steel Forgings, Carbon and Alloy, for Pinions, Gears, and Shafts for Reduction Gears
A 336/A 336M	Alloy Steel Forgings for Pressure and High-Temperature Parts
A 372/A 372M	Carbon and Alloy Steel Forgings for Thin-Walled Pressure Vessels
A 427	Wrought Alloy Steel Rolls for Cold and Hot Reduction
A 469/A 469M	Vacuum-Treated Steel Forgings for Generator Rotors
A 470/A 470M	Vacuum-Treated Carbon and Alloy Steel Forgings for Turbine Rotors and Shafts
A 471	Vacuum-Treated Alloy Steel Forgings for Turbine Rotor Disks and Wheels
A 508/A 508M	Quenched and Tempered Vacuum-Treated Carbon and Alloy Steel Forgings for Pressure Vessels
A 521	Steel, Closed-Impression Die Forgings for General Industrial Use
A 541/A 541M	Quenched and Tempered Carbon and Alloy Steel Forgings for Pressure Vessel Components
A 579/A 579M	Superstrength Alloy Steel Forgings
A 592/A 592M	High-Strength Quenched and Tempered Low-Alloy Steel Forged Fittings and Parts for Pressure Vessels
A 649/A 649M	Forged Steel Rolls Used for Corrugating Paper Machinery

ASTM Designation	Title
A 668/A 668M	Steel Forgings, Carbon and Alloy, for General Industrial Use
A 723/A 723M	Alloy Steel Forgings for High-Strength Pressure Component Application
A 765/A 765M	Carbon Steel and Low-Alloy Steel Pressure-Vessel-Component Forgings with Mandatory Toughness Requirements
A 768/A 768M	Vacuum-Treated 12% Chromium Alloy Steel Forgings for Turbine Rotors and Shafts
A 837/A 837M	Steel Forgings, Alloy, for Carburizing Applications
A 859/A 859M	Age-Hardening Alloy Steel Forgings for Pressure Vessel Components
A 891	Precipitation Hardening Iron Base Superalloy Forgings for Turbine Rotor Disks and Wheels
A 909	Steel Forgings, Microalloy, for General Industrial Use
A 940	Vacuum Treated Steel Forgings, Alloy, Differentially Heat Treated, for Turbine Rotors
A 965/A 965M	Steel Forgings, Austenitic, for Pressure and High Temperature Parts
A 983/A 983M	Specification for Continuous Grain Flow Forged Carbon and Alloy Steel Crankshafts for Medium Speed Diesel Engines
A 1021	Martensitic Stainless Steel Forgings and Forging Stock for High-Temperature Service

1.2 In case of conflict in requirements, the requirements of the individual product specifications shall prevail over those of this specification.

1.3 The purchaser may specify additional requirements (see 4.2.3) that do not negate any of the provisions of either this specification or of the individual product specifications. The acceptance of any such additional requirements shall be dependent on negotiations with the supplier and must be included in the order.

1.4 If, by agreement, forgings are to be supplied in a partially completed condition, that is, all of the provisions of the product specification have not been filled, then the

material marking (see Section 17) and certification (see Section 16) shall reflect the extent to which the product specification requirements have been met.

1.5 As noted in the Certification Section (16), the number and year date of this specification, as well as that of the product specification, are required to be included in the product certification.

1.6 When the SI version of a product specification is required by the purchase order, Specification A 788/A 788M shall be used.

1.7 The values stated in either SI units or inch-pound units are to be regarded separately as standard. The values stated in each system may not be exact equivalents; therefore, each system shall be used independently of the other. Combining values from the two systems may result in non-conformance with the standard.

1.8 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

3. Terminology

3.1 Terminology A 941 is applicable to this specification. Additional terms and wording more applicable to forgings are as noted in this section.

3.2 Definitions:

3.2.1 steel forging — the product of a substantially compressive plastic working operation that consolidates the material and produces the desired shape. The plastic working may be performed by a hammer, press, forging machine, or ring rolling machine, and must deform the material to produce an essentially wrought structure. Hot rolling operations may be used to produce blooms or billets for reforging. Forgings may be subdivided into the following three classes on the basis of their forging temperatures:

3.2.1.1 cold-worked forgings — forgings produced by plastic working well below the temperature range at which recrystallization of the material occurs. Cold-worked forgings must be made from material previously hot worked by forging or rolling.

3.2.1.2 hot-cold-worked forgings — forgings worked at elevated temperatures slightly below the recrystallization range to increase mechanical strength. Hot-cold-worked forgings must be made from material previously hot worked by forging or rolling. A hot-cold-worked forging may be produced in one continuous operation wherein the material is first hot worked and then cold worked by control of the finishing temperature.

Discussion — Because of differences in manufacture, hot-rolled, or hot-rolled and cold-finished bars (semi-finished or finished), billets, or blooms are not considered to be forgings.

3.2.1.3 hot-worked forgings — forgings produced by working at temperatures above the recrystallization temperature for the material.

3.3 Billets and Blooms — Interchangeable terms representing hot-worked semi-finished product intended as a starting stock for making forgings.

3.3.1 Discussion — No size limitations are assumed for either term. Cast shapes produced by a continuous casting process, without subsequent work, are considered to be ingots for the purposes of this specification, and if supplied as billets or blooms must carry the descriptor *Cast Billet* or *Cast Bloom*.

3.4 Definitions of Terms Specific to This Standard:

3.4.1 bottom pouring — steel from a single heat, or from a multiple heat tapped into a common ladle (see 8.1.1 and 8.1.2), introduced into ingot mold(s) such that they are filled from the bottom up. One or more molds can be set up on an individual plate, and more than one plate may be poured in sequence from a heat. The plate is generally constructed such that the molten steel can be ducted through refractory channels to the bottom of each mold on the plate. The steel is poured into a central sprue that is high enough to permit filling the ingot molds to the required level.

3.4.2 ingot — the product obtained when molten steel, upon being cast into a mold, is subsequently capable of being wrought in conformance with 3.1. Open-ended molds, that are usually cooled and used, for example, in the continuous casting of steel, are considered to be included in this definition.

3.4.3 intercritical heat treatment — use of a multi-stage heat treatment procedure in which the material is first austenitized at a temperature above the upper critical temperature (A_{c3}) followed by cooling below the lower critical temperature (A_{c1}). The material is then reheated to a temperature in the intercritical range between the A_{c1} and the A_{c3} and again cooled below the A_{c1} , followed by subcritical tempering in the range specified in the material specification.

3.4.3.1 Discussion — This procedure is generally applicable to low hardenability carbon and low alloy steels that would usually have a microstructure of ferrite and pearlite in the heat treated section size of the component being heat treated.

3.4.4 killed steel — steel deoxidized, either by the addition of strong deoxidizing agents or by vacuum treatment, to reduce the oxygen content to such a level that

essentially no reaction occurs between carbon and oxygen during solidification

3.4.4.1 Discussion — Vacuum carbon deoxidation (VCD) is a steelmaking process in which primary deoxidation occurs during vacuum treatment as a result of the carbon-oxygen reaction. In order for primary deoxidation to occur during vacuum treatment, deoxidizing agents such as aluminum or silicon are not to be added to the melt in any significant amount prior to the vacuum treatment operation.

3.4.4.2 Discussion — Precipitation deoxidation is a steelmaking process in which primary deoxidation is achieved by the addition of strong deoxidizing agents, such as aluminum, early in the process, and holding the steel in the molten state for sufficient time for the products of deoxidation to separate from the melt to the slag.

3.4.5 sequential or continuous strand casting — steel from several heats poured consecutively into a cooled open-ended mold to form a continuous cast product with a change from heat to heat along its length.

3.4.6 strand casting — steel from one heat poured into a cooled open-ended mold to form a continuous strand or strands.

4. Ordering Information

4.1 It shall be the responsibility of the purchaser to specify all requirements that are necessary for forgings under the applicable product specification. Such requirements to be considered include, but are not restricted to, the following:

4.1.1 Quantity,

4.1.2 Dimensions, including tolerances and surface finishes, and so forth.

4.1.3 Specification number with type, class, and grade as applicable (including year date), and should include:

4.1.4 Number of copies of the material test report.

4.2 Additional information including the following may be added by agreement with the supplier:

4.2.1 Type of heat treatment when alternative methods are allowed by the product specification,

4.2.2 Supplementary requirements, if any, and

4.2.3 Additional requirements (see 1.4, 16.1.5, and 16.1.6).

4.2.4 Repair welding NOT permitted.

4.3 For dual format specifications, unless otherwise specified, the inch-pound units shall be used.

5. Melting Process

5.1 Unless otherwise specified in the product specification, the steel shall be produced by any of the following primary processes: electric-furnace, basic oxygen, vacuum-induction (VIM), or open-hearth. The primary melting may incorporate separate degassing or refining and may be followed by secondary melting, using electro slag remelting (ESR) or vacuum arc remelting (VAR).

5.1.1 The steel shall be fully killed.

5.2 The molten steel may be vacuum-treated prior to or during pouring of the ingot.

5.2.1 When vacuum treatment of the molten steel is required by the product specification the following conditions shall apply:

5.2.1.1 When the vacuum stream degassing process is used, the vacuum system must be of sufficient capacity to effect a blank-off pressure low enough (usually less than 1000 μm) to break up the normal tight, rope-like stream of molten metal into a wide-angled conical stream of relatively small droplets. The capacity of the system must also be sufficiently high to reduce the initial surge pressure at the start of the pour to a low level within 2 min.

5.2.1.2 When the vacuum-lift process is utilized, the molten metal shall be repeatedly drawn into the evacuated vessel to give a recirculation factor (see Annex A1) of at least 2.5 to ensure thorough degassing and mixing of the entire heat. The evacuation system shall be capable of reducing the pressure surges, which occur each time a new portion of steel is admitted to the vessel to increasingly lower levels, until a blank-off pressure (usually less than 1000 μm) is achieved signifying the end of the degassing treatment.

5.2.1.3 When the ladle degassing process is used, the evacuation system shall be capable of reducing the system vacuum pressure to a low level (usually less than 1000 μm). The molten metal shall be adequately stirred for a sufficient length of time to maximize exposure to the evacuated atmosphere.

5.2.1.4 Other methods of vacuum treatment may be used if the supplier can demonstrate adequate degassing and acceptable properties in the finished forging to the satisfaction of the purchaser.

6. Forging

6.1 Forgings shall be made in accordance with 3.2.1.

7. Cooling Prior to Heat Treatment

7.1 After forging and before reheating for heat treatment, the forgings shall be allowed to cool in such a manner

as to prevent injury and, in the case of ferritic forgings, to permit substantially complete transformation of austenite.

8. Chemical Composition

8.1 Heat Analysis:

8.1.1 An analysis of each heat of steel shall be made by the steel producer to determine the percentages of those elements specified in the product specification. This analysis shall be made from a test sample preferably taken during the pouring of the heat and shall conform to the requirements of the product specification.

8.1.2 When multiple heats are tapped into a common ladle, the ladle chemistry shall apply. The chemical composition thus determined shall conform to the requirements of the product specification.

8.1.3 For multiple-heat ingots, either individual heat analyses or a weighted average (see Annex A2) may be taken. The results of the method used shall conform to the requirements of the product specification.

8.1.4 With the exception of the product from multiple heats sequentially cast in strand casting machines (see 8.1.5), if the test sample taken for a heat analysis is lost or declared inadequate for chemical determinations, the steel producer may take alternative samples from appropriate locations near the surface of the ingot or forging as necessary to establish the analysis of the heat in question.

8.1.5 For multiple heats sequentially cast in strand casting machines, the heat analysis shall be determined for each individual heat in accordance with 8.1.1 or 8.1.2 if applicable.

8.1.5.1 If, for multiple heats sequentially strand cast, the test sample is lost or declared inadequate for chemical analysis determination, alternative samples, remote from the transition zones, may be taken by the steel producer from the cast material or product of that heat, as defined in 8.2 or 8.3 as appropriate.

8.1.6 Heat Analysis for Remelted Ingots:

8.1.6.1 When consumable remelting processes are used, a chemical analysis shall be taken from a remelted ingot (or the product of a remelted ingot) for the remelt heat analysis.

8.1.6.2 When more than one electrode is prepared from a master or parent heat for remelting in the same facility by the same process, then the heat analysis obtained from one remelted ingot, or the product from that ingot, shall be taken as the heat analysis for all of the remelted ingots from that master heat. For analysis from each remelted ingot, see S27.

8.1.6.3 When electrodes from different master heats are remelted sequentially, an analysis shall be made

in each zone of the remelted ingot corresponding to at least one electrode from each master heat. The resultant chemical analysis of each zone shall conform to the requirements of the product specification. The heat analysis of the remelted ingot shall be represented by a weighted average (see Annex A2) of the individual chemical analyses for each zone.

8.1.6.4 Limits on aluminum content in remelt ingots shall be set as required in the product specification.

8.2 Heat Number Assignment for Sequentially Strand Cast Material — When heats of the same chemical composition are sequentially strand cast, the heat number assigned to the cast product may remain unchanged until all of the steel in the product is from the following heat, except when Supplementary Requirement S3 is invoked.

8.3 Identification of Material of Different Chemical Composition Ranges, Sequentially Strand Cast — Because of intermixing in the tundish, separation and identification of the resultant transition material is required when steels of different chemical composition ranges are sequentially strand cast. The steel producer shall remove the transition material by any established procedure that positively separates the grades.

8.4 Product Analysis:

8.4.1 An analysis may be made by the purchaser from a forging representing each heat or multiple heat (see 8.1). Samples for analysis may be taken from the forging or from a full-size prolongation at any point from the midradius to the outer surface of disk or other solid forgings or midway between the inner and outer surfaces of hollow or bored forgings. The analysis may also be taken from a mechanical test specimen or the mechanical test location as defined in the product specification.

8.4.2 The chemical composition thus determined shall conform to the heat analysis requirements of the forging specification subject to the permissible variations specified in Table 1, for those elements listed in the product specification. Limitations on the application of the allowances in Table 1 may be made in the product specification for specified elements.

8.5 Residual and Unspecified Elements — Provisions for the limitation of certain residual and unspecified elements have been made in Supplementary Requirements S1 and S2, respectively.

8.6 Grade substitution is not permitted.

8.7 Method of Analysis — Methods included in Test Methods, Practices, and Terminology A 751 shall be used for referee purposes.

9. Heat Treatment

9.1 Heat treatment shall be performed as specified in the product specification. Supplementary Requirement S4

concerns a specialized heat treat process (see 3.4.3) whose application will be controlled in the product specification. Unless otherwise specified during a heat treating hold cycle, the recorded furnace temperature shall be within $\pm 25^{\circ}\text{F}$ [$\pm 15^{\circ}\text{C}$] of the controlling set point temperature. Material shall be heat treated in the working zone of a furnace that has been surveyed in accordance with Test Method A 991/A 991M provided that the working zone was established using a variation of $\pm 25^{\circ}\text{F}$ [$\pm 15^{\circ}\text{C}$] or less from the furnace set point.

10. Mechanical Testing

10.1 Test Methods — All tests shall be conducted in accordance with Test Methods and Definitions A 370.

10.1.1 In addition to the hardness testing provisions of Test Methods and Definitions A 370, comparison hardness testing in accordance with Practice A 833 may be used in determining the hardness of forgings.

10.2 Retests — If the results of the tension tests do not conform to the requirements specified, retests are permitted as outlined in Test Methods and Definitions A 370 or as follows:

10.2.1 If the percentage of elongation or reduction of area of any tension test specimen is less than specified because a flaw becomes evident in the test specimen during testing, a retest shall be allowed provided that the defect was not attributable to ruptures, cracks, or flakes in the steel.

10.2.2 If the average impact energy value meets the specification requirements, but the energy value for one specimen is below the specified minimum value for individual specimens prescribed in the material specification, a retest is permitted. This shall consist of two impact specimens from a location adjacent to and on either side of the specimen that failed. Each of the retested specimens must exhibit an energy value equal to or greater than the minimum average value required by the product specification.

11. Reheat Treatment

11.1 If the results of the initial mechanical tests do not conform to the specified requirements, the forgings may be heat treated (if initially tested in the as-forged condition) or reheat treated (if heat treated prior to initial testing).

12. Repair Welding

12.1 Repair welding of forgings is not permitted unless specifically allowed by the product specification (see also 4.2.4).

13. Dimensions and Finish

13.1 The forgings shall conform to the dimensions, tolerances, and finishes required by the ordering information (4.1.2). Supplementary Requirements S5 or S6, concerning straightening of forgings, may be used.

14. Inspection

14.1 All tests and inspections other than 8.4 shall be made at the place of manufacture, unless otherwise agreed upon.

14.2 The manufacturer shall afford the purchaser's inspector all reasonable facilities necessary to satisfy him that the material is being produced and furnished in accordance with the material specification.

14.3 Mill inspection by the purchaser shall not interfere unnecessarily with the manufacturer's operations.

15. Rejection

15.1 Any rejection based on the presence of an injurious defect found subsequent to acceptance at the manufacturer's works or based on the results of a product analysis made in accordance with 8.4 shall be reported to the manufacturer.

15.2 Disposition of forgings rejected by the purchaser under 15.1 shall be as agreed upon between manufacturer and the purchaser.

16. Certification

16.1 The manufacturer shall furnish to the purchaser the number of copies of the material test report specified in the ordering information (4.1.4). The following items shall be reported:

16.1.1 Purchase order number,

16.1.2 Forging identification number,

16.1.3 The product specification number, including the year date and revision letter if any, as well as the appropriate class, type, and grade,

16.1.3.1 Reference to Specification A 788/A 788M including the year date together with the applicable revision letter, if any, of the revision used shall be a part of the certification.

16.1.4 Heat number and analysis,

16.1.5 Results of the required acceptance tests for mechanical properties,

16.1.6 Results of any required nondestructive examinations,

16.1.7 Final heat treatment cycle including austenitizing and tempering temperatures and holding times and

cooling methods if required by the product specification or 4.2.3,

16.1.8 Extent to which the forging is incomplete with respect to the product specification (see 1.4 and 16.1.7), and

16.1.9 Results of any supplementary and additional test requirements that were specified.

16.1.10 The material test report may be sent to the purchaser in electronic form from an electronic data interchange (EDI) transmission, and this shall be regarded as having the same validity as a counterpart printed in the certifier's facility. The content of the EDI transmitted document shall meet the requirements of the invoked ASTM standard(s) and conform to any existing EDI agreement between the purchaser and the supplier. Notwithstanding the absence of a signature, the organization submitting the EDI transmission is responsible for the content of the report.

17. Packaging and Package Marking

17.1 Each forging shall be legibly identified as required by the product specification and instructions from the purchaser. When not otherwise defined, each forging shall be identified by the manufacturer as follows:

17.1.1 Manufacturer's name or symbol.

17.1.2 Manufacturer's identification or heat number.

17.1.3 Product specification number.

17.1.4 The class, grade, and type identification as appropriate.

17.1.5 Purchaser's identification (4.2.3).

17.1.6 Location of stamping (4.2.3).

17.1.7 Incomplete forging (1.4). The marking shall include the suffix Y immediately following the ASTM number, and preceding any other suffix. This suffix shall not be removed until the material specification requirements have been completed and the material test report supplemented.

17.2 Marking shall be done by impression stamping or other acceptable means specified in the product specification or order. Bar coding is an acceptable supplemental identification method. The purchaser may specify in the order a specific bar coding system to be used. The bar coding system, if applied at the discretion of the supplier, should be consistent with one of published industry standards for bar coding.

17.3 The specification year date, and revision letter are not required to be marked on the forgings.

18. Keywords

18.1 general delivery requirements; steel forgings—alloy; steel forgings—carbon

GENERAL NOTES:

- (1) This table covers permissible variations in product analysis for most of the elements commonly found in killed steels under the jurisdiction of A01.06. This table is applicable only for those elements for which product analysis variations are permitted by the material specification. The listed variation value is subtracted from the minimum specified limit, or added to the maximum specified limit for the heat analysis in the product specification.
- (2) Product cross-sectional area (taken at right angles to the axis of the original ingot or billet) is defined as either: (1) maximum cross-sectional area of rough machined forging (excluding boring), (2) maximum cross-sectional area of the unmachined forging, or (3) maximum cross-sectional area of the billet bloom or slab.

NOTE:

- (A) When the product size range up to 100 in.² [650 cm²] is deleted, then the 100 to 200-in.² [650 to 1300 cm²] column shall be changed to read up to and including 200 in.² [1300 cm²].

SUPPLEMENTARY REQUIREMENTS (GENERAL)

The following supplementary general requirements are common to the forging specifications listed in this specification. These and other limitations or tests may be performed by agreement between the supplier and purchaser. The additional requirements shall be specified in the order, and shall be completed by the supplier before the shipment of the forgings.

S1. Residual Elements

S1.1 Small quantities of certain unspecified elements may be present in carbon and low alloy steel forgings. These elements are considered as incidental and may be present to the following maximum amounts:

Copper	0.35%
Nickel	0.30%
Chromium	0.25%
Molybdenum	0.10%
Vanadium ^A	0.03%

^A Unless Supplementary Requirement S2 is required.

S2. Unspecified Elements

S2.1 Vanadium used for grain refinement or deoxidation shall not exceed 0.08%.

S3. Sequential or Continuous Strand Casting

S3.1 When multiple heats of the same chemical composition range are sequentially strand cast, the heats shall be separated by an established procedure such that intermix material will not be supplied.

S4. Intercritical Heat Treatment

S4.1 The austenitizing stage in the heat treatment of ferritic forgings is intended to be done at suitable temperatures above the upper critical temperature (Ac_3) for the heat of steel involved, that is, full austenitization. However, when multiple austenitizing stages are used the temperature for the last may be set between the upper (Ac_3) and lower (Ac_1) critical temperature for partial austenitizing. Such cycles shall be followed by tempering within the temperature limits required by the material specification.

S5. Straightening of Forgings

S5.1 Unless otherwise specified by Supplementary Requirement S6, straightening of forgings after heat treatment for properties shall be performed at a temperature which is not more than 100°F [55°C] below the final tempering temperature. Following straightening, forgings shall be stress relieved at a temperature of 50 to 100°F [30 to

55°C] below the final tempering temperature and shall be reported on the material test report. Any straightening performed before heat treatment for properties does not require an intermediate stress-relief heat treatment.

S6. Post-Heat Treatment Straightening of Forgings

S6.1 Straightening after heat treatment for specified properties is not permitted without prior approval by the purchaser.

S7. Fracture Toughness Test

S7.1 The purchaser shall specify one or more of the following test methods for fracture toughness determination. Required information including test temperature, conditioning, environment, and acceptance criteria shall be provided as necessary.

S7.2 Determination of the plane strain fracture toughness in accordance with Test Method E 399.

S7.3 Fracture toughness determination in accordance with Test Method E 1820.

S7.4 Crack-tip opening displacement determination in accordance with Test Method E 1290.

S8. Vacuum Degassing

S8.1 The vacuum degassing requirements of 5.2 shall apply.

S9. Vacuum Carbon Deoxidation

S9.1 The molten steel shall be vacuum carbon deoxidized (VCD) during processing, in which case the silicon content shall be 0.10% maximum.

S10. Restricted Phosphorus and Sulfur, Levels A or B

S10.1 For level A, the phosphorus and sulfur levels shall be limited as follows:

		Heat	Product
Level A	P	0.015% maximum	0.018% maximum
	S	0.018% maximum	0.021% maximum

S10.2 For level B, the phosphorus and sulfur levels shall be limited to the following:

		Heat	Product
Level B	P	0.012% maximum	0.015% maximum
	S	0.015% maximum	0.018% maximum

S11. Restricted Copper, Levels A or B

S11.1 For level A, the heat and product analyses limits for copper shall be 0.15% maximum.

S11.2 For level B, the heat and product analyses limits for copper shall be 0.10% maximum.

S12. Tension Specimens for Hubbed Flanges and Tube Sheets

S12.1 For hubbed tube sheets and flanges to be used in ASME Boiler and Pressure Vessel Code construction, an axial tension specimen shall be taken as close as possible to the hub and either inboard or outboard of it, using a sub size specimen if necessary. The longitudinal axis of the specimen shall be parallel to the length of the hub, as shown in Fig. S1.

S12.2 By agreement with the purchaser, this test orientation may replace a specified tension test specimen, provided that other location criteria are met.

S13. Charpy Impact Tests

S13.1 Charpy impact tests shall be made. The number, orientation and location of the tests shall be specified along with the test temperature and the applicable acceptance criteria for absorbed energy, fracture appearance, lateral expansion, or both.

S13.2 The specimens shall be machined and tested in accordance with Test Methods and Definitions A 370.

S14. Charpy V Notch Impact Transition Curve

S14.1 Sufficient impact tests shall be made from the forging material to establish a transition temperature curve based upon one or several of the following criteria:

S14.1.1 Absorbed energy (ft·lbf [J]) (See Test Methods E 23),

S14.1.2 Fracture appearance (see Supplement 5 of Test Methods and Definitions A 370), or

S14.1.3 Lateral expansion.

S14.1.4 The test temperature range shall be wide enough to establish the upper and lower shelf energies, with sufficient testing at intermediate temperatures to permit a

smooth curve to be plotted. A minimum test temperature may be set by agreement instead of establishing the lower shelf temperature. The upper shelf energy level is defined as having at least 95% fibrous fracture and the lower shelf level is defined as showing 5% or less fibrous fracture.

S14.2 The purchaser shall furnish the manufacturer with details of sample location, number of specimens, heat treatments, and information to be derived from the test.

S15. Grain Size

S15.1 When a grain size range is required, it shall be specified in the ordering information as heat treated or austenitic, and shall be determined by an agreed-upon method from Test Methods E 112.

S15.2 Samples for grain size estimation from heat treated products shall be taken from the tension test specimen location.

S16. Rough Machining and Boring

S16.1 The position of the rough machining and boring in the manufacturing sequence shall be specified by the purchaser, particularly with regard to heat treatment for mechanical properties.

S17. Simulated Post-Weld Heat Treatment of Mechanical Test Samples

S17.1 All test coupons shall be subjected to single or multiple heat treatments at subcritical temperatures prior to testing. Such treatments are intended to simulate post-weld or other treatments to which the forgings will be subjected during subsequent fabrication. The purchaser shall furnish the manufacturer with details of the desired heat treatment for the test coupons, including temperatures, times, and cooling rates.

S18. Magnetic Particle Examination

S18.1 All accessible surfaces of the finished forging shall be subject to magnetic particle examination in accordance with Test Method A 275/A 275M.

S18.2 Unless otherwise agreed upon between the manufacturer and the purchaser the wet continuous method shall be used.

S18.2.1 The following conditions are subject to rejection or removal:

S18.2.1.1 Indications with major dimension exceeding $\frac{3}{16}$ in. [5 mm].

S18.2.1.2 Four or more indications exceeding $\frac{1}{16}$ in. [1.5 mm] in major dimensions that are aligned and separated by $\frac{1}{16}$ in. [1.5 mm] or less end to end.

S18.2.1.3 Ten or more indications exceeding $\frac{1}{16}$ in. [1.5 mm] in major dimensions contained in any 6 in.² [40 cm²] of surface, with the major dimension of this area not to exceed 6 in. [150 mm]. The area shall be taken in the most unfavorable location relative to the indications being evaluated.

S19. Liquid Penetrant Examination

S19.1 All accessible surfaces of the finished forging shall be subject to liquid penetrant examination in accordance with Test Method E 165. The penetrant system to be used shall be agreed upon between the manufacturer and purchaser.

S19.2 The following conditions are subject to rejection or removal:

S19.2.1 Indications with major dimensions exceeding $\frac{3}{16}$ in. [5 mm].

S19.2.2 Four or more indications exceeding $\frac{1}{16}$ in. [1.5 mm] in major dimensions that are aligned and separated by $\frac{1}{16}$ in. [1.5 mm] or less end to end.

S19.2.3 Ten or more indications exceeding $\frac{1}{16}$ in. [1.5 mm] in major dimensions contained in any 6 in.² [40 cm²] of surface, with the major dimension in this area not to exceed 6 in. [150 mm]. The area shall be taken in the most unfavorable location relative to the indications being evaluated.

S20. Ultrasonic Examination

S20.1 Ultrasonic examination of forgings shall be carried out in accordance with Practice A 388/A 388M.

S20.2 Unless otherwise agreed upon between the manufacturer and the purchaser, acceptance levels BR or DA shall be specified for the longitudinal wave examination and level S for shear wave examination.

Level BR—Longitudinal Wave

S20.2.1 The back reflection method of tuning shall be used in accordance with Practice A 388/A 388M.

S20.2.2 In addition to the reportable conditions of the Recording Section of Practice A 388/A 388M, indications exceeding the resultant back reflection shall be recorded.

S20.2.3 The following conditions are subject to rejection, or repair if applicable.

S20.2.3.1 Complete loss of back reflection accompanied by an indication of a discontinuity. For this purpose, a back reflection less than 5% of full screen height shall be considered complete loss of back reflection.

S20.2.3.2 An indication equal in amplitude to that of the back reflection established in an indication-free portion of the forging.

Level DA—Longitudinal Wave

S20.2.4 Reference blocks of acoustically similar metal shall be used for calibration. Blocks shall meet one of the following requirements:

S20.2.4.1 A comparison of the back reflections between equivalent thicknesses of the reference block material and the actual forging to be tested, without change in instrument setting shall not show a variation in excess of 25%.

S20.2.4.2 The reference blocks shall be manufactured from steel that is similar in chemistry and processing history to the production forging being tested. The reference blocks shall be fabricated in accordance with the procedures of Practice E 428.

S20.2.4.3 For test sections up to and including 12 in. [300 mm] thick, the reference blocks shall contain a $\frac{1}{4}$ in. [6 mm] diameter flat-bottom hole; for over 12 in. [300 mm] up to and including 18 in. [300 to 450 mm], the hole diameter shall be $\frac{3}{8}$ in. [10 mm]; and for over 18 in. [450 mm], it shall be $\frac{1}{2}$ in. [13 mm].

S20.2.4.4 A distance-amplitude correction curve shall be established for the proper grade of steel and specified hole size.

S20.2.4.5 A forging containing one or more indications equal in amplitude to that of the applicable reference hole, when properly corrected for distance, is subject to rejection, or repair if applicable.

Level S—Shear Wave

S20.2.5 Calibration notches, calibration reference, and method of scanning shall be in accordance with Practice A 388/A 388M. Unless otherwise agreed upon, a 60° V-notch shall be used.

S20.2.6 A forging containing a discontinuity that results in an indication exceeding the amplitude of the reference line is subject to rejection.

S20.2.7 The report of the ultrasonic examination shall be in compliance with Practice A 388/A 388M.

S20.2.8 Additional nondestructive examination or trepanning may be employed to resolve questions of interpretation of ultrasonic indications. The manufacturer shall accept responsibility for injurious conditions that will not be removed in final machining.

S21. Additional Test Coupon Heat Treatment

S21.1 When subcritical heat treatment, applied to a completed forging during subsequent fabrication, may

affect the mechanical properties of the forging, then coupons for the mechanical testing required by the product specification shall be given a laboratory heat treatment, which simulates the anticipated subcritical heat treatment.

S21.2 The purchaser shall specify the required heat treatment temperature range, minimum time at temperature, and the rates of heating and cooling.

S21.3 The required number of test coupons shall be taken from the forging location described in the product specification.

S21.4 The test specimens shall meet the minimum mechanical test requirements of the product specification, as well as those of any additional tests agreed upon between producer and purchaser, after completion of the test coupon heat treatment.

S21.5 The forgings supplied in accordance with this supplementary requirement shall be marked in accordance with 17.1.7.

S21.6 The material test reports shall include the heat treatment of the as-delivered material and the results of the mechanical tests from the test coupons subjected to the purchaser specified heat treatments that represent fabrication.

S22. Ultrasonic Examination from Bore Surface

S22.1 Bored cylindrical forgings shall be examined from the bored surface in accordance with Test Method A 939. The acceptance criteria shall be agreed upon between the purchaser and the producer.

S23. Magnetic Particle Examination Using AC Current

S23.1 The designated surfaces of ferromagnetic steel forgings shall be examined at the stage in machining specified by the purchaser in accordance with Test Method A 966/A 966M. The acceptance criteria for the examination shall be specified by the purchaser.

S24. J_{factor}

S24.1 The J_{factor} , calculated by means of the following equation, shall be established for each heat of steel used in forging manufacture:

$$J_{\text{factor}} = (Mn + Si) (P + Sn) \times 10^4$$

Has been found to be effective in reducing temper embrittlement effects.

S24.2 The purchaser shall specify the required maximum value of J_{factor} in both the inquiry and ordering documents.

S24.3 The determination of the tin content of the steel is necessary for the application of this supplementary requirement even if there is no chemical analysis requirement for tin in the product specification.

NOTE — In Dr. Paul Bate's paper it was noted that the Fracture Appearance Transition Temperature (FATT) fell steadily from J_{factor} 120 to 60, but below 20, the drop in FATT was much less apparent.

S25. Positive Material Identification

S25.1 Forgings shall receive positive material identification to ensure that forgings are of the ordered material grade prior to shipment.

S25.2 Forgings shall receive a positive material identification in accordance with Guide E 1916.

S25.3 The entire ordered quantity of forgings shall be examined.

S25.4 Forgings not conforming to the ordered grade shall be rejected.

S25.5 Following this material identification examination, acceptable forgings shall be marked as agreed between the purchaser and producer.

S26. Pressure Equipment Directive—Mechanical Testing

S26.1 Charpy impact testing shall be done at the lowest scheduled operating temperature, but not higher than 68°F [20°C].

S26.2 The frequency of Charpy impact testing shall be the same as that specified in the product specification for the tension test, with one Charpy test (3 specimens) for each required tension test.

S26.3 The minimum individual absorbed energy for the Charpy impact test shall be 20 ft-lbf [27 J].

S26.4 The minimum elongation in the tension test shall be measured on a gauge length of five times the diameter of the test specimen (5D), and shall be not less than 14%.

S26.5 The results of the impact and tension tests shall be included in the product certification.

S27. Heat Analysis for Remelted Ingots

S27.1 Instead of the heat analysis provisions in 8.1.6.2 of Specification A 788/A 788M for consumable electrode remelting processes, a heat analysis shall be obtained from each remelted ingot (or the product from it) from single master or parent heat.

S27.2 The product analysis provisions of Specification A 788/A 788M shall not apply.

FIG. S1 TENSION TEST SPECIMENS

GENERAL NOTE: Tension test specimens also may be located inboard of the hub.

ANNEXES

(Mandatory Information)

A1. RECIRCULATION FACTOR

A1.1 The recirculation factor for the vacuum lift process is obtained as follows:

$$\frac{\text{Tons (kg) of Steel Lifted per Cycle} \times \text{Number of Cycles}}{\text{Heat Weight in Tons [kg]}}$$

more heats wherein the resultant chemistry of the ingot assumes an identity attributable to each heat involved in the combination. It is necessary to make this determination to ensure that each element in the official chemistry is represented by proportion to its amount in each individual furnace heat. An example of the determination of a weighted average analysis for an ingot made from a three-heat combination pour with varying weights and chemistry involved in each heat is shown below:

A2. EXPLANATORY NOTE FOR WEIGHTED AVERAGE ANALYSIS

A2.1 A weighted average analysis is mandatory whenever an ingot is poured from the combination of two or

Furnace	Heat ^A Weight, tons	Individual Heat Chemistry, %								
		C	Mn	P	S	Si	Ni	Cr	Mo	V
A	25	0.20	0.50	0.010	0.020	0.34	0.92	0.32	0.12	0.03
B	50	0.25	0.50	0.013	0.015	0.38	0.98	0.32	0.12	0.02
C	50	0.25	0.50	0.015	0.018	0.38	0.94	0.34	0.13	0.02
	125 ^B									

^A This is individual heat contribution to the total ingot weight.

^B Total ingot weight.

Step # 1—Determine furnace factor (FF) for each heat based on weight.

$$\text{Furnace A} = 25/125 = 20\%$$

$$\text{Furnace B} = 50/125 = 40\%$$

$$\text{Furnace C} = 50/125 = 40\%$$

$$\text{FF} = \frac{(\text{Individual Furnace Ht. Wt})}{(\text{Combined Heat Weight})} \times 100\%$$

Step # 2—Calculate the weighted average for each element. Examples for several elements shown below:

Weighted avg = sum of (% element in each furnace heat × FF)

(°) Weighted avg of Carbon (weighted avg):

$$\text{Furnace A}—0.20\% \times 20\% = 0.04\%$$

$$\text{Furnace B}—0.25\% \times 40\% = 0.10\%$$

$$\text{Furnace C}—0.25\% \times 40\% = 0.10\%$$

Add to get weighted avg of 0.24%

(°) Weighted avg of manganese:

$$\text{Furnace A}—0.50\% \times 20\% = 0.10\%$$

$$\text{Furnace B}—0.50\% \times 40\% = 0.20\%$$

$$\text{Furnace C}—0.50\% \times 40\% = 0.20\%$$

Add to get weighted avg of 0.50%

(°) Weighted avg of phosphorus:

$$\text{Furnace A}—0.010\% \times 20\% = 0.002\%$$

$$\text{Furnace B}—0.013\% \times 40\% = 0.0052\%$$

$$\text{Furnace C}—0.015\% \times 40\% = 0.006\%$$

Add to get weighted avg of 0.013%(A)

^A Round to significant figures in accordance with Practice E 380.

[°] The same procedure is used for all of the other elements.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR SEAMLESS AND WELDED FERRITIC/AUSTENITIC STAINLESS STEEL TUBING FOR GENERAL SERVICE

SA-789/SA-789M

(Identical with ASTM Specification A 789/A 789M-05b except that the sulfur content for S32808 in Table 1 is corrected to 0.010.)

1. Scope

1.1 This specification covers grades of nominal wall thickness, stainless steel tubing for services requiring general corrosion resistance, with particular emphasis on resistance to stress corrosion cracking. These steels are susceptible to embrittlement if used for prolonged periods at elevated temperatures.

1.2 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification. The inch-pound units shall apply unless the *M* designation of this specification is specified in the order.

2. Referenced Documents

2.1 ASTM Standards:

- A 480/A 480M Specification for General Requirements for Flat-Rolled Stainless and Heat-Resisting Steel Plate, Sheet, and Strip
- A 1016/A 1016M Specification for General Requirements for Ferritic Alloy Steel, Austenitic Alloy Steel, and Stainless Steel Tubes
- E 527 Practice for Numbering Metals and Alloys (UNS)

2.2 SAE Standard:

- SAE J 1086 Practice for Numbering Metals and Alloys (UNS)

3. Ordering Information

3.1 Orders for product under this specification should include the following, as required, to describe the desired material adequately:

3.1.1 Quantity (feet, metres, or number of lengths),

3.1.2 Name of product (seamless or welded tubes),

3.1.3 Grade (see Table 1),

3.1.4 Size (outside diameter and nominal wall thickness),

3.1.5 Length (specific or random),

3.1.6 Optional requirements (for product analysis, see Section 8; for hydrostatic or nondestructive electric test, see Section 10),

3.1.7 Test report required (see the Inspection section of Specification A 1016/A 1016M),

3.1.8 Specification designation, and

3.1.9 Special requirements.

4. General Requirements

4.1 Product furnished under this specification shall conform to the applicable requirements of Specification A 1016/A 1016M, unless otherwise provided herein.

5. Manufacture

5.1 The tubes shall be made by the seamless or welded process with no filler metal added.

6. Heat Treatment

6.1 All tubes shall be furnished in the heat-treated condition in accordance with the procedures shown in Table 2. For seamless tubes, as an alternate to final heat treatment in a continuous furnace or batch-type furnace, immediately following hot forming while the temperature of the tubes is not less than the specified minimum solution

treatment temperature, tubes may be individually quenched in water or rapidly cooled by other means.

7. Chemical Composition

7.1 The steel shall conform to the chemical requirements prescribed in Table 1.

8. Product Analysis

8.1 An analysis of either one billet or one length of flat-rolled stock or one tube shall be made from each heat. The chemical composition thus determined shall conform to the requirements specified.

8.2 A product analysis tolerance (see the annex table on Chemical Requirements (Product Analysis Tolerances) in Specification A 480/A 480M) shall apply. The product analysis tolerance is not applicable to the carbon content for material with a specified maximum carbon of 0.04% or less.

8.3 If the original test for product analysis fails, retests of two additional billets, lengths of flat-rolled stock, or tubes shall be made. Both retests for the elements in question shall meet the requirements of this specification; otherwise, all remaining material in the heat shall be rejected or, at the option of the producer, each billet or tube may be individually tested for acceptance. Billets, lengths of flat-rolled stock, or tubes that do not meet the requirements of this specification shall be rejected.

NOTE 1 — For flange and flaring requirements, the term lot applies to all tubes prior to cutting of the same nominal size and wall thickness that are produced from the same heat of steel. When final heat treatment is in a batch-type furnace, a lot shall include only those tubes of the same size and from the same heat that are heat treated in the same furnace charge. When the final heat treatment is in a continuous furnace, or when heat treated condition is obtained directly by quenching after hot forming, the number of tubes of the same size and from the same heat in a lot shall be determined from the size of the tubes as prescribed in Table 3.

NOTE 2 — For tension and hardness test requirements, the term lot applies to all tubes prior to cutting, of the same nominal diameter and wall thickness that are produced from the same heat of steel. When final heat treatment is in a batch-type furnace, a lot shall include only those tubes of the same size and the same heat that are heat treated in the same furnace charge. When the final heat treatment is in a continuous furnace, or when heat treated condition is obtained directly by quenching after hot forming, a lot shall include all tubes of the same size and heat, heat treated in the same furnace at the same temperature, time at heat, and furnace speed, or all tubes of the same size and heat, hot formed and quenched in the same production run.

9. Mechanical Tests Required

9.1 Tension Tests — One tension test shall be made on a specimen for lots of not more than 50 tubes. Tension tests shall be made on specimens from two tubes for lots of more than 50 tubes (see Note 2).

9.2 Flaring Test (for Seamless Tubes) — One test shall be made on specimens from one end of one tube from each lot (see Note 1) of finished tubes. The minimum expansion of the inside diameter shall be 10%.

9.3 Flange Test (for Welded Tubes) — One test shall be made on specimens from one end of one tube from each lot (see Note 1) of finished tubes.

9.4 Hardness Test — Brinell or Rockwell hardness tests shall be made on specimens from two tubes from each lot (see Note 2).

9.5 When more than one heat is involved, the tension, flaring, flanging, and hardness test requirements shall apply to each heat.

9.6 Reverse Flattening Test — For welded tubes, one reverse flattening test shall be made on a specimen from each 1500 ft [450 m] of finished tubing.

10. Hydrostatic or Nondestructive Electric Test

10.1 Each tube shall be subjected to the nondestructive electric test or the hydrostatic test. The type of test to be used shall be at the option of the manufacturer, unless otherwise specified in the purchase order.

10.2 The hydrostatic test shall be in accordance with Specification A 1016/A 1016M, except that in the calculation of the hydrostatic test pressure *64000 (441.2)* shall be substituted for *32000 (220.6)*.

11. Tensile and Hardness Properties

11.1 The material shall conform to the tensile and hardness properties prescribed in Table 4.

12. Permissible Variations in Dimensions

12.1 Variations in outside diameter, wall thickness, and length from those specified shall not exceed the amounts prescribed in Table 5.

12.2 The permissible variations in outside diameter given in Table 5 are not sufficient to provide for ovality in thin-walled tubes, as defined in the table. In such tubes, the maximum and minimum diameters at any cross section shall deviate from the nominal diameter by no more than twice the permissible variation in outside diameter given in Table 5; however, the mean diameter at that cross section must still be within the given permissible variation.

13. Surface Condition

13.1 All tubes shall be free of excessive mill scale, suitable for inspection. A slight amount of oxidation will not be considered as scale. Any special finish requirements shall be subject to agreement between the manufacturer and the purchaser.

14. Product Marking

14.1 In addition to the marking prescribed in Specification A 1016/A 1016M, the marking shall indicate whether the tubing is seamless or welded.

15. Keywords

15.1 duplex stainless steel; ferritic/austenitic stainless steel; seamless steel tube; stainless steel tube; steel tube; welded steel tube

NOTES:

^A For tubing smaller than ½ in. [12.7 mm] in outside diameter, the elongation values given for strip specimens in Table 4 shall apply. Mechanical property requirements do not apply to tubing smaller than ⅛ in. [3.2 mm] in outside diameter or with walls thinner than 0.015 in. [0.4 mm].

^B Prior to A 789/A 789M-87, the values for S31260 were: 92 ksi tensile strength, 54 ksi yield strength, and 30% elongation.

^C Prior to A 789/A 789M-04, the values for S32003 were 90 ksi tensile strength and 65 ksi yield strength.

^D Prior to A 789/A 789M-89, the tensile strength value was 90 ksi for UNS S32950.

TABLE 5
PERMISSIBLE VARIATIONS IN DIMENSIONS

Group	Size, Outside Diameter, in. [mm]	Permissible Variations in Outside Diameter, in. [mm]	Permissible Variations in Wall Thickness, ^A %	Permissible Variations in Cut Length, in. ^B [mm]		Thin Walled Tubes ^C
				Over	Under	
1	Up to 1/2 [12.7], excl	±0.005 [0.13]	±15	1/8 [3]	0	...
2	1/2 to 1 1/2 [12.7 to 38.1], excl	±0.005 [0.13]	±10	1/8 [3]	0	less than 0.065 in. [1.6 mm] nominal
3	1 1/2 to 3 1/2 [38.1 to 88.9], excl	±0.010 [0.25]	±10	3/16 [5]	0	less than 0.095 in. [2.4 mm] nominal
4	3 1/2 to 5 1/2 [88.9 to 139.7], excl	±0.015 [0.38]	±10	3/16 [5]	0	less than 0.150 in. [3.8 mm] nominal
5	5 1/2 to 8 [139.7 to 203.2], incl	±0.030 [0.76]	±10	3/16 [5]	0	less than 0.150 in. [3.8 mm] nominal

NOTES:

^A When tubes as ordered require wall thicknesses 3/4 in. [19 mm] or over, or an inside diameter 60% or less of the outside diameter, a wider variation in wall thickness is required. On such sizes a variation in wall thickness of 12.5% over or under will be permitted. For tubes less than 1/2 in. [12.7 mm] in inside diameter that cannot be successfully drawn over a mandrel, the wall thickness may vary ±15% from that specified.

^B These tolerances apply to cut lengths up to and including 24 ft [7.3 m]. For lengths greater than 24 ft [7.3 m], the above over-tolerances shall be increased by 1/8 in. [3 mm] for each 10 ft [3 m] or fraction thereof over 24 ft or 1/2 in. [13 mm], whichever is the lesser.

^C Ovality provisions of 12.2 apply.

SUPPLEMENTARY REQUIREMENTS

The following supplementary requirement shall apply only when specified by the purchaser in the inquiry, contract, or order.

S1. Air-Underwater Pressure Test

S1.1 When specified, each tube shall be examined by the air underwater pressure test.

SPECIFICATION FOR SEAMLESS AND WELDED FERRITIC/AUSTENITIC STAINLESS STEEL PIPE

SA-790/SA-790M

(Identical with ASTM Specification A 790/A 790M-08 except for the sulfur content for UNS S32808 in Table 2 is corrected to 0.010.)

(10)

1. Scope

1.1 This specification covers seamless and straight-seam welded ferritic/austenitic steel pipe intended for general corrosive service, with particular emphasis on resistance to stress corrosion cracking. These steels are susceptible to embrittlement if used for prolonged periods at elevated temperatures.

1.2 Optional supplementary requirements are provided for pipe when a greater degree of testing is desired. These supplementary requirements call for additional tests to be made and, when desired, one or more of these may be specified in the order.

1.3 Appendix X1 of this specification lists the dimensions of welded and seamless stainless steel pipe as shown in ANSI B36.19. Pipe having other dimensions may be furnished provided such pipe complies with all other requirements of this specification.

1.4 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification. The inch-pound units shall apply unless the *M* designation of this specification is specified in the order.

NOTE 1 — The dimensionless designator NPS (nominal pipe size) has been substituted in this standard for such traditional terms as nominal diameter, size, and nominal size.

3. Terminology

3.1 Definitions — For definitions of terms used in this specification refer to Terminology A 941.

4. Ordering Information

4.1 Orders for material under this specification should include the following, as required, to describe the desired material adequately:

4.1.1 Quantity (feet, [metres], or number of lengths),

4.1.2 Name of material (ferritic/austenitic steel pipe),

4.1.3 Process (seamless or welded),

4.1.4 Grade (see Table 1),

4.1.5 Size (NPS designator or outside diameter and schedule number of average wall thickness),

4.1.6 Length (specific or random) (see Section 11),

4.1.7 End finish (section on ends of Specification A 999/A 999M),

4.1.8 Optional requirements (product analysis, Section 9; hydrostatic test or nondestructive electric test, Section 14),

4.1.9 Test report required (section on certification of Specification A 999/A 999M),

4.1.10 Specification designation, and

4.1.11 Special requirements and any supplementary requirements selected.

5. General Requirements

5.1 Material furnished under this specification shall conform to the applicable requirements of the current edition of Specification A 999/A 999M unless otherwise provided herein.

6. Materials and Manufacture

6.1 Manufacture:

6.1.1 The pipe shall be made by the seamless or an automatic welding process, with no addition of filler metal in the welding operation.

6.1.2 At the manufacturer's option, pipe may be either hot-finished or cold-finished.

6.1.3 The pipe shall be pickled free of scale. When bright annealing is used, pickling is not necessary.

6.2 *Discard* — A sufficient discard shall be made from each ingot to secure freedom from injurious piping and undue segregation.

6.3 Unless otherwise stated in the order, all pipe shall be furnished in the heat-treated condition as shown in Table 1.

6.3.1 For seamless pipe, as an alternate to final heat treatment in a continuous furnace or batch-type furnace, immediately following hot forming while the temperature

of the pipes is not less than the specified minimum solution treatment temperature, pipes shall be individually quenched in water or rapidly cooled by other means, except for UNS S32950, which shall be air cooled.

6.3.2 If the purchaser desires pipe without heat treatment subsequent to welding, the purchase order shall specify the following condition:

6.3.2.1 No final heat treatment of pipe fabricated from plate that has been heat treated as required by Table 1 for the particular grade is required, *provided a sample of that heat of finished pipe or material representative of that heat of pipe as a prolongation of the weld passes the Test Methods A 923 Method B or C (See Note 2), including base metal, weld metal, and heat affected zone per heat.* Each pipe supplied under this requirement shall be stenciled with the suffix "HT-O."

6.3.2.2 For materials not listed in Table 3 of Test Methods A 923, the HT-O provision does not apply.

NOTE 2 — The Test Methods A 923 test method (B or C) is at the manufacturer's option, unless otherwise specified by the purchaser.

7. Chemical Composition

7.1 The steel shall conform to the chemical requirements as prescribed in Table 2.

8. Heat Analysis

8.1 An analysis of each heat of steel shall be made by the steel manufacturer to determine the percentages of the elements specified.

9. Product Analysis

9.1 At the request of the purchaser's inspector, an analysis of one billet or one length of flat-rolled stock from each heat, or two pipes from each lot, shall be made by the manufacturer. A lot of pipe shall consist of the following number of lengths of the same size and wall thickness from any one heat of steel:

NPS Designator	Lengths of Pipe in Lot
Under 2	400 or fraction thereof
2 to 5, incl	200 or fraction thereof
6 and over	100 or fraction thereof

9.2 The results of these analyses shall be reported to the purchaser or the purchaser's representative and shall conform to the requirements specified in Section 7.

9.3 If the analysis of one of the tests specified in 8.1 or 9.1 does not conform to the requirements specified in Section 7, an analysis of each billet or pipe from the same heat or lot may be made, and all billets or pipe conforming to the requirements shall be accepted.

10. Tensile and Hardness Properties

10.1 The material shall conform to the tensile and hardness properties prescribed in Table 3.

11. Lengths

11.1 Pipe lengths shall be in accordance with the following regular practice:

11.1.1 Unless otherwise agreed upon, all sizes from NPS $\frac{1}{8}$ to and including NPS 8 are available in a length up to 24 ft (see Note 3) with the permissible range of 15 to 24 ft (see Note 3). Short lengths are acceptable and the number and minimum length shall be agreed upon between the manufacturer and the purchaser.

NOTE 3 — This value applies when the inch-pound designation of this specification is the basis of purchase. When the *M* designation of this specification is the basis of purchase, the corresponding metric value(s) shall be agreed upon between the manufacturer and purchaser.

11.1.2 If definite cut lengths are desired, the lengths required shall be specified in the order. No pipe shall be less than the specified length and no more than $\frac{1}{4}$ in. [6 mm] over it.

11.1.3 No jointers are permitted unless otherwise specified.

12. Workmanship, Finish, and Appearance

12.1 The finished pipes shall be reasonably straight and shall have a workmanlike finish. Imperfections may be removed by grinding, provided the wall thicknesses are not decreased to less than that permitted, in the Permissible Variations in Wall Thickness Section of Specification A 999/A 999M.

13. Mechanical Tests Required

13.1 *Transverse or Longitudinal Tension Test* — One tension test shall be made on a specimen for lots of not more than 100 pipes. Tension tests shall be made on specimens from 2 pipes for lots of more than 100 pipes.

13.2 *Mechanical Testing Lot Definition* — The term *lot* for mechanical tests applies to all pipe of the same nominal size and wall thickness (or schedule) that is produced from the same heat of steel and subjected to the same finishing treatment as defined as follows:

13.2.1 Where the heat treated condition is obtained, consistent with the requirements of 6.3, in a continuous heat treatment furnace or by directly obtaining the heat treated condition by quenching after hot forming, the lot shall include all pipe of the same size and heat, heat treated in the same furnace at the same temperature, time at heat, and furnace speed or all pipe of the same size and heat, hot formed and quenched in the same production run.

13.2.2 Where final heat treatment is obtained, consistent with the requirements of 6.3, in a batch-type heat-treatment furnace equipped with recording pyrometers and automatically controlled within a 50°F [30°C] or smaller range, the lot shall be the larger of (a) each 200 ft [60 m] or fraction thereof or (b) that pipe heat treated in the same batch furnace charge.

13.2.3 Where the final heat treatment is obtained, consistent with the requirements of 6.3, in a batch-type heat-treatment furnace not equipped with recording pyrometers and automatically controlled within a 50°F [30°C] or smaller range, the term *lot* for mechanical tests applies to the pipe heat treated in the same batch furnace charge, provided that such pipe is of the same nominal size and wall thickness (or schedule) and is produced from the same heat of steel.

13.3 *Flattening Test* — For pipe heat treated in a batch-type furnace, flattening tests shall be made on 5% of the pipe from each heat-treated lot. For pipe heat treated by the continuous process, or by direct quenching after hot forming, this test shall be made on a sufficient number of pipes to constitute 5% of the lot, but in no case less than two lengths of pipe.

13.3.1 For welded pipe with a diameter equal to or exceeding NPS 10, a transverse guided face bend test of the weld may be conducted instead of a flattening test in accordance with the method outlined in the steel tubular product supplement of Test Methods and Definitions A 370. The ductility of the weld shall be considered acceptable when there is no evidence of cracks in the weld or between the weld and the base metal after bending. Test specimens from 5% of the lot shall be taken from the pipes or test plates of the same material as the pipe, the test plates being attached to the end of the cylinder and welded as a prolongation of the pipe longitudinal seam.

13.4 *Hardness Test* — Brinell or Rockwell hardness tests shall be made on specimens from two pipes from each lot (see 13.2).

14. Hydrostatic or Nondestructive Electric Test

14.1 Each pipe shall be subjected to the nondestructive electric test or the hydrostatic test. The type of test to be used shall be at the option of the manufacturer, unless otherwise specified in the purchase order.

14.2 The hydrostatic test shall be in accordance with Specification A 999/A 999M, except that the value for *S* to be used in the calculation of the hydrostatic test pressure shall be equal to 50% of the specified minimum yield strength of the pipe.

14.3 Nondestructive Electric Test — Nondestructive electric tests shall be in accordance with Practices E 213 or E 309.

14.3.1 As an alternative to the hydrostatic test, and when specified by the purchaser, each pipe shall be examined with a nondestructive test in accordance with Practices E 213 or E 309. Unless specifically called out by the purchaser, the selection of the nondestructive electric test will be at the option of the manufacturer. The range of pipe sizes that may be examined by each method shall be subject to the limitations in the scope of the respective practices.

14.3.1.1 The following information is for the benefit of the user of this specification:

14.3.1.2 The reference standards defined in 14.3.1.3-14.3.1.5 are convenient standards for calibration of nondestructive testing equipment. The dimensions of these standards should not be construed as the minimum size imperfection detectable by such equipment.

14.3.1.3 The ultrasonic testing (UT) can be performed to detect both longitudinally and circumferentially oriented defects. It should be recognized that different techniques should be employed to detect differently oriented imperfections. The examination may not detect short, deep, defects.

14.3.1.4 The eddy-current testing (ET) referenced in this specification (see Practice E 426) has the capability of detecting significant discontinuities, especially the short abrupt type.

14.3.1.5 A purchaser interested in ascertaining the nature (type, size, location, and orientation) of discontinuities that can be detected in the specific application of these examinations should discuss this with the manufacturer of the tubular product.

14.4 Time of Examination — Nondestructive testing for specification acceptance shall be performed after all mechanical processing, heat treatments, and straightening operations. This requirement does not preclude additional testing at earlier stages in the processing.

14.5 Surface Condition:

14.5.1 All surfaces shall be free of scale, dirt, grease, paint, or other foreign material that could interfere with interpretation of test results. The methods used for cleaning and preparing the surfaces for examination shall not be detrimental to the base metal or the surface finish.

14.5.2 Excessive surface roughness or deep scratches can produce signals that interfere with the test.

14.6 Extent of Examination:

14.6.1 The relative motion of the pipe and the transducer(s), coil(s), or sensor(s) shall be such that the entire pipe surface is scanned, except as in 14.6.2.

14.6.2 The existence of end effects is recognized and the extent of such effects shall be determined by the manufacturer and, if requested, shall be reported to the purchaser. Other nondestructive tests may be applied to the end areas, subject to agreement between the purchaser and the manufacturer.

14.7 Operator Qualifications — The test unit operator shall be certified in accordance with SNT-TC-1A, or an equivalent recognized and documented standard.

14.8 Test Conditions:

14.8.1 For eddy-current testing, the excitation coil frequency shall be chosen to ensure adequate penetration yet provide good signal-to-noise ratio.

14.8.2 The maximum eddy-current coil frequency used shall be as follows:

On specified walls up to 0.050 in.—100 KHz max

On specified walls up to 0.150 in.—50 KHz max

On specified walls over 0.150 in.—10 KHz max

14.8.3 Ultrasonic — For examination by the ultrasonic method, the minimum nominal transducer frequency shall be 2.00 MHz and the maximum nominal transducer size shall be 1.5 in. If the equipment contains a reject notice filter setting, this shall remain off during calibration and testing unless linearity can be demonstrated at that setting.

14.9 Reference Standards — Reference standards of convenient length shall be prepared from a length of pipe of the same grade, size (NPS, or outside diameter and schedule or wall thickness), surface finish and heat treatment condition as the pipe to be examined.

14.9.1 For Ultrasonic Testing, the reference ID and OD notches shall be any one of the three common notch shapes shown in Practice E 213, at the option of the manufacturer. The depth of each notch shall not exceed $12\frac{1}{2}\%$ of the specified nominal wall thickness of the pipe or 0.004 in., whichever is greater. The width of the notch shall not exceed twice the depth. Notches shall be placed on both the OD and ID surfaces.

14.9.2 For Eddy-Current Testing, the reference standard shall contain, at the option of the manufacturer, any one of the following discontinuities:

14.9.2.1 Drilled Hole — The reference standard shall contain three or more holes equally spaced circumferentially around the pipe and longitudinally separated by a sufficient distance to allow distinct identification of the signal from each hole. The holes shall be drilled radially and completely through the pipe wall, with care being taken to avoid distortion of the pipe while drilling. One hole shall be drilled in the weld, if visible. Alternately, the producer of welded pipe may choose to drill one hole in the weld and run the calibration standard through the test

coils three times with the weld turned at 120° on each pass. The hole diameter shall vary with NPS as follows:

NPS Designator	Hole Diameter
	0.039 in. (1 mm)
above 1/2 to 1 1/4	0.055 in. (1.4 mm)
above 1 1/4 to 2	0.071 in. (1.8 mm)
above 2 to 5	0.087 in. (2.2 mm)
above 5	0.106 in. (2.7 mm)

14.9.2.2 Transverse Tangential Notch — Using a round tool or file with a 1/4 in. [6.4 mm] diameter, a notch shall be filed or milled tangential to the surface and transverse to the longitudinal axis of the pipe. Said notch shall have a depth not exceeding 12 1/2% of the specified nominal wall thickness of the pipe or 0.004 in. [0.102 mm], whichever is greater.

14.9.2.3 Longitudinal Notch — A notch 0.031 in. or less in width shall be machined in a radial plane parallel to the tube axis on the outside surface of the pipe to have a depth not exceeding 12 1/2% of the specified wall thickness of the pipe or 0.004 in., whichever is greater. The length of the notch shall be compatible with the testing method.

More or smaller reference discontinuities, or both, may be used by agreement between the purchaser and the manufacturer.

14.10 Standardization Procedure:

14.10.1 The test apparatus shall be standardized at the beginning and end of each series of pipes of the same size (NPS or diameter and schedule or wall thickness, grade, and heat treatment condition), and at intervals not exceeding 4 h. More frequent standardization may be performed at the manufacturer's option or may be required upon agreement between the purchaser and the manufacturer.

14.10.2 The test apparatus shall also be standardized after any change in test system settings, change of operator, equipment repair, or interruption due to power loss, process shut-down, or when a problem is suspected.

14.10.3 The reference standard shall be passed through the test apparatus at the same speed and test system settings as the pipe to be tested.

14.10.4 The signal-to-noise ratio for the reference standard shall be 2 1/2 to 1 or greater. Extraneous signals caused by identifiable causes such as dings, scratches, dents, straightener marks, and so forth shall not be considered noise. The rejection amplitude shall be adjusted to be at least 50% of full scale of the readout display.

14.10.5 If upon any standardization, the rejection amplitude has decreased by 29% (3 dB) of peak height from the last standardization, the pipe since the last calibration shall be rejected. The test system settings may be changed or the transducer(s), coil(s), or sensor(s) adjusted

and the unit restandardized. But all pipe tested since the last acceptable standardization must be retested for acceptance.

14.11 Evaluation of Imperfections:

14.11.1 Pipes producing a signal equal to or greater than the lowest signal produced by the reference standard(s) shall be identified and separated from the acceptable pipes. The area producing the signal may be reexamined.

14.11.2 Such pipes shall be rejected if the test signal was produced by imperfections that cannot be identified or was produced by cracks or crack-like imperfections. These pipes may be repaired per Sections 12 and 13. To be accepted, a repaired pipe must pass the same non-destructive test by which it was rejected, and it must meet the minimum wall thickness requirements of this specification.

14.11.3 If the test signals were produced by visual imperfections such as: (1) scratches, (2) surface roughness, (3) dings, (4) straightener marks, (5) cutting chips, (6) steel die stamps, (7) stop marks, or (8) pipe reducer ripple. The pipe may be accepted based on visual examination, provided the imperfection is less than 0.004 in. [0.1 mm] or 12 1/2% of the specified wall thickness (whichever is greater).

14.11.4 Rejected pipe may be reconditioned and retested providing the wall thickness is not decreased to less than that required by this or the product specification. The outside diameter at the point of grinding may be reduced by the amount so removed. To be accepted, retested pipe shall meet the test requirement.

14.11.5 If the imperfection is explored to the extent that it can be identified as non-rejectable, the pipe may be accepted without further test providing the imperfection does not encroach on the minimum wall thickness.

15. Repair by Welding

15.1 For welded pipe of size NPS 6 or larger with a specified wall thickness of 0.188 in. [4.8 mm] or more, weld repairs made with the addition of compatible filler metal may be made to the weld seam with the same procedures specified for plate defects in the section on Repair by Welding of Specification A 999/A 999M.

15.2 Weld repairs of the weld seam shall not exceed 20% of the seam length.

15.3 Except as allowed by 15.3.1, weld repairs shall be made only with the gas tungsten-arc welding process using the same classification of bare filler rod qualified to the most current AWS Specification A5.9 as the grade of pipe being repaired as given in Table 4.

15.3.1 Subject to approval by the purchaser, it shall be permissible for weld repairs to be made with the gas

tungsten-arc welding process using a filler metal more highly alloyed than the base metal, if needed for corrosion resistance or other properties.

15.4 Pipes that have had weld seam repairs with filler metal shall be identified with the symbol “WR” and shall be so stated and identified on the certificate of tests. If filler metal other than that listed in Table 4 is used, the filler metal shall be identified on the certificate of tests.

15.5 Weld repairs shall be completed prior to any heat treatment.

16. Product Marking

16.1 In addition to the marking prescribed in Specification A 999/A 999M, the marking shall include the manufacturer’s private identifying mark and whether the pipe is seamless or welded. If specified in the purchase order, the marking for pipe larger than NPS 4 shall include the weight.

17. Keywords

17.1 duplex stainless steel; ferritic/austenitic stainless steel; seamless steel pipe; stainless steel pipe; steel pipe; welded steel pipe

S32205	ER2209	S39209
S31200	ER2553	S39553

SUPPLEMENTARY REQUIREMENTS FOR PIPE REQUIRING SPECIAL CONSIDERATION

One or more of the following supplementary requirements shall apply only when specified in the purchase order. The purchaser may specify a different frequency of test or analysis than is provided in the supplementary requirement. Subject to agreement between the purchaser and manufacturer, retest and retreatment provisions of these supplementary requirements may also be modified.

S1. Product Analysis

S1.1 For all pipe over NPS 5 there shall be one product analysis made of a representative sample from one piece for each ten lengths or fraction thereof from each heat of steel.

S1.2 For pipe smaller than NPS 5 there shall be one product analysis made from ten lengths per heat of steel or from 10% of the number of lengths per heat of steel, whichever number is smaller.

S1.3 Individual lengths failing to conform to the chemical requirements specified in Section 7 shall be rejected.

S2. Transverse Tension Tests

S2.1 There shall be one transverse tension test made from one end of 10% of the lengths furnished per heat of steel. This applies only to pipe over NPS 8.

S2.2 If a specimen from any length fails to conform to the tensile properties specified that length shall be rejected.

S3. Flattening Test

S3.1 The flattening test of Specification A 999/A 999M shall be made on a specimen from one end or both ends

of each pipe. Crops ends may be used. If this supplementary requirement is specified, the number of tests per pipe shall also be specified. If a specimen from any length fails because of lack of ductility prior to satisfactory completion of the first step of the flattening test requirement, that pipe shall be rejected subject to retreatment in accordance with Specification A 999/A 999M and satisfactory retest. If a specimen from any length of pipe fails because of a lack of soundness that length shall be rejected, unless subsequent retesting indicates that the remaining length is sound.

S4. Etching Tests

S4.1 The steel shall be homogeneous as shown by etching tests conducted in accordance with the appropriate portions of Method E 381. Etching tests shall be made on a cross section from one end or both ends of each pipe and shall show sound and reasonably uniform material free of injurious laminations, cracks, and similar objectionable defects. If this supplementary requirement is specified, the number of tests per pipe required shall also be specified. If a specimen from any length shows objectionable defects, the length shall be rejected, subject to removal of the defective end and subsequent retests indicating the remainder of the length to be sound and reasonably uniform material.

APPENDIX

(Nonmandatory Information)

- X1. Table X1.1 IS BASED ON TABLE 1 OF THE AMERICAN NATIONAL STANDARD FOR STAINLESS STEEL PIPE (ANSI B36.19-1965)**

GENERAL NOTE: The decimal thickness listed for the respective pipe sizes represents their nominal or average wall dimensions.

NOTES:

(1) Schedules 5S and 10S wall thicknesses do not permit threading in accordance with the American National Standard for Pipe Threads (ANSI B1.20.1).

(2) These do not conform to the American National Standard for Welded and Seamless Wrought Steel Pipe (ANSI B36.10-1979).

SPECIFICATION FOR WELDED FERRITIC STAINLESS STEEL FEEDWATER HEATER TUBES

SA-803/SA-803M

(Identical with ASTM Specification A 803/A 803M-03.)

1. Scope

1.1 This specification covers welded ferritic stainless steel feedwater heater tubes including those bent, if specified, into the form of U-tubes for application in tubular feedwater heaters.

1.2 The tubing sizes covered shall be $\frac{5}{8}$ to 1 in. [15.9 to 25.4 mm] inclusive, in outside diameter, and average or minimum wall thicknesses of 0.028 in. [0.7 mm] and heavier.

1.3 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification. The inch-pound units shall apply unless the “M” designation of this specification is specified in the order.

2. Referenced Documents

2.1 ASTM Standards:

- A 480/A 480M Specification for General Requirements for Flat-Rolled Stainless and Heat Resisting Steel Plate, Sheet, and Strip
- A 763 Practices for Detecting Susceptibility to Intergranular Attack in Ferritic Stainless Steels
- A 941 Terminology Relating to Steel, Stainless Steel, Related Alloys, and Ferroalloys
- A 1016/A 1016M Specification for General Requirements for Ferritic Alloy Steel, Austenitic Alloy Steel, and Stainless Steel Tubes

3. Terminology

3.1 Definitions — For definitions of terms used in this specification, refer to Terminology A 941.

4. Ordering Information

4.1 It is the responsibility of the purchaser to specify all requirements that are necessary for material under this specification. Such requirements may include, but are not limited to, the following:

4.1.1 Quantity (length or number of pieces),

4.1.2 Material description,

4.1.3 Dimensions (outside diameter, wall thickness (minimum or average wall), and length),

4.1.4 Grade (chemical composition) (Table 1), and

4.1.5 U-bend requirements, if order specifies bending, U-bend schedules or drawings shall accompany the order.

4.2 Optional Requirements — Purchaser shall specify whether annealing of the U-bends is required or whether tubes are to be hydrotested or air-tested (see 10.5).

4.3 Supplementary Requirements — Purchaser shall specify on this purchase order if material is to be eddy-current tested in accordance with Supplementary Requirement S1 or S2, and if special test reports are required, under Supplementary Requirement S3, and,

4.4 Any special requirements.

5. General Requirements

5.1 Material furnished to this specification shall conform to the applicable requirements of the latest published edition of Specification A 1016/A 1016M unless otherwise provided herein.

6. Materials and Manufacture

6.1 The tube shall be made from flat-rolled steel by an automatic welding process with no addition of filler metal.

6.2 Surface contaminants may have detrimental effects on high temperature properties or corrosion resistance of tubing. Contamination by copper, lead, mercury, zinc, chlorides, or sulfur may be detrimental to stainless steels. The manufacturer shall employ techniques which minimize surface contamination by these elements.

7. Cleaning Before Annealing

7.1 All lubricants or coatings used in the manufacture of straight-length tube or in the bending shall be removed from all surfaces prior to any annealing treatments. U-bends on which a lubricant had been applied to the inside surface during bending shall have the cleanness of their inside surface confirmed by blowing close-fitting acetone-soaked felt plugs through 10% of the tubes of each bend radius. Dry, oil-free air or inert gas shall be used to blow the plugs through the tubes. If the plugs blown through any tube show more than a light gray discoloration, all tubes that have had a lubricant applied to the inside surface during bending shall be recleaned. After recleaning 10% of the tubes of each bend radius whose inside surface had been subjected to bending, lubricants shall be retested.

8. Heat Treatment

8.1 All finished straight tubing or straight tubing ready for U-bending shall be furnished in the solution-annealed condition. The annealing procedure shall consist of heating the material to a temperature of 1200°F [650°C] or higher and cooling (as appropriate for the grade) to meet the requirements of this specification.

8.2 If heat treatment of U-bends is specified, it shall satisfy the annealing procedure described in 8.1 and shall be done as follows:

8.2.1 The heat treatment shall be applied to the U-bend area plus approximately 6 in. [150 mm] of each leg beyond the tangent point of the U-bend.

8.2.2 If the heat treatment specified in 8.2 is accomplished by resistance-heating methods wherein electrodes are clamped to the tubes, the clamped areas shall be visually examined for arc burns. Burn indications shall be cause for rejection unless they can be removed by local polishing without encroaching upon minimum wall thickness.

8.2.3 Temperature control shall be accomplished through the use of optical or emission pyrometers, or both. No temperature-indicating crayons, lacquers, or pellets shall be used.

8.2.4 The inside of the tube shall be purged with a protective or an inert gas atmosphere during heating and cooling to below 700°F [370°C] to prevent scaling of the inside surface. The atmosphere should be noncarburizing.

9. Chemical Composition

9.1 Product Analysis:

9.1.1 The steel shall conform to the chemical composition in Table 1.

9.1.2 When specified on the purchase order, a product analysis shall be supplied from one tube or coil of steel per heat. The product analysis tolerance of Specification A 480/A 480M shall apply.

9.1.3 If the original test for product analysis fails, retests of two additional lengths of flat-rolled stock or tubes shall be made. Both retests, for the elements in question, shall meet the requirements of this specification; otherwise all remaining material in the heat or lot (see Note 1) shall be rejected or, at the option of the producer, each length of flat-rolled stock or tube may be individually tested for acceptance. Lengths of flat-rolled stock or tubes that do not meet the requirements of this specification shall be rejected.

NOTE 1 — For product analyses and flange requirements, the term “lot” applies to 125 tube groupings, prior to cutting to length, of the same nominal size and wall thickness, produced from the same heat of steel and annealed in a continuous furnace.

10. Mechanical Requirements

10.1 Tensile Properties:

10.1.1 The material shall conform to the tensile properties shown in Table 2.

10.1.2 One tension test shall be made on a specimen for lots of not more than 50 tubes. Tension tests shall be made on specimens from two tubes for lots of more than 50 tubes (Note 2).

10.1.3 Table 3 gives the computed minimum elongation values for each $\frac{1}{32}$ in. [0.8 mm] decrease in wall thickness.

10.2 Hardness:

10.2.1 The tubes shall have a hardness number not to exceed those prescribed in Table 4. This hardness requirement is not to apply to the bend area of U-bend tubes which are not heat treated after bending.

10.2.2 Brinell or Rockwell hardness tests shall be made on specimens from two tubes from each lot (see Note 2).

NOTE 2 — For tension, hardness, and corrosion test requirements, the term “lot” applies to all tubes prior to cutting to length, of the same nominal diameter and wall thickness, produced from the same heat of steel and annealed in a continuous furnace at the same temperature, time at heat, and furnace speed.

10.3 Reverse Flattening Test — One reverse flattening test shall be made on a specimen from each 1500 ft [460 m] of finished tubing.

10.4 Flange Test — Flange tests shall be made on specimens from each end of one finished tube, not the one used for the flattening test, from each lot (see Note 1).

10.5 Pressure Test — Each straight tube, or each U-tube after completion of the bending and post-bending heat treatment, shall be pressure-tested in accordance with one of the following paragraphs as specified by the purchaser:

10.5.1 Hydrostatic Test — Each tube shall be given an internal hydrostatic test in accordance with Specification A 1016/A 1016M.

10.5.2 Air Underwater Test — Each tube shall be air underwater tested in accordance with Specification A 1016/A 1016M.

11. Corrosion Resisting Properties

11.1 One full section sample 1 in. [25 mm] long from the center of a sample tube of the smallest radius bend that is heat treated shall be tested in the heat treated condition in accordance with the appropriate practice in Practices A 763 for the specified grade, or as agreed upon for TP409.

11.2 One full-section sample 1 in. [25 mm] long from each lot (Note 2) of straight tubes shall be tested in the finished condition in accordance with the appropriate practice in Practices A 763 for the specified grade, or as agreed upon for TP409.

11.3 The appearance of any fissures or cracks in the test specimen, when evaluated in accordance with the Evaluation Sections of Practices A 763 indicating the presence of intergranular attack, shall be cause for rejection of that lot.

12. Permissible Variations in Dimensions (Fig. 1)

12.1 Permissible variations from the specified outside diameter shall be in accordance with Specification A 1016/A 1016M. Those tolerances do not apply to the bent portion of the U-tubes. At the bent portion of a U-tube for $R = 2 \times D$ or greater, neither the major nor minor diameter of the tube shall deviate from the nominal diameter prior to bending by more than 10%. If less than $2 \times D$ is specified, tolerances could be greater.

12.2 Permissible Variations from the Specified Wall Thickness:

12.2.1 Permissible variations from the specified minimum wall thickness shall not exceed +20 – 0%.

12.2.2 Permissible variations from the specified average wall thickness are $\pm 10\%$ of the nominal wall thickness.

12.2.3 The wall thickness of the tube in the U-bent section shall not be less than value determined by the equation:

$$t_f = \frac{4RT}{4R + D}$$

where:

t_f = wall thickness after bending, in. [mm],
 T = specified minimum tube wall thickness, in. [mm],
 R = centerline bend radius, in. [mm], and
 D = nominal outside tube diameter, in. [mm].

12.3 Permissible Variations from the Specified Length:

12.3.1 Straight Lengths — The maximum permissible variations for lengths 24 ft [7.3 m] and shorter shall be $+\frac{1}{8}$ in. [+3 mm], –0; for lengths longer than 24 ft [7.3 m], an additional over tolerance of $+\frac{1}{8}$ in. [+3 mm] for each 10 ft [3 m], or fraction thereof, shall be permitted up to a maximum of $+\frac{1}{2}$ in. [+13 mm].

12.3.2 U-Bends — In the case of U-tubes, the length of the tube legs, as measured from the point of tangency of the bend and the tube leg to the end of the tube leg, shall not be less than specified, but may exceed the specified values by the amount given in Table 5. The difference in lengths of the tube legs shall not be greater than $\frac{1}{8}$ in. [3 mm] unless otherwise specified.

12.4 The end of any tube may depart from square by not more than the amount given in Table 6.

12.5 The leg spacing measured between the points of tangency of the bend to the legs shall not vary from the value ($2R$ -specified tube outside diameter) by more than $\frac{1}{16}$ in. [1.5 mm] where R is the centerline bend radius.

12.6 The bent portion of the U-tube shall be substantially uniform in curvature, and not to exceed $\pm \frac{1}{16}$ in. [± 1.5 mm] of the nominal centerline radius.

12.7 Permissible deviation from the plane of bend (see Fig. 1) shall not exceed $\frac{1}{16}$ in. [1.5 mm] as measured from the points of tangency.

13. Workmanship, Finish, and Appearance

13.1 Tubing purchased to this specification is intended for use in heat exchangers and will be inserted through close-fitting holes in baffles or support plates, or both, spaced along the tube length. The tube ends will also be inserted into very close-fitting holes in a tubesheet and expanded and may be welded therein. The tubes shall be able to stand expanding and bending without showing cracks and flaws, and shall be finished reasonably straight and suitable for the intended purpose. Surface defects that violate minimum wall requirements shall be cause for rejection.

13.2 The residual chloride salt contamination of the inside and outside surface of the tubing at the time of packing for shipment from the mill shall not exceed a

concentration of 1 mg/ft² [10.7 mg/m²] of tube surface. One tube in each 500 pieces shall be checked immediately prior to packing for shipment for chloride salt contamination by a procedure agreed to between the manufacturer and purchaser.

14. Surface Condition

14.1 The straight tubes, after final annealing, shall be pickled using a solution of nitric and hydrofluoric acids followed by flushing and rinsing in water. If bright-annealing is performed, this requirement does not apply.

14.1.1 All tubes shall be free of excessive mill scale, suitable for inspection. A slight amount of oxidation will not be considered as scale. Any special finish requirements shall be subject to agreement between the manufacturer and the purchaser.

14.2 A light oxide scale on the outside surface of U-bend area shall be permitted for tubes that have been electric-resistance heat treated after bending.

15. Nondestructive Test (Electric Test)

15.1 Each straight tube shall be tested after the finish heat treatment by passing it through a nondestructive tester capable of detecting defects on the entire cross section of the tube in accordance with Specification A 1016/A 1016M.

16. Inspection

16.1 The inspector representing the purchaser shall have entry, at all times, to those areas where inspection and testing is being performed on the purchaser's ordered material. The manufacturer shall afford the inspector all reasonable facilities to satisfy the inspector that the material is being furnished in accordance with this specification. All required tests and inspections shall be made at the place of manufacture prior to shipment, unless otherwise specified, and shall be conducted so as not to interfere unnecessarily with the operation of the works.

17. Rejection

17.1 Each length of tubing received from the manufacturer may be inspected by the purchaser, and, if it does not meet the requirements of the specification based on the inspection and test method outlined in the specification, the tubing may be rejected and the manufacturer shall be

notified. Disposition of rejected tubing shall be a matter of agreement between the manufacturer and the purchaser.

17.2 Material that fails in any of the forming operations or in the process of installation and is found to be defective, shall be set aside, and the manufacturer shall be notified. Disposition of such material shall be a matter for agreement between the manufacturer and the purchaser.

18. Certification

18.1 A test report, signed by an authorized employee or representative of the manufacturer, shall be furnished to the purchaser to indicate the specification and grade, the results of the heat analysis, hardness, and tensile properties. Product analysis will be reported only when requested on the purchase order as provided in 9.1.1.

19. Product Marking

19.1 All tubes shall be marked with the heat number.

19.2 Containers and packages shall be marked or tagged to show the purchaser's order number, the manufacturer's order number, specification, grade, size and gage of tubing, number of pieces contained in the package, and item number (if appropriate).

20. Packaging

20.1 All tubing shall be packaged and blocked in such a manner as to prevent damage in ordinary handling and transportation. The boxes shall be constructed in such a manner that no nails, staples, screws, or similar fasteners are required to close and secure the box after the tubes have been placed in the box. The box shall be lined with plastic sheet or vapor barrier materials so as to prevent chloride contamination of the tube during handling, transportation, and storage.

20.2 The U-bent tubes shall be arranged in boxes so that the smaller radius bends may be removed without disturbing larger radius bends. Tubes for an item number shall be boxed together.

21. Keywords

21.1 feedwater heater tubes; ferritic stainless steel; seamless steel tube; stainless steel tube; steel tube; welded steel tube

^A For small diameter or thin walls, or both, tubing, where many drawing passes are required, a carbon maximum of 0.015% is necessary. Small outside diameter tubes are defined as those less than 0.500 in. [12.7 mm] in outside diameter and light wall tubes as those less than 0.049 in. [1.2 mm] in average wall thickness (0.040 in. [1 mm] in minimum wall thickness).

^B Nickel + copper.

^C Carbon + nitrogen = 0.025 max.

TABLE 2
TENSILE REQUIREMENTS

Grade	Tensile Strength, min, ksi [MPa]	Yield Strength, min, ksi [MPa]	Elongation ⁴ in 2 in. or 50 mm, min, %
TP 409	55 [380]	30 [205]	20
TP 439	60 [415]	30 [205]	20
TP XM-27	65 [450]	40 [275]	20
TP XM-33	68 [470]	45 [310]	20
25-4-4	90 [620]	75 [515]	20
26-3-3	85 [585]	65 [450]	20
29-4	80 [550]	60 [415]	20
29-4-2	80 [550]	60 [415]	20
18-2	60 [415]	35 [240]	20
29-4C	75 [515]	60 [415]	18

⁴ For longitudinal strip tests, a deduction of 0.90% for 29-4C and 1% for all other grades shall be made from the basic minimum elongation for each $\frac{1}{32}$ in. [0.8 mm] decrease in wall thickness below $\frac{5}{16}$ in. [8 mm]. The following table gives the computed minimum values.

TABLE 3
MINIMUM ELONGATION VALUES

Wall Thickness ⁴		Elongation in 2 in. or 50 mm, min, %	
in.	mm	29-4C	All Other
$\frac{5}{16}$ (0.312)	8	18	20
$\frac{9}{32}$ (0.281)	7.2	17	19
$\frac{1}{4}$ (0.250)	6.4	16	18
$\frac{7}{32}$ (0.219)	5.6	15	17
$\frac{3}{16}$ (0.188)	4.8	14	16
$\frac{5}{32}$ (0.156)	4	13	15
$\frac{1}{8}$ (0.125)	3.2	13	14
$\frac{3}{32}$ (0.094)	2.4	12	13
$\frac{1}{16}$ (0.062)	1.6	11	12
0.062 to 0.035, excl	1.6 to 0.9	10	12
0.035 to 0.022, excl	0.9 to 0.6	10	11
0.022 to 0.015, excl	0.6 to 0.4	10	11

GENERAL NOTE: Calculation elongation shall be rounded to the nearest whole number.

⁴ Where the wall thickness lies between two values shown above, the minimum elongation value shall be determined by the following equation:

Grade	Equation
29-4C	$E = 28.8t + 9.00$ [$E = 1.13t + 9.00$]
All other	$E = 32t + 10.00$ [$E = 1.25t + 10.00$]

where

E = elongation in 2 in. or 50 mm, %, and

t = actual thickness of specimen, in. [mm].

TABLE 4
HARDNESS REQUIREMENTS

SUPPLEMENTARY REQUIREMENTS

The following supplementary requirements may become a part of the specification when specified in the inquiry or invitation to bid and purchase order or contract. These requirements shall not be considered, unless specified in the order, in which event the necessary tests shall be made by the manufacturer prior to the bending or shipment of the tubing.

S1. Nondestructive Eddy-Current Test

S1.1 Each tube in the finished condition, except for bending if that is required, shall be tested by passing it through an electric nondestructive tester capable of detecting defects on the entire cross section of the tube. Suitable instrumentation shall be used to clearly distinguish the artificial defects. The outside and inside surfaces of the tubes shall be free of loose scale, metallic particles, or other material that would tend to restrict signals or create electrical noise. The tubing shall be inspected by feeding it longitudinally through an inspection coil or coils with a diameter suitable for the diameter of tubing to be inspected. The instrument calibration shall be accomplished with a reference standard prepared from the appropriate length of selected tubing of the same size, grade, and physical condition as the material to be inspected. The standard shall be fed through the coil at the same speed that the inspection of the tubing is performed.

S1.2 The factors listed in S1.3 shall be selected or adjusted, or both, in accordance with the instrument manufacturer's instructions, for the particular instrument involved as required to achieve optimum instrument distinction between the reference defects and plain portions of the tube.

S1.3 The following as well as other factors involved shall not be used in such a manner that they detract from the overall ability of the instrument to detect defects: test frequency, direct-current saturation level, filter networks, phase-analysis circuits, coil diameter, and instrument gain.

S1.4 The reference standard shall consist of a defect-free sample of the same size, alloy, and condition (temper) as that being tested, and shall contain longitudinal and circumferential notches on the outside diameter establishing the rejection level of the tubing to be tested. Inside diameter notches, both longitudinal and transverse, shall also be a part of the reference standard. These inside

notches may be larger than the outside notches, and are intended for use only to assure instrument phase settings capable of yielding optimum inside surface sensitivity.

S1.4.1 All notches shall be produced by EDM methods. The outside diameter notches shall be of the dimensions shown in Table S1.1. See also Fig. S1.1.

S1.5 All tubing shall meet this specification. The instrument calibration shall be verified at the start of testing, after any shut down of the test equipment, after any test equipment adjustment, or at least every $\frac{1}{2}$ h of continuous production testing, or both. Tubes generating a signal above the outside-diameter calibration standard sensitivity level shall be rejected.

S1.6 Tubes may be reconditioned and retested provided reconditioning does not adversely effect the minimum wall thickness or other properties of the tube specification requirements. Upon agreement between purchaser and manufacturer, the referee method, employing ultrasonic testing, may be employed for retesting tubes rejected by the eddy-current test. The calibration standard for this test shall be identical to that required for the eddy-current test.

S2. Nondestructive Eddy-Current Testing (Select Commercial Grade)

S2.1 The manufacturer shall test the tubing using the procedure outlined in Supplementary Requirement S1, except for the notch standards, which shall be as indicated in Table S2.1.

S3. Report

S3.1 A report shall be furnished by the manufacturer to include a record of all tests performed to qualify material to this specification. This record shall include numbers of tests performed and qualitative or quantitative results as are applicable.

FIG. S1.1 EDDY-CURRENT TEST STANDARD

TABLE S1.1
NOTCH DEPTH

OD, in. [mm]	Wall, in. [mm]	Depth, in. [mm]	Length, max, in. [mm]	Width, max
$\frac{5}{8}$ to 1 [15.9 to 25.4] incl	0.028 [0.71] and heavier	0.005 [0.12] or 10.8% of specified average wall (when average wall is ordered), or 11.8% of specified minimum wall (when minimum wall is ordered), whichever is greater	0.375 [9.52]	wall thickness, but not greater than 0.062 in. [1.6 mm]

GENERAL NOTE: The tolerance of notch depth shall be $\pm 8\%$ or ± 0.0005 in. [0.01 mm], whichever is greater. Refer to Fig. S1.1 for notch location orientation and length of calibration standard.

TABLE S2.1
NOTCH DEPTH FOR SELECT COMMERCIAL GRADE

OD, in. [mm]	Wall, in. [mm]	Depth, max, in. [mm]	Length, max, in. [mm]	Width, max

$\frac{5}{8}$ to 1 [15.9 to 25.4], incl	less than 0.035 [0.9 mm]	0.005 [0.12] or 10.8% of specified average wall (when average wall is ordered), or 11.8% of specified minimum wall (when minimum wall is ordered), whichever is greater	0.375 [9.5]	wall thickness

SUMMARY OF CHANGES

The Committee has identified the location of selected changes to this specification since the last issue which may impact the use of this specification.

(1) Clarified ordering requirements to include purchaser's responsibility in Section 4.

(2) Specification A 450/A 450M has been changed to A 1016/A 1016M throughout.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR SINGLE- OR DOUBLE-WELDED AUSTENITIC STAINLESS STEEL PIPE

SA-813/SA-813M

(Identical with ASTM Specification A 813/A 813M-01(R05) except for the addition of grain size requirements for H grades and S30815, the deletion of heat treat omitted options, and adding a minimum heat treat temperature for S30815.)

1. Scope

1.1 This specification covers two classes of fit-up and alignment quality straight-seam single- or double-welded austenitic steel pipe intended for high-temperature and general corrosive service.

NOTE 1 — When the impact test criterion for a low-temperature service would be 15 ft-lbf [20 J] energy absorption or 15 mils [0.38 mm] lateral expansion, some of the austenitic stainless steel grades covered by this specification are accepted by certain pressure vessel or piping codes without the necessity of making the actual test. For example, Grades 304, 304L, and 347 are accepted by the ASME Pressure Vessel Code, Section VIII Division 1, and by the Chemical Plant and Refinery Piping Code, ANSI B31.3 for service at temperatures as low as -425°F [-250°C] without qualification by impact tests. Other AISI stainless steel grades are usually accepted for service temperatures as low as -325°F [-200°C] without impact testing. Impact testing may, under certain circumstances, be required. For example, materials with chromium or nickel content outside the AISI ranges, and for material with carbon content exceeding 0.10%, are required to be impact tested under the rules of ASME Section VIII Division 1 when service temperatures are lower than -50°F [-45°C].

1.2 Grades TP304H, TP304N, TP316H, TP316N, TP321H, TP347H, and TP348H are modifications of Grades TP304, TP316, TP321, TP347, and TP348, and are intended for high-temperature service.

1.3 Two classes of pipe are covered as follows:

1.3.1 Class SW — Pipe, single-welded with no addition of filler metal and

1.3.2 Class DW — Pipe, double-welded with no addition of filler metal.

1.4 Optional supplementary requirements are provided for pipe where a greater degree of testing is desired. These supplementary requirements call for additional tests to be made and, when desired, one or more of these may be specified in the order.

1.5 Table 1 lists the dimensions of welded stainless steel pipe as shown in ANSI B36.19. Pipe having other

dimensions may be furnished provided such pipe complies with all other requirements of this specification.

1.6 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification. The inch-pound units shall apply unless the “M” designation of this specification is specified in the order.

3. Ordering Information

3.1 Orders for material under this specification should include the following as required, to describe the desired material adequately:

3.1.1 Quantity (feet, centimetres, or number of lengths),

3.1.2 Name of material (austenitic steel pipe),

3.1.3 Class (1.3). If not specified by the purchaser, the producer shall have the option to furnish either single-welded (SW) or double-welded (DW) pipe,

3.1.4 Grade (Table 2),

3.1.5 Size (NPS or outside diameter and schedule number or average wall thickness),

3.1.6 Length (specific or random), (Section 9),

3.1.7 End finish (section on Ends of Specification A 999/A 999M),

3.1.8 Optional requirements (hydrostatic or nondestructive electric test, Section 13,) (Supplementary Requirements S1 to S6),

3.1.9 Test report required (Section on Certification of Specification A 999/A 999M),

3.1.10 Specification number, and

3.1.11 Special requirements or exceptions to the specification.

4. Materials and Manufacture**4.1 Manufacture:**

4.1.1 The pipe shall be made by a machine-welding or an automatic-welding process, welding from one or both sides and producing full penetration welds with no addition of filler metal in the welding operation.

4.1.2 Weld repairs, with the addition of compatible filler metal, may be made to the weld joint in accordance with the requirements of the section on Repair by Welding of Specification A 999/A 999M.

4.1.3 The pipe shall be pickled free of scale. When bright annealing is used, pickling is not necessary.

4.1.4 H grades and S30815 shall have a grain size of 7 or coarser when determined in accordance with ASTM E 112.

4.2 Heat Treatment:

4.2.1 All pipe shall be furnished in the heat-treated condition. The heat-treatment procedure, except for H grades, N08367, S30815, and S31254, shall consist of heating the pipe to a minimum temperature of 1900°F [1040°C] and quenching in water or rapidly cooling by other means.

4.2.2 All H grades and S30815 shall be furnished in the solution-treated condition. The minimum solution treating temperature for Grades TP321H, TP347H, and TP348H shall be 2000°F [1100°C] and for Grades TP304H and TP316H, 1900°F [1040°C]. The minimum temperature for S30815 shall be 1920°F [1050°C].

4.2.3 The heat-treatment procedure for S31254 shall consist of heating the pipe to a minimum temperature of 2100°F [1150°C] and quenching in water or rapidly cooling by other means.

4.2.4 UNS N08367 shall be solution annealed from 2025°F [1107°C] minimum followed by rapid quenching.

4.2.5 DELETED

4.2.6 DELETED

4.2.7 DELETED

5. Chemical Composition

5.1 The steel shall conform to the chemical composition in Table 2.

5.2 When specified on the purchase order, a product analysis shall be supplied from one tube or coil of steel per heat. The product analysis tolerance of Specification A 480/A 480M shall apply.

6. Product Analysis

6.1 At the request of the purchaser, an analysis of one length of flat-rolled stock from each heat, or one pipe from each lot shall be made by the manufacturer. A lot of pipe shall consist of the following number of lengths of the same size and wall thickness from any one heat of steel.

NPS Number	Lengths of Pipe in Lot
Under 2	400 or fraction thereof
2 to 5 inclusive	200 or fraction thereof
6 and over	100 or fraction thereof

6.2 The results of these analyses shall be reported to the purchaser or his representative, and shall conform to the requirements specified in Section 5.

6.3 If the analysis of one of the tests specified in 6.1 does not conform to the requirements specified in Section 5, an analysis of each length of flat-rolled stock from each heat or pipe from the same heat or lot may be made, and all pipe conforming to the requirements shall be accepted.

6.4 For referee purposes, Test Methods, Practices, and Terminology A 751 shall be used.

7. Tensile Requirements

7.1 The tensile properties of the material shall conform to the requirements prescribed in Table 3.

8. Permissible Variations in Dimensions

8.1 Permissible variations in dimensions shall not exceed the following at any point in each length of pipe.

8.1.1 Specified Diameter — The outside diameter shall be based on circumferential measurement and shall not exceed the tolerances stated as follows:

8.1.1.1 For sizes up to and including NPS 1½, ±0.010 in. [±0.25 mm],

8.1.1.2 For sizes NPS 1½ up to and including NPS 6, ±0.020 in. [±0.5 mm],

8.1.1.3 For sizes NPS 8 up to and including NPS 18, ±0.030 in. [±0.75 mm],

8.1.1.4 For sizes NPS 20 up to and including NPS 24, ±0.040 in. [±1 mm], and

8.1.1.5 For sizes NPS 30, ±0.050 in. [±1.25 mm].

8.1.1.6 Outside diameter tolerances closer than shown above may be obtained by agreement between the pipe manufacturer and purchaser.

8.1.2 Out-of-Roundness — The difference between the major and the minor outside diameter shall not be more than 1.5% of the specified outside diameter.

8.1.3 Alignment (Camber) — Using a 10 ft [3.0 m] straightedge placed so that both ends are in contact with the pipe, the camber shall not be more than ⅜ in. [4.8 mm].

8.1.4 Thickness — The wall thickness at any point in the pipe excluding the weld, shall not be more than 12% under or over the nominal thickness for wall thickness less than 0.188 in. [4.8 mm] and not more than 0.030 in. [0.8 mm] under or over the nominal thickness for wall thickness 0.188 in. [4.8 mm] and greater. Weld reinforcement not to exceed 20% of the wall thickness is permitted on each of the inside and outside surfaces of the pipe.

9. Lengths

9.1 Pipe lengths shall be in accordance with the following regular practice:

9.1.1 Unless otherwise agreed upon, all sizes up to and including NPS 8 are available in a length up to 24 ft (Note 2) with the permissible range of 15 to 24 ft (Note 2). Short lengths are acceptable and the number and minimum length shall be agreed upon between the manufacturer and the purchaser.

NOTE 2 — The value(s) applies when the inch-pound designation of this specification is the basis of purchase. When the “M” designation of this specification is the basis of purchase, the corresponding metric value(s) shall be agreed upon between the manufacturer and purchaser.

9.1.2 If definite cut lengths are desired, the lengths required shall be specified in the order. No pipe shall be under the specified length and not more than ¼ in. [6 mm] over that specified.

10. Workmanship, Finish, and Appearance

10.1 The finished pipes shall be free of injurious imperfections and shall have a workmanlike finish. Minor imperfections may be removed by grinding, provided the wall thicknesses are not decreased to less than that permitted in Section 8.

11. Examination of Double-Welded Pipe

11.1 Both ends of each double-welded (Class DW) pipe shall be visually examined to determine that complete fusion was attained between the two welds. In lieu of examining the ends of the pipe, this examination may be performed on cropped ends removed from both ends of each double welded pipe.

12. Mechanical Tests Required

12.1 Transverse or Longitudinal Tension Test — One tension test shall be made on a specimen for lots of not more than 100 pipes. Tension tests shall be made on specimens from two tubes for lots of more than 100 pipes. Pipe size greater than NPS 6 shall be tested using the transverse tension test with the weld centered in the gage length of the test specimen. Test specimens shall be taken from the pipe or test plates of the same material as the pipe, the test plates being attached to the end of the cylinder and welded as prolongation of the pipe longitudinal weld seam.

NOTE 3 — The term lot, for mechanical tests, applies to all pipe of the same nominal size and wall thickness (or schedule) which is produced from the same heat of steel and subjected to the same finishing treatment: (1) in a continuous heat-treatment furnace, or (2) in a batch-type heat-treatment furnace, equipped with recording pyrometers and automatically controlled within a 50°F [30°C] range, the larger of: (a) each 200 ft [60 m] or fraction thereof or (b) that pipe heat treated in the same batch furnace charge.

12.2 Flattening Test — For material heat treated in a batch-type furnace, flattening tests shall be made on 5%

of the pipe from each heat-treated lot. For material heat treated by the continuous process, this test shall be made on a sufficient number of pipe to constitute 5% of the lot, but in no case less than two lengths of pipe.

12.2.1 For pipe where the diameter equals or exceeds NPS 10, a transverse-guided face bend test of the weld may be conducted instead of a flattening test in accordance with the method outlined in the steel tubular product supplement of Test Methods and Definitions A 370. The ductility of the weld shall be considered acceptable when there is no evidence of cracks in the weld or between the weld and the base metal after bending. Test specimens from 5% of the lot shall be taken from the pipe or test plates of the same material as the pipe, the test plates being attached to the end of the cylinder and welded as a prolongation of the pipe longitudinal seam.

13. Hydrostatic or Nondestructive Electric Test

13.1 Each pipe shall be subjected to the nondestructive electric test or the hydrostatic test. The type of test to be used shall be at the option of the manufacturer, unless otherwise specified in the purchase order.

13.2 The hydrostatic test shall be in accordance with Specification A 999/A 999M.

13.3 Nondestructive Examination — Each pipe shall be examined with a nondestructive test in accordance with Practice E 213, or E 426. Unless specifically called out by the purchaser, the selection of the nondestructive electric test will be at the option of the manufacturer. The range of pipe sizes that may be examined by each method shall be subject to the limitations in the scope of the respective practices.

13.3.1 The following information is for the benefit of the user of this specification:

13.3.1.1 The reference standards defined in 13.9.1–13.9.4 are convenient standards for calibration of nondestructive testing equipment. The dimensions of these standards should not be construed as the minimum size imperfection detectable by such equipment.

13.3.1.2 The ultrasonic testing (UT) can be performed to detect both longitudinally and circumferentially oriented defects. It should be recognized that different techniques should be employed to detect differently oriented imperfections. The examination may not detect short, deep, defects.

13.3.1.3 The eddy-current testing (ET) referenced in this specification, (Practice E 426), has the capability of detecting significant discontinuities, especially the short abrupt type.

13.3.1.4 A purchaser interested in ascertaining the nature (type, size, location, and orientation) of discontinuities that can be detected in the specific application of these

examinations should discuss this with the manufacturer of the tubular product.

13.4 Time of Examination:

13.4.1 Nondestructive testing for specification acceptance shall be performed after all mechanical processing, heat treatments, and straightening operations. This requirement does not preclude additional testing at earlier stages in the processing.

13.5 Surface Condition:

13.5.1 All surfaces shall be free of scale, dirt, grease, paint, or other foreign material that could interfere with interpretation of test results. The methods used for cleaning and preparing the surfaces for examination shall not be detrimental to the base metal or the surface finish.

13.5.2 Excessive surface roughness or deep scratches can produce signals that interfere with the test.

13.6 Extent of Examination:

13.6.1 The relative motion of the pipe and the transducer(s), coil(s), or sensor(s) shall be such that the entire pipe surface is scanned, except as in 13.5.2.

13.6.2 The existence of end effects is recognized, and the extent of such effects shall be determined by the manufacturer, and, if requested, shall be reported to the purchaser. Other nondestructive tests may be applied to the end areas, subject to agreement between the purchaser and the manufacturer.

13.7 Operator Qualifications:

13.7.1 The test unit operator shall be certified in accordance with SNT-TC-1A, or an equivalent recognized and documented standard.

13.8 Test Conditions:

13.8.1 For eddy-current testing, the excitation coil frequency shall be chosen to ensure adequate penetration yet provide good signal-to-noise ratio.

13.8.2 The maximum eddy-current coil frequency used shall be as follows:

- On specified walls up to 0.050 in.—100 KHz max
- On specified walls up to 0.150 in.—50 KHz max
- On specified walls above 0.150 in.—10 KHz max

13.8.3 Ultrasonic — For examination by the ultrasonic method, the minimum nominal transducer frequency shall be 2.00 MHz and the maximum nominal transducer size shall be 1.5 in.

(1) If the equipment contains a reject notice filter setting, this shall remain off during calibration and testing unless linearity can be demonstrated at that setting.

13.9 Reference Standards:

13.9.1 Reference standards of convenient length shall be prepared from a length of pipe of the same grade,

size (NPS, or outside diameter and schedule or wall thickness), surface finish and heat treatment condition as the pipe to be examined.

13.9.2 For Ultrasonic Testing, the reference ID and OD notches shall be any one of the three common notch shapes shown in Practice E 213, at the option of the manufacturer. The depth of each notch shall not exceed $12\frac{1}{2}\%$ of the specified nominal wall thickness of the pipe or 0.004 in., whichever is greater. The width of the notch shall not exceed twice the depth. Notches shall be placed on both the OD and ID surfaces.

13.9.3 For Eddy-Current Testing, the reference standard shall contain, at the option of the manufacturer, any one of the following discontinuities:

(1) *Drilled Hole* — The reference standard shall contain three or more holes, equally spaced circumferentially around the pipe and longitudinally separated by a sufficient distance to allow distinct identification of the signal from each hole. The holes shall be drilled radially and completely through the pipe wall, with care being taken to avoid distortion of the pipe while drilling. One hole shall be drilled in the weld, if visible. Alternately, the producer of welded pipe may choose to drill one hole in the weld and run the calibration standard through the test coils three times with the weld turned at 120° on each pass. The hole diameter shall vary with NPS as follows:

NPS Designator	Hole Diameter
$\frac{1}{2}$	0.039 in. [1 mm]
above $\frac{1}{2}$ to $1\frac{1}{4}$	0.055 in. [1.4 mm]
above $1\frac{1}{4}$ to 2	0.071 in. [1.8 mm]
above 2 to 5	0.087 in. [2.2 mm]
above 5	0.106 in. [2.7 mm]

(2) *Transverse Tangential Notch* — Using a round tool or file with a $\frac{1}{4}$ in. [6.4 mm] diameter, a notch shall be filed or milled tangential to the surface and transverse to the longitudinal axis of the pipe. Said notch shall have a depth not exceeding $12\frac{1}{2}\%$ of the specified nominal wall thickness of the pipe or 0.004 in. (0.102 mm), whichever is greater.

(3) *Longitudinal Notch* — A notch 0.031 in. or less in width shall be machined in a radial plane parallel to the tube axis on the outside surface of the pipe, to have a depth not exceeding $12\frac{1}{2}\%$ of the specified wall thickness of the pipe or 0.004 in., whichever is greater. The length of the notch shall be compatible with the testing method.

13.9.4 More or smaller reference discontinuities, or both, may be used by agreement between the purchaser and the manufacturer.

13.10 Standardization Procedure:

13.10.1 The test apparatus shall be standardized at the beginning and end of each series of pipes of the same size (NPS or diameter and schedule or wall thickness), Grade and heat treatment condition, and at intervals not exceeding 4 h. More frequent standardization may be performed at the manufacturer's option or may be required upon agreement between the purchaser and the manufacturer.

13.10.2 The test apparatus shall also be standardized after any change in test system settings, change of operator, equipment repair, or interruption due to power loss, process shutdown or when a problem is suspected.

13.10.3 The reference standard shall be passed through the test apparatus at the same speed and test system settings as the pipe to be tested.

13.10.4 The signal-to-noise ratio for the reference standard shall be $2\frac{1}{2}$ to 1 or greater. Extraneous signals caused by identifiable causes such as dings, scratches, dents, straightener marks, etc., shall not be considered noise. The rejection amplitude shall be adjusted to be at least 50% of full scale of the readout display.

13.10.5 If upon any standardization, the rejection amplitude has decreased by 29% (3 dB) of peak height from the last standardization, the pipe since the last calibration shall be rejected. The test system settings may be changed, or the transducer(s), coil(s) or sensor(s) adjusted, and the unit restandardized, but all pipe tested since the last acceptable standardization must be retested for acceptance.

13.11 Evaluation of Imperfections:

13.11.1 Pipes producing a signal equal to or greater than the lowest signal produced by the reference standard(s) shall be identified and separated from the acceptable pipes. The area producing the signal may be reexamined.

13.11.2 Such pipes shall be rejected if the test signal was produced by imperfections that cannot be identified or was produced by cracks or crack-like imperfections. These pipes may be repaired per Sections 4 and 10. To be accepted, a repaired pipe must pass the same non-destructive test by which it was rejected, and it must meet the minimum wall thickness requirements of this specification.

13.11.3 If the test signals were produced by visual imperfections such as:

- (1) Scratches,
- (2) Surface roughness,
- (3) Dings,
- (4) Straightener marks,
- (5) Cutting chips,
- (6) Steel die stamps,
- (7) Stop marks, or
- (8) Pipe reducer ripple.

The pipe may be accepted based on visual examination provided the imperfection is less than 0.004 in. [0.1 mm] or $12\frac{1}{2}\%$ of the specified wall thickness (whichever is greater).

13.11.4 Rejected pipe may be reconditioned and retested providing the wall thickness is not decreased to less than that required by this or the product specification. The outside diameter at the point of grinding may be reduced by the amount so removed. To be accepted, retested pipe shall meet the test requirement.

13.11.5 If the imperfection is explored to the extent that it can be identified as non-rejectable, the pipe may be accepted without further test providing the imperfection does not encroach on the minimum wall thickness.

14. Product Marking

14.1 In addition to that specified in Specification A 999/A 999M, the marking shall include the manufacturer's private identifying mark and identified as either single

welded (SW) or double welded (DW) as applicable. For Grades TP304H, TP316H, TP321H, TP347H, and TP348H, the marking shall also include the heat number and heat-treatment lot identification. If specified in the purchase order, the marking for pipe larger than NPS 4 shall include the weights.

14.2 When heat treatment of the pipe is not performed, the pipe shall be marked HT-O.

14.3 When a hydrostatic test of the pipe is not performed, the pipe shall be marked NH.

15. General Requirements

15.1 Material furnished under this specification shall conform to the applicable requirements of the current edition of Specification A 999/A 999M unless otherwise provided herein.

^A For pipe sizes not listed, the dimensions and tolerances shall be by agreement between the purchaser and producer.

^B Schedules 5S and 10S wall thicknesses do not permit threading in accordance with the American National Standard for Pipe Threads (ANSI B1.20.1).

^C These do not conform to the American National Standard for Welded and Seamless Wrought Steel Pipe (ANSI B36.10-1979).

NOTES:

(1) Table 1 is based on Table number 1 of the American National Standard for Stainless Steel Pipe (ANSI B36.19-1965).

(2) The decimal thickness listed for the respective pipe sizes represents their nominal or average wall dimensions.

SUPPLEMENTARY REQUIREMENTS

One or more of the following supplementary requirements shall apply only when specified in the purchase order. The purchaser may specify a different frequency of test or analysis than is provided in the supplementary requirement. Subject to agreement between the purchaser and manufacturer, retest and retreatment provisions of these supplementary requirements may also be modified.

S1. Product Analysis

S1.1 For all pipes NPS 5 and larger in nominal size, there shall be one product analysis made of a representative sample from one piece for each ten lengths or fraction thereof from each heat of steel.

S1.2 For pipe smaller than NPS 5, there shall be one product analysis made from ten lengths per heat of steel or from 10% of the number of lengths per heat of steel, whichever number is smaller.

S1.3 Individual lengths failing to conform to the chemical requirements specified in Section 5 shall be rejected.

S2. Transverse Tension Tests

S2.1 There shall be one transverse tension test made from one end of 10% of the lengths furnished per heat of steel. This applies only to pipe NPS 8 and larger in nominal size.

S2.2 If a specimen from any length fails to conform to the tensile properties specified that length shall be rejected.

S3. Flattening Test

S3.1 The flattening test of Specification A999/A999M shall be made on a specimen from one or both ends of each pipe. Crop ends may be used. If this supplementary requirement is specified, the number of tests per pipe shall also be specified. If a specimen from any length fails because of lack of ductility prior to satisfactory completion of the first step of the flattening test requirement, that pipe shall be rejected subject to retreatment in accordance with Specification A 999/A 999M and satisfactory retest. If a specimen from any length of pipe fails because of a lack of soundness, that length shall be tested, unless subsequent retesting indicates that the remaining length is sound.

S4. Etching Tests

S4.1 The steel shall be homogeneous as shown by etching tests conducted in accordance with the appropriate portions of Method E 381. Etching tests shall be made on a cross section from one end or both ends of each pipe

and shall show sound welds and reasonably uniform material free of injurious laminations, cracks, and similar objectionable imperfections. If this supplementary requirement is specified, the number of tests per pipe required shall also be specified. If a specimen from any length shows objectionable imperfections, the length shall be rejected subject to removal of the defective end and subsequent retests indicating the remainder of the length to be sound and reasonably uniform material.

S5. Radiographic Examination

S5.1 Weld soundness shall be determined through radiographic examination made in accordance with requirements as agreed upon between the pipe manufacturer and purchaser.

S6. Corrosion Requirements

S6.1 Boiling Nitric Acid Test — Except for Grade TP 321, coupons representing finished pipe made of non-molybdenum-bearing material (0.50% and less molybdenum) shall meet the requirements of Practice C of Practices A 262. The condition of the test specimens and the corrosion rates are as follows: Types 304L, 304LN, 347, and 348 shall be tested in the sensitized condition (heated for 1 h at 1240°F [670°C]) and the rate of penetration when the solution is tested in accordance with Practice C shall not exceed 0.0020 in. [0.05 mm] per month. All other nonmolybdenum-bearing types, except for Grade TP 321, shown in Table 2, shall be tested in the annealed and unsensitized condition and the rate of penetration shall not exceed 0.0015 in. [0.038 mm] per month.

S6.2 Acidified Copper Sulfate Test — Coupons representing finished pipe made of molybdenum-bearing material (over 0.50% molybdenum) and Type 321 shall meet the requirements of Practice E of Practices A 262. The condition of the test specimen is as follows: Types 316L, 316LN, 317L, and 321 shall be tested in the sensitized condition (heated for 1 h at 1240°F [670°C]). All molybdenum-bearing types shown in Table 2 shall be tested in the annealed and unsensitized condition. All specimens shall meet the requirements of the prescribed bend tests.

SPECIFICATION FOR COLD-WORKED WELDED AUSTENITIC STAINLESS STEEL PIPE

SA-814/SA-814M

(Identical with ASTM Specification A 814/A 814M-05.)

1. Scope

1.1 This specification covers two classes of flanged and cold-bending quality cold-worked straight-seam single or double welded austenitic steel pipe intended for high-temperature and general corrosive services.

NOTE 1 — When the impact test criterion for a low-temperature service would be 15 ft-lbf [20 J] energy absorption or 15 mils [0.38 mm] lateral expansion, some of the austenitic stainless steel grades covered by this specification are accepted by certain pressure vessel or piping codes without the necessity of making the actual test. For example, Grades 304, 304L, and 347 are accepted by the ASME Pressure Vessel Code, Section VIII Division 1, and by the Chemical Plant and Refinery Piping Code, ANSI B31.3 for service at temperatures as low as -425°F [-250°C] without qualification by impact tests. Other AISI stainless steel grades are usually accepted for service temperatures as low as -325°F [-200°C] without impact testing. Impact testing may, under certain circumstances, be required. For example, materials with chromium or nickel content outside the AISI ranges, and for material with carbon content exceeding 0.10%, are required to be impact tested under the rules of ASME Section VIII Division 1 when service temperatures are lower than -50°F [-45°C].

1.2 Grades TP304H, TP304N, TP316H, TP316N, TP321H, TP347H, and TP348H are modifications of Grades TP304, TP316, TP321, TP347, and TP348, and are intended for high-temperature service.

1.3 Two classes of pipe are covered as follows:

1.3.1 Class SW — Pipe, single-welded with no addition of filler metal and

1.3.2 Class DW — Pipe, double-welded with no addition of filler metal.

1.4 Optional supplementary requirements are provided for pipe where a greater degree of testing is desired. These supplementary requirements call for additional tests to be made and, when desired, one or more of these may be specified in the order.

1.5 Table 1 lists the dimensions of cold-worked single- or double-welded stainless steel pipe. Pipe having other

dimensions may be furnished provided such pipe complies with all other requirements of this specification.

1.6 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification. The inch-pound units shall apply unless the “M” designation of this specification is specified in the order.

3. Ordering Information

3.1 Orders for material under this specification should include the following as required, to describe the desired material adequately:

3.1.1 Quantity (feet, centimetres, or number of lengths),

3.1.2 Name of material (austenitic steel pipe),

3.1.3 Class (1.3). If not specified by the purchaser, the producer shall have the option to furnish either single-welded (SW) or double-welded (DW) pipe,

3.1.4 Grade (Table 2),

3.1.5 Size (NPS or outside diameter and schedule number or average wall thickness),

3.1.6 Length (specific or random) (Section 10),

3.1.7 End finish (Section on Ends of Specification A 999/A 999M),

3.1.8 Optional requirements (Section 9), (Supplementary Requirements S1 to S8),

3.1.9 Test report required (Section on Certification of Specification A 999/A 999M),

3.1.10 Specification designation, and

3.1.11 Special requirements or exceptions to the specification.

4. Materials and Manufacture

4.1 *Manufacture:*

4.1.1 The pipe shall be made by a machine-welding or an automatic-welding process, welding from one or both sides and producing full penetration welds with no addition of filler metal in the welding operation.

4.1.2 Weld repairs, with the addition of compatible filler metal, may be made to the weld joint in accordance with the requirements of the section on Repair by Welding of Specification A 999/A 999M.

4.1.3 Prior to final heat treatment of the pipe, the weld bead must be cold-worked by methods such as forging, planishing, drawing, swaging or bead rolling so as to obtain a flush condition on the inside and outside of the pipe. Undercuts shall be limited to shallow rounded depressions of less than 0.005 in. [0.127 mm] deep on either the inside or outside surface of the pipe with no encroachment of the minimum permitted wall thickness.

4.1.4 The pipe shall be pickled free of scale. When bright annealing is used, pickling is not necessary.

4.2 *Heat Treatment:*

4.2.1 All pipe shall be furnished in the heat-treated condition. The heat-treatment procedure, except for H

grades, S30815, N08367 and S31254, shall consist of heating the pipe to a minimum temperature of 1900°F [1040°C] and quenching in water or rapidly cooling by other means.

4.2.2 All H grades and S30815 shall be furnished in the solution-treated condition. The minimum solution treating temperature for Grades TP321H, TP347H, and TP348H shall be 2000°F [1100°C] and for Grades TP304H and TP316H, 1900 °F [1040 °C]. The minimum temperature for S30815 shall be 1920°F [1050°C].

4.2.3 The heat-treatment procedure for S31254 shall consist of heating the pipe to a minimum temperature of 2100°F [1150°C] and quenching in water or rapidly cooling by other means.

4.2.4 UNS N08367 shall be solution annealed from 2025°F minimum followed by rapid quenching.

4.3 H grades and S30815 shall have a minimum grain size of 7 or coarser when measured in accordance with Test Methods E 112.

5. Chemical Composition

5.1 The steel shall conform to the chemical composition prescribed in Table 2.

5.2 When specified on the purchase order, a product analysis shall be supplied from one tube or coil of steel per heat. The product analysis tolerance of Specification A 480/A 480M shall apply.

6. Tensile Requirements

6.1 The tensile properties of the material shall conform to the requirements prescribed in Table 3.

7. Permissible Variations in Dimensions

7.1 Specified Diameter — The diameter at any point in each length of pipe shall be within the tolerance specified in Table 1.

7.2 Alignment (Camber) — Using a 3 ft [1.0 m] straight-edge placed so that both ends are in contact with the pipe, the camber shall not be more than 0.030 in. [0.8 mm].

7.3 Thickness — The wall thickness at any point in the pipe shall be within the thickness tolerance specified in Table 3, except that for pipe in which the wall thickness exceeds 0.188 in. [4.8 mm] a weld reinforcement of up to 0.015 in. [0.38 mm] is permitted on the inside of the pipe.

8. Lengths

8.1 Pipe lengths shall be in accordance with the following regular practice.

8.1.1 Unless otherwise agreed upon, all sizes up to and including NPS 4 are available in a length up to 24 ft (Note 2) with the permissible range of 15 of 24 ft (Note 2).

NOTE 2 — The value(s) applies when the inch-pound designation of this specification is the basis of purchase. When the “M” designation of this specification is the basis of purchase, the corresponding metric value(s) shall be agreed upon between the manufacturer and purchaser.

8.1.2 If definite cut lengths are desired, the lengths required shall be specified in the order. No pipe shall be under the specified length and not more than $\frac{1}{4}$ in. [6 mm] over that specified.

8.1.3 No jointers are permitted unless otherwise specified.

9. Workmanship, Finish, and Appearance

9.1 The finished pipes shall be free of injurious imperfections and shall have a workmanlike finish. Minor imperfections may be removed by grinding, provided the wall thicknesses are not decreased to less than that permitted in Section 9.

10. General Requirements

10.1 Material furnished under this specification shall conform to the applicable requirements of the current edition of Specification A 999/A 999M unless otherwise provided herein.

11. Examination of Double-Welded Pipe

11.1 Both ends of each double-welded (Class DW) pipe shall be visually examined to determine that complete fusion was attained between the two welds. In lieu of examining the ends of the pipe, this examination may be performed on cropped ends removed from both ends of each double welded pipe.

12. Mechanical Tests Required

12.1 Transverse or Longitudinal Tension Test — One tension test shall be made on a specimen for lots of not more than 100 pipes. Tension tests shall be made on specimens from two tubes for lots of more than 100 pipes.

NOTE 3 — The term “lot”, for mechanical tests, applies to all pipe of the same nominal size and wall thickness (or schedule) which is produced from the same heat of steel and subjected to the same finishing treatment (1) in a continuous heat-treatment furnace, or (2) in a batch-type heat-treatment furnace, equipped with recording pyrometers and automatically controlled within a 50°F [30°C] range, the larger of (a) Each 200 ft [60 m] or fraction thereof or, (b) That pipe heat treated in the same batch furnace charge.

12.2 Flattening Test — For material heat treated in a batch-type furnace, flattening tests shall be made of 5% of the pipe from each heat-treated lot. For material heat treated by the continuous process, this test shall be made on a sufficient number of pipe to constitute 5% of the lot, but in no case less than two lengths of pipe.

12.2.1 For pipe where the diameter equals or exceeds NPS 10, a transverse-guided face bend test of the weld may be conducted instead of a flattening test in accordance with the method outlined in the steel tubular product supplement of Test Methods and Definitions A 370. The ductility of the weld shall be considered acceptable when there is no evidence of cracks in the weld or between the weld and the base metal after bending. Test specimens from 5% of the lot shall be taken from the pipe or test plates of the same material as the pipe, the test plates being attached to the end of the cylinder and welded as a prolongation of the pipe longitudinal seam.

12.3 Hydrostatic Test — Each length of pipe shall be subjected to the hydrostatic test in accordance with Specification A 999/A 999M.

13. Product Marking

13.1 In addition to the marking specified in Specification A 999/A 999M, the marking shall include the manufacturer’s identifying mark and double-welded pipe shall be identified with the mark (DW). For Grades TP304H, TP316H, TP321H, TP347H, TP348H, and S30815, the marking shall also include the heat number and heat-treatment lot identification. If specified in the purchase order, the marking for pipe larger than NPS 4 shall include the weight.

14. Keywords

14.1 austenitic stainless steel pipe; cold-worked pipe

^A New designation established in accordance with ASTM E 527 and SAE J1086.

^B Maximum, unless otherwise indicated.

^C The method of analysis for nitrogen shall be a matter of agreement between the purchaser and manufacturer.

^D For small diameter or thin walls or both, where many drawing passes are required, a carbon maximum of 0.040% is necessary in grades TP304L and TP316L. Small outside diameter tubes are defined as those less than 0.500 in. [12.7 mm] in outside diameter and light wall tubes as those less than 0.049 in. [1.2 mm] in average wall thickness (0.044 in. [1 mm] in minimum wall thickness).

^E The titanium content shall be not less than five times the carbon content and not more than 0.70%.

^F The titanium content shall be not less than four times the carbon content and not more than 0.70%.

^G The columbium plus tantalum content shall be not less than ten times the carbon content and not more than 1.10%.

^H The columbium plus tantalum content shall be not less than eight times the carbon content and not more than 1.10%.

SUPPLEMENTARY REQUIREMENTS

One or more of the following supplementary requirements shall apply only when specified in the purchase order. The purchaser may specify a different frequency of test or analysis than is provided in the supplementary requirement. Subject to agreement between the purchaser and manufacturer, retest and retreatment provisions of these supplementary requirements may also be modified.

S1. Product Analysis

S1.1 For all pipe NPS 5 and larger in nominal size, there shall be one product analysis made of a representative sample from one piece for each ten lengths or fraction thereof from each heat of steel.

S1.2 For pipe smaller than NPS 5 in nominal size there shall be one product analysis made from ten lengths per heat of steel or from 10% of the number of lengths per heat of steel, whichever number is smaller.

S1.3 Individual lengths failing to conform to the chemical requirements specified in Section 6 shall be rejected.

S2. Transverse Tension Tests

S2.1 There shall be one transverse tension test made from one end of 10% of the lengths furnished per heat of steel. This applies only to pipe NPS 8 and larger in nominal size.

S2.2 If a specimen from any length fails to conform to the tensile properties specified, that length shall be rejected.

S3. Flattening Test

S3.1 The flattening test of Specification A 999/A 999M shall be made on a specimen from one or both ends of each pipe. Crop ends may be used. If this supplementary requirement is specified, the number of tests per pipe shall also be specified. If a specimen from any length fails because of ductility prior to satisfactory completion of the first step of the flattening test requirement, that pipe shall be rejected subject to retreatment in accordance with Specification A 999/A 999M and satisfactory retest. If a specimen from any length of pipe fails because of a lack of soundness, that length shall be rejected, unless subsequent retesting indicates that the remaining length is sound.

S4. Etching Tests

S4.1 The steel shall be homogeneous as shown by etching tests conducted in accordance with the appropriate portions of Method E 381. Etching tests shall be made on a cross section from one end or both ends of each pipe

and shall show sound welds and reasonably uniform material free of injurious laminations, cracks, and similar objectionable imperfections. If this supplementary requirement is specified, the number of tests per pipe required shall also be specified. If a specimen from any length shows objectionable imperfections, the length shall be rejected subject to the removal of the defective end and subsequent retests indicating the remainder of the length to be sound and reasonably uniform material.

S5. Eddy Current Examination

S5.1 Pipe soundness shall be determined through eddy-current examination made in accordance with requirements as agreed upon between the pipe manufacturer and purchaser.

S6. Ultrasonic Examination

S6.1 Pipe soundness shall be determined through ultrasonic examination made in accordance with requirements as agreed upon between the pipe manufacturer and purchaser.

S7. Corrosion Requirements

S7.1 Boiling Nitric Acid Test — Except for Grade TP 321, coupons representing finished pipe made of non-molybdenum-bearing material (0.50% and less molybdenum) shall meet the requirements Practice C of Practices A 262. The condition of the test specimens and the corrosion rates are as follows: Types 304L, 304LN, 347, and Type 348 shall be tested in the sensitized condition (heated for 1 h at 1240°F [670°C]) and the rate of penetration shall not exceed 0.0020 in. [0.05 mm]/month. All other nonmolybdenum-bearing types, except for Grade TP 321, shown in Table 2 shall be tested in the annealed and unsensitized condition and the rate of penetration when solution tested in accordance with Practice C shall not exceed 0.0015 in./month [0.038 mm/month].

S7.2 Acidified Copper Sulfate Test — Coupons representing finished pipe made of molybdenum-bearing material (over 0.50% molybdenum) and Type 321 shall meet the requirements of Practice E of Practices A 262. The condition of the test specimen is as follows: Types 316L,

316LN, 317L and 321 shall be tested in the sensitized condition (heated for 1 h at 1240°F [670°C]). All molybdenum-bearing types shown in Table 2 shall be tested in the annealed and unsensitized condition. All specimens shall meet the requirements of the prescribed bend tests.

S8. Flange Test

S8.1 A section of pipe shall be capable of having a flange turned over at a right angle to the body of the pipe without cracking. The width of the flange shall be not less than 15% of the outside diameter of the pipe.

SPECIFICATION FOR WROUGHT FERRITIC, FERRITIC/AUSTENITIC, AND MARTENSITIC STAINLESS STEEL PIPING FITTINGS

SA-815/SA-815M

(Identical with ASTM Specification A 815/A 815M-08 except for the deletion of 5.14 and 5.15.)

1. Scope

1.1 This specification covers two general classes, WP and CR, of wrought ferritic, ferritic/austenitic, and martensitic stainless steel fittings of seamless and welded construction covered by the latest revision of Specification A 960/A 960M. Fittings differing from these standards may be furnished in accordance with Supplementary Requirement S8.

1.1.1 Class WP fittings are subdivided into four subclasses: Classes WP-S, WP-W, WP-WX, and WP-WU. They are manufactured to the requirements of Specification A 960/A 960M, and they shall have pressure ratings compatible with 12.2. Class WP-S fittings are those manufactured from seamless product by a seamless method of manufacture (marked with class symbol WP-S); Class WP-W fittings are those which contain welds where the fitting fabrication or construction welds have been radiographed (marked with class symbol WP-W); and Class WP-WX fittings are those which contain welds where all welds have been radiographed (marked with class symbol WP-WX); and Class WP-WU fittings are those which contain welds where all welds have been ultrasonically tested (marked with class symbol WP-WU).

1.1.2 Class CR fittings are those manufactured to the requirements of MSS SP-43, and they shall have pressure ratings compatible with 12.3.

1.2 This specification does not apply to cast fittings.

1.3 Optional supplementary requirements are provided. When desired, one or more of these may be specified in the order.

1.4 This specification is expressed in both inch-pound units and in SI units. However, unless the order specifies the applicable "M" specification designation [SI units], the material shall be furnished to inch-pound units.

1.5 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification.

Testing Personnel Qualification and Certification

3. Common Requirements and Ordering Information

3.1 Material furnished to this specification shall conform to the requirements of Specification A 960/A 960M including any supplementary requirements that are indicated in the purchase order. Failure to comply with the common requirements of Specification A 960/A 960M constitutes nonconformance with this specification. In case of conflict between this specification and Specification A 960/A 960M, this specification shall prevail.

3.2 Specification A 960/A 960M identifies the ordering information that should be complied with when purchasing material to this specification.

4. Materials

4.1 The material for fittings shall consist of forgings, bars, plates, or seamless or welded tubular products that conform to the chemical requirements in Table 1.

4.2 The steel shall be melted by one of the following processes:

4.2.1 Electric furnace (with separate degassing and refining optional),

4.2.2 Vacuum furnace, or

4.2.3 Electric furnace followed by vacuum or electroslag-consumable remelting.

4.3 If secondary melting is employed, the heat shall be defined as all ingots remelted from a primary heat.

5. Manufacture

5.1 Forming — Forging or shaping operations may be performed by hammering, pressing, piercing, extruding, upsetting, rolling, bending, fusion welding, machining or by combination of two or more of these operations. The forming procedure shall be so applied that it will not produce surface discontinuities deeper than 5% of the specified nominal thickness of the fitting.

5.2 All classes of fittings shall be heat treated in accordance with Section 6.

5.3 Fittings ordered as Class WP-S shall be of seamless construction and shall meet all requirements of Specification A 960/A 960M.

5.4 Fittings ordered as Class WP-W shall meet the requirements of Specification A 960/A 960M and (1) shall have all welds made by the fitting manufacturer and all pipe welds made with the addition of filler metal radiographically examined throughout the entire length in accordance with Paragraph UW-51 of Section VIII, Division 1, of the ASME Boiler and Pressure Vessel Code; and (2) shall not require radiography of the starting pipe weld if the pipe was welded without the addition of filler metal. In place of radiographic examination, welds made by the fitting manufacturer may be ultrasonically examined in accordance with the code requirements stated in 5.6.

5.5 Fittings ordered as Class WP-WX shall meet the requirements of Specification A 960/A 960M and shall have all welds, whether made by the fitting manufacturer or the starting material manufacturer, radiographically examined throughout their entire length in accordance with Paragraph UW-51 of Section VIII, Division I of the ASME Boiler and Pressure Vessel Code. The radiography of welds for this class of fittings can be done either prior to or after forming at the option of the manufacturer.

5.6 Fittings ordered as Class WP-WU shall meet the requirements of Specification A 960/A 960M and shall have all welds, whether made by the fitting manufacturer or the starting material manufacturer, ultrasonically examined throughout their entire length in accordance with Appendix 12 of Section VIII, Division 1 of ASME Boiler and Pressure Vessel Code.

5.7 The radiography or ultrasonic examination for this class of fittings may be done at the option of the manufacturer, either prior to or after forming.

5.8 Personnel performing NDE examinations shall be qualified in accordance with SNT-TC-1A.

5.9 Fittings covered in Specification A 960/A 960M and ordered as CR shall meet the requirements of Specification A 960/A 960M and do not require nondestructive examination.

5.10 All classes of fittings shall have the welders, welding operators, and welded procedures qualified under the provisions of Specification A 960/A 960M except that starting pipe welds made without the addition of filler metal do not require such qualification.

5.11 All joints welded with filler metal shall be finished in accordance with the requirements of Paragraph UW-35(a) of Section VIII, Division 1, of the ASME Boiler and Pressure Vessel Code.

5.12 Fittings machined from bar shall be restricted to NPS 4 or smaller.

5.12.1 All caps machined from bar shall be examined by liquid penetrant in accordance with Practice E 165.

5.13 Weld buildup is permitted to dimensionally correct unfilled areas produced during cold forming of stub ends. Radiographic examination of the weld buildup shall not be required provided that all of the following steps are adhered to:

5.13.1 The weld procedure and welders or welding operators meet the requirements of 5.10,

5.13.2 Heat-treatment is performed after welding and prior to machining,

5.13.3 All weld surfaces are liquid penetrant examined in accordance with Appendix 8 of Section VIII, Division 1 of the ASME Boiler and Pressure Vessel Code, and

5.13.4 Repair of areas in the weld is permitted, but 5.13.1, 5.13.2, and 5.13.3 must be repeated.

5.14 DELETED

5.15 DELETED

6. Heat Treatment

6.1 Unless otherwise stated herein, heat treatment shall be performed after welding and in accordance with the requirements of Table 2.

6.1.1 No final heat treatment of welded fittings (HT-O) fabricated from ferritic/austenitic plate that has been heat treated as required by Table 2 for the particular grade, is required, provided material representative of the fittings, including base metal, weld metal, and heat affected zone, passes a Test Methods A 923 Method B or C (See Note 1) corrosion evaluation per heat. Each fitting supplied under this requirement shall be stenciled with the suffix HT-O.

6.1.2 For materials not listed in Table 3 of Test Methods A 923, the HT-O provision does not apply.

6.2 All fittings shall be heat treated in accordance with the requirements specified in Table 2.

NOTE 1 — The Test Methods A 923 test method (B or C) is at the manufacturer's option, unless otherwise specified by the purchaser.

6.3 All welding shall be done prior to the heat treatment specified in Table 2.

6.4 All fittings machined directly from forgings or bars (see 5.12), previously heat treated in accordance with the requirements specified in Table 2, need not be reheat treated.

7. Chemical Composition

7.1 The chemical composition of each cast or heat shall be determined and shall conform to the requirements of the chemical composition for the respective grades of materials

listed in Table 1. Methods and practices relating to chemical analyses required by this specification shall be in accordance with Methods, Practices, and Definitions A 751. Product analysis tolerances in accordance with Table 3 are applicable.

7.2 Except as listed below, in fittings of welded construction, the composition of the deposited weld shall conform to the same requirements as the base metal.

7.2.1 Welds on S32950 base metal shall be made with nominal 26% Cr, 8% Ni, 2% Mo weld metal.

7.2.2 Welds on S31803 base metal shall conform to the same requirements as the base metal or shall be made with nominal 22% Cr, 8 to 10% Ni, 3% Mo weld metal.

8. Tensile Requirements

8.1 The tensile properties of the fitting material shall conform to the requirements of Table 4. The testing and reporting shall be performed in accordance with Test Methods and Definitions A 370.

8.2 At least one tension test per heat shall be made on material representative of the fitting, including weld metal when filler metal is added, and in the same condition of heat treatment as the finished fitting it represents.

8.3 The fittings manufacturer shall perform a tensile test on material representative of the finished fitting. Records of the tensile test made on the starting material may be certification that the material of hot-finished fittings meets the tensile requirements of this specification provided the heat treatments are the same.

9. Hardness Requirements

9.1 Fittings shall not exceed the maximum hardness shown in Table 4.

10. Dimensions

10.1 The sizes, shapes, and dimensions of the fittings covered by ASME B16.9, ASME B16.11, MSS SP-43, MSS SP-79, MSS-SP-83, or MSS-SP-95 shall be as specified in those standards.

10.2 Fittings of size or shape differing from these standards, but meeting all other requirements of this specification, may be furnished in accordance with Supplementary Requirement S58 of Specification A 960/A 960M.

11. Workmanship, Finish, and Appearance

11.1 Fittings supplied under this specification shall be examined visually. Selected typical surface discontinuities shall be explored for depth. The fittings shall be free from

surface discontinuities that penetrate more than 5% of the specified nominal wall thickness, except as defined in 11.3 and 11.4, and shall have a workmanlike finish.

11.2 Surface discontinuities deeper than 5% of the specified nominal wall thickness, except as defined in 11.3 and 11.4, shall be removed by the manufacturer by machining or grinding to sound metal, and the repaired areas shall be well faired. The wall thickness at all points shall be at least 87½% of the specified nominal wall thickness, and the diameters at all points shall be within the specified limits.

11.3 Surface checks (fish scale) deeper than ¼ in. [0.4 mm] shall be removed.

11.4 Mechanical marks deeper than ⅓ in. [1.6 mm] shall be removed.

11.5 When the removal of a surface discontinuity reduces the wall thickness below 87½% of the specified nominal wall thickness at any point, the fitting shall be subject to rejection or to repair as provided in 11.6.

11.6 Repair by Welding:

11.6.1 Repair welding, of the base metal by the manufacturer, is permissible for fittings made to the dimensional standards listed in 10.1 or for other standard fittings made for stock. Prior approval of the purchaser is required to repair special fittings made to the purchaser's requirements. Repair by welding shall neither exceed 10% of the outside surface area of the fitting nor 33⅓% of the nominal wall thickness.

11.6.2 The welding procedure and welders shall be qualified in accordance with Specification A 960/A 960M.

11.6.3 The alloy content (carbon, chromium, nickel, molybdenum, columbium, and titanium) of the deposited weld metal shall be within the same percentage range as permitted for the base metal. (**Warning** —When selecting the filler metal and welding procedure, consideration should be given to their effect on corrosion resistance in service.)

11.6.4 Surface discontinuities deeper than 5% of the specified nominal wall thickness shall be removed by mechanical means or thermal cutting or gouging methods. Cavities prepared for welding shall be examined by the liquid penetrant method of Practice E 165. No cracks shall be permitted in the prepared cavities.

11.6.5 The weld repair shall be permanently identified with the welder's stamp or symbol in accordance with Specification A 960/A 960M.

11.6.6 Weld repair area(s) shall be blended uniformly to the base metal and shall be examined by liquid penetrant in accordance with Practice E 165. No cracks shall be permitted in the weld or surrounding ½ in. [13 mm] of base metal.

11.6.7 After weld repair, material shall be heat treated in accordance with Section 6.

11.7 The fittings shall be cleaned free of scale.

12. Hydrostatic Tests

12.1 Hydrostatic testing is not required by this specification.

12.2 Each fitting of Class WP shall be capable of withstanding without failure, leakage, or impairment of serviceability, a test pressure equal to that prescribed for the specified matching pipe or equivalent material.

12.3 Each fitting of Class CR, except tees covered in 12.3.1, shall be capable of withstanding without failure, leakage, or impairment of serviceability, a test pressure based on the ratings in MSS SP-43.

12.3.1 Class CR tees fabricated using intersection welds shall be capable of passing a hydrostatic test based on 70% of the ratings in MSS SP-43.

13. Rejection

13.1 Unless otherwise specified, any rejection based on tests by the purchaser shall be reported to the manufacturer within 30 working days from the receipt of samples or test reports by the purchaser.

13.2 Each fitting that develops surface discontinuities deeper than 5% of the specified nominal wall thickness in shop working or application operations may be rejected and the manufacturer so notified.

14. Rehearing

14.1 Test samples that represent fittings rejected by the purchaser shall be preserved for four weeks from the date of the rejection report. In case of dissatisfaction with the test results, the manufacturer may make claim for a rehearing within the period that the samples are preserved.

15. Test Reports

15.1 Test reports are required for all fittings covered by this specification. Each test report shall include the following information:

15.1.1 The year-date of the specification to which the fitting was furnished,

15.1.2 Heat number or serial number traceable to a heat number,

15.1.3 Chemical analysis for all starting materials,

15.1.4 Starting material; plate, bar, pipe (specify welded or seamless), forging,

15.1.5 Mechanical test results (Section 8),

15.1.6 Seamless or welded construction,

15.1.7 For construction with filler metal added, weld metal specification number,

15.1.8 For welded fittings, construction method, weld process, and procedure specification number,

15.1.9 Heat treatment type,

15.1.10 Results of all nondestructive examinations,

15.1.11 Results of all tests required by Supplementary Requirements and the order, and

15.1.12 Statement that the fitting was manufactured, sampled, tested, and inspected in accordance with the specification and was found to meet the requirements.

16. Keywords

16.1 corrosive service applications; ferritic/austenitic stainless steel; ferritic stainless steel; martensitic stainless steel; pipe fittings-steel; piping applications; pressure containing parts; stainless steel fittings

⁴ Minimum unless otherwise indicated.

SUPPLEMENTARY REQUIREMENTS

One or more of the supplementary requirements described below may be included in the purchaser's inquiry or in the order or contract. When so included, a supplementary requirement shall have the same force as if it were in the body of the specification. Supplementary requirement details not fully described shall be agreed upon between the purchaser and the supplier.

S1. Product Analysis (Note S1.1)

S1.1 A product analysis shall be made for each heat of base metal and, if of welded construction, from each lot number of welding material of the fittings offered for delivery and shall conform to the requirements specified in Section 7.

NOTE S1.1 — If the results of any of the tests specified in Supplementary Requirements S1, S2, or S3 do not conform to requirements, retests may be made at the manufacturer's expense on additional fittings or representative test pieces of double the original number from the same heat or lot as defined in Supplementary Requirements S1, S2, or S3, each of which shall conform to the requirements specified.

S2. Tension Test (Note S1.1)

S2.1 One tension test shall be made on one fitting or representative test piece (Note S2.1) per lot (Note S2.2) of fittings. If the fittings are of welded construction, the tension specimen shall include the weld and be prepared so that the weld is at the midlength of the specimen.

NOTE S2.1 — Where the test specimen for the tension or intergranular corrosion bend test cannot be taken from a fitting due to size limitations, a representative test piece shall be obtained. The test piece shall be from the same lot it represents and shall have approximately the same amount of working. In addition, these pieces representing fittings manufactured from bars, plate, or forgings shall have a cross section equal to the greatest cross section of the fitting, and test pieces representing fittings manufactured from tubular products shall have a cross section approximately the same as that of the finished product. The test piece for fittings of welded construction shall be prepared to the same weld procedures and from the same heats of materials as the fittings it represents.

NOTE S2.2 — A lot shall consist of all fittings of the same type, size, and wall thickness, manufactured from one heat of material (and, if fabrication welding is performed using one lot number of electrode or one heat of weld wire), and heat treated using the same heat treat cycle in either a continuous or batch-type furnace controlled within a range of 50°F [28°C] and equipped with recording pyrometers so that complete records of heat treatment are available.

S3. Intergranular Corrosion Bend Test (Note S1.1)

S3.1 An intergranular corrosion bend test shall be made on one fitting or representative test piece (Note S2.1) per

lot (Note S2.2) of fittings. If the fittings are of welded construction, the bend specimen shall include the weld and be prepared so that the weld is at the midlength location of the specimen. Specimens containing a weld shall be bent so that the location of weld is at the point of maximum bend. The method of testing shall be in accordance with Practices A 262 or Practices A 763, as applicable.

S4. Ultrasonic Test

S4.1 Each fitting or the raw material from which each fitting is made shall be ultrasonically tested to determine its soundness. The method, where applicable, shall be in accordance with Practice A 388/A 388M. Acceptance limits shall be specified by the purchaser.

S5. Photomicrographs

S5.1 Photomicrographs at 100 diameters shall be made for information only of the actual base metal structure from one fitting as furnished in each lot. The photomicrographs shall be identified as to fitting size, wall thickness, lot identification, and heat. The definition of "lot" shall be as specified by the purchaser.

S6. Surface Finish

S6.1 Machined surfaces shall have a maximum roughness of 250 RMS (root-mean-square) or 6.3 $\mu\text{in. AA}$ (arithmetical average). All other surfaces shall be suitable for ultrasonic testing.

S7. Liquid Penetrant Test

S7.1 All surfaces shall be liquid penetrant tested. The method shall be in accordance with Practice E 165.

SPECIFICATION FOR PRESSURE VESSEL PLATES, ALLOY STEEL, CHROMIUM-MOLYBDENUM- VANADIUM

SA-832/SA-832M

(Identical with ASTM Specification A 832/A 832M-06.)

1. Scope

1.1 This specification covers chromium-molybdenum-vanadium alloy steel plates intended primarily for the fabrication of welded pressure vessels.

1.2 The plates furnished under this specification are required to be normalized-and-tempered. Specification A 542/A 542M includes coverage of the material in the quenched-and-tempered condition.

1.3 The maximum thickness of plates furnished to this specification is limited only by the capacity of the composition to meet the specified property requirements. However, the maximum thickness of plates normally furnished under this specification is 6 in. [150 mm].

1.4 The material is intended to be suitable for fusion welding. Welding technique is of fundamental importance and it is presupposed that welding procedures will be in accordance with approved methods.

1.5 This specification is expressed in both inch-pound units and in SI units. However, unless the order specifies the applicable “M” specification designation (SI units), the material shall be furnished to inch-pound units.

1.6 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification.

2. Referenced Documents

2.1 ASTM Standards:

A 20/A 20M Specification for General Requirements for Steel Plates for Pressure Vessels

A 370 Test Methods and Definitions for Mechanical Testing of Steel Products

A 435/A 435M Specification for Straight-Beam Ultrasonic Examination of Steel Plates

A 577/A 577M Specification for Ultrasonic Angle-Beam Examination of Steel Plates

A 578/A 578M Specification for Straight-Beam Ultrasonic Examination of Plain and Clad Steel Plates for Special Applications

3. General Requirements and Ordering Information

3.1 Material supplied to this material specification shall conform to Specification A 20/A 20M. These requirements outline the testing and retesting methods and procedures, permissible variations in dimensions, quality and repair of defects, marking, loading, etc.

3.2 Specification A 20/A 20M establishes the rules for ordering information that should be complied with when purchasing material to this specification.

3.3 In addition to the basic requirements of this specification, certain supplementary requirements are available when additional control, testing, or examination is required to meet end use requirements. These include the following:

3.3.1 Vacuum treatment,

3.3.2 Additional or special tension testing,

3.3.3 Impact testing, and

3.3.4 Nondestructive examination.

3.4 The purchaser is referred to the listed supplementary requirements in this specification and to the detailed requirements in Specification A 20/A 20M. If the requirements of this specification are in conflict with the requirements of Specification A 20/A 20M, the requirements of this specification shall prevail.

4. Manufacture

4.1 Steelmaking Process — The steel shall be made by one of the processes permitted in Specification A 20/A 20M.

4.2 Steelmaking Practice — The steel shall be killed and shall conform to the fine grain size requirement of Specification A 20/A 20M.

5. Heat Treatment

5.1 All plates shall be normalized and tempered except as allowed by 5.2. The minimum normalizing temperature for Grade 22V shall be 1650°F [900°C]. The minimum normalizing temperature for Grade 23V shall be 1850°F [1010°C]. The minimum tempering temperature shall be 1250°F [675°C].

5.2 Plates ordered without the heat treatment required by 5.1 shall be furnished in either the stress-relieved or the annealed condition. Heat treatment of plates so ordered, to conform to 5.1 and to Table 1, shall be the responsibility of the purchaser.

6. Chemical Composition

6.1 The steel shall conform to the requirements as to chemical composition shown in Table 2.

7. Mechanical Properties**7.1 Tension Test Requirements:**

7.1.1 The material as represented by the tension test specimens shall conform to the requirements of Table 1.

7.2 Notch Toughness Requirements:

7.2.1 A transverse Charpy V-notch test from each plate as heat-treated shall have a minimum energy absorption value of 40 ft-lbf [54 J] average of three specimens and 35 ft-lbf [48 J] for one specimen only in the set.

7.2.2 The notch toughness test temperature shall be 0°F [−18°C].

8. Keywords

8.1 alloy steel plates; pressure containing parts; pressure vessel steels; steel plates; steel plates for pressure vessel applications

^B NA = Not Applicable.

^C Rare earth metals (REM) may be added in place of calcium, subject to agreement between the producer and the purchaser. In that case, the total amount of REM shall be determined and reported.

SUPPLEMENTARY REQUIREMENTS

Supplementary requirements shall not apply unless specified in the order.

A list of standardized supplementary requirements for use at the option of the purchaser is included in Specification A 20/A 20M. Some of those considered suitable for use with this specification are listed below by title.

- | | |
|---|---|
| S1. Vacuum Treatment, | S8. Ultrasonic Examination in Accordance With |
| S2. Product Analysis, | Specification A 435/A 435M, |
| S3. Simulated Post-Weld Heat Treatment of | S9. Magnetic Particle Examination, |
| Mechanical Test Coupons, | S11. Ultrasonic Examination in Accordance With |
| S4. Additional Tension Test, | Specification A 577/A 577M, |
| S6. Drop-Weight Test (for Material 0.625 in. | S12. Ultrasonic Examination in Accordance With |
| [16 mm] and Over in Thickness), | Specification A 578/A 578M, and |
| S7. High-Temperature Tension Test, | S19. Restricted Chemical Requirements. |

ADDITIONAL SUPPLEMENTARY REQUIREMENTS HIGH TEMPERATURE HYDROGEN SERVICE

In addition, the following supplementary requirements are suitable for this application.

S62. Temper Embrittlement Factor

S62.1 The composition of the steel, based on heat analysis, shall be restricted in accordance with the following equations:

$$J = (Si + Mn) \times (P + Sn) \times 10^4 \leq 150$$

(Si, Mn, P and Sn in wt%)

$$Cu \leq 0.20\%$$

$$Ni \leq 0.30\%$$

S62.1.1 Lower values of J, Cu and Ni can be specified by agreement between purchaser and the supplier.

S62.1.2 When so specified by the purchaser, the maximum value of J shall not exceed 100.

S62.1.3 The values of J shall be reported.

S62.1.4 If the plates are repaired by welding, the composition of the weld deposit shall be restricted in accordance with the following equations:

$$X = (10P + 5Sb + 4Sn + As)/100 \leq 15$$

(P, Sb, Sn and As in ppm)

$$Cu \leq 0.20\%$$

$$Ni \leq 0.30\%$$

S62.1.5 The values of X shall be reported.

S63. Impact Properties After Step Cooling

S63.1 The Charpy V-notch impact properties shall be determined as follows:

S63.1.1 A sufficient amount of Charpy V-notch test specimens shall be taken from the same location from a plate from each heat of steel to construct two transition temperature curves.

S63.1.2 The test specimens for one transition temperature curve shall be given the minimum post-weld heat treatment (PWHT) cycle specified by the purchaser.

S63.2 The test specimens for the other transition temperature curve shall be given the PWHT cycle specified

in S63.1.2 plus the following step cooling heat treatment:

Hold at 1100°F (593°C) for 1 h, then cool at 10°F (5.6°C)/h to 1000°F (538°C).

Hold at 1000°F (538°C) for 15 h, then cool at 10°F (5.6°C)/h to 975°F (524°C).

Hold at 975°F (524°C) for 24 h, then cool at 10°F (5.6°C)/h to 925°F (496°C).

Hold at 925°F (496°C) for 60 h, then cool at 5°F (2.8°C)/h to 875°F (468°C).

Hold at 875°F (468°C) for 100 h, then cool at 50°F (27.8°C)/h to 600°F (315°C).

Cool in still air.

S63.3 Test the Charpy V-notch test specimens in accordance with Test Methods and Definitions A 370 to determine the 40 ft-lbs (55 J) transition temperature from each transition temperature curve using a set of three test specimens at each test temperature. The test temperatures shall include tests on the upper and lower shelves and a minimum of four intermediate temperatures.

S63.4 The following requirements shall be met:

$$vTr40 + 2.5 \Delta vTr40 \leq 50^\circ F$$

$$vTr55 + 2.5 \Delta vTr55 \leq 10^\circ C$$

where:

$vTr40$ ($vTr55$) = the 40 ft-lbs (55 J) transition temperature of the material subjected to the minimum PWHT specified by the purchaser

$\Delta vTr40$ ($\Delta vTr55$) = the shift of the 40 ft-lbs (55 J) transition temperature of the step cooled material. [The 40 ft-lbs (55 J) transition temperature of the step cooled material minus that of the material subjected to the minimum PWHT only].

S63.5 The 40 ft-lbs (55 J) transition temperatures for the two material conditions shall be reported. Fig. S1.1.

FIG. S1.1 TRANSITION TEMPERATURE CURVES
BEFORE AND AFTER STEP COOL HEAT TREATMENT

SPECIFICATION FOR COMMON REQUIREMENTS FOR IRON CASTINGS FOR GENERAL INDUSTRIAL USE

SA-834

[Identical with ASTM Specification A 834-95(R06).]

1. Scope

1.1 This specification covers a group of requirements that are mandatory requirements when used in conjunction with the following iron casting specifications issued by ASTM:

ASTM Specification
A 47
A 48
A 197
A 220
A 278
A 319
A 395
A 436
A 439
A 518
A 532
A 536
A 571
A 823
A 842
A 874
A 897

1.2 This specification also covers a group of supplementary requirements which may be applied to the above specifications as indicated herein. These are provided for use when additional testing or inspection is desired and apply only when specified individually by the purchaser in the order.

1.3 The requirements of the individual material specification, and this general specification shall prevail in the sequence named.

1.4 The values stated in inch-pound units are to be regarded as the standard. The values given in parentheses are for information only.

2.2 Military Standard:

MIL-STD-129 Marking for Shipment and Storage

2.3 Federal Standard:

Fed. Std. No. 123 Marking for Shipment (Civil Agencies)

3. Terminology

3.1 Definitions:

3.1.1 Definitions for many terms common to iron castings and their heat treatment are found in Terminology A 919 and Terminology A 644. A classification of graphite structure is found in Test Method A 247.

4. Ordering Information

4.1 The purchase order for castings ordered under this specification shall stipulate the applicable material specification(s), grade of iron, and any options or additions to the basic requirements, including the supplementary requirements included in this specification.

5. Tensile Requirements

5.1 The individual product specifications vary as to whether tension tests are required. For this reason, and to determine specific test requirements, the individual product specification shall be reviewed. When required, tension tests shall be determined in accordance with Test Methods E 8.

6. Chemical Requirements

6.1 The individual product specifications vary as to whether chemical analysis is required. To determine specific requirements, the individual product specification should be reviewed.

6.2 Sampling shall be conducted in accordance with Test Method E 59. Spectrographic or other methods such as those in Test Methods E 30 and E 351 may be used for chemical analysis. In the event of a dispute regarding chemical composition, Test Methods E 351 and E 30 shall be used for referee purposes.

6.3 The chemical analysis for total carbon shall be made on chilled pencil-type specimens or from thin wafers approximately ⅓ in. (0.8 mm) thick cut from test coupons. Drillings are not reliable because of a probable loss of graphite.

6.4 Chemical analysis results shall be rounded, in accordance with Practice E 29, to the nearest unit in the last right-hand place of values in the table of chemical requirements.

6.5 A product analysis may be made by the purchaser from material representing each heat, lot, or casting. The analysis shall be made on representative material. Samples for carbon analysis shall be taken no closer than ¼ in. to a cast surface, and shall follow the practice in 5.3, except where the size or shape of the casting does not permit such sampling. The chemical composition thus determined shall meet the requirements specified in the applicable specification for the grade involved.

7. Workmanship, Finish, and Appearance

7.1 All castings shall be made in a workman-like manner and shall conform to the dimensions on drawings furnished by the purchaser before manufacture is started. If the pattern is supplied by the purchaser, the dimensions of the casting shall be as predicted by the pattern.

8. Sampling

8.1 A lot shall consist of one of the following:

8.1.1 All the metal from a single heating in a batch-type melting furnace.

8.1.2 All the metal poured from two or more batch-type melting furnaces into a single ladle or a single casting.

8.1.3 All the metal poured from a continuous melting furnace for a given period of time between changes in charge, processing conditions, or aim-for chemistry, or 4 h, whichever is the shorter period.

8.1.3.1 The purchaser may agree to extend the 4 h time period to 8 h if the manufacturer can demonstrate sufficient process control to warrant such an extension.

9. Inspection

9.1 All tests and inspections required by this specification shall be performed by the manufacturer or other reliable sources whose services have been contracted for by the manufacturer. Complete records of all tests and inspections shall be maintained by the manufacturer and shall be available for review by the purchaser.

9.2 The manufacturer shall afford the purchaser's inspector all reasonable facilities necessary to satisfy that the material is being produced and furnished in accordance

with the applicable specification. Foundry inspection by the purchaser shall not interfere unnecessarily with the manufacturer's operations.

9.3 When agreed upon between manufacturer and purchaser, test specimens or unbroken test bars from the same lot shall be saved for a period of 3 months after date of the test report.

9.4 When unbroken test bars are reprocessed with castings for rehearing, test specimens from these bars shall be saved, as described in 9.3.

9.5 The purchaser reserves the right to perform any inspections set forth in the specification where such inspections are deemed necessary to assure that supplies and services conform to the prescribed requirements.

10. Repair

10.1 Any repair shall be made in accordance with the requirements of the individual specification using procedures qualified by the manufacturer for the type of repair involved.

11. Rejection and Rehearing

11.1 Castings which fail to conform to the requirements specified when inspected or tested by the purchaser or his agent may be rejected. Rejection shall be reported to the manufacturer or supplier promptly and in writing. In case of dissatisfaction with the test results, the manufacturer or supplier may make claim for a rehearing.

12. Packaging and Package Marking

12.1 Unless otherwise specified in the contract or purchase order, cleaning, preservation, and packaging of castings shall be in accordance with the manufacturer's commercial practice. Packing and marking shall also be adequate to identify the contents and to ensure acceptance and safe delivery by the carrier for the mode of transportation employed.

12.2 *Government Procurement*— When specified in the contract or purchase order, marking for shipment shall be in accordance with the requirements of Fed. Std. No. 123 for civil agencies and MIL-STD-129 for military activities.

13. Quality Assurance

13.1 The surface of the casting shall be free of adhering sand, scale, cracks, and hot tears as determined by visual examination. Other surface discontinuities shall meet the visual acceptance standards specified in the order. Visual Practice A 802/A 802M or other visual standards may be used to define acceptable surface discontinuities and finish. Unacceptable visual surface discontinuities shall be removed and their removal verified by visual examination of the resultant cavities.

13.2 When additional inspection is desired, Supplementary Requirements S1, S2, or S3 may be specified.

14. Keywords

14.1 chemical composition; common requirements; general industry; inspection; iron castings; ordering information; packaging; quality assurance; repair; sampling; tensile requirements; terminology; workmanship

SUPPLEMENTARY REQUIREMENTS

Supplementary requirements shall be applied only when specified by the purchaser. Details of the supplementary requirements shall be agreed upon by the manufacturer and purchaser. The specified tests shall be performed by the manufacturer prior to shipment of the castings.

S1. Magnetic Particle Examination

S1.1 Castings shall be examined for surface discontinuities by magnetic particle examination. The examination shall be in accordance with Practice E 709. The extent of examination and the basis for acceptance shall be agreed upon between the manufacturer and purchaser.

S2. Radiographic Examination

S2.1 Castings shall be examined for internal defects by means of X-rays or gamma rays. The procedure shall be in accordance with Guide E 94, and types and degrees of discontinuities considered shall be judged by Reference Radiographs E 689 and E 802. The extent of examination and basis for acceptance shall be agreed upon between the manufacturer and purchaser.

S3. Liquid Penetrant Examination

S3.1 Castings shall be examined for surface discontinuities by means of liquid penetrant examination. The examination shall be in accordance with Practice E 165. Areas to be inspected, methods and types of liquid penetrants to be used, developing procedure, and basis for acceptance shall be agreed upon between the manufacturer and purchaser.

S4. Certification

S4.1 The manufacturer's certification shall be furnished to the purchaser stating that the material was manufactured, sampled, tested, and inspected in accordance with the material specification, including the year date, and was found to meet the requirements. Additionally, the certification shall include for each lot the results of all tests required by the material specification and any supplementary or

additional requirements imposed by the purchase order.

S4.2 A signature is not required on the certification or test report. However, the document shall clearly identify the organization submitting the certification and the authorized agent of the manufacturer who certified the test results. Notwithstanding the absence of a signature, the organization submitting the certification is responsible for its content.

S4.3 The test report shall be furnished within 5 working days of shipment of the castings.

S5. Prior Approval of Major Repairs

S5.1 Major repairs as defined and agreed upon between the manufacturer and purchaser shall be subject to the prior approval of the purchaser.

S6. Marking

S6.1 The manufacturer's name or identification mark and the part identification number shall be cast or stamped on all castings. When further specified, lot numbers shall be marked on individual castings.

S6.2 When the castings are of such size that individual marking is impracticable, they shall be grouped by part identification or lot number and placed in a container. The container shall be marked with the required identification.

S7. Hardness Test

S7.1 Hardness measurements at specified locations on the castings shall be made in accordance with Test Method E 10 and reported.

SPECIFICATION FOR TITANIUM-STABILIZED CARBON STEEL FORGINGS FOR GLASS-LINED PIPING AND PRESSURE VESSEL SERVICE

SA-836/SA-836M

[Identical with ASTM Specification A 836/A 836M-02(R07).]

1. Scope

1.1 This specification covers nonstandard as-forged fittings, valve components, and parts for glass-lined piping and pressure vessel service. Mechanical properties are certified on the basis of test material subjected to heat treatments to simulate glass-coating operations.

1.2 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification. The inch-pound units shall apply unless the “M” designation of this specification is specified in the order.

2. Referenced Documents

2.1 ASTM Standards:

- A 788/A 788M Specification for Steel Forgings, General Requirements
- A 961/A 961M Specification for Common Requirements for Steel Flanges, Forged Fittings, Valves, and Parts for Piping Applications

3. Ordering Information

3.1 Product furnished to this specification shall conform to the requirements of Specification A 961/A 961M, including any supplementary requirements that are indicated in the purchase order. Failure to comply with the requirements of Specification A 961/A 961M constitutes non-conformance with this specification.

3.2 It is the purchaser’s responsibility to specify in the purchase order all ordering information necessary to

purchase the needed material. Examples of such information include but are not limited to the ordering information in Specification A 961/A 961M and the following:

3.2.1 Supplementary requirements, and

3.2.2 Additional requirements (see 10.1, 12.1, 12.2, and 12.3).

3.3 If the requirements of this specification are in conflict with the requirements of Specification A 961/A 961M, the requirements of this specification shall prevail.

4. Materials and Manufacture

4.1 The material shall be forged by hammering, pressing, rolling, extruding, or upsetting, such that the finished product will be a forging as defined in the Terminology Section of Specification A 788/A 788M.

4.2 When specified in the order, the manufacturer shall submit for approval by the purchaser a sketch showing the shape of the rough forging before machining.

4.3 Forgings shall be protected against sudden or too rapid cooling from the rolling or forging while passing through the critical range.

4.4 Heat treatment of forgings is neither required nor prohibited. However, the test material for qualifying the forging or the welding procedure shall be heat treated to simulate glass-coating operations.

5. Chemical Composition

5.1 An analysis of each heat shall be made by the manufacturer to determine the percentages of the elements specified in Table 1. The chemical composition thus determined shall conform to the requirements in Table 1.

6. Mechanical Properties

6.1 The test material shall conform to the requirements as to tensile properties prescribed in Table 2.

7. Number of Tests and Retests

7.1 One tension test shall be made from each heat.

7.2 If any test specimen is defectively machined, it may be discarded and another specimen substituted.

8. Retests

8.1 When one or more representative test specimens do not conform to specification requirements for the tested characteristic, only a single retest for each nonconforming characteristic may be performed to establish product acceptability. Retests shall be performed on twice the number of representative specimens that were originally nonconforming. When any retest specimen does not conform to specification requirements for the characteristic in question, the lot represented by that specimen shall be rejected, or the test material shall be heat treated or reheat-treated in accordance with 4.4, and tested in accordance with Sections 6 and 7.

9. Test Specimens

9.1 The test material to be used for qualifying the forgings shall be heat treated with the forgings represented by the test material, if the forgings are heat treated, then, the test material shall be normalized three times from a minimum temperature of 1550°F [845°C] prior to testing. This heat treatment simulates glass-coating operations.

10. Repair by Welding

10.1 Approval by the purchaser shall be required prior to weld repair.

10.2 The welded test plate used to qualify the procedure shall be normalized three times at 1550°F [845°C] prior to testing to simulate glass-coating operations.

10.3 The composition of the weld deposits shall be similar to the base metal and in accordance with the procedure qualification for the applicable material. Welding shall be accomplished with a weld procedure designed to produce low hydrogen in the weldment. Short-circuit gas metal

arc welding is permissible only with the approval of the purchaser.

11. Rejection and Rehearing

11.1 Samples representing material rejected by the purchaser shall be preserved until disposition of the claim has been agreed upon by the manufacturer and the purchaser.

12. Certification

12.1 When specified in the purchase order or contract, a producer's or supplier's certification shall be furnished to the purchaser that the material was manufactured, sampled, tested, and inspected in accordance with this specification and has been found to meet the requirements. The specification designation included on test reports shall include year of issue and revision letter, if any.

12.2 When specified in the purchase order or contract, a report of the test results shall be furnished.

12.3 Upon request of the purchaser in the contract or order, a report of the test results and chemical analyses shall be furnished.

13. Marking of Forgings

13.1 Identification marks consisting of the manufacturer's symbol or name (Note), designation of service rating, this specification number, class, and size shall be legibly forged or stamped on each forging, and in such a position as not to injure the usefulness of the forgings.

13.2 Bar Coding — In addition to the requirements in 13.1, bar coding is acceptable as a supplemental identification method. The purchaser may specify in the order a specific bar coding system to be used. The bar coding system, if applied at the discretion of the supplier, should be consistent with one of the published industry standards for bar coding. If used on small parts, the bar code may be applied to the box or a substantially applied tag.

SPECIFICATION FOR STEEL PLATES FOR PRESSURE VESSELS, PRODUCED BY THERMO- MECHANICAL CONTROL PROCESS (TMCP)

SA-841/SA-841M

[Identical with ASTM Specification A 841/A 841M-03a(R07).]

1. Scope

1.1 This specification covers steel plates produced by the thermo-mechanical control process (TMCP). The plates are intended primarily for use in welded pressure vessels.

1.2 The TMCP method consists of rolling-reduction and cooling rate controls that result in mechanical properties in the finished plate that are equivalent to those attained using conventional rolling and heat treating processes which entail reheating after rolling. A description of the TMCP method is given in Appendix X1.

1.3 Due to the inherent characteristics of the TMCP method, the plates cannot be formed at elevated temperatures without sustaining significant losses in strength and toughness. The plates may be formed and post-weld heat-treated at temperatures not exceeding 1200°F [650°C], providing the requirements of 6.1 are met.

1.4 The maximum permitted nominal thickness of plates furnished to this specification is 4 in. [100 mm] for Grades A, B and C; and 1.5 in. [40 mm] for Grades D, E and F.

1.5 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents. Therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with this specification.

2. Referenced Documents

2.1 ASTM Standards:

A 20/A 20M Specification for General Requirements for Steel Plates for Pressure Vessels

A 435/A 435M Specification for Straight-Beam Ultrasonic Examination of Steel Plates

A 577/A 577M Specification for Ultrasonic Angle-Beam Examination of Steel Plates

A 578/A 578M Specification for Straight-Beam Ultrasonic Examination of Plain and Clad Steel Plates for Special Applications

3. General Requirements and Ordering Information

3.1 Plates supplied to this product specification shall conform to Specification A 20/A 20M, which outlines the testing and retesting methods and procedures, permissible variations in dimensions, quality and repair of defects, marking, loading, etc.

3.2 Specification A 20/A 20M also establishes the rules for ordering information that should be complied with when purchasing plates to this specification.

3.2.1 If the plates are to be subjected to warm forming or post-weld heat treatment, the order must indicate the temperatures and times-at-temperature that will be utilized in such operations. (See 6.1 and Specification A 20/A 20M, Supplementary Requirement S3.)

3.3 In addition to the basic requirements of this specification, certain supplementary requirements are available when additional control, testing, or examination is required to meet end use requirements. These include:

3.3.1 Vacuum treatment,

3.3.2 Additional or special tension testing,

3.3.3 Additional or special impact testing, and

3.3.4 Nondestructive examination.

3.4 The purchaser is referred to the listed supplementary requirements in this specification and to the detailed

requirements in Specification A 20/A 20M.

3.5 If the requirements of this specification are in conflict with the requirements of Specification A 20/A 20M, the requirements of this specification shall prevail.

4. Manufacture

4.1 *Steelmaking Practice* — The steel shall be killed and shall conform to the fine austenitic grain size requirement of Specification A 20/A 20M.

4.2 The plates shall be produced by the thermo-mechanical control process.

5. Chemical Composition

5.1 The chemical composition on heat analysis shall conform to the requirements given in Table 1, except as otherwise provided in Supplementary Requirement S17 of Specification A 20/A 20M when that requirement is involved.

5.2 If a product analysis is made on a sample taken from the standard location (see Specification A 20/A 20M), the results of the analysis shall not deviate from the limits for the heat analysis by more than the values given in Table 2.

6. Mechanical Requirements

6.1 If the plates are to be subjected to warm forming or post-weld heat treatment, the test coupons shall be subjected to heat treatment to simulate such fabrication operations. (See 3.2.1 and Specification A 20/A 20M, Supplementary Requirement S3.)

6.2 *Tension Test Requirements* — The plates as represented by the tension-test specimens shall conform to the requirements given in Table 3.

6.2.1 *Number and Location of Test Coupons*— Two tension tests shall be made from each plate-as-rolled. One test coupon shall be taken from a corner of the plate on each end.

6.3 Notch Toughness Test Requirements:

6.3.1 Longitudinal Charpy V-notch tests shall be made in accordance with Specification A 20/A 20M.

6.3.2 For Grades A, B and C, unless the test temperature and absorbed energy requirements are specified on the purchase order, the tests shall be conducted at -40°F [-40°C] and the average absorbed energy for each set of three full size specimens shall be 15 ft-lb [20 J] or more.

6.3.3 For Grade D, unless the test temperature and the lateral expansion requirements are specified in the purchase order, the tests shall be conducted at -40°F [-40°C] and the lateral expansion for each specimen shall be 0.015 in. [0.4 mm] or more.

6.3.4 For Grades E and F, unless the test temperature and absorbed energy requirements are specified in the purchase order, the test shall be conducted at -40°F [-40°C] and the average absorbed energy for each set of three full size specimens shall be 20 ft-lb [27 J] or more.

7. Marking

7.1 In addition to the marking required in Specification A 20/A 20M, each plate shall be legibly stamped with the letters “TMC” following the stamped specification designation.

8. Keywords

8.1 pressure containing parts; pressure vessel steel; steel plates; steel plates for pressure vessel applications

NOTES:

^A For each reduction of 0.01 percentage point below the specified maximum for carbon, an increase of 0.06 percentage points above the specified maximum for manganese is permitted, up to a maximum of 1.85%.

^B Manganese may exceed 1.35% on heat analysis, up to a maximum of 1.60%, provided that the carbon equivalent on heat analysis does not exceed 0.47%, or the value specified in Supplementary Requirement S77 when that requirement is invoked, when based on the following formula.

$$CE = C + Mn/6 + (Cr + Mo + V)/5 + (Ni + Cu)/15\%$$

When this option is exercised, the manganese content on product analysis shall not exceed the heat analysis content by more than 0.12 percentage points.

^C Not applicable.

^D By agreement the steel may be produced with titanium, in which case the minimum aluminum content shall not apply. When this option is exercised, the titanium content, by heat analysis shall be 0.006% to 0.02%, and the actual titanium content shall be reported on the test report.

^E By agreement, the steel may be produced with titanium, in which case the minimum aluminum content shall not apply. When this option is exercised, the titanium content, by heat analysis, shall be 0.006% to 0.03%, and the actual titanium content shall be reported on the test report.

NOTE:

A Not applicable.

B See Specification A 20/A 20M for elongation requirements.

SUPPLEMENTARY REQUIREMENTS

Supplementary requirements shall not apply unless specified in the order.

A list of standardized supplementary requirements for use at the option of the purchaser are included in Specification A 20/A 20M. Several of those that are considered suitable for use with this specification are listed in this section by title. Other tests may be performed by agreement between the supplier and the purchaser.

- | | |
|--|---|
| S1. Vacuum Treatment, | S10. Charpy V-Notch Test Curve, |
| S2. Product Analysis, | S11. Ultrasonic Examination in accordance with Specification A 577/A 577M, |
| S3. Simulated Post-Weld Heat Treatment of Mechanical Test Coupons, | S12. Ultrasonic Examination in accordance with Specification A 578/A 578M, |
| S5. Charpy V-Notch Impact Test, | S13. NDT Temperature Determination, |
| S6. Drop Weight Test, | S17. Vacuum Carbon-Deoxidized Steel, |
| S7. High-Temperature Tension Test, | S18. Unspecified Elements, and |
| S8. Ultrasonic Examination in accordance with Specification A 435/A 435M, | S19. Restricted Chemical Requirements. |
| S9. Magnetic Particle Examination, | |

ADDITIONAL SUPPLEMENTARY REQUIREMENTS

Also listed is an additional supplementary requirement suitable for use with this specification.

S77. Carbon Equivalent Limit

S77.1 The carbon equivalent, on heat analysis, shall not exceed the limits listed in this section when based on the following equation:

$$CE = C + Mn/6 + (Cr + Mo + V)/5 + (Cu + Ni)/15\%$$

[Grade A]
t = 2 in. [50 mm] and under in thickness
t > 2 in. [50 mm] in thickness

%
0.40
0.45

[Grade B]
t = 2 in. [50 mm] and under in thickness
t > 2 in. [50 mm] in thickness

%
0.45
0.50

S78. Low Sulfur Treatment

S78.1 Restricted sulfur content shall be specified on the order. In the absence of such a specification the maximum sulfur furnished under this supplementary requirement shall be 0.003% on heat analysis.

NOTE 1 — The low sulfur treatment is for the purpose of enhancing the HIC (Hydrogen Induced Cracking) and SSC (Sulfide Stress Cracking) resistance.

S79. Carbon Equivalent Limit

S79.1 The carbon equivalent, on heat analysis, shall not exceed 0.27%, or lower value as specified in the purchase order, when based on the following equation:

$$P_{CM} = C + \frac{Si}{30} + \frac{Mn + Cu + Cr}{20} + \frac{Ni}{60} + \frac{Mo}{15} + \frac{V}{10} + 5B\%$$

APPENDIX

(Nonmandatory Information)

X1. THERMO-MECHANICAL CONTROLLED PROCESSING (TMCP)

X1.1 Introduction — The Thermo-Mechanical Controlled Processing, commonly referred to as “TMCP,” has evolved from the “controlled rolling” (CR) processes which have been known and used for a number of years. TMCP produces fine-grained steel by a combination of chemical composition and integrated controls of manufacturing processes from slab reheating to post-rolling cooling, thereby achieving the specified mechanical properties in the required plate thicknesses. TMCP requires accurate control of both the steel temperature and rolling reductions, and does not involve coiling after the post-cooling.

X1.2 Outline of TMCP — As shown in Fig. X1.1, TMCP may incorporate three processes, as follows:

X1.2.1 Thermo-Mechanical Rolling (TMR) — Steels of fine grain size are produced by rolling in the recrystallization and the nonrecrystallization regions of austenite, and sometimes in the dual-phase temperature region of austenite and ferrite. Generally, a high proportion of the

rolling reduction is performed close to, or below, the temperature at which austenite begins to transform to ferrite during cooling (Ar₃) and may involve rolling in the lower portion of the temperature range of the intercritical dual-phase region.

X1.2.2 Accelerated Cooling (AC) — Steels meeting the specified requirements are produced by controlled cooling (accelerated cooling and air cooling) through the dual-phase temperature region immediately after final controlled rolling (CR) or TMR operation.

X1.2.3 Direct Quenched and Tempered (DQT) — Steels meeting the specified requirements are produced by promoting grain refinement and increasing hardness through direct quenching immediately after final controlled rolling (CR) or TMR operations. Subsequent to direct quenching the plates are tempered.

X1.3 The selection, from the above, of the method to be used is made by the plate producer depending upon the chemical composition, the plate thickness, and the required properties.

FIG. X1.1 SCHEMATIC DIAGRAMS OF THERMO-MECHANICAL CONTROL AND CONVENTIONAL PROCESS OF STEEL PLATE

SUMMARY OF CHANGES

The Committee has identified the location of selected changes to this specification since the last issue that may impact the use of this specification.

(1) Revised Appendix X1.

(2) Added new Grades E and F, Grade E is available as Class 4 or 5, Grade F is available as Class 6, 7, or 8.

(3) Deleted S14 Bend Test.

SPECIFICATION FOR STEEL WIRE, PRESSURE VESSEL WINDING

SA-905

(Identical with ASTM Specification A 905-93.)

1. Scope

1.1 This specification covers requirements for a high strength drawn and cold rolled steel wire in two strength classes, with rectangular cross section, and round mill edge. This wire is intended for prestressed vessel and press frame windings.

1.2 The values stated in either inch-pound units or SI (metric) units are to be regarded separately as standards. Within the text and tables, the SI units are shown in parentheses. The values stated in each system are not exact equivalents. Therefore, each system must be used independent of the other. Combining values from the two systems may result in nonconformance with the specification.

3. Ordering Information

3.1 Material furnished under this specification shall conform to the applicable requirements of the current edition of Specification A 510 or A 510M.

3.2 Orders for material under this specification shall include the following information for each ordered item.

- 3.2.1** Quantity (mass),
- 3.2.2** Name of material,
- 3.2.3** Dimensions (see Section 7),
- 3.2.4** Finish (see Section 8),
- 3.2.5** Packaging (see Section 11),
- 3.2.6** Heat analysis report (see 5.2),
- 3.2.7** Number of certification and test reports required,
- 3.2.8** ASTM designation and year of issue, and
- 3.2.9** Supplementary requirements, if any.

4. Material and Manufacture

4.1 The steel shall be produced by any of the following primary processes: (1) basic oxygen, and (2) electric furnace or vacuum induction (VIM). The primary melting may incorporate separate degassing or refining and may be followed by secondary melting by the electrode slag process (ESR) or the vacuum arc remelting process (VAR).

4.1.1 The steel may be ingot cast or continuously cast.

4.2 The finished wire shall be free from detrimental pipe and undue segregation.

4.3 The wire shall be cold drawn or cold rolled, or both, to produce the desired mechanical properties and dimensions after subjecting it to the patenting treatment.

4.4 The width to thickness ratio of the wire cross section shall not exceed 8.

5. Chemical Composition

5.1 The steel shall conform to the requirements for chemical composition prescribed in Table 1.

5.2 Heat Analysis — Each heat of steel shall be analyzed by the manufacturer to determine the percentage of elements prescribed in Table 1. This analysis shall be made from a test specimen preferably taken during the pouring of the heat. When requested, this shall be reported to the purchaser and shall conform to the requirements of Table 1.

5.3 Heat Number Assignment for Sequentially Strand Cast Material — When heats of the same chemical composition are sequentially strand cast, the heat number assigned to the cast product may remain unchanged until all of the steel in the product is from the following heat.

5.4 Product Analysis — An analysis may be made by the purchaser from finished wire representing each heat of steel. The chemical composition thus determined, as to elements required or restricted, shall conform to the product analysis requirements specified in Table 10 of Specification A 510 or A 510M.

5.5 For referee purposes, Methods E 30 shall be used.

6. Mechanical Requirements

6.1 Tension Test:

6.1.1 Requirements — The material as represented by tension test specimens shall conform to the requirements prescribed in Table 2.

6.1.2 Number of Tests — One test specimen shall be taken from each end of every coil.

6.1.3 Test Method — The tension test shall be made in accordance with Test Methods A 370, except that the length L for evaluation of the elongation shall be calculated from the following formula:

$$L = 11.3 \sqrt{W \cdot T}$$

where:

W = width of the wire, and

T = thickness of the wire.

The length L shall be used to calculate the permanent elongation. The distance between the gage marks shall be measured to the nearest 0.004 in. (0.1 mm). Determine tensile properties and permanent elongation as described in Test Methods A 370.

6.1.4 Retest — If any test specimen exhibits obvious discontinuity, it may be discarded and another specimen substituted.

7. Dimensions and Permissible Variations

7.1 The permissible variations in dimensions of the wire shall be as specified in Table 3, unless otherwise specified in the ordering information.

8. Workmanship, Finish, and Appearance

8.1 The wire shall be free of detrimental surface imperfections, tangles and sharp kinks.

8.2 The wire shall conform to the dimensions, tolerances, and finish specified on the order or drawing. Welds are not permitted.

8.3 When required, non-destructive examination shall be carried out in accordance with Supplementary Requirement S1.

8.4 The wire as received shall be smooth and substantially free from rust. No detrimental die marks or scratches may be present.

9. Inspection

9.1 All tests and inspections shall be made at the place of manufacture unless otherwise agreed upon, and shall not interfere unnecessarily with the manufacturer's operations. The manufacturer shall afford the purchaser's inspector all reasonable facilities necessary to satisfy him that the material is being produced and furnished in accordance with this specification.

10. Certification and Reports

10.1 The manufacturer shall furnish the required number, from the purchase order, of test reports to the purchaser. The following items shall be reported.

10.1.1 Heat number,

10.1.2 Heat chemical analysis,

10.1.3 Result of test of tensile properties,

10.1.4 Reports of non-destructive tests, if required (S.1), and

10.1.5 ASTM specification number, year of issue and revision letter, if any.

11. Packaging, Marking, and Loading for Shipment

11.1 The coil, reel or spool mass, dimensions, and the method of packaging shall be agreed upon between the manufacturer and purchaser.

11.2 The size of the wire, purchaser's order number, ASTM specification number, and name or mark of the manufacturer shall be marked on a tag securely attached to each coil, reel, or spool of wire.

11.3 Unless otherwise specified in the purchaser's order, packaging, marking, and loading for shipments shall be in accordance with those procedures recommended by Practices A 700.

11.4 *For Government Procurement* — Packaging, packing, and marking of material for military procurement shall be in accordance with the requirements of MIL-STD-163, Level A, Level C, or commercial as specified in the contract or purchase order. Marking for shipment of material for civil agencies shall be in accordance with Fed. Std. No. 123.

11.5 *Bar Coding* — In addition to the previously-stated identification requirements, bar coding is acceptable as a supplementary identification method. Bar coding should be consistent with AIAG Standard 02.00, Primary Metals Identification Tag Application. The bar code may be applied to a substantially affixed tag.

 PERMISSIBLE VARIATIONS IN DIMENSIONS

Thickness in. (mm)	Permissible Variation, ± in. (mm)
0.02 to 0.03 (0.51 to 0.76), incl	0.0004 (0.01)
Over 0.03 to 0.04 (0.76 to 1.02), incl	0.0008 (0.02)
Over 0.04 to 0.06 (1.02 to 1.52), incl	0.0012 (0.03)
Width in. (mm)	Permissible Variation, ± in. (mm)
0.08 to 0.16 (2.03 to 4.06), incl	0.0016 (0.04)
Over 0.16 to 0.24 (4.06 to 6.10), incl	0.0024 (0.06)
Over 0.24 to 0.48 (6.10 to 12.2), incl	0.0040 (0.10)

SUPPLEMENTARY REQUIREMENTS

Supplementary requirements to this specification shall only apply to a product specification when specified by the purchaser in his inquiry, contract or order. Details of the supplementary requirements shall be agreed upon in writing between the manufacturer and purchaser.

S1. Surface Examination

S1.1 The surface of the wire shall be examined by the eddy current method in accordance with Practice E 309. The acceptance criteria shall be mutually agreed upon by the purchaser and manufacturer.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR TERMINOLOGY RELATING TO STEEL, STAINLESS STEEL, RELATED ALLOYS, AND FERROALLOYS

SA-941

(Identical with ASTM Specification A 941-06a.)

1. Scope

1.1 This standard is a compilation of definitions of terms related to steel, stainless steel, related alloys, and ferroalloys.

1.2 When a term is used in an ASTM document for which Committee A01 is responsible, it is included herein only when judged, after review by Subcommittee A01.92, to be a generally usable term.

1.3 Some definitions include a discussion section, which is a mandatory part of the definition and contains additional information that is relevant to the meaning of the defined term.

1.4 Definitions of terms specific to a particular standard will appear in that standard and will supersede any definitions of identical terms in this standard.

2. Referenced Documents

2.1 ASTM Standards:
E 112 Test Methods for Determining Average Grain Size

3. Terminology

3.1 Definitions of General Terms:

alloy steel, n — a steel, other than a stainless steel, that conforms to a specification that requires one or more of the following elements, by mass percent, to have a minimum content equal to or greater than: 0.30 for aluminum; 0.0008 for boron; 0.30 for chromium; 0.30 for cobalt; 0.40 for copper; 0.40 for lead; 1.65 for manganese; 0.08 for molybdenum; 0.30 for nickel; 0.06 for niobium (columbium); 0.60 for silicon; 0.05 for titanium; 0.30 for tungsten (wolfram); 0.10 for vanadium; 0.05 for zirconium; or 0.10 for

any other alloying element, except sulphur, phosphorus, carbon, and nitrogen.

capped steel, n — a rimmed steel in which, during ingot solidification, the rimming action was limited by mechanical or chemical means.

carbon steel, n — a steel that conforms to a specification that prescribes a maximum limit, by heat analysis in mass percent, of not more than: 2.00 for carbon and 1.65 for manganese, but does not prescribe a minimum limit for chromium, cobalt, molybdenum, nickel, niobium (columbium), tungsten (wolfram), vanadium, or zirconium.

DISCUSSION — Except as required above, it is permissible for carbon steel specifications to prescribe limits (minimum or maximum, or both) for each specified alloying element, subject to the following restrictions for the heat analysis limits in mass percent:

(a) for wrought carbon steel products, the specified maximum limit is not to exceed: 0.10 for aluminum, 0.60 for silicon, and 0.050 for titanium;

(b) for carbon steel castings, the specified maximum limit is not to exceed: 0.10 for aluminum, 1.00 for silicon, and 0.050 for titanium.

(c) for carbon steels that are required to be rephosphorized, the specified minimum limit for phosphorus is not to be less than 0.040;

(d) for carbon steels that are required to be resulfurized, the specified minimum limit for sulfur is not to be less than 0.060;

(e) for carbon steels that are not required to be rephosphorized or resulfurized, the specified maximum limit is not to exceed: 0.60 for copper, 0.050 for phosphorus, and 0.060 for sulfur; and

(f) for carbon steels that are required to contain boron, copper, or lead, the specified minimum limit is not to exceed: 0.0005 for boron, 0.35 for copper, and 0.25 for lead.

cast analysis — Deprecated term. Use the preferred term heat analysis.

certificate of compliance, n — in manufactured products, a document that states that the product was manufactured, sampled, tested, and inspected in accordance with the

requirements of the specification (including year of issue) and any other requirements specified in the purchase order or contract, and has been found to meet such requirements.

DISCUSSION — A single document, containing test report information and certificate of compliance information, may be used.

certifying organization, n — in product specifications, the entity responsible for the conformance and certification of the product to the specification requirements.

check analysis — Deprecated term. Use the preferred term product analysis.

coarse grain practice, n — a steelmaking practice for other than stainless steel that is intended to produce a killed steel in which aluminum, niobium (columbium), titanium, and vanadium are residual elements.

cold working, n — mechanical deformation of a metal at temperatures below its recrystallization temperature.

defect, n — an imperfection of sufficient magnitude to warrant rejection based on the specified requirements.

direct quenching, n — in thermomechanical processing, quenching immediately following the final hot deformation.

document, n — a written, printed, or electronic record that provides information, evidence, or official statements.

electronic data interchange, n — the computer to computer exchange of business information in a standardized format.

ellipsis, n — in a tabular entry, three periods (...) that indicate that there is no requirement.

ferroalloy, n — an alloy of iron and one or more other metals, for use as an addition to the molten metal during the manufacture of steels, nickel alloys, or cobalt alloys.

fine grain practice, n — a steelmaking practice for other than stainless steel that is intended to produce a killed steel that is capable of meeting the requirements specified for fine austenitic grain size.

DISCUSSION — It normally involves the addition of one or more austenitic grain refining elements in amounts that have been established by the steel producer as being sufficient. Austenitic grain refining elements include, but are not limited to, aluminum, niobium (columbium), titanium, and vanadium.

grain size, n — the dimensions of the grains or crystals in a polycrystalline metal, exclusive of twinned regions and subgrains when present.

DISCUSSION — Grain size is usually estimated or measured on the cross section of an aggregate of grains, and designated by an ASTM grain size number. (See Test Methods E 112.)

heat, n — a generic term denoting a specific lot of steel, based upon steelmaking and casting considerations.

DISCUSSION — Where it is necessary to be more definitive, the following more specific terms are used: primary heat, multiple heat, and remelted heat. In product specifications, the term heat generally is used, without qualification, to mean the primary, multiple, or remelted heat, whichever is applicable.

heat analysis, n — the chemical analysis determined by the steel producer as being representative of a specific heat of steel.

DISCUSSION — Where the analysis reported by the steel producer is not sufficiently complete for conformance with the heat analysis requirements of the applicable product specification to be fully assessed, the manufacturer may complete the assessment of conformance with such heat analysis requirements by using a product analysis for the specified elements that were not reported by the steel producer, provided that product analysis tolerances are not applied and the heat analysis is not altered.

heat number, n — the alpha, numeric, or alphanumeric designator used to identify a specific heat of steel.

high-strength low-alloy steel, n — a steel, other than a carbon steel or an interstitial-free steel, that conforms to a specification that requires the minimum content for each specified alloying element to be lower than the applicable limit in the definition for alloy steel, and the yield point or yield strength of the product to be at least 36 ksi or 250 MPa.

hot-cold working, n — the mechanical deformation of austenitic and precipitation hardening steels at a temperature just below the recrystallization temperature to increase the yield strength and hardness by plastic deformation or precipitation hardening effects induced by plastic deformation, or both.

hot working, n — mechanical deformation of a metal at temperatures above its recrystallization temperature.

imperfection, n — a material discontinuity or irregularity that is detectable by inspection.

inclusion shape control, n — the addition of elements during steel making in order to affect the inclusion morphology.

inspection, n — the process of measuring, examining, testing, gaging, or otherwise comparing the unit of product with the applicable requirements.

interstitial-free steel, n — a steel that has essentially all of its carbon and nitrogen chemically combined with stabilization elements rather than being present interstitially.

DISCUSSION — The heat analysis limits (minimum or maximum, or both) that are permitted to be prescribed in interstitial-free steel specifications are as given in the definition for carbon steel, except that the 0.050% maximum limit for titanium does not apply.

killed steel, n — a steel deoxidized to such a level that essentially no reaction occurred between carbon and oxygen during solidification.

laser beam welding, n — a welding process that uses a laser beam as the heat source.

lot, n — a definite quantity of product manufactured under conditions that are considered uniform.

low-alloy steel, n — a steel, other than a carbon steel or an interstitial-free steel, that conforms to a specification that requires the minimum content for each specified alloying element to be lower than the applicable limit in the definition for alloy steel.

manufacturer, n — the organization responsible for the conversion of materials into products meeting the requirements of a product specification.

microalloyed steel, n — a low-alloy steel that conforms to a specification that requires the presence of one or more carbide-, nitride-, or carbonitride-forming elements, generally in individual concentrations less than 0.15 mass percent, to enhance strength.

DISCUSSION — The most common microalloying elements are niobium (columbium), titanium, and vanadium.

multiple heat, n — two or more molten primary heats, in whole or in part, combined in a common ladle or in a common non-oscillating mold.

DISCUSSION — A multiple heat is identified by a single heat number representative of the multiple heat, or by the individual heat numbers of the primary heats contained in the multiple heat. The heat analysis of a multiple heat identified by a single heat number is the weighted average analysis of the individual primary heats contained in the multiple heat. Two or more molten primary heats sequentially strand cast (poured into an oscillating mold) constitute a series of individual heats, not a multiple heat.

nickel alloy, n — a material that conforms to a specification that requires by mass percent more nickel than any other element.

DISCUSSION — In castings, the nickel content requirement is not normally stated in the specification and is not normally determined by chemical analysis, but is taken to be 100% minus the sum of the mean values permitted by the specification for all other elements having a specified range or a specified maximum.

plate-as-rolled, n — the quantity of plate product rolled at one time, either from an individual slab or directly from an ingot.

DISCUSSION — This term does not refer to the surface condition or the heat-treatment state of the material; a plate-as-rolled may be in the as-rolled condition, or may have received one or more surface treatments or heat treatments, or both.

primary heat, n — the product of a single cycle of a batch melting process.

DISCUSSION — In the investment casting industry, the term *master heat* is used.

product analysis, n — a chemical analysis of a specimen taken from the semi-finished product or the finished product.

remelted heat, n — the product of the remelting of a primary heat, in whole or in part.

DISCUSSION — In the investment casting industry, the term *sub-heat* is used.

residual element, n — in steel, a specified or unspecified element, not intentionally added, originating in the raw materials, refractories, or surrounding atmospheres used in steel making.

rimmed steel, n — a steel that contained sufficient oxygen to generate carbon monoxide at the boundary between the solid metal and the remaining molten metal during solidification, resulting in an outer layer low in carbon.

semikilled steel, n — an incompletely deoxidized steel that contained sufficient oxygen to form enough entrapped carbon monoxide during solidification to offset solidification shrinkage.

specified element, n — in steel, an element controlled to a specified minimum, maximum, or range, in accordance with the requirements of the applicable product specification.

stabilized stainless steel, n — a stainless steel that conforms to a specification that prescribes limits (minimum or range) for niobium (columbium), tantalum, titanium, or a combination thereof.

DISCUSSION — Such limits are sometimes expressed as a function of the carbon and nitrogen contents. In an appropriately annealed condition, a stabilized stainless steel will resist sensitization to intergranular corrosion associated with the precipitation of chromium carbide at grain boundaries as a result of thermal exposure, such as annealing, stress relieving, welding, or high temperature service. Resistance to sensitization to intergranular corrosion is dependent upon the corrosivity of the environment. The condition of being stabilized with respect to sensitization is frequently demonstrated by passing one or more standard corrosion tests for sensitization.

stainless steel, n — a steel that conforms to a specification that requires, by mass percent, a minimum chromium content of 10.5 or more, and a maximum carbon content of less than 1.20.

steel, n — a material that conforms to a specification that requires, by mass percent, more iron than any other element and a maximum carbon content of generally less than 2.

DISCUSSION — The iron content requirement is not normally stated in the specification and is not normally determined by chemical analysis, but is taken to be 100% minus the sum of the mean values permitted by

the specification for all other elements having a specified range or a specified maximum. For conformance purposes, this calculated value for iron is compared on an individual basis to the mean values permitted by the specification for each of the other elements having a specified range or a specified maximum. Some chromium-containing steels may contain more than 2% carbon; however, 2% carbon is generally considered to be the demarcation between steel and cast iron.

strain hardening, n — an increase in hardness and strength of a metal caused by plastic deformation at temperatures below its recrystallization temperature. (Syn. *work hardening*)

test record, n — a document or electronic record that contains the observations and derived data obtained by applying a given test method.

test report, n — a document that presents the applicable qualitative or quantitative results obtained by applying one or more given test methods.

DISCUSSION — A single document, containing test report information and certificate of compliance information, may be used.

unspecified element, n — in steel, an element not controlled to a specified minimum, maximum, or range, in accordance with the requirements of the applicable product specification.

3.2 Definitions of Terms Relating to Heat Treatment of Steels:

Ac_{cm} , Ac_1 , Ac_3 , Ac_4 — See *transformation temperature*.

Ae_{cm} , Ae_1 , Ae_3 , Ae_4 — See *transformation temperature*.

age hardening, n — hardening by aging, usually after rapid cooling or cold working.

aging, n — a change in the properties of certain steels that occurs at ambient or moderately elevated temperatures after hot working or a heat treatment (quench aging, natural aging, or artificial aging) or after a cold-working operation (strain aging).

DISCUSSION — The change in properties is often, but not always, due to precipitation hardening, but never involves a change in the chemical composition of the steel.

annealing, n — a generic term covering any of several heat treatments.

DISCUSSION — This treatment is used for purposes such as reducing hardness, improving machinability, facilitating cold working, producing a desired microstructure, or obtaining desired mechanical, physical, or other properties. Where applicable, it is preferred that the following more specific terms be used: box annealing, bright annealing, flame annealing, full annealing, graphitization annealing, intermediate annealing, isothermal annealing, process annealing, recrystallization annealing, spheroidizing, and subcritical annealing. The term “annealing,” without qualification, implies full annealing. Any process of annealing will usually reduce stresses; however, if the treatment is applied for the sole purpose of stress reduction, it should be designated stress relieving.

Ar_{cm} , Ar_1 , Ar_3 , Ar_4 — See *transformation temperature*.

artificial aging, n — aging above room temperature.

austempering, n — heat treatment involving quenching a steel object from a temperature above the transformation range in a medium maintained at a temperature above the martensite range sufficiently fast to avoid the formation of high temperature transformation products, and then holding it at that temperature until transformation is complete.

austenitizing, n — forming austenite by heating a steel object above the transformation range.

baking, n — heating to a low temperature in order to remove gases.

batch furnace, n — a heating device within which steel objects are held stationary or oscillated during the thermal processing cycle.

blank carburizing, n — simulating the carburizing operation without introducing carbon.

DISCUSSION — This is usually accomplished by using an inert material in place of the carburizing agent, or by applying a suitable protective coating on the object being heat treated.

blank nitriding, n — simulating the nitriding operation without introducing nitrogen.

DISCUSSION — This is usually accomplished by using an inert material in place of the nitriding agent, or by applying a suitable protective coating on the object being heat treated.

bluing, n — subjecting the scale-free surface of a steel object to the action of air, steam, or other agents at a suitable temperature, thereby forming a thin blue film of oxide and improving the object's appearance and corrosion resistance.

DISCUSSION — This term is ordinarily applied to sheet, strip, or finished parts. It is used also to denote the heating of springs after fabrication in order to improve their properties.

box annealing, n — annealing in a sealed container under conditions that minimize oxidation.

DISCUSSION — The charge is usually heated slowly to a temperature below the transformation range, but sometimes above or within it, and is then cooled slowly.

bright annealing, n — annealing in a protective medium to prevent discoloration of the bright surface.

carbon potential, n — the carbon content at the surface of a specimen of pure iron in equilibrium with the carburizing medium considered, and under the conditions specified.

carbon restoration, n — replacing the carbon lost from the surface layer in previous processing by carburizing this layer to substantially the original carbon level.

carbonitriding, n — case hardening in which a suitable steel object is heated above A_{c1} in a gaseous atmosphere of such composition as to cause simultaneous absorption of carbon and nitrogen by the surface and, by diffusion, to create a concentration gradient.

carburizing, n — a process in which an austenitized steel object is brought into contact with a carbonaceous environment of sufficient carbon potential to cause absorption of carbon at the surface and, by diffusion, to create a concentration gradient.

case, n — *in case hardening*, the outer portion that has been made harder than the core as a result of altered composition or microstructure, or both, from treatments such as carburizing, nitriding, and induction hardening.

case hardening, n — a generic term covering any of several processes applicable to steel that change the chemical composition or microstructure, or both, of the surface layer.

DISCUSSION — The processes commonly used are: carburizing and quench hardening; nitriding; and carbonitriding. It is preferred that the applicable specific process name be used.

cementation, n — the introduction of one or more elements into the outer portion of a steel object by means of diffusion at high temperature.

cold treatment, n — exposing a steel object to temperatures below room temperature for the purpose of obtaining desired conditions or properties, such as dimensional or structural stability.

conditioning heat treatment, n — a preliminary heat treatment used to prepare a steel object for a desired reaction to a subsequent heat treatment.

continuous-conveyance furnace, n — a heating device through which steel objects are intentionally moved at a constant rate during the thermal processing cycle.

controlled cooling, n — cooling a steel object from an elevated temperature in a predetermined manner to avoid hardening, cracking, or internal damage, or to produce a desired microstructure or mechanical properties.

core, n — *in case hardening*, the interior portion of unaltered composition or microstructure, or both, of a case hardened steel object.

core, n — *in clad products*, the central portion of a multilayer composite metallic material.

critical cooling rate, n — the slowest rate of continuous cooling at which austenite can be cooled from above the transformation range to prevent its transformation above M_s .

cycle annealing, n — annealing employing a predetermined and closely controlled time-temperature cycle to produce specific properties or a specific microstructure.

decarburization, n — the loss of carbon from the surface of a steel object as a result of its being heated in a medium that reacts with the carbon.

differential heating, n — heating that intentionally produces a temperature gradient within a steel object such that, after cooling, a desired stress distribution or variation in properties is present within the object.

diffusion coating, n — any process whereby a base metal is either coated with another metal and heated to a sufficient temperature in a suitable environment, or exposed to a gaseous or liquid medium containing the other metal, thereby causing diffusion of the coating or other metal into the base metal, with a resultant change in the composition and properties of its surface.

direct quenching, n — in thermochemical processing, quenching immediately following the thermochemical treatment.

double aging, n — employment of two different aging treatments, in sequence, to control the type of precipitate formed from a supersaturated alloy matrix in order to obtain the desired properties.

DISCUSSION — the first aging treatment, sometimes referred to as intermediate or stabilizing, is usually carried out at a higher temperature than the second.

double tempering, n — a treatment in which a quench-hardened steel object is given two complete tempering cycles at substantially the same temperature for the purpose of ensuring completion of the tempering reaction and promoting stability of the resultant microstructure.

ferritizing anneal, n — a heat treatment that produces a predominantly ferritic matrix in a steel object.

flame annealing, n — *annealing* in which the heat is applied directly by a flame.

flame hardening, n — a process in which only the surface layer of a suitable steel object is heated by flame to above A_{c3} or A_{cm} , and then the object is quenched.

fog quenching, n — quenching in a mist.

full annealing, n — annealing a steel object by austenitizing it and then cooling it slowly through the transformation range.

DISCUSSION — The austenitizing temperature is usually above A_{c3} for hypoeutectoid steels and between A_{c1} and A_{cm} for hypereutectoid steels.

grain growth, n — an increase in the grain size of a steel object, usually as a result of exposure to elevated temperatures.

graphitization annealing, n — annealing a steel object in such a way that some or all of the carbon is precipitated as graphite.

hardenability, n — the property that determines the depth and distribution of hardness induced by quenching a steel object.

hardening, n — increasing the hardness by suitable treatment, usually involving heating and cooling.

DISCUSSION — Where applicable, it is preferred that the following more specific terms be used: age hardening, case hardening, flame hardening, induction hardening, precipitation hardening, and quench hardening.

heat treatment, n — heating and cooling a steel object in such a way as to obtain desired conditions or properties.

DISCUSSION — Heating for the sole purpose of hot working is excluded from the meaning of this definition.

homogeneous carburizing, n — a process that converts a low-carbon steel to one of substantially uniform and higher carbon content throughout the section, so that a specific response to hardening may be obtained.

homogenizing, n — holding a steel object at high temperature to eliminate or decrease chemical segregation by diffusion.

hot quenching, n — an imprecise term used to cover a variety of quenching procedures in which the quenching medium is maintained at a prescribed temperature above 160°F or 70°C.

induction hardening, n — *in surface hardening*, a process in which only the surface layer of a suitable steel object is heated by electrical induction to above A_{c3} or $A_{c_{cm}}$, and then the object is quenched.

induction hardening, n — *in through hardening*, a process in which a suitable steel object is heated by electrical induction to above A_{c3} or $A_{c_{cm}}$ throughout its section, and then the object is quenched.

induction heating, n — heating by electrical induction.

intermediate annealing, n — annealing wrought steel objects at one or more stages during manufacture prior to final thermal treatment.

interrupted aging, n — aging at two or more temperatures, by steps, and cooling to room temperature after each step.

interrupted quenching, n — quenching in which the object being quenched is removed from the quenching medium

while the object is at a temperature substantially higher than that of the quenching medium.

isothermal annealing, n — austenitizing a steel object and then cooling it to, and holding it at, a temperature at which austenite transforms to a ferrite-carbide aggregate.

isothermal transformation, n — a change in phase at any constant temperature.

M_f , M_s — See *transformation temperature*.

maraging, n — a precipitation hardening treatment applied to a special group of alloy steels to precipitate one or more intermetallic compounds in a matrix of essentially carbon-free martensite.

martempering, n — quenching an austenitized steel object in a medium at a temperature in the upper part of, or slightly above, the martensite range, holding it in the medium until its temperature is substantially uniform throughout, and then cooling it in air through the martensite range.

martensite range, n — the temperature interval between M_s and M_f .

natural aging, n — spontaneous aging of a super-saturated solid solution at room temperature.

nitriding, n — introducing nitrogen into a solid steel object by holding it at a suitable temperature in contact with a nitrogenous environment.

normalizing, n — heating a steel object to a suitable temperature above the transformation range and then cooling it in air to a temperature substantially below the transformation range.

overaging, n — aging under conditions of time and temperature greater than those required to obtain maximum change in a certain property, so that the property is altered away from the maximum.

overheating, n — heating a steel object to such a high temperature that excessive grain growth occurs.

DISCUSSION — Unlike burning, it may be possible to restore the original properties/microstructure by further heat treatment or mechanical working, or a combination thereof.

patenting, n — *in wire making*, heating a medium-carbon or high-carbon steel before wire drawing, or between drafts, to a temperature above the transformation range, and then cooling it in air, or a bath of molten lead or salt, to a temperature below A_{e1} .

post-weld heat treatment, n — heating weldments immediately after welding, to provide tempering, stress relieving, or a controlled rate of cooling to prevent formation of a hard or brittle microstructure.

precipitation hardening, n — hardening caused by the precipitation of a constituent from a supersaturated solid solution.

precipitation heat treatment, n — artificial aging in which a constituent precipitates from a supersaturated solid solution.

preheating, n — for tool steels, heating to an intermediate temperature immediately before final austenitizing.

preheating, n — heating before welding, a mechanical treatment, or some further thermal treatment.

process annealing, n — in the sheet and wire industries, heating a steel object to a temperature close to, but below, Ac_1 and then cooling it, in order to soften it for further cold working.

progressive aging, n — aging by increasing the temperature in steps, or continuously, during the aging cycle.

quench aging, n — aging associated with quenching after solution heat treatment.

quench hardening, n — hardening a steel object by austenitizing it, and then cooling it rapidly enough that some or all of the austenite transforms to martensite.

DISCUSSION — The austenitizing temperature is usually above Ac_3 for hypoeutectoid steels and between Ac_1 and Ac_{cm} for hypereutectoid steels.

quenching, n — rapid cooling.

DISCUSSION — Where applicable, it is preferred that the following more specific terms be used: fog quenching, hot quenching, interrupted quenching, selective quenching, spray quenching, and time quenching.

recrystallization, n — the formation of a new grain structure through a nucleation and growth process.

DISCUSSION — This is commonly produced by subjecting a steel object, which may be strained, to suitable conditions of time and temperature.

recrystallization annealing, n — annealing a cold-worked steel object to produce a new grain structure without a change in phase.

recrystallization temperature, n — the approximate minimum temperature at which recrystallization of a cold-worked steel object occurs within a specified time.

secondary hardening, n — the hardening phenomenon that occurs during high-temperature tempering of certain steels containing one or more carbide-forming alloying elements.

selective heating, n — intentionally heating only certain portions of a steel object.

selective quenching, n — quenching only certain portions of a steel object.

semicontinuous-conveyance furnace, n — a heating device through which steel objects are intentionally moved in accordance with a predetermined start-stop-start pattern during the thermal processing cycle.

shell hardening, n — a surface hardening process in which a suitable steel object, when heated through and quench hardened, develops a martensitic layer or shell that closely follows the contour of the piece and surrounds a core of essentially pearlitic transformation product.

DISCUSSION — This result is accomplished by a proper balance between section size, hardenability, and severity of quench.

slack quenching, n — the incomplete hardening of a steel object due to quenching from the austenitizing temperature at a rate slower than the critical cooling rate for the particular steel composition, resulting in the formation of one or more transformation products in addition to martensite.

snap temper, n — a precautionary interim stress-relieving treatment applied to a high-hardenability steel immediately after quenching to prevent cracking because of delay in tempering it at the prescribed higher temperature.

soaking, n — prolonged holding at a selected temperature.

solution heat treatment, n — heating a steel object to a suitable temperature, holding it at that temperature long enough to cause one or more constituents to enter into solid solution, and then cooling it rapidly enough to hold such constituents in solution.

spheroidizing, n — heating and cooling a steel object to produce a spheroidal or globular form of carbide in its microstructure.

DISCUSSION — Spheroidizing methods commonly used are the following: (1) prolonged holding at a temperature just below Ae_1 ; (2) heating and cooling alternately between temperatures that are just above, and just below, Ae_1 ; (3) heating to a temperature above Ae_1 or Ae_3 and then cooling very slowly in the furnace or holding at a temperature just below Ae_1 ; (4) cooling, from the minimum temperature at which all carbide is dissolved, at a rate suitable to prevent the reformation of a carbide network, and then reheating in accordance with Method (1) or (2) above. (Applicable to hypereutectoid steels containing a carbide network.)

spray quenching, n — quenching in a spray of liquid.

stabilizing treatment, n — any treatment intended to stabilize the microstructure or dimensions of a steel object.

strain aging, n — aging induced by cold working.

stress relieving, n — heating a steel object to a suitable temperature, holding it long enough to reduce residual stresses, and then cooling it slowly enough to minimize the development of new residual stresses.

subcritical annealing, n — annealing at a temperature slightly below Ac_1 .

surface hardening, n — a generic term covering any of several processes that, by quench hardening only, produce in a steel object a surface layer that is harder or more wear resistant than the core.

DISCUSSION — There is no significant alteration of the chemical composition of the surface layer. Where applicable, it is preferred that the following more specific terms be used: induction hardening, flame hardening, and shell hardening.

temper brittleness, n — brittleness that results when certain steels are held within, or are cooled slowly through, a certain range of temperature below the transformation range.

tempering, n — reheating a quench hardened or normalized steel object to a temperature below A_{c1} , and then cooling it at any desired rate.

thermochemical treatment, n — a heat treatment carried out in a medium suitably chosen to produce a change in the chemical composition of the steel object by exchange with the medium.

time quenching, n — interrupted quenching in which the duration of holding in the quenching medium is controlled.

transformation ranges, n — those ranges of temperature within which austenite forms during heating and transforms during cooling.

DISCUSSION — The two ranges are distinct, sometimes overlapping but never coinciding. The limiting temperatures of the ranges are dependent upon the steel composition and the rate of change of temperature, particularly during cooling.

transformation temperature, n — the temperature at which a change in phase occurs, with the limiting temperatures of the transformation ranges designated using the following symbols:

A_{cm} — the temperature at which the solution of cementite in austenite is completed during heating.

A_{c1} — the temperature at which austenite begins to form during heating.

A_{c3} — the temperature at which transformation of ferrite to austenite is completed during heating.

A_{c4} — the temperature at which austenite transforms to delta ferrite during heating.

$A_{e1}, A_{e3}, A_{e_{cm}}, A_{e4}$ — the temperatures of phase change at equilibrium.

$A_{r_{cm}}$ — the temperature at which precipitation of cementite starts during cooling.

A_{r1} — the temperature at which transformation of austenite to ferrite or to ferrite plus cementite is completed during cooling.

A_{r3} — the temperature at which austenite begins to transform to ferrite during cooling.

A_{r4} — the temperature at which delta ferrite transforms to austenite during cooling.

M_f — the temperature at which transformation of austenite to martensite is substantially completed during cooling.

M_s — the temperature at which transformation of austenite to martensite starts during cooling.

DISCUSSION — All of the above changes, except the formation of martensite, occur at lower temperatures during cooling than during heating, and are dependent upon the rate of change of temperature.

SPECIFICATION FOR COMMON REQUIREMENTS FOR WROUGHT STEEL PIPING FITTINGS

**SA-960/SA-960M**

(Identical with ASTM Specification A 960/A 960M-07.)

1. Scope

1.1 This specification covers a group of common requirements that shall apply to wrought steel piping fittings covered in any of the following individual product specifications or any other ASTM specification that invokes this specification or portions thereof:

Title of Specification	ASTM Designation
Specification for Piping Fittings of Wrought Carbon Steel and Alloy Steel for Moderate and Elevated Temperatures	A 234/A 234M
Specification for Wrought Austenitic Stainless Steel Piping Fittings	A 403/A 403M
Specification for Piping Fittings of Wrought Carbon Steel and Alloy Steel for Low-Temperature Service	A 420/A 420M
Specification for Butt-Welding, Wrought-Carbon Steel, Piping Fittings with Improved Notch Toughness	A 758/A 758M
Specification for As-Welded Wrought Austenitic Stainless Steel Fittings for General Corrosive Service at Low and Moderate Temperatures	A 774/A 774M
Specification for Wrought Ferritic, Ferritic/Austenitic, and Martensitic Stainless Steel Piping Fittings	A 815/A 815M
Specification for Heat-Treated Carbon Steel Fittings for Low-Temperature and Corrosive Service	A 858/A 858M
Specification for Wrought High-Strength Low-Alloy Steel Butt-Welded Fittings	A 860/A 860M

1.2 In case of conflict between a requirement of the individual product specification and a requirement of this general requirement specification, the requirements of the individual product specification shall prevail over those of this specification.

1.3 By mutual agreement between the purchaser and the supplier, additional requirements may be specified (see 4.1.7). The acceptance of any such additional requirements shall be dependent on negotiations with the supplier and

must be included in the order as agreed upon by the purchaser and supplier.

1.4 The values stated in either inch-pound units or SI units [metric] are to be regarded separately as standard. Within the text and the tables, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification. The inch-pound units shall apply unless the “M” designation [SI] of the product specification is specified in the order.

3. Terminology

3.1 Definitions of Terms Specific to This Standard:

3.1.1 bar — a solid section that is long in relationship to its cross sectional dimensions, with a relatively constant cross section throughout its length. (See Specification A 29/A 29M for definitions relating to the production of hot wrought and cold finished bars.)

3.1.2 certifying organization — the company or association responsible for the conformance of, the marking of, and the certification of the product to the specification requirements.

3.1.3 fitting — a component for non-bolted joints used in piping systems and pressure vessels.

3.1.4 flange — a component for bolted joints used in piping systems and pressure vessels.

3.1.5 forging — the product of a substantially compressive hot or cold plastic working operation that consolidates the material and produces the required shape.

3.1.6 Discussion — The plastic working must be performed by a forging machine, such as a hammer, press, or ring rolling machine and must deform the material to produce an essentially wrought structure throughout the material cross section.

3.2 Definitions — For definitions of other terms used in this specification, refer to Terminology A 941.

4. Ordering Information

4.1 It is the purchaser's responsibility to specify in the purchase order all ordering information necessary to purchase the needed material. Examples of such information include but are not limited to the following:

4.1.1 Quantity,

4.1.2 Description of fitting and nominal dimensions (standard or special),

4.1.3 Steel composition by grade and class designation,

4.1.4 Construction, seamless or welded (unless seamless or welded construction is specified by the purchaser, either may be furnished at the option of the supplier),

4.1.5 Specification number (including the year/date of issue),

4.1.6 Supplementary requirements, and

4.1.7 Additional requirements.

5. Material

5.1 The material for fittings shall consist of forgings, bars, plates and seamless or welded tubular products.

5.2 The steel shall conform to the chemical requirements of the individual product specification and may be made from any process.

5.3 Ferritic steels shall be fully killed.

5.4 If secondary melting is employed, the heat shall be defined as all ingots remelted from a primary heat.

6. Manufacture

6.1 Forging or shaping operations may be performed by any of the methods included in the individual product specification.

6.2 Hollow cylindrically shaped parts up to and including NPS 4 may be machined from bar or seamless tubular material provided the axial length of the part is approximately parallel to the axial length of the fitting. Elbows, return bends, tees and header tees shall not be machined directly from bar stock.

6.3 Fittings, after forming at an elevated temperature, shall be cooled to a temperature below the critical range under suitable conditions to prevent injury by cooling too rapidly.

6.4 All classes of fittings shall have the welders, welding operators, and welding procedures qualified under the provision of Section IX of the ASME Boiler and Pressure Vessel Code except that welds from the original pipe manufacturer made without the addition of filler metal do not require such qualification.

7. Heat Treatment

7.1 Fittings requiring heat treatment shall be treated as specified in the individual product specification using the following procedures:

7.1.1 Full Annealing — Fittings shall be uniformly reheated to a temperature above the transformation range and, after holding for a sufficient time at this temperature, cooled slowly to a temperature below the transformation range.

7.1.2 Solution Annealing — Fittings shall be heated to a temperature that causes the carbides to go into solution and then quenched in water or rapidly cooled by other means to prevent reprecipitation.

7.1.3 Isothermal Annealing — Isothermal annealing shall consist of austenitizing a ferrous alloy and then cooling to and holding within the range of temperature at which the austenite transforms to a relatively soft ferrite-carbide aggregate.

7.1.4 Normalizing — Fittings shall be uniformly reheated to a temperature above the transformation range and subsequently cooled in air at room temperature.

7.1.5 Tempering and Post-Weld Heat Treatment — Fittings shall be reheated to the prescribed temperature below the transformation range, held at temperature for the greater of $\frac{1}{2}$ h or 1 h/in. [25.4 mm] of thickness at the thickest section and cooled in still air.

7.1.6 Stress Relieving — Fittings shall be uniformly heated to the selected stress relieving temperature. The temperature shall not vary from the selected temperature by more than $\pm 25^\circ\text{F}$ [$\pm 14^\circ\text{C}$].

7.1.7 Quench and Temper — Fittings shall be fully austenitized and immediately quenched in a suitable liquid medium. The quenched fittings shall be reheated to a minimum temperature of 1100°F [590°C] and cooled in still air.

8. Chemical Requirements

8.1 Chemical Analysis — Samples for chemical analysis and methods of analysis shall be in accordance with Test Methods, Practices and Terminology A 751 for Chemical Analysis of Steel Products.

8.2 Heat Analysis — An analysis of each heat of steel shall be made by the manufacturer to determine the percentages of those elements specified in the individual product specification. If secondary melting processes are employed, the heat analysis shall be obtained from one remelted ingot of each primary melt. The chemical analysis thus determined shall conform to the requirements of the individual product specification. Note that the product analysis (check analysis) tolerances are not to be applied to the heat analysis requirements.

8.2.1 For steels ordered under product specifications referencing this specification of general requirements, the steel shall not contain an unspecified element, other than nitrogen for stainless steels, for the ordered grade to the extent that the steel conforms to the requirements of another grade for which that element is a specified element having a required minimum content. For this requirement, a grade is defined as an alloy described individually and identified by its own UNS or grade designation in a table of chemical requirements within any specification listed within the scope as being covered by this specification.

8.3 Product Analysis — If a product analysis is performed it shall be in accordance with Test Methods, Practices, and Terminology A 751. The chemical composition thus determined shall conform to limits of the product specification, within the permissible variations of Table 1 or Table 2 of this specification, as appropriate for the grade being supplied.

9. Mechanical Requirements

9.1 Method of Mechanical Test — All tests shall be conducted in accordance with Test Methods and Definitions A 370.

9.2 The test specimen shall represent all material from the same heat and heat treatment load whose maximum thicknesses do not exceed the thickness of the test specimen or blank by more than $\frac{1}{4}$ in. [6 mm].

9.3 One tension test at room temperature shall be made in accordance with 9.2 from each heat in each heat treatment load.

9.3.1 If heat treatment is performed in either a continuous or batch type furnace controlled within $\pm 25^{\circ}\text{F}$ [$\pm 14^{\circ}\text{C}$] of the required heat treatment temperature and equipped with recording pyrometers so that complete records of heat treatment are available, and if the same heat treating cycles are used on the material represented by the tension test, then one tension test from each heat shall be required, instead of one tension test from each heat in each heat treatment load in accordance with 9.2.

9.4 Retest — When a retest is permitted by the product specification, it shall be performed on twice the number of representative specimens that were originally nonconforming. When any retest specimen does not conform to the product specification requirements for the characteristic in question, the lot represented by that specimen shall be rejected or reworked in accordance with Section 14.

9.4.1 If the results of the tension test do not conform to the requirements specified in the product specification, retests are permitted as outlined in Test Methods and Definitions A 370. If the results of any tension test specimen are less than specified because a flaw becomes evident in the test specimen during testing, a retest shall be allowed provided that the defect is not attributable to ruptures, cracks, or flakes in the steel.

9.4.2 If the average impact energy value meets the product specification requirements, but one energy value is below the specified minimum value for individual specimens, a retest is permitted. The retest shall be conducted in accordance with Test Methods and Definitions A 370.

9.5 For the purpose of determining conformance to the product specification requirements, specimens shall be obtained from a finished product, or from production material that is in the same condition of working and heat treatment as the production material.

10. Hardness Requirements

10.1 The part shall conform to the hardness requirements prescribed in the product specification.

10.2 Sampling for hardness testing shall conform to the product specification.

11. Tensile Requirements

11.1 The part shall conform to the tensile property requirements prescribed in the product specification.

11.2 Sampling for tensile testing shall conform to the product specification.

11.3 When the dimensions of the material to be tested will permit, the tension test specimens shall be machined to the form and dimensions of the standard 2 in. [50 mm]

gage length tension test specimens described in Test Methods and Definitions A 370.

11.3.1 In the case of small sections, which will not permit taking the standard test specimen described in 11.3, the subsize round or strip specimen shall be machined as described in Test Methods and Definitions A 370. The tension test specimen shall be as large as feasible.

12. Impact Requirements

12.1 The part shall conform to the impact requirements prescribed in the product specification.

12.2 Sampling for impact testing shall conform to the product specification.

13. Hydrostatic Test Requirements

13.1 Parts manufactured under this specification shall be capable of passing a hydrostatic test compatible with the rating of the specified matching pipe of equivalent material. Such a test shall be conducted only when specified in the purchase order or when the hydrostatic test Supplementary Requirement is invoked by the purchaser.

14. Rework

14.1 When one or more representative test specimens or retest specimens do not conform to the requirements specified in the product specification for the tested characteristic, the lot of material represented by the test specimen may be reworked according to the following requirements.

14.1.1 If previously tested in the untreated condition, the product may be reworked by heat treatment, and subsequently retested, in accordance with the product specification.

14.1.2 If previously tested in the heat treated condition, the product may be reworked by reheat treatment, and subsequently retested, in accordance with the product specification.

15. Finish and Appearance

15.1 The parts shall conform to the dimensions, tolerances and finish as specified in the purchaser's order. Parts ordered to the requirements of an ASTM specification shall conform to the requirements of the individual product specification.

15.2 The surface finish shall allow the detection of imperfections that can be disclosed by visual inspection. Where necessary the finished parts shall be cleaned to remove all loose scale and processing compounds prior to the final surface examination. The cleaning process shall

not injure the surface finish, material properties, or the metallurgical structure. The cleaned parts shall be protected to prevent recontamination. Protective coatings on parts subsequently subjected to socket welds or butt welds shall be suitable for welding without removal of the coating. When specified in the purchase order, parts may be furnished in the as-formed condition.

15.3 Fittings supplied under this specification shall be examined visually. Selected typical surface discontinuities shall be explored for depth. Unless otherwise specified in the purchase order, the following shall apply.

15.3.1 Fittings conforming to ASME B16.9 and MSS-SP-43 shall be free of surface discontinuities that penetrate more than 5% of the specified nominal wall thickness, except as defined in 15.3.3 and 15.3.4. Fittings conforming to ASME B16.11 and MSS-SP-79 shall be free of surface discontinuities that penetrate more than 5% of the actual wall thickness at the point of interest, or $\frac{1}{16}$ in. [1.6 mm], whichever is less, except as defined in 15.3.4.

15.3.2 Surface discontinuities deeper than 5% of the specified nominal wall thickness, except as defined in 15.3.3 and 15.3.4, shall be removed by the manufacturer by machining or grinding to sound metal, and the repaired areas shall blend smoothly into the contour of the finished fitting. Except for fittings conforming to MSS-SP-75, the wall thickness at all points shall be at least the specified minimum wall thickness, or 87½% of the specified nominal wall thickness and the diameters shall be within the limits specified in the applicable dimensional standards.

15.3.3 Surface checks (fish scale) deeper than $\frac{1}{64}$ in. [0.4 mm] shall be removed.

15.3.4 Mechanical marks deeper than $\frac{1}{16}$ in. [1.6 mm] shall be removed.

15.3.5 When the removal of a surface discontinuity reduces the wall thickness below the specified minimum wall thickness at any point, the fitting shall be subject to rejection or to repair as provided in Section 16.

16. Repair by Welding

16.1 The purchaser may require the supplier to submit proposed weld repairs for approval by invoking the appropriate Supplementary Requirement in the purchase order.

16.2 If the purchaser does not require prior approval of the proposed weld repairs, these repairs shall be permitted at the discretion of the supplier. All weld repairs shall be performed in accordance with the following limitations and requirements.

16.2.1 The welding procedure, welders and operators shall be qualified in accordance with Section IX of the ASME Boiler and Pressure Vessel Code. The composition

of the weld deposit shall be compatible with the composition of the material being welded.

16.2.2 Defects shall be completely removed prior to welding by machining, chipping or grinding to sound metal. Removal of these defects shall be verified by magnetic particle examination in accordance with Guide E 709 or liquid penetrant inspection in accordance with Test Method E 165, as applicable.

16.2.3 After repair welding, the welded area shall be machined or ground smooth to the original contour and shall be completely free of defects as verified by magnetic particle examination in accordance with Guide E 709 or liquid penetrant inspection in accordance with Test Method E 165, as applicable.

16.2.4 Repair welding shall not exceed 10% of the external surface area of the part, or $33\frac{1}{3}\%$ of the wall thickness of the finished product, or $\frac{3}{8}$ in. [10 mm] deep maximum at the location of the repair, without prior approval of the purchaser.

16.2.5 Weld repaired material or parts, or both, shall be marked "RW" when required by the product specification.

16.3 The weld repair shall conform to the additional requirements, if any, invoked in the product specification.

17. Inspection

17.1 The supplier shall provide the purchaser's inspector with all reasonable facilities necessary to satisfy him that the material is being produced and furnished in accordance with this specification and the applicable product specification. Site inspection by the purchaser shall not interfere unnecessarily with the supplier's operations.

18. Rejection and Rehearing

18.1 Samples representing material rejected by the purchaser shall be preserved until disposition of the claim has been agreed to between the supplier and the purchaser.

19. Marking

19.1 Each piece shall be legibly marked with the specification designation, grade and class, certifying organization's name or symbol, the heat number or heat identification, size, and schedule or thickness, if applicable. It is not required to mark the product with the specification year and date of issue. The Standard Marking System of Valves, Fittings, Flanges and Unions (MSS-SP-25) of the Manufacturer's Standardization Society of the Valve and Fittings Industry may be followed except the word "steel" shall not be substituted for the specification designation.

19.2 Product marking shall conform to the additional requirements, if any, invoked in the product specification.

20. Certification

20.1 Application of the specification designation and other identification marks as required in Section 19 shall be the certification that the material or parts, or both, have been furnished in accordance with the requirements of the specification.

20.2 When test reports are required, they shall include the year/date of issue, and shall be traceable to the part represented. In addition, the certification shall include the results of all tests required by this specification, the product specification, and the purchase order. The manufacturer, and any subsequent suppliers, shall provide the specific information required by the product specification and the purchase order.

20.3 A certificate printed from or used in electronic data interchange (EDI) transmission shall be regarded as having the same validity as a counterpart printed in the certifier's facility. The content of the EDI transmitted document shall conform to any existing EDI agreement between the purchaser and the supplier.

20.4 Notwithstanding the absence of a signature, the organization submitting either a printed certificate or an EDI transmitted certificate is responsible for the content of the report.

21. Packaging, Marking and Loading for Shipment

21.1 Packaging, marking, and loading for shipment shall be in accordance with Practices A 700.

21.2 When specified in the contract or order, and or direct procurement by or direct shipment to the government, when Level A is specified, preservation, packaging, and packing shall be in accordance with Level A requirements of MIL-STD-163.

22. Keywords

22.1 austenitic stainless steel; corrosive service applications; ferritic/austenitic stainless steel; ferritic stainless steel; high strength low alloy steel; martensitic stainless steel; piping applications; pressure containing parts; pressure vessel service; stainless steel fittings; temperature service applications-elevated; temperature service applications-low; temperature service applications-moderate

TABLE 1
PRODUCT ANALYSIS TOLERANCES FOR LOW ALLOY
AND CARBON STEELS^A

Elements	Limit, or Maximum of Specified Range, %	Permissible Variations Over Maximum Limit or Under Minimum Limit, %
Carbon	0.30 and under	0.01
	over 0.30 to 0.75, incl	0.02
	over 0.75	0.03

SUPPLEMENTARY REQUIREMENTS

These requirements shall not be considered unless specified in the order, in which event, the supplementary requirements specified shall be made at the place of manufacture, unless otherwise agreed upon, at the purchaser's expense. The test specified shall be witnessed by the purchaser's inspector before shipment of material, if so specified in the order. The rationale for beginning the section numbering with S50 is to eliminate the possibility of confusion with supplementary requirements existing in individual product specifications.

S50. Product Analysis (See Note S50.1)

S50.1 A product analysis shall be made from each heat of base metal and, if of welded construction, from each lot number of welding material of the fittings offered for delivery. The analysis shall conform to the requirements specified in Section 8.

S51. Tension Test (See Note S50.1)

S51.1 One tension test shall be made on one fitting or representative test piece (See Note S50.2) per lot (See Note S50.3) of fittings. If the fittings are of welded construction, the tension specimen shall include the weld and shall be prepared so that the weld is at the midlength location of the specimen. However, in no case shall the tensile properties of the finished fitting be less than the requirements listed in the individual product specification.

NOTE S50.1 — If the result of any of the tests specified in Supplementary Requirements S50, S51, or S63 do not conform to requirements, retests may be made at the manufacturer's expense on additional fittings or representative test pieces of double the original number from the same heat or lot as defined in Supplementary Requirements S50, S51, or S63, each of which shall conform to the requirements specified.

NOTE S50.2 — Where the test specimen for the tension or intergranular corrosion bend test cannot be taken from a fitting due to size limitations, a representative test piece shall be obtained. The test piece shall be from the same lot it represents and shall have approximately the same amount of working. In addition, these pieces representing fittings manufactured from bars, plate, or forgings shall have a cross section equal to the greatest cross section of the fitting, and test pieces representing fittings manufactured from pipe shall have an outside diameter and wall thickness equal to those of the fitting. The test piece for fittings of welded construction shall be prepared to the same weld procedures and from the same heat of materials as the fittings it represents.

NOTE S50.3 — A lot shall consist of all fittings of the same type, size, and wall thickness, manufactured from one heat of material (and, if fabrication welding is performed using one lot number of electrode or one heat of weld wire), and heat treated using the same heat-treat cycle in either a continuous or batch-type furnace controlling within a range of 50°F [28°C] and equipped with recording pyrometers so that complete records of heat treatment are available.

S52. Liquid Penetrant Examination

S52.1 All surfaces shall be liquid penetrant examined in accordance with Test Method E 165. Acceptance limits

shall be specified by the purchaser. Personnel performing the examination shall be qualified in accordance with SNT-TC-1A-1988 or later.

S53. Magnetic-Particle Examination

S53.1 All accessible surfaces shall be magnetic particle examined in accordance with Guide E 709. Acceptance limits shall be specified by the purchaser. Personnel performing the examination shall be qualified in accordance with SNT-TC-1A-1988 or later.

S54. Hydrostatic Test

S54.1 A hydrostatic test shall be applied as agreed upon between the manufacturer and purchaser.

S55. Bar Stock Fittings

S55.1 Bar stock fittings shall not be permitted.

S56. Special Heat Treatment

S56.1 A special heat treatment shall be applied as agreed upon between the manufacturer and the purchaser.

S57. Hardness Test

S57.1 If actual hardness testing of fittings is required, the frequency and the method used shall be as agreed upon between the manufacturer and the purchaser.

S58. Special Fittings

S58.1 Partial compliance fittings of size or shape not conforming to the dimensional requirements of ASME B16.9, B16.11, MSS-SP-79, and MSS-SP-95 shall meet all other requirements of the individual product specification. In addition to the marking required by Section 19, the grade designation symbol of the individual product specification shall be followed by the symbol "S58."

S59. Heat Treatment of Concentric Reducers

S59.1 Concentric reducers formed by local heating of the fitting shall be subsequently annealed, normalized, or normalized and tempered.

S60. Marking Small Fittings

S60.1 For small products where the space for marking is less than 1 in. [25 mm] in any direction, test reports are mandatory and marking may be restricted to only such symbols or codes as are necessary to identify the parts with test reports.

S60.2 When the configuration or size does not permit marking directly on the fitting, the marking method shall be a matter of agreement between the manufacturer and the purchaser.

S61. Phosphorous and Sulphur Content

S61.1 The phosphorous and sulphur contents of the fittings shall not exceed 0.025%.

S62. Ultrasonic Test

S62.1 Each fitting or the raw material from which the fitting is made shall be ultrasonically tested to determine its soundness. The method, where applicable, shall be in accordance with Practice A 388/A 388M. Acceptance limits shall be specified by the purchaser. Personnel performing NDE examinations shall be qualified in accordance with SNT-TC-1A-1988 or later.

S62.2 Each fitting or the raw material from which each fitting is made shall be ultrasonically tested to determine its soundness. The method, where applicable, shall be in accordance with Practice E 213. Acceptable limits shall be specified by the purchaser. Personnel performing the examination shall be qualified in accordance with SNT-TC-1A-1988 or later.

S63. Intergranular Corrosion Bend Test (See Note S50.1)

S63.1 An intergranular corrosion bend test shall be made on one fitting or representative test piece (See Note S50.2) per lot (See Note S50.3) of fittings. If the fittings are of welded construction, the bend specimen shall include the weld and be prepared so that the weld is at the midlength location of the specimen. Specimens containing a weld shall be bent so that the location of weld is at the point of maximum bend. The method of testing shall be in accordance with Practices A 262 or Practices A 763, as applicable.

S64. Photomicrographs

S64.1 Photomicrographs at 100 diameters shall be made for information only of the actual base metal structure from one fitting as furnished in each lot. The photomicrographs shall be identified as to fitting size, wall thickness, lot identification, and heat. The definition of "lot" shall be as specified by the purchaser.

S65. Surface Finish

S65.1 Machined surfaces shall have a maximum roughness of 250 μ in. AARH [6.3 μ m]. All other surfaces shall be suitable for ultrasonic testing.

S66. Repair Welding

S66.1 No weld repair shall be permitted without prior approval of the purchaser.

S67. Charpy V-Notch Test

S67.1 Charpy V-notch test shall be made as specified on the order. The test temperature, acceptance criteria, number of tests, and location of tests (whether from base metal, weld metal, or heat affected zone of welds) shall be specified.

S68. Special Notch Toughness

S68.1 The impact test temperature or acceptance values, or both, shall be as agreed upon, but only with respect to lower temperatures or higher energy values.

S69. Magnetic Particle Examination-Weld Metal

S69.1 All accessible welds shall be examined in accordance with Guide E 709. Accessible is defined as all outside surfaces, all inside fitting surfaces 24 in. [610 mm] in diameter and greater, and inside fitting surfaces less than 24 in. [610 mm] in diameter, for a distance of one diameter from the ends.

S69.2 Acceptance Criteria — The following indications are unacceptable:

S69.2.1 Any cracks and linear indications,

S69.2.2 Rounded indications with dimensions greater than $\frac{3}{16}$ in. [4.8 mm],

S69.2.3 Four or more indications in any line separated by $\frac{1}{16}$ in. [1.6 mm],

S69.2.4 Ten or more indications located in any 6 in.² [4000 mm²] of surface, with the major dimensions not to exceed 6 in. [150 mm] when the major dimension is oriented so that the area includes the maximum number of indications being evaluated.

S69.3 Personnel performing NDE examinations shall be qualified in accordance with SNT-TC-1A-1988 or later.

S70. Liquid Penetrant Examination of Weld Metal

S70.1 All accessible surfaces of fittings shall be examined in accordance with Test Method E 165. Accessible is defined in S69.

S70.2 Acceptance criteria shall be in accordance with S69.2.

S70.3 Personnel performing NDE examinations shall be qualified in accordance with SNT-TC-1A-1988 or later.

S71. Product Marking

S71.1 Weld repaired parts shall be marked "S71."

S72. Nondestructive Electromagnetic (Eddy-Current) Test

S72.1 For eddy-current testing, the calibration tube shall contain, at the option of the manufacturer, any one of the following discontinuities placed in the weld to establish a minimum sensitivity level for rejection.

S72.2 *Drilled Hole* — A hole not larger than 0.031 in. [0.79 mm] in diameter shall be drilled radially and completely through the tube wall, with care being taken to avoid distortion of the tube while drilling.

S72.3 *Transverse Tangential Notch* — Using a round tool or file with a $\frac{1}{4}$ in. [6 mm] diameter, a notch shall be filed or milled tangential to the surface and transverse to the longitudinal axis of the tube. The notch shall have a depth not exceeding $12\frac{1}{2}\%$ of the specified wall thickness of the tube or 0.004 in. [0.102 mm], whichever is greater.

S72.4 *Longitudinal Notch* — A notch 0.031 in. [0.79 mm] or less in width shall be machined in a radial plane parallel to the tube axis on the outside surface of the tube, to have a depth not exceeding $12\frac{1}{2}\%$ of the specified wall thickness of the tube or 0.004 in. [0.102 mm], whichever is greater. The length of the notch shall be compatible with the testing method.

S72.5 Fittings producing a signal equal to or greater than the calibration defect shall be subject to rejection. To be accepted, after rework, the fittings must pass the same test to which it was originally subjected.

S72.6 Personnel performing NDE examinations shall be qualified in accordance with SNT-TC-1A-1988 or later.

S73. Weld Metal Analysis

S73.1 Analysis of weld metal shall be reported.

S74. Welding Procedure Test Record

S74.1 A welding procedure test record shall be furnished.

S75. Chemical Analysis of Remelted Steel

S75.1 Each remelted ingot shall be assigned a unique identification number.

S75.2 A chemical analysis shall be made from each remelted ingot.

S76. Electropolished Austenitic Grades

S76.1 All electropolished austenitic fittings shall be of a cleanliness according to Specification A 967.

S76.2 Details concerning which test method of Specification A 967 are to be a matter of agreement between the manufacturer and the purchaser.

S77. Positive Material Identification Examination

S77.1 Fittings shall be examined to assure that the purchaser is receiving fittings of the correct material grade prior to shipment of the fittings. This examination is to assure that no material grade mix-up has happened during manufacturing and marking of the fittings.

S77.2 Fittings shall receive a Positive Material Identification examination using the methods of Guide E 1916.

S77.3 The quantity examined shall be 100% of the fittings.

S77.4 All fittings that are not of the correct material grade shall be rejected.

S77.5 The method of fitting marking after this examination shall be agreed upon between the manufacturer and purchaser.

S78. Requirements for Carbon Steel Products for Concentrated Hydrofluoric Acid Service

S78.1 Products shall be provided in the normalized heat-treated condition.

S78.2 The maximum carbon equivalent based on heat analysis shall be as follows:

Maximum section thickness less than or equal to 1 in.	CE maximum = 0.43
Maximum section thickness greater than 1 in.	CE maximum = 0.45

S78.3 Determine the carbon equivalent (CE) as follows:

$$CE = C + Mn/6 + (Cr + Mo + V)/5 + (Ni + Cu)/15$$

S78.4 Vanadium and Niobium maximum content based on heat analysis shall be:

Maximum Vanadium = 0.02 wt%

Maximum Niobium = 0.02 wt%

Maximum Vanadium plus Niobium = 0.03 wt% (Note Niobium = Columbium)

S78.5 The maximum composition based on heat analysis of Ni + Cu shall be 0.15 wt%.

S78.6 The minimum C content based on heat analysis shall be 0.18 wt%. The maximum C content shall be as specified in the appropriate material specification.

S78.7 Repair welds shall not be made with E60XX electrodes. Use of E70XX electrodes is recommended and the resulting weld chemistry should meet the same chemistry criteria as the base metal as listed above.

S78.8 In addition to the requirements of product marking of the specification, an "HF-N" stamp or marking shall

be provided on each component to identify that component complies with this supplementary requirement.

S79 Pressure Equipment Directive-Mechanical Testing

S79.1 Charpy impact testing shall be done at the lowest scheduled operating temperature, but not higher than 68°F [20°C].

S79.2 The frequency of impact testing shall be the same as that specified in the product specification for the tension test, with three individual Charpy test specimens for each required tension test.

S79.3 The minimum impact absorption energy for the Charpy test specimen shall be at least 20 ft-lb [27 J].

S79.4 The minimum elongation in the tension test shall be measured on a gage length of five times the diameter of the test specimen, and shall not be less than 14%.

S79.5 Impact and tension test results shall be included in the product certification.

ANNEX

(Mandatory Information)

A1. Requirements for the Introduction of New Materials

A1.1 New materials may be proposed for inclusion in specifications referencing this specification of general requirements subject to the following conditions:

A1.1.1 Application for the addition of a new grade to a specification shall be made to the chairman of the subcommittee, which has jurisdiction over that specification.

A1.1.2 The application shall be accompanied by a statement from at least one user indicating that there is a

need for the new grade to be included in the applicable specification.

A1.1.3 The application shall be accompanied by test data as required by the applicable specification. Test data from a minimum of three test lots, as defined by the specification, each from a different heat, shall be furnished.

A1.1.4 The application shall provide recommendations for all requirements appearing in the applicable specification.

A1.1.5 The application shall state whether the new grade is covered by patent.

SPECIFICATION FOR COMMON REQUIREMENTS FOR STEEL FLANGES, FORGED FITTINGS, VALVES, AND PARTS FOR PIPING APPLICATIONS

SA-961/SA-961M

(Identical with ASTM Specification A 961/A 961M-07 except certification in 19.1 is mandatory.)

1. Scope

1.1 This specification covers a group of common requirements that shall apply to steel flanges, forged fittings, valves, and parts for piping applications under any of the following individual product specifications:

Title of Specification	ASTM Designation
Forgings, Carbon Steel, for Piping Components	A 105/A 105M
Forgings, Carbon Steel, for General-Purpose Piping	A 181/A 181M
Forged or Rolled Alloy-Steel Pipe Flanges, Forged Fittings, and Valves and Parts for High Temperature Service	A 182/A 182M
Forgings, Carbon and Low Alloy Steel, Requiring Notch Toughness Testing for Piping Components	A 350/A 350M
Forged or Rolled 8 and 9% Nickel Alloy Steel Flanges, Fittings, Valves, and Parts for Low-Temperature Service	A 522/A 522M
Forgings, Carbon and Alloy Steel, for Pipe Flanges, Fittings, Valves and Parts for High-Pressure Transmission Service	A 694/A 694M
Flanges, Forged, Carbon and Alloy Steel for Low Temperature Service	A 707/A 707M
Forgings, Carbon Steel, for Piping Components with Inherent Notch Toughness	A 727/A 727M
Forgings, Titanium-Stabilized Carbon Steel, for Glass-Lined Piping and Pressure Vessel Service	A 836/A 836M

1.2 In case of conflict between a requirement of the individual product specification and a requirement of this general requirement specification, the requirements of the individual product specification shall prevail over those of this specification.

1.3 By mutual agreement between the purchaser and the supplier, additional requirements may be specified (see

Section 4.1.2). The acceptance of any such additional requirements shall be dependent on negotiations with the supplier and must be included in the order as agreed upon between the purchaser and supplier.

1.4 The values stated in either inch-pound units or SI units (metric) are to be regarded separately as standard. Within the text and the tables, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification. The inch-pound units shall apply, unless the “M” designation (SI) of the product specification is specified in the order.

2.1 ASTM Standards:

- A 105/A 105M Specification for Carbon Steel Forgings for Piping Applications
- A 181/A 181M Specification for Carbon Steel Forgings, for General-Purpose Piping
- A 182/A 182M Specification for Forged or Rolled Alloy and Stainless Steel Pipe Flanges, Forged Fittings, and Valves and Parts for High-Temperature Service
- A 275/A 275M Practice for Magnetic Particle Examination of Steel Forgings
- A 350/A 350M Specification for Carbon and Low-Alloy Steel Forgings, Requiring Notch Toughness Testing for Piping Components
- A 370 Test Methods and Definitions for Mechanical Testing of Steel Products
- A 522/A 522M Specification for Forged or Rolled 8 and 9% Nickel Alloy Steel Flanges, Fittings, Valves, and Parts for Low-Temperature Service

A 694/A 694M Specification for Carbon and Alloy Steel Forgings for Pipe Flanges, Fittings, Valves, and Parts for High-Pressure Transmission Service
 A 700 Practices for Packaging, Marking, and Loading Methods for Steel Products for Shipment
 A 707/A 707M Specification for Forged Carbon and Alloy Steel Flanges for Low-Temperature Service
 A 727/A 727M Specification for Carbon Steel Forgings for Piping Components with Inherent Notch Toughness
 A 751 Test Methods, Practices, and Terminology for Chemical Analysis of Steel Products
 A 836/A 836M Specification for Titanium-Stabilized Carbon Steel Forgings for Glass-Lined Piping and Pressure Vessel Service
 A 941 Terminology Relating to Steel, Stainless Steel, Related Alloys, and Ferroalloys
 A 967 Specification for Chemical Passivation Treatments for Stainless Steel Parts
 A 991/A 991M Test Method for Conducting Temperature Uniformity Surveys of Furnaces Used to Heat Treat Steel Products
 B 880 Specification for General Requirements for Chemical Check Analysis Limits for Nickel, Nickel Alloys and Cobalt Alloys
 E 165 Test Method for Liquid Penetrant Examination
 E 381 Method of Macroetch Testing Steel Bars, Billets, Blooms, and Forgings
 E 709 Guide for Magnetic Particle Examination
 E 1916 Guide for Identification and/or Segregation of Mixed Lots of Metals

2.2 ASME Standard:

ASME Boiler and Pressure Vessel Code—Section IX

2.3 Military Standard:

MIL-STD-163 Steel Mill Products, Preparation for Shipment and Storage

2.4 Manufacturer's Standardization Society Standard:

SP 25 Standard Marking System of Valves, Fittings, Flanges and Unions

3. Terminology

3.1 Definitions — For definitions of other terms used in this specification, refer to Terminology A 941.

3.2 Definitions of Terms Specific to This Standard:

3.2.1 bar, *n* — a solid rolled or forged section that is long in relationship to its cross sectional dimensions, with a relatively constant cross section throughout its length and a wrought microstructure.

3.2.2 certifying organization, *n* — the company or association responsible for the conformance of, and marking of, the product to the specification requirements.

3.2.3 fitting, *n* — a component for non-bolted joints in piping systems.

3.2.4 flange, *n* — a component for bolted joints used in piping systems.

3.2.5 forging, *n* — the product of a substantially compressive hot or cold plastic working operation that consolidates the material and produces the required shape.

3.2.5.1 Discussion — The plastic working must be performed by a forging machine, such as a hammer, press, or ring rolling machine, and must deform the material to produce a wrought structure throughout the material cross section.

3.2.6 seamless tubing, *n* — a tubular product made without a welded seam.

3.2.6.1 Discussion — It is manufactured usually by hot working the material, and if necessary, by subsequently cold finishing the hot worked tubular product to produce the desired shape, dimensions and properties.

4. Ordering Information

4.1 It is the purchaser's responsibility to specify in the purchase order all ordering information necessary to purchase the needed material. Examples of such information include, but are not limited to, the following:

4.1.1 Quantity,

4.1.2 Size and pressure class or dimensions, (tolerances and surface finishes should be included),

4.1.3 Specification number with grade or class, or both, as applicable, and year/date,

4.1.4 Supplementary requirements, and

4.1.5 Additional requirements.

5. Melting Process

5.1 Unless otherwise specified in the individual Product Specification, the steel shall be fully killed.

5.2 If a specific type of melting is required by the purchaser, it shall be stated on the purchase order.

5.3 The primary melting may incorporate separate degassing or refining and may be followed by secondary melting, such as electroslag remelting or vacuum remelting. If secondary melting is employed, the heat shall be defined as all of the ingot remelted from a single primary heat.

5.4 Steel may be cast in ingots or may be strand cast. When steel of different grades is sequentially strand cast, identification of the resultant transition material is required. The steel producer shall remove the transition material

by an established procedure that positively separates the grades.

5.5 A sufficient discard shall be made from the source material to secure freedom from injurious porosity and shrinkage, and undue segregation.

6. Manufacture

6.1 The finished part shall be manufactured from a forging that is as close as practicable to the finished size or shape. Alternative starting materials may be used, but with the following exceptions and requirements.

6.1.1 Bar — Flanges, elbows, return bends, tees, and header tees shall not be machined directly from bar. Other hollow cylindrical shaped parts up to, and including, NPS 4 can be machined from bar provided that the axial length of the part is approximately parallel to the metal flow lines of the starting stock.

6.1.2 Wrought Seamless Pipe and Tubing — Flanges shall not be machined directly from seamless pipe or tubing. Other hollow cylindrical shaped parts can be machined from seamless pipe and tubing provided that the axial length of the part is approximately parallel to the metal flow lines of the starting stock.

7. Heat Treatment

7.1 Material requiring heat treatment shall be treated as specified in the individual product specification using the following procedures that are defined in more detail in Terminology A 941.

7.1.1 Full Annealing — Material shall be uniformly reheated to a temperature above the transformation range and, after holding for a sufficient time at this temperature, cooled slowly to a temperature below the transformation range.

7.1.2 Solution Annealing — Material shall be heated to a temperature that causes the chrome carbides to go into solution, and then, quenched in water or rapidly cooled by other means to prevent reprecipitation.

7.1.3 Isothermal Annealing — Isothermal annealing shall consist of austenitizing a ferrous alloy, and then, cooling to and holding within the range of temperature at which the austenite transforms to a relatively soft ferrite-carbide aggregate.

7.1.4 Normalizing — Material shall be uniformly reheated to a temperature above the transformation range, and subsequently, cooled in air at room temperature.

7.1.5 Tempering and Post-Weld Heat Treatment — Material shall be reheated to the prescribed temperature below the transformation range, held at temperature for

the greater of 30 min or 1 h/in. [25.4 mm] of thickness at the thickest section and cooled in still air.

7.1.6 Stress Relieving — Material shall be uniformly heated to the selected stress relieving temperature. The temperature shall not vary from the selected temperature by more than $\pm 25^{\circ}\text{F}$ [$\pm 14^{\circ}\text{C}$].

7.1.7 Quench and Temper — Material shall be fully austenitized and quenched immediately in a suitable liquid medium. The quenched fittings shall be reheated to a minimum temperature of 1100°F [590°C] and cooled in still air.

8. Chemical Requirements

8.1 Chemical Analysis — Samples for chemical analysis and methods of analysis shall be in accordance with Test Methods, Practices, and Terminology A 751.

8.2 Heat Analysis — An analysis of each heat of steel shall be made by the steel manufacturer to determine the percentages of those elements specified in the individual product specification. If secondary melting processes are employed, the heat analysis shall be obtained from one remelted ingot, or the product of one remelted ingot, from each primary melt. The chemical analysis thus determined shall conform to the requirements of the individual product specification. Note that the product analysis (check analysis) tolerances are not to be applied to the Heat Analysis requirements.

8.3 Product Analysis — If a product analysis is performed it shall be in accordance with Test Methods, Practices, and Terminology A 751. Samples for analysis shall be taken from midway between center and surface of solid parts, midway between inner and outer surfaces of hollow parts, midway between center and surface of full-size prolongations or from broken mechanical test specimens. The chemical composition thus determined shall conform to the limits of the product specification, within the permissible variations of Table 1 or Table 2 of this specification, as appropriate for the grade being supplied.

9. Mechanical Requirements

9.1 Method of Mechanical Tests — All tests shall be conducted in accordance with Test Methods and Definitions A 370.

9.2 For the purpose of determining conformance to the product specification requirements, specimens shall be obtained from the production forgings, or from separately forged test blanks prepared from the stock used to make the finished product. In either case, mechanical test specimens shall not be removed until after all heat treatment is complete. If repair welding is performed, test specimens shall not be removed until after post-weld heat treatment is

complete, unless permitted by the product specification. The locations from which test specimens are removed shall be in accordance with the Product Specification.

9.3 If separately forged test blanks are used, they shall be of the same heat of steel, be subjected to substantially the same reduction and working as the production forging they represent, be heat treated in the same furnace charge except as provided for in the reduced testing provisions of the product specification, under the same conditions as the production forging, and be of the same nominal thickness as the maximum heat treated thickness of the production forging.

9.4 When parts are machined from bar or seamless tubing, as permitted in 6.1.1 and 6.1.2, the mechanical properties may be determined for the parts from the starting material, if the parts have not been subjected to any subsequent thermal processing since the time of mechanical test.

10. Hardness Requirements

10.1 The part shall conform to the hardness requirements prescribed in the product specification.

10.2 Sampling for hardness testing shall conform to the product specification.

11. Tensile Requirements

11.1 Sampling for tensile testing shall conform to the Product Specification.

11.2 When the dimensions of the material to be tested will permit, the tension test specimens shall be machined to standard round 2 in. [50 mm] gage length tension test specimen described in Test Methods and Definitions A 370.

11.3 In the case of small sections, which will not permit taking of the standard test specimen described in 11.2, the subsize round specimen shall be machined as described in Test Methods and Definitions A 370. The tension test specimen shall be as large as feasible.

11.4 The results of the tensile tests shall conform to the tensile property requirements prescribed in the product specification.

11.5 If the results of tension tests do not conform to the requirements specified in the product specification, retests are permitted as outlined in Test Methods and Definitions A 370. If the results of any tension test specimen are less than specified because a flaw becomes evident in the test specimen during testing, a retest shall be allowed provided that the defect is not attributable to ruptures, cracks, or flakes in the steel.

12. Impact Requirements

12.1 The part shall conform to the impact requirements prescribed in the product specification.

12.2 Sampling for impact testing shall conform to the Product Specification.

12.3 If the average impact energy value meets the product specification requirements, but the energy value for one specimen is below the specified minimum value for individual specimens, a retest is permitted. This shall consist of two impact specimens from a location adjacent to, and on either side of, the specimen that failed. Each of the retested specimens must exhibit an energy value equal to or greater than the minimum average value required by the product specification.

13. Hydrostatic Test Requirements

13.1 Parts manufactured under this specification shall be capable of passing a hydrostatic test compatible with the rating of the finished part. Such tests shall be conducted by the supplier only when the hydrostatic test supplementary requirement in the product specification is invoked by the purchaser.

14. Rework

14.1 When one or more representative test specimens or retest specimens do not conform to the requirements specified in the product specification for the tested characteristic, the product may be reworked according to the following requirements:

14.1.1 If previously tested in the unheat treated condition, the product may be reworked by heat treatment, and subsequently retested, in accordance with the product specification.

14.1.2 If previously tested in the heat treated condition, the product may be reworked by reheat treatment, and subsequently retested, in accordance with the product specification.

15. Finish and Appearance

15.1 The parts shall conform to the dimensions, tolerances, and finish as specified on the purchaser's drawing or order.

15.2 The finished parts shall be cleaned to remove all scale and processing compounds prior to the final surface examination. The cleaning process shall not injure the surface finish, material properties, or the metallurgical structure. The cleaned parts shall be protected to prevent recontamination. Protective coatings on parts subsequently subjected to socket welds or butt welds shall be suitable

for welding without removal of the coating. When specified in the purchase order, parts may be furnished in the as-formed or as-forged condition.

15.3 The parts shall be free of injurious imperfections as defined below. At the discretion of the inspector representing the purchaser, finished parts shall be subject to rejection if surface imperfections acceptable under 15.5 are not scattered, but appear over a large area.

15.4 *Depth of Injurious Imperfections* — Selected typical linear and other typical surface imperfections shall be explored for depth. When the depth encroaches on the minimum specified wall thickness of the finished part, such imperfections shall be considered injurious.

15.5 *Imperfections Not Classified as Injurious* — Surface imperfections not classified as injurious shall be treated as follows:

15.5.1 Seams, laps, tears, or slivers not deeper than 5% of the actual wall thickness at the point of interest or $\frac{1}{16}$ in. [1.6 mm], whichever is less, are acceptable. If deeper, these imperfections require removal, and shall be removed by machining or grinding.

15.5.2 Mechanical marks or abrasions and pits shall be acceptable without grinding or machining provided the depth does not exceed $\frac{1}{16}$ in. [1.6 mm]. If such imperfections are deeper than $\frac{1}{16}$ in. [1.6 mm] but do not encroach on the minimum wall thickness of the forging they shall be removed by machining or grinding to sound metal.

15.5.3 The wall thickness at the point of grinding, or at imperfections not required to be removed, shall be determined by deducting the amount removed by grinding, from the nominal finished wall thickness of the part. In any case, the wall thickness shall not be less than the specified minimum value.

16. Repair by Welding

16.1 The purchaser may require the supplier to submit proposed weld repairs for approval by invoking the appropriate supplementary requirement from the applicable product specification in the purchase order. If the purchaser does not require prior approval of proposed weld repairs, these repairs shall be permitted at the discretion of the supplier. All weld repairs shall be performed in accordance with the following limitations and requirements.

16.1.1 The welding procedure and welders shall be qualified in accordance with Section IX of the ASME Boiler and Pressure Vessel Code.

16.1.2 Defects shall be completely removed prior to welding by chipping or grinding to sound metal. Removal of these defects shall be verified by magnetic particle inspection in accordance with Test Method A 275/A 275M

or Guide E 709 for the ferritic, martensitic, or ferritic/austenitic grades, or by liquid penetrant inspection in accordance with Test Method E 165 for ferritic, martensitic, or austenitic grades.

16.1.3 After repair welding, the welded area shall be ground smooth to the original contour and shall be completely free of defects as verified by magnetic particle or liquid penetrant inspection, as applicable.

16.1.4 Repair by welding shall not exceed 10% of the surface area of the part, or $33\frac{1}{3}\%$ of the wall thickness of the finished product, or $\frac{3}{8}$ in. [10 mm] deep at the location of the repair.

16.2 The weld repair shall conform to 9.2 and to the additional requirements, if any, invoked in the Product Specification.

17. Inspection

17.1 The supplier shall afford the purchaser's inspector all reasonable facilities necessary to satisfy him that the material is being produced and furnished in accordance with the general specification and the applicable product specification. Site inspection by the purchaser shall not interfere unnecessarily with the supplier's operations.

18. Rejection and Rehearing

18.1 Samples representing material rejected by the purchaser shall be preserved until disposition of the claim has been agreed upon between the manufacturer and the purchaser.

18.2 Material that shows injurious defects subsequent to its acceptance at the manufacturer's works will be rejected, and the manufacturer shall be notified.

19. Certification

19.1 Marking of the specification number and manufacturer's name or trademark on the parts, and printing of the same on test reports, shall be certification that the parts have been furnished in accordance with the requirements of the specification.

19.2 Test reports shall be traceable to the heat identification on the parts. They shall contain the information specified by the Product Specification and the purchaser order. They shall include the specification number and year/date of issue.

19.3 A certificate printed from or used in electronic data interchange (EDI) transmission shall be regarded as having the same validity as a counterpoint printed in the certifiers facility. The content of the EDI transmitted document shall conform to any existing EDI agreement between the purchaser and supplier.

19.4 Notwithstanding the absence of a signature, the organization submitting either a printed certificate or an EDI transmitted certificate is responsible for the content of the report.

20. Marking

20.1 Each piece shall be legibly marked with the specification number, grade and class, certifying organization's name or symbol, the heat number or heat identification, size, and service rating, if applicable. It is not required to mark the product with the specification year and date of issue. The Standard Marking System of Valves, Fittings, Flanges and Unions (SP 25) may be followed except the word "steel" shall not be substituted for the specification designation.

20.2 Product marking shall conform to the additional requirements, if any, invoked in the product specification or purchase order.

21. Packaging, Marking and Loading for Shipment

21.1 Packaging, marking, and loading for shipment shall be in accordance with Practices A 700.

21.2 When specified in the contract or order, and or direct procurement by or direct shipment to the government, when Level A is specified, preservation, packaging, and packing shall be in accordance with Level A requirements of MIL-STD-163.

22. Keywords

22.1 alloy steel; carbon steel; fittings; flanges; forgings; general requirement; piping applications; pressure containing parts; stainless steel; temperature service applications—elevated; temperature service applications—high; valves

⁴ Cross-sectional area.

SUPPLEMENTARY REQUIREMENTS

These requirements shall not be considered unless specified in the order, in which event, the supplementary requirements specified shall be made at the place of manufacture, unless otherwise agreed upon, at the purchaser's expense. The test specified shall be witnessed by the purchaser's inspector before shipment of material, if so specified in the order. The rationale for beginning the section numbering with S50 is to eliminate the possibility of confusion with supplementary requirements existing in individual product specifications.

S50. Macroetch Test

S50.1 A sample forging shall be sectioned and etched to show flow lines and internal imperfections. The test shall be conducted according to Method E 381.

S50.2 Acceptance limits shall be as agreed upon between the certifying organization and the purchaser.

S51. Heat Analysis

S51.1 When secondary melting processes are employed, a heat analysis shall be obtained from each remelted ingot, or the product of each remelted ingot, from each primary melt. The chemical analysis thus determined shall conform to the requirements of the individual product specification. Note that the product analysis (check analysis) tolerances are not to be applied to the heat analysis requirements.

S52. Product Analysis

S52.1 A product analysis shall be made from one randomly selected forging representing each heat. The results shall comply with the product analysis limits listed in the applicable product specification. For Specification A 182/A 182M grades of F20 and F58, results shall comply with the product analysis limits listed in Specification B 880.

S52.2 If the analysis fails to comply, each forging shall be checked or the lot rejected. All results shall be reported to the purchaser.

S53. Tension Tests

S53.1 In addition to the requirements of Section 9, one tension specimen shall be obtained from a representative forging from each heat at a location agreed upon between the certifying organization and the purchaser. The results of the test shall comply with the tensile property requirements listed in the applicable product specification and shall be reported to the purchaser.

S54. Impact Tests

S54.1 In addition to the requirements of Section 9, three CVN impact energy specimens shall be obtained from a representative forging from each heat at a location agreed upon between the certifying organization and the purchaser.

S54.2 The purchaser shall supply the impact test temperature and the required minimum requirements for the test, including the lowest single absorbed energy for a single specimen if an average absorbed energy value is required. The lateral expansion values and the fracture appearance of the specimens as percentage ductile fracture shall be reported for information if these parameters are not part of the acceptance requirements.

S55. Magnetic Particle Examination

S55.1 All accessible surfaces of the finished forging shall be examined by a magnetic particle method. The method shall be in accordance with Test Method A 275/A 275M. Acceptance limits shall be as agreed upon between the certifying organization and the purchaser.

S56. Liquid Penetrant Examination

S56.1 All accessible surfaces shall be examined by a liquid penetrant method in accordance with Test Method E 165. Acceptance limits shall be as agreed upon between the certifying organization and the purchaser.

S57. Hydrostatic Testing

S57.1 A hydrostatic test at a pressure agreed upon between the certifying organization and the purchaser shall be applied by the certifying organization.

S58. Repair Welding

S58.1 No repair welding shall be permitted without prior approval of the purchaser. If permitted, the restrictions of Section 16 shall apply.

S59. Electropolished Austenitic and Ferritic–Austenitic Grades

S59.1 All electropolished austenitic and ferritic-austenitic products shall be of a cleanliness in accordance with Specification A 967.

S59.2 Details concerning which test method of Specification A 967 are to be a matter of agreement between the manufacturer and the purchaser.

S60. Positive Material Identification Examination

S60.1 Forgings shall receive positive material identification to ensure that the purchaser is receiving forgings of the correct material grade prior to shipment of the forgings. This examination is a method to ensure that no material grade mix-up has occurred during the manufacturing and marking of the forgings.

S60.2 Forgings shall receive a positive material identification examination in accordance with Guide E 1916.

S60.3 The quantity examined shall be 100% of the forgings.

S60.4 All forgings that are not of the correct material grade shall be rejected.

S60.5 The method of forging marking after examination shall be agreed upon between the manufacturer and the purchaser.

S61. Heat Treatment in the Working Zone of a Surveyed Furnace

S61.1 Material shall be heat treated in the working zone of a furnace that has been surveyed in accordance with Test Method A 991/A 991M, provided that such working zone was established using a variation of 25°F [14°C] or less from the furnace set point.

S61.2 The test report shall indicate that S61 applies.

S62. Requirements for Carbon Steel Products for Concentrated Hydrofluoric Acid Service

S62.1 Products shall be provided in the normalized heat-treated condition.

S62.2 The maximum carbon equivalent based on heat analysis shall be as follows:

Maximum section thickness less than or equal to 1 in.	CE maximum = 0.43
Maximum section thickness greater than 1 in.	CE maximum = 0.45

S62.3 Determine the carbon equivalent (CE) as follows:

$$CE = C + Mn/6 + (Cr + Mo + V)/5 + (Ni + Cu)/15$$

S62.4 Vanadium and Niobium maximum content based on heat analysis shall be:

$$\text{Maximum Vanadium} = 0.02 \text{ wt\%}$$

$$\text{Maximum Niobium}^A = 0.02 \text{ wt\%}$$

$$\text{Maximum Vanadium plus Niobium}^A = 0.03 \text{ wt\%}$$

^ANiobium = Columbium

S62.5 The maximum composition based on heat analysis of Ni + Cu shall be 0.15 wt%.

S62.6 The minimum C content based on heat analysis shall be 0.18 wt%. The maximum C content shall be as specified in the appropriate material specification.

S62.7 Repair welds shall not be made with E60XX electrodes. Use of E70XX electrodes is recommended, and the resulting weld chemistry should meet the same chemistry criteria as the base metal as listed above.

S62.8 In addition to the requirements of product marking of the specification, a “HF-N” stamp or marking shall be provided on each component to identify that component complies with this supplementary requirement.

S63 Pressure Equipment Directive-Mechanical Testing

S63.1 Charpy impact testing shall be done at the lowest scheduled operating temperature but not higher than 68°F [20°C].

S63.2 The frequency of impact testing shall be the same as that specified in the product specification for the tension test, with three individual Charpy test specimens for each required tension test.

S63.3 The minimum impact absorption energy for the Charpy test specimen shall be at least 20 ft/lb [27 J].

S63.4 The minimum elongation in the tension test shall be measured on a gage length of five times the diameter of the test specimen, and it shall not be less than 14%.

S63.5 Impact and tension test results shall be included in the product certification.

ANNEX

(Mandatory Information)

A1. REQUIREMENTS FOR THE INTRODUCTION OF NEW MATERIALS

A1.1 New materials may be proposed for inclusion in specifications referencing this specification of general requirements subject to the following conditions:

A1.1.1 Application for the addition of a new grade to a specification shall be made to the chairman of the subcommittee, which has jurisdiction over that specification.

A1.1.2 The application shall be accompanied by a statement from at least one user indicating that there is a

need for the new grade to be included in the applicable specification.

A1.1.3 The application shall be accompanied by test data as required by the applicable specification. Test data from a minimum of three test lots, as defined by the specification, each from a different heat, shall be furnished.

A1.1.4 The application shall provide recommendations for all requirements appearing in the applicable specification.

A1.1.5 The application shall state whether or not the new grade is covered by patent.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR COMMON REQUIREMENTS FOR STEEL FASTENERS OR FASTENER MATERIALS, OR BOTH, INTENDED FOR USE AT ANY TEMPERATURE FROM CRYOGENIC TO THE CREEP RANGE

SA-962/SA-962M

(Identical with ASTM Specification A 962/A 962M-07.)

1. Scope

1.1 This specification covers a group of common requirements that shall apply to carbon, alloy and stainless steel fasteners or fastener materials, or both, under any of the following ASTM Specifications (or under any other ASTM Specifications that invoke this specification or portions thereof):

Title of Specifications	ASTM Designation
Alloy-Steel and Stainless Steel Bolting Materials for High-Temperature Service	A 193/A 193M
Carbon and Alloy Steel Nuts for Bolts for High Pressure and High-Temperature Service	A 194/A 194M
Alloy Steel Bolting Materials for Low-Temperature Service	A 320/A 20M
Alloy-Steel Turbine-Type Bolting Material Specially Heat Treated for High-Temperature Service	A 437/A 437M
High-Temperature Bolting Materials With Expansion Coefficients Comparable to Austenitic Stainless Steels	A 453/A 453M
Alloy-Steel Bolting Materials for Special Applications	A 540/A 540M
Precipitation-Hardening Bolting Material (UNS N07718) for High Temperature Service	A 1014/A 1014M

1.2 In case of conflict the requirements of the individual product specification shall prevail over those of this specification.

1.3 Additional requirements may be specified by mutual agreement between the purchaser and supplier.

1.4 Values stated in either inch-pound or SI units (metric) are to be regarded separately. The SI units are shown

in brackets within the text and tables. The values stated in each system are not exact equivalents, therefore, each system shall be used independently of the other. Combining values from the two systems may result in nonconformance with the specification. Inch-pound units shall apply unless the “M” designation of the product specification is specified in the order.

2. Referenced Documents

The following documents shall form a part of this specification to the extent specified. The latest issue shall apply unless otherwise specified.

2.1 ASTM Standards:

- A 29/A 29M Specification for Steel Bars, Carbon and Alloy, Hot-Wrought, General Requirements for
- A 193/A 193M Specification for Alloy-Steel and Stainless Steel Bolting Materials for High Temperature or High Pressure Service and Other Special Purpose Applications
- A 194/A 194M Specification for Carbon and Alloy Steel Nuts for Bolts for High Pressure or High Temperature Service, or Both
- A 320/A 320M Specification for Alloy-Steel and Stainless Steel Bolting Materials for Low-Temperature Service
- A 370 Test Methods and Definitions for Mechanical Testing of Steel Products
- A 437/A 437M Specification for Alloy-Steel Turbine-Type Bolting Material Specially Heat Treated for High-Temperature Service
- A 453/A 453M Specification for High-Temperature Bolting Materials, with Expansion Coefficients Comparable to Austenitic Stainless Steels

A 484/A 484M Specification for General Requirements for Stainless Steel Bars, Billets, and Forgings
 A 540/A 540M Specification for Alloy-Steel Bolting Materials for Special Applications
 A 574 Specification for Alloy Steel Socket-Head Cap Screws
 A 700 Practices for Packaging, Marking, and Loading Methods for Steel Products for Shipment
 A 751 Test Methods, Practices, and Terminology for Chemical Analysis of Steel Products
 A 788/A 788M Specification for Steel Forgings, General Requirements
 A 941 Terminology Relating to Steel, Stainless Steel, Related Alloys, and Ferroalloys
 A 1014/A 1014M Specification for Precipitation-Hardening Bolting Material (UNS N07718) for High Temperature Service
 E 3 Guide for Preparation of Metallographic Specimens
 E 381 Method of Macroetch Testing Steel Bars, Billets, Blooms, and Forgings
 E 384 Test Method for Microindentation Hardness of Materials
 E 1417 Practice for Liquid Penetrant Testing
 E 1444 Practice for Magnetic Particle Testing
 E 1916 Guide for Identification and/or Segregation of Mixed Lots of Metals
 F 788/F 788M Specification for Surface Discontinuities of Bolts, Screws, and Studs, Inch and Metric Series

2.2 ANSI Standards:

B1.1 Screw Threads
 B1.13M Metric Screw Threads – M Profile
 B1.2 Gages and Gaging for Unified Screw Threads
 B1.3M Screw Thread Gaging Systems for Dimensional Acceptability of Metric Screw Threads
 B18.2.1 Square and Hex Bolts and Screws
 B18.2.3.6M Metric Heavy Bolts
 B18.3 Hexagon Socket and Spline Socket Screws

2.3 Other Documents:

ASNT Recommended Practice No. SNT-TC-1A

3. Terminology

3.1 Definitions of Terms Specific to This Standard:

3.1.1 bar — a solid rolled or forged section that is long in relationship to its cross-sectional dimensions with a relatively constant cross section throughout its length. See Specification A 29/A 29M for definitions relating to the production of hot wrought and cold finished bars.

3.1.2 bolting material — rolled or forged bars or blanks, wire, rod, threaded bar, rotary pierced or extruded seamless tubes, bored bars, or forged hollows from forged or rolled bar segments to be manufactured into bolts, screws, studs, washers, and nuts.

3.1.3 certifying organization — the company or association responsible for the conformance and marking of the product to the specification requirements.

3.1.4 class — a term used to differentiate between different heat treatment conditions or strength levels, or both, often within the same grade but sometimes within the same family of materials. May also apply to work hardened condition or strength level, or both.

3.1.5 grade — an alloy described individually and identified by its own designation in a table of chemical requirements within any specification.

3.1.6 killed steel — steel deoxidized, by addition of strong deoxidizing agents or by vacuum treatment, to reduce the oxygen content to such a level that no reaction occurs between carbon and oxygen during solidification.

3.1.7 length, fasteners subject to full size testing — that portion of the fastener whose body diameter is approximately the same as the nominal thread size.

3.1.8 lot — unless otherwise specified, a lot shall consist of:

3.1.8.1 bolting material, heat treated in batch type furnaces — all material of the same heat or cast of material, condition, finish, and size subjected to the same heat treatment in one tempering charge and submitted for inspection at the same time.

3.1.8.2 bolting material, heat treated in continuous type furnaces — all material of the same heat or cast of material, condition, finish, and size heat treated without interruption in a continuous type furnace during an eight hour period.

3.1.8.3 bolting material, non heat treated (strain hardened) — all material of the same heat or cast of material, condition, reduction (cold work), finish and size.

3.1.8.4 fasteners, machined from bolting material — all fasteners machined from the same lot of material defined as outlined in either 3.1.8.1 or 3.1.8.2, above without any subsequent heat treatment or hot or cold forming.

3.1.8.5 fasteners, heat treated in batch type furnaces — all items produced by any technique (forming, machining, etc.) from the same heat or cast of material, of the same prior condition, the same size, and subjected to the same heat treatment in one tempering charge.

3.1.8.6 fasteners, heat treated in continuous type furnaces — all items produced by any technique (forming, machining, etc.) from the same heat or cast of material, of the same prior condition, of the same size, subjected to the same heat treatment in a four hour period and in one tempering charge.

3.1.8.7 fasteners, non heat treated (strain hardened) — all fasteners of the same heat or cast of material, condition, reduction (cold work), finish and size.

3.1.8.8 strain hardened material — austenitic stainless steel material which has been subjected to cold working sufficient to cause a significant increase in strength.

3.2 Definitions — For definitions of other terms used in this specification, refer to Terminology A 941.

4. Ordering Information

4.1 It is the purchaser's responsibility to specify in the purchase order all information necessary to purchase the needed material. Examples of such information include, but are not limited, to the following:

4.1.1 Quantity and size,

4.1.2 Product specification number with grade, class, type, as applicable, and including the product specification year date,

4.1.3 Any additional information required by the individual product specification,

4.1.4 Supplementary requirements,

4.1.5 Additional requirements (see 5.2, 5.4, 5.5, 6.1, 7.4, 13.1, 13.3.1, 13.3.3, 13.5.2, 13.6, 15.8, and 19.1).

4.1.6 Additional ordering options provided in the individual product specification, and

4.1.7 Dimensions (diameter, length of point, overall length, finish, shape, threads, etc.).

5. Melting Process

5.1 Unless otherwise specified in the individual product specification, the steel shall be fully killed. Use of the basic oxygen process shall be limited to grades containing less than 6 % chromium.

5.2 If a specific type of melting is required by the purchaser, it shall be stated on the purchase order.

5.3 The primary melting may incorporate separate degassing or refining and may be followed by secondary melting such as electroslag remelting or vacuum remelting. If secondary melting is employed, the heat shall be defined as all of the ingot remelted from a single primary heat.

5.4 Steel may be cast in ingots or may be continuously cast. When steel of different grades is continuously cast identification of the resultant transition material is required. The steel producer shall remove the transition material by an established procedure that positively separates the grades. Should the purchaser deem it necessary to have the transition zone of two heats of the same grade which are continuously cast discarded, the purchaser shall invoke Supplementary Requirement S53.

5.5 Quality — The steel producer quality control procedures shall provide sufficient testing of carbon and alloy steels in accordance with Method E 381 or other suitable method as agreed upon between the purchaser and the producer to assure the internal quality of the product.

5.5.1 Ingot Cast Product — Visual examination of transverse sections shall show no imperfections worse than the macrographs of Method E 381 S2-R2-C3 or equivalent as agreed upon.

5.5.2 Strand Cast Product — Visual examination of traverse sections in accordance with Method E 381 shall reveal none of the conditions shown in macrographs 1-5, 7, 12-18 of Plate III. Conditions 6, 8-11 shall not be present to a degree greater than the macrographs of Plates I and II, S2-R2-C3.

6. Materials and Manufacture

6.1 Bars shall be produced in accordance with Specifications A 29/A 29M or A 484/A 484M as applicable. Finish (hot or cold, ground, rough turned, drawn, etc.) shall be at the option of the manufacturer unless otherwise specified.

6.2 Fasteners shall be produced in accordance with the product specification.

7. Chemical Composition

7.1 Chemical Analysis — Heat or product chemical analysis shall be in accordance with Test Methods, Practices, and Terminology A 751.

7.2 Heat Analysis — An analysis of each heat of steel shall be made by the steel manufacturer to determine the percentages of those elements specified in the individual product specification. If secondary melting processes are employed, the heat analysis shall be obtained from one remelted ingot or the product of one remelted ingot of each primary melt. The chemical analysis thus determined shall conform to the requirements of the individual product specification. Product analysis (check analysis) tolerances shall not be applied to heat analysis requirements.

7.3 Product Analysis — When performed, by manufacturer, purchaser, end user, and so forth, samples for analysis shall be taken from midway between center and surface of solid parts, midway between inner and outer surfaces of hollow parts, midway between center and surface of full-size prolongations or from broken mechanical test specimens. The chemical composition thus determined shall conform to the limits of the product specification, within the permissible tolerances found in Tables 5 and 6 of Specification A 29/A 29M and Table 1 of Specification A 484/A 484M as appropriate for the grade being supplied.

When multiple samples are taken from the same lot for product analysis individual elements shall not vary both above and below the specified range.

7.4 For continuous cast materials the requirements of 8.2 or 8.3, as appropriate, of Specification A 788/A 788M shall be met.

7.5 Steels with intentional additions of lead, bismuth, or tellurium shall not be supplied or used. Steels with intentional additions of selenium may only be supplied or used when specifically called out in the product specification.

7.6 The starting material shall not contain any unspecified elements, other than nitrogen in austenitic stainless steels, for the ordered grade(s) to the extent that it then conforms to the requirements of another grade for which that element is a specified element having a required minimum content.

8. Mechanical Properties

8.1 *Method of Mechanical Tests* — All tests shall be conducted in accordance with Test Methods and Definitions A 370 unless otherwise specified.

8.2 For the purpose of determining conformance to the product specification requirements, specimens shall be obtained from the production material, or, in the case of forgings, from separately forged test blanks prepared from the stock used to make the finished product. Heat treatment shall be completed prior to removal of material for mechanical testing.

8.3 If separately forged test blanks are used, they shall be of the same heat of steel, be subjected to substantially the same reduction and working as the production forging they represent, be heat treated in the same furnace charge and under the same conditions as the production forging, and be of the same nominal thickness as the maximum heat treated thickness of the production forging.

8.4 *Bars* — Tension and impact tests representing bar stock shall be taken in accordance with the requirements of Annex A1 of Test Methods and Definitions A 370. Impact tests are not required on bars $\frac{1}{2}$ in. and under in diameter.

8.5 *Fasteners, Machined from Heat Treated Bar* — Mechanical properties of fasteners machined from heat treated bar shall be represented by the tests run on the bar in accordance with 8.4.

8.6 *Fasteners, All Classes – Produced by other methods* — When fasteners have been produced by forming, when they have been subjected to heat treatment, or when the nominal thread size falls into a different diameter range than that of the starting bar as shown in the applicable

specifications, then tests shall be run on material taken from those fasteners.

8.6.1 Tension test specimens taken from finished fasteners shall be machined to the form and dimensions and from the positions shown in Annex A3 of Test Methods and Definitions A 370. Impact tests are not required on material from externally threaded fasteners when the thread diameter is $\frac{1}{2}$ in. and under.

9. Hardness Requirements

9.1 The material shall conform to the hardness requirements prescribed in the product specification. Hardness testing shall be performed in accordance with Test Methods and Definitions A 370.

9.2 Tensile tests prevail over hardness tests in the event a conflict exists relative to minimum strength unless otherwise specified in the product specification.

10. Tensile Requirements

10.1 *Bars and Specimens Machined From Fasteners* — The material shall conform to the tensile property requirements prescribed in the product specification.

10.1.1 When the dimensions of the material to be tested will permit, the tension test specimens shall be machined to the form and dimensions of the standard 2 in. [50 mm] gage length tension test specimen described in Test Methods and Definitions A 370.

10.1.2 When the dimensions of the material to be tested do not permit full size samples, small size specimens meeting the requirements of Test Methods and Definitions A 370 shall be used.

11. Proof Load and Cone Proof Requirements

11.1 *Proof Load Test* — Nuts shall be assembled on a threaded mandrel or a test bolt as illustrated in Fig. 1(a) Tension Method or (b) Compression Method. The minimum proof load required by the product specification shall be applied using a free running cross head speed of 1.0 in [25 mm] per minute maximum and shall be held for at least 10 s. The nut shall resist this load without stripping or rupture, and shall be removable by hand, without use of tooling, after the load is released. A wrench may be used to loosen the nut one-half turn maximum to start it in motion. The test shall be discarded if the threads of the mandrel or test bolt are damaged during the test.

11.1.1 Mandrels shall have a hardness of 45 HRC minimum with threads of the appropriate series and conforming to the requirements of ANSI B1.1 Class 3A or ANSI B1.13M tolerance 4H except that the maximum

major diameter shall be the minimum major diameter plus 0.25 times the major diameter tolerance.

11.1.2 The test bolt shall have threads appropriate to the standard specified for the nut being tested and shall have a yield strength in excess of the specified proof load of the nut being tested.

11.1.3 The mandrel/tension method shall be used when arbitration is required.

11.2 Cone Proof Load Test — This test is performed when visible surface discontinuities become a matter of issue. The test uses a conical washer and threaded mandrel to determine the load-carrying ability of hardened steel nuts through $1\frac{1}{2}$ in. [36 mm] in diameter assembled as shown in Fig. 2. The minimum cone proof load required by the product specification shall be applied using a free running cross head speed of 0.12 in. [3 mm] per minute maximum and shall be held for at least 10 s. The nut shall support its specified cone proof load without stripping or rupture.

11.2.1 Mandrels shall conform to the requirements of 11.1.1.

11.2.2 Conical washers shall have a hardness of 57 HRC minimum and a hole diameter equivalent to the nominal diameter of the mandrel +0.002, -0.000 in. [+0.05 and -0.00 mm].

11.2.3 The contact point of the cone shall be sharp for nut sizes $\frac{1}{2}$ in. [12 mm] or less. For sizes over $\frac{1}{2}$ in. [12 mm], the point shall be flat and 0.015 ± 0.001 in. [0.38 + 0.03 mm] in width.

11.2.4 Cone proof loads may be determined as shown in Tables 1 and 2 when they are not specified in the product specification.

12. Impact Requirements

12.1 The material shall conform to the impact requirements prescribed in the product specification.

12.2 Sampling for impact testing shall conform to the product specification.

12.3 The impact test specimen shall have the form and dimensions shown in Fig. 10 of Test Methods and Definitions A 370 for the Charpy V-notch specimen, Type A. The longitudinal axis of the specimen shall be parallel to the direction of rolling or, in the case of forgings, to the longest axis of the component the test bar represents. The notch shall be located on the test specimen surface which most closely approaches a radial direction. The base of the notch shall be as nearly as practicable perpendicular to the longest axis of the component.

13. Workmanship, Finish, and Appearance

13.1 The parts shall conform to the dimensions, tolerances and finish as specified on the purchaser's order or in the individual product specification.

13.2 Bars — Bars shall meet the dimensional requirements of Specifications A 29/A 29M or A 484/A 484M as applicable.

13.3 Bolts, Screws, Studs, and Stud Bolts — Fastener points shall be flat and chamfered or rounded at the option of the manufacturer. The length of the point on studs and stud bolts shall be not less than one nor more than two complete threads as measured from the extreme end parallel to the axis. Length of studs and stud bolts shall be measured from first thread to first thread. Bolts, studs, and bolting material shall be capable of passing inspection in accordance with Specification F 788/A 788M.

13.3.1 Hex Bolts — Unless otherwise specified in the purchase order heads shall be in accordance with the dimensions of ANSI B18.2.1 or B18.2.3.6M and the Heavy Hex screw series, should be used, except the maximum body diameter and radius of fillets may be the same as for the heavy hex bolt series. The body diameter and head fillet radius for sizes of heavy hex cap screws and bolts that are not shown in their respective tables in the ANSI specifications may be that shown in the corresponding hex cap screw and bolt tables respectively.

13.3.2 Socket Heads — Unless otherwise specified socket head fasteners shall be in accordance with ANSI B18.3 or the applicable metric series.

13.3.3 Studs and Stud Bolts — The dimensions and tolerances of studs and stud bolts shall be as specified by the purchaser or the product specification.

13.4 External Threads — Threads shall either be formed after heat treatment or heat treatment shall be performed in atmosphere control furnaces.

13.4.1 Thread Form — Unless otherwise specified external threads shall be in accordance with ANSI B1.1, Class 2A fit, or ANSI B1.13M, Class 6G fit.

13.4.2 Inch Series — Sizes 1 in. and smaller in diameter shall be coarse thread series, and those $1\frac{1}{8}$ in. and larger in diameter shall be eight pitch thread series, unless otherwise specified.

13.5 Nuts — Unless otherwise specified nuts shall be hexagonal in shape and the American National Standard Heavy Hex Series shall be used. In addition nuts shall either be double chamfered or have a machined or forged washer face, at the option of the manufacturer, and shall conform to the angularity requirements of the applicable ANSI specification.

13.5.1 Thread — Unless otherwise specified threads in nuts shall be in accordance with ANSI B1.1 Class 2B

fit or B1.13M Class 6H fit, and shall be gaged in accordance with ANSI B1.2 or B1.3M

13.5.2 Inch Series — Unless otherwise specified, nuts up to and including 1 in. in diameter shall be UNC Series Class 2B fit and nuts over 1 in. nominal size shall be 8 UN Series Class 2B fit.

13.6 If a scale-free bright finish is required, this shall be specified on the purchase order.

14. Decarburization

14.1 Depth — The depth of decarburization (total + partial) shall be determined after completion of all heat treatment and shall not exceed the limits shown in Specification A 574, regardless of material being tested.

14.2 Test Method — The depth of decarburization shall preferably be determined by metallographic etching. The edge of the specimen shall be suitably prepared to preserve the original heat treated surface. The sample shall be polished, etched with a suitable solution (2 to 5% Nital if carbon or alloy steel, Vilella's reagent if stainless steel, etc.), and examined under a microscope at 100x using an eyepiece graduated in 0.001 in. [0.025 mm] increments. The measured depth of any light etched band shall be taken as the decarburization depth.

14.2.1 Microhardness Testing — When the metallographic etch method of 14.2 renders results that are inconclusive, then the microhardness traverse method of Specification A 574 shall be employed. The depth of decarburization is denoted by that radial depth where the hardness decrease is more than the equivalent of three points HRA, when compared to the average microhardness of the base material at a depth equal to or less than 25% of the diameter or thickness.

14.3 Alternate — Depth of decarburization may be determined on the threads of components rather than on the starting material.

15. Number of Tests

15.1 Chemical Analysis — One test per heat.

15.2 Tension Tests, Bar, Rod, or Wire or Fasteners, or Both, Machined from Heat Treated Bar, Rod or Wire — One test per lot (See 3.1.6).

15.3 Tension Tests, Fasteners Produced as Defined in 8.6 — The number of machined specimens or full size fasteners tested shall be as follows:

Lot Size (pc)	Sample Size
50 and less	2
51 to 500	3
501 to 35 000	5
Over 35 000	8

15.4 Decarburization Test, Carbon and Alloy Steel, Fasteners Produced as Defined in 8.6 and Studs Machined from Cold or Hot Rolled and Heat Treated Bar Whose Diameter Prior to Machining Threads is Within 0.06 in. [1.5 mm] in Diameter of the Maximum Thread Diameter — One test per lot (see 3.1.6).

15.5 Hardness Tests:

15.5.1 Hardness Tests, Bar, Rod, or Wire — One test per lot.

15.5.2 Hardness Tests, Fasteners — The number of fasteners hardness tested per lot, regardless of production technique, shall be as shown in 15.3.

15.6 Macroetch, Carbon and Alloy Steels Only — One test per lot.

15.7 Impact Tests — Three impact test specimens shall be made for each lot when impact testing is required by the product specification.

15.8 Other Tests — The number of tests shall be as specified by the purchaser or the individual product specification.

16. Retests and Rework

16.1 If the results of any tension test do not conform to the requirements specified in the product specification, retests are permitted as outlined in Test Methods and Definitions A 370. If the results of a tension test are less than specified because a flaw becomes evident in the test specimen during testing, a retest shall be allowed provided that the flaw is not attributable to ruptures, cracks, or flakes in the steel. Retesting shall be performed on twice the number of samples originally specified.

16.2 When the impact test acceptance requirements of the specification are not met, one retest of three additional specimens from the same test location may be performed. Each individual test value of the retested specimens shall be equal to or greater than the specified minimum average value.

16.3 Repair by welding is prohibited.

17. Inspection

17.1 The supplier shall afford the purchaser's inspector all reasonable facilities necessary to satisfy him that the material is being produced and furnished in accordance with this specification and the applicable product specification. Site inspection by the purchaser shall not interfere unnecessarily with the supplier's operations.

17.2 Personnel performing the nondestructive examination shall be qualified and certified in accordance with a written procedure conforming to ASNT Recommended

Practice No. SNT-TC-1A (1988 or later) or another national standard that is acceptable to both the purchaser and the supplier.

18. Rejection and Rehearing

18.1 Samples representing material rejected by the purchaser shall be preserved until disposition of the claim has been agreed to between the supplier and the purchaser.

19. Certification

19.1 Certification shall include a statement that the material or parts, or both, were manufactured, sampled, tested, and inspected in accordance with the requirements of the individual product specification, including the specification number and year date of issue. In addition, the certification shall include the results of all tests required by this specification, the product specification, and the purchase order. The supplier shall provide additional specific information as required by the product specification or purchase order.

19.2 A certificate printed from or used in electronic form from an electronic data interchange (EDI) transmission shall be regarded as having the same validity as a counterpart printed in the certifier's facility. The content of the EDI transmitted document shall also conform to any existing EDI agreement between the purchaser and the supplier.

19.3 Notwithstanding the absence of a signature, the organization submitting either the EDI transmission or paper copies of certificates of test is responsible for the content of the report.

20. Product Marking

20.1 Bars shall be marked in accordance with Specifications A 29/A 29M or A 484/A 484M as applicable.

20.2 Grade and manufacturer's identification symbols shall be applied to one end of studs $\frac{3}{8}$ in. [10 mm] in diameter and larger and to the heads of bolts and screws $\frac{1}{4}$ in. [6 mm] in diameter and larger. If the available area is inadequate, the grade symbol may be marked on one

end and the manufacturer's identification symbol marked on the other end of studs. Bolts and screws shall preferably be marked on top of the head. When necessary, bolts and screws may be marked on the side of the head provided the marking does not interfere with wrenchability or become damaged during tightening to the extent that legibility is lost. Products shall not be marked on the bearing surface or be marked in a way that alters the dimensions or geometric characteristics of the bearing surface.

20.3 Grade and manufacturer's identification symbols shall be applied to all nuts regardless of size.

20.4 Hollow forgings shall be marked with the heat number or heat symbol and grade.

20.5 When product is altered in a manner which changes specified requirements, it is the responsibility of the current certifying organization to ensure that the product marking is appropriately revised. This includes the removal of the name or symbol of the previous certifying organization.

20.6 Dual Marking — Product that meets all requirements of more than one grade within or between product specifications may be marked with both grade markings. The dual marking shall consist of the complete marking requirement for each grade, as required by the product specification, separated by a slash. For example, for Grade A 193 B7 and A 320 L7, the dual marking would be B7/L7.

21. Packaging, Package Marking and Loading for Shipment

21.1 Packaging, marking, and loading for shipment shall be in accordance with Practices A 700.

22. Keywords

22.1 austenitic stainless steel; bolts, steel; fasteners, steel; nuts, steel; pressure vessel service; steel bars, alloy; steel bars, carbon; steel bars, stainless; steel bolting materials; stainless steel bolting materials; temperature service applications, high; temperature service applications, low; turbine materials

FIG. 1 PROOF LOAD TESTING—NUTS

FIG. 2 CONE-PROOF TEST

TABLE 1
CONE PROOF LOAD USING 120° HARDENED STEEL CONE — INCH⁴

Nominal Size, in.	Threads per inch	Stress Area, in. ²	Cone Proof Load, lbf				
			Based on Proof Stress, psi, Shown in Column Header Below

⁴ Based upon the following equation (this equation should not be used for extrapolating values beyond the size ranges listed in this table) and rounded to nearest 1/2 ksi equivalent:

$$CPL = (1 - 0.30D) \times f \times As$$

where:

CPL = cone stripping proof load, lbf.,

D = nominal diameter of nut, in.,

f = minimum proof stress of nut, psi.,

As = tensile stress area of nut, in.² = 0.7854 [D - 0.9743/n]², and

n = threads per inch.

TABLE 2
 CONE PROOF LOAD USING 120° HARDENED STEEL CONE — METRIC⁴

Nominal Size, mm	Thread Pitch	Stress Area, mm ²	Cone Proof Load, kN				
			Based on Proof Stress Shown in Column Header Below				
			825 MPa	895 MPa	930 MPa	1035 MPa	1205 MPa
M6	1	20.1	15.4	16.7	17.4	19.3	22.5

M30	3.5	561	296	322	334	372	432
M36	4	817	382	416	432	480	558

⁴ Based upon the following equation (this equation should not be used for extrapolating values beyond the size ranges listed in this table) and rounded to nearest 3.5 MPa equivalent:

$$CPL = (1 - 0.012D) \times f \times As \times 0.001$$

where:

CPL = Cone stripping proof load, kN,

D = Nominal diameter of nut, mm,

f = Minimum proof stress of nut, MPa,

As = Tensile stress area of nut, mm² = $0.7854 [D - 0.9382P]^2$, and

P = Thread pitch, mm.

SUPPLEMENTARY REQUIREMENTS

One or more of the following supplementary requirements shall be applied only when specified by the purchaser in the inquiry, contract, or order, in which event the specified tests shall be made before shipment of the product.

S50. Product Marking

S50.1 Grade and manufacturer's identification symbols shall be applied to one end of studs and to the heads of bolts of all sizes. If the available area is inadequate, the grade symbol may be marked on one end and the manufacturer's identification symbol marked on the other end.

S51. Stress Relieving

S51.1 A stress relieving operation shall follow straightening after heat treatment. The minimum stress relieving temperature shall be 100°F [55°C] below the tempering temperature. Tests for mechanical properties shall be performed after stress relieving.

S52. Heat Analysis

S52.1 An analysis of each remelt ingot shall be made by the steel manufacturer to determine the percentages of those elements specified in the individual product specification. The chemical analysis thus determined shall conform to the requirements of the individual product specification.

S53. Sequential or Continuous Strand Casting

S53.1 When multiple heats of the same chemical composition range are sequentially strand cast, the heats shall be separated by an established procedure such that intermix material shall not be supplied.

S54. Bolts, Studs and Bolting Material for Dynamic Service

S54.1 Bolts, studs and bolting material for dynamic service shall be examined for surface discontinuities and decarburization.

S54.2 Surface Discontinuities

S54.2.1 The surface discontinuities shall conform to Specification F 788/F 788M and the additional limitations in S54.2.2.

S54.2.2 Thread lap inspection shall be performed in accordance with Specification F 788/F 788M Supplementary Requirement S50. The threads shall have no laps at

the root, or on the flanks initiating or extending below the pitch line.

S54.2.3 Quench cracks of any depth, any length, or in any location are not permitted.

S54.2.4 Folds at the junction of the head and the shank are not permitted.

S54.3 Decarburization

S54.3.1 Decarburization tests shall be conducted as follows, with the same number of tests as the tension test:

S54.3.2 Section the thread area longitudinally through the axis, and mount and polish the cut face in accordance with Practice E 3. Use either optical or microhardness measurements for decarburization. In case of dispute, the microhardness method shall be used.

S54.3.3 For optical measurement, etch the metallographic section in 4% Nital. Examine the surface of the etched sample under a microscope at 100X using a measuring eyepiece graduated in 0.001 in. (0.03 mm) increments, or on a ground glass screen or photomicrograph. There shall be no gross decarburization (clearly defined ferrite grains), and the depth of partial decarburization (light etching zone) anywhere below the pitch line shall be less than 5% of the nominal thread height.

S54.3.4 For microhardness measurement, make hardness tests in accordance with Test Method E 384 on unetched metallographic sections using either a DPH 136° indenter and a 200 gf load, or a Knoop indenter and a 200 gf load. Take measurements at the minor diameter on the thread crest bisector to determine the base metal hardness. On the same or an adjacent thread, take measurements within 0.003 in. (0.08 mm) of the flank surface at the pitch line, and 0.003 in. (0.08 mm) below the thread root. These two hardness readings shall be equal to or greater than the base metal hardness minus 30 DPH or KHN.

S55. Magnetic Particle Examination

S55.1 The wet fluorescent magnetic particle examination method shall be applied to 100% of the lot in accordance with Practice E 1444. Acceptance criteria shall be in accordance with S57.

S56. Liquid Penetrant Examination

S56.1 The fluorescent liquid penetrant examination method shall be applied to 100% of the lot in accordance with Practice E 1417. Acceptance criteria shall be in accordance with S57.

S57. Acceptance Criteria

S57.1 Only indications, which have a dimension greater than $\frac{1}{16}$ in., shall be considered relevant. A linear indication is one having a length greater than three times the width. A rounded indication is one of circular or elliptical shape with a length equal to or less than three times the width. All surfaces examined shall be free of the following:

S57.1.1 Relevant linear indications;

S57.1.2 Relevant rounded indications greater than $\frac{3}{16}$ in.; and,

S57.1.3 Four or more relevant rounded indications in a line separated by $\frac{1}{16}$ in. or less, edge to edge.

S58. Positive Material Identification Examination

S58.1 Bolting shall receive Positive Material Identification to ensure that the purchaser is receiving bolting of the correct material grade prior to shipment of the bolting. This examination is a method to assure that no material grade mix-up has happened during manufacturing and marking of bolting.

S58.2 Bolting shall receive a Positive Material Identification examination by Guide E 1916.

S58.3 The quantity examined shall be 100% of the bolting.

S58.4 All bolting that are not of the correct material grade shall be rejected.

S58.5 The method of bolting marking after examination shall be agreed upon between the manufacturer and purchaser.

S59. Pressure Equipment Directive-Mechanical Testing

S59.1 Charpy impact testing shall be done at the lowest scheduled operating temperature, but not higher than 20°C (68°F).

S59.2 The frequency of impact testing shall be the same as that specified in the product specification for the tension test, with three individual Charpy test specimens for each required tension test.

S59.3 The minimum individual energy for the Charpy impact test shall be 20 ft-lb [27 J].

S59.4 The minimum elongation in the tension test shall be measured on a gage length of five times the diameter of the test specimen, and shall not be less than 14%.

S59.5 Impact and tension test results shall be included in the product certification.

ANNEXES

(Mandatory Information)

A1. REQUIREMENTS FOR THE INTRODUCTION OF NEW MATERIALS

A1.1 New materials may be proposed for inclusion in specifications referencing this Specification of General Requirements subject to the following conditions:

A1.1.1 Application for the addition of a new grade to a specification shall be made to the chairman of the subcommittee which has jurisdiction over that specification.

A1.1.2 The application shall be accompanied by a statement from at least one user indicating that there is a need for the new grade to be included in the applicable specification.

A1.1.3 The application shall be accompanied by test data as required by the applicable specification. Test data from a minimum of three test lots, as defined by the specification, each from a different heat, shall be furnished.

A1.1.4 The application shall provide recommendations for all requirements appearing in the applicable specification.

A1.1.5 The application shall state whether the new grade is covered by patent.

A2. CHANGES TO EXISTING GRADES

A2.1 When changes such as chemistry, heat treatment, or processing, or combinations thereof are proposed for grades in specifications under the purview of A01.22, it is the purview of the subcommittee to request additional data/tests. Testing required may include, but is not limited to, stress rupture, tensile, impact, and stress relaxation in order to validate that the changes have not adversely impacted those properties, even though the testing may not normally be required by the standard.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR STEEL FORGINGS, AUSTENITIC, FOR PRESSURE AND HIGH TEMPERATURE PARTS

SA-965/SA-965M

(Identical with ASTM Specification A 965/A 965M-06a.)

1. Scope

1.1 This specification covers austenitic stainless steel forgings for boilers, pressure vessels, high temperature parts, and associated equipment.

1.2 Supplementary requirements are provided for use when additional testing, inspection, or processing is required. In addition, supplementary requirements from Specification A 788/A 788M may be specified when appropriate.

1.3 This specification includes the austenitic steel forgings that were a part of Specification A 336/A 336M.

1.4 The values stated in either SI units or inch-pound units are to be regarded separately as standard. The values stated in each system may not be exact equivalents; therefore, each system shall be used independently of the other. Combining values from the two systems may result in non-conformance with the standard.

1.5 Unless the order specifies the applicable “M” specification designation, the material shall be furnished to the inch-pound units.

1.6 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

2. Referenced Documents

- 2.1 ASTM Standards:**
- A 336/A 336M Specification for Alloy Steel Forgings for Pressure and High-Temperature Parts
 - A 370 Test Methods and Definitions for Mechanical Testing of Steel Products
 - A 788/A 788M Specification for Steel Forgings, General Requirements

E 112 Test Methods for Determining Average Grain Size

2.2 Other Standards:

ASME Boiler and Pressure Vessel Code, including Section VIII Pressure Vessels and Section IX Welding Qualifications

3. Ordering Information and General Requirements

3.1 In addition to the ordering information required by Specification A 788/A 788M, the intended use should be stated if 5.1 is to be applicable.

3.2 Material supplied to this specification shall conform to the requirements of Specification A 788/A 788M, which outlines additional ordering information, manufacturing requirements, testing and retesting methods and procedures, marking, certification, product analysis variations, and additional supplementary requirements.

3.3 If the requirements of this specification are in conflict with the requirements of Specification A 788/A 788M, the requirements of this specification shall prevail.

3.4 If the forgings are intended for use under the ASME Boiler and Pressure Vessel Code at temperatures exceeding 1000°F [540°C], then use Supplementary Requirement S7. Grain size requirements for service exceeding 1000°F [540°C] should be specified unless the required grade has the suffix “H.”

4. Melting and Forging

4.1 In addition to the melting and forging requirements of Specification A 788/A 788M, which may include Supplementary Requirement S8, the following condition applies:

4.1.1 A sufficient discard shall be made to secure freedom from injurious pipe and undue segregation.

5. Machining

5.1 Forged pressure vessels for steam power service shall have the inner surface machined or ground. Unfired pressure vessels shall have the inner surfaces sufficiently free of scale to permit inspection.

5.2 When rough machining is performed, it may be done either before or after heat treatment.

6. Heat Treatment

6.1 Forgings shall be furnished in the solution treated condition. On completion of forging operations, the forgings shall be solution annealed and quenched in water, oil, or a polymer water solution. Direct quenching after completion of forging without subsequent reheating to the temperatures prescribed in 6.2–6.5 is not permissible.

6.2 For Grades F304H, F309H, F310H, F316H, F321H, F347H, and F 348H, the minimum solution annealing temperature shall be 1925°F [1050°C].

6.3 Grades FXM-11 and FXM-19 shall be solution annealed at 1950°F [1065°C].

6.4 Grade F46 shall be solution annealed in the temperature range of 2010–2140°F [1100–1170°C].

6.5 The remaining grades in Table 1 shall be solution annealed at a minimum temperature of 1900°F [1040°C].

7. Chemical Composition

7.1 Heat Analysis — The heat analysis obtained from sampling in accordance with Specification A 788/A 788M shall comply with Table 1.

7.2 Product Analysis — The manufacturer shall use the product analysis provision of Specification A 788/A 788M to obtain a product analysis from a forging representing each heat or multiple heat. The product analysis tolerances for carbon shall not apply, and the carbon requirements shall conform to Table 1.

7.3 Types (common names) and UNS designations follow:

Grade	Type	UNS Designation
F304	304	S30400
F304H	304H	S30409
F304L	304L	S30403
F304N	304N	S30451
F304LN	304LN	S30453
F309H	309H	S30909
F310	310	S31000
F310H	310H	S31009
F316	316	S31600
F316H	316H	S31609
F316L	316L	S31603
F316N	316N	S31651
F316LN	316LN	S31653
F321	321	S32100
F321H	321H	S32109
F347	347	S34700
F347H	347H	S34709
F348	348	S34800
F348H	348H	S34809
FXM-19	XM19	S20910
FXM-11	XM11	S21904
F46		S30600

8. Mechanical Properties

8.1 Requirements — The material shall conform to the requirements for mechanical properties prescribed in Table 2 or, if applicable, Supplementary Requirement S2. The largest obtainable tension test specimen as specified in Test Methods and Definitions A 370 shall be used.

8.2 Number of Tests — The number and location of tests are based on the heat-treated weight of the forging(s) from the same heat, solution annealed in the same furnace charge.

8.2.1 For forgings weighing less than 5000 lb [2250 kg] as heat treated, one tension test shall be required on the basis of one test per heat in each heat treatment load. This test shall be taken from a prolongation of one of the forgings. Use of a separately forged test bar for the mechanical test specimens, instead of an integral prolongation, is acceptable for forgings weighing less than 5000 lb [2250 kg], provided that the heat-treated cross section of the test bar is not less than the maximum heat-treated cross section of the forgings it represents. The separately forged test bar shall be from the same heat as the forgings it represents and shall accompany the forgings during heat treatment.

8.2.2 When heat treatment is performed in continuous type furnaces equipped with recording pyrometers, such that complete heating records are available, a solution annealing charge may be considered as any continuous run not exceeding an 8 h period.

8.2.3 For forgings weighing over 5000 lb [2250 kg], as heat treated, one tension test shall be taken from a prolongation on each forging.

8.3 The longitudinal axis of the tension test specimen shall be parallel to the direction of major working of the forging, except when Supplementary Requirement S2 is specified. For upset disk forgings the longitudinal axis of the specimen shall be in either the tangential or radial direction.

8.3.1 The location of the longitudinal axis of the tension test specimen shall be located midway between the parallel surfaces of the test extension, if added to the periphery of disks, or midway between the center and surface of solid forgings. For hollow forgings, or those heat treated after boring, the specimen shall be located at midwall. For the special case of forgings that are heat treated solid, but are subsequently bored, the tension test specimen may be taken at the location of the minimum inside diameter after boring instead of the mid-radius position.

9. Grain Size

9.1 For Grades F304H, F316H, F309H, F310H, F321H, F347H, and F348H, the grain size of the forgings shall be ascertained according to Test Methods E 112, after solution treatment. One sample shall be examined for each tensile

specimen required in 8.2 and shall be taken from the tension test location. The grain size shall be number 6, or coarser, over at least 75% of the surveyed area.

10. Repair Welding

10.1 Repair welding of forgings may be permitted but only at the option of the purchaser. Such repair welds shall be made in accordance with Section IX of the ASME Boiler and Pressure Vessel Code.

11. Marking

11.1 The marking requirements of Specification A 788/A 788M apply.

12. Test Reports

12.1 The certification requirements of Specification A 788/A 788M shall apply.

13. Keywords

13.1 austenitic stainless steel forgings; high temperature service; pressure containing parts; pressure vessel service

NOTES:

(A) F46 shall have a maximum copper content of 0.50.

(B) F347 shall have a columbium content of not less than ten times the carbon content and not more than 1.10%. (Alternatively, tantalum may be substituted for part of the columbium as approved by the purchaser.)

(C) F321 shall have a titanium content of not less than 5 × (C+N) and not more than 0.70%.

(D) F321H shall have a titanium content of not less than 4 × (C+N) and not more than 0.70%.

SUPPLEMENTARY REQUIREMENTS

One or more of the following supplementary requirements shall apply only when specified by the purchaser in the inquiry, contract, and order. Details of these supplementary requirements shall be agreed upon between the manufacturer and the purchaser.

S1. Rough Turning and Boring

S1.1 The position of the rough turning and boring in the sequence of manufacturing operations shall be specified.

S2. Transverse Tension Test

S2.1 Instead of the test specimen orientation requirements in 8.3, the longitudinal axis of the test specimens shall be transverse to the direction of major working of the forging. The results shall conform with requirements of Table 2, with the exception of the ductility limits which shall be as prescribed in Table S2.1.

S3. Hydrostatic Test

S3.1 A hydrostatic pressure test shall be applied. The details of the test, including its position in the sequence of manufacturing operations, shall be specified.

S4. Stabilization Heat Treatment

S4.1 When specified, Grades F347 and F321 shall receive stabilization treatment, which shall consist of holding the forging at 1500 to 1600°F [815 to 870°C], for not less than 2h/in. of thickness and then cooling in the furnace or in still air.

S5. Marking

S5.1 Forgings shall be marked at a location indicated by the purchaser in the purchase order or drawing.

S6. Individual Forging

S6.1 Forgings, whether identical or not identical, shall be produced individually. They shall not be forged in multiple and separated prior to or after heat treatment.

S6.2 The shape and size of individual forgings shall be agreed between the manufacturer and the purchaser by means of a forging drawing or the purchase order.

S7. Grain Size Requirements for Service Exceeding 1000°F [540°C]

S7.1 For design metal temperatures above 1000°F [540°C], the forgings shall have a grain size of 7 or coarser as determined in accordance with Test Methods E 112. The actual grain size shall be reported on the certificate of test.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR STEEL INVESTMENT CASTINGS GENERAL REQUIREMENTS, FOR PRESSURE- CONTAINING PARTS

SA-985/SA-985M

(Identical with ASTM Specification A 985/A 985M-04a.)

1. Scope

1.1 This specification covers a group of common requirements that are mandatory for steel castings produced by the investment casting process for pressure-containing parts under each of the following ASTM Specifications:

Title of Specification	ASTM Designation
Steel Castings, Carbon, Suitable for Fusion Welding for High-Temperature Service	A 216/A 216M
Steel Castings, Martensitic Stainless and Alloy, for Pressure-Containing Parts, Suitable for High-Temperature Service	A 217/A 217M
Castings, Austenitic, Austenitic-Ferritic (Duplex), for Pressure-Containing Parts	A 351/A 351M
Steel Castings, Ferritic and Martensitic, for Pressure-Containing Parts Suitable for Low-Temperature Service	A 352/A 352M
Steel Castings, Alloy, Specially Heat-Treated, for Pressure-Containing Parts, Suitable for High Temperature Service	A 389/A 389M
Steel Castings Suitable for Pressure Service	A 487/A 487M

1.2 This specification also covers a group of supplementary requirements, which may be applied to the above specifications as indicated therein. These requirements are provided for use when additional testing or inspection is desired and apply only when specified individually by the purchaser in the order.

1.3 When investment casting is ordered, the requirements of this specification shall take precedence over the individual material specification requirements.

1.4 The values stated in either inch-pound or SI units are to be regarded separately as the standard. Within the text, the SI units are shown in brackets. The values in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with

this specification. Inch-pound units are applicable for material ordered to Specification A 985 and SI units for material ordered to Specification A 985M.

1.5 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

- B16.5 Steel Pipe Flanges and Flanged Fittings

2.3 ASME Standard:

- ASME Boiler and Pressure Vessel Code, Section III, NB-2546

2.4 Standards of the Manufacturer's Standardization Society of the Valve and Fitting Industry:

- MSS SP 53 Quality Standard for Steel Castings for Valves, Flanges and Fittings, and Other Piping Components (Dry Magnetic Particle Inspection Method)
- MSS SP 54 Quality Standard for Steel Castings for Valves, Flanges and Fittings, and Other Piping Components (Radiographic Inspection Method)

2.5 SAE Aerospace Recommended Practice:

- ARP 1341 Determining Decarburization and Carburization in Finished Parts of Carbon and Low-Alloy Steel

3. Terminology

3.1 Definitions — The definitions in Test Methods and Definitions A 370 and Terminology A 941 are applicable to this specification and those listed in 1.1.

3.2 Definitions of Terms Specific to This Standard:

3.2.1 heat, *n* — all the molten metal poured from a single furnace or all of the molten metal from two or more furnaces poured into a single ladle or casting prior to the replenishing of the furnace(s).

3.2.2 investment casting, *n* — a metal casting that is produced in a mold obtained by investing (surrounding) an expendable pattern with a ceramic slurry, which is allowed to solidify. The expendable pattern may consist of wax, plastic, or other material and is removed prior to filling the mold with liquid metal.

3.2.3 master heat, *n* — a single furnace charge of alloy that may be either poured directly into castings or into remelt alloy for individual melts.

3.2.4 subheat, *n* — a portion of master heat remelted with only minor additions for deoxidation for pouring into castings. Syn. melt, production heat.

4. Materials and Manufacture

4.1 Melting Process — Master heats shall be made by the electric furnace process with or without separate refining such as argon-oxygen-decarburization (AOD), vacuum-oxygen-degassing (VOD), vacuum-induction-melting (VIM), and so forth, unless otherwise specified in the individual specification or agreed upon between the customer and producer. Master heats may be used directly for producing castings or converted into ingot, bar, shot, or other suitable form, not including gates and risers from casting production, for later remelting as a subheat.

4.2 Re-Melting Process — Subheats shall be produced from master heat metal in suitable batch sizes by electric induction furnace, with or without atmosphere protection, such as vacuum or inert gas unless otherwise agreed upon between the customer and producer. Revert (gates, sprues, risers, and rejected castings) shall not be remelted except in master heats.

4.3 Heat Treatment:

4.3.1 Ferritic and martensitic steel shall be cooled after pouring to provide substantially complete transformation of austenite prior to heat treatment to enhance mechanical properties.

4.3.2 Castings shall be heat treated in the working zone of a furnace that has been surveyed in accordance with Test Method A 991/A 991M.

4.3.2.1 When castings are heat treated at temperatures above 2000°F [1100°C], then the working zone shall have been established by a survey performed at not more than 25°F [15°C] below nor more than 200°F [110°C] above the minimum heat treatment temperature specified for the grade. If a minimum heat treatment temperature is not specified for the grade, then the survey temperature shall be not more than 50°F [30°C] below nor more than 175°F [100°C] above the furnace set point used.

4.3.2.2 The maximum variation in measured temperature as determined by the difference between the highest temperature and the lowest temperature shall be as agreed between the purchaser and producer except that during production heat treatment no portion of the furnace shall be below the minimum specified temperature nor above the maximum specified temperature for the grade being processed.

4.4 Sampling:

4.4.1 If castings are poured directly from one or more master heats, then the samples for chemical and other required testing also shall be poured directly from each of the master heats.

4.4.2 If castings are poured from a subheat, then the samples for chemical and other required testing also shall be poured from a subheat of that same master heat, but not necessarily from the same subheat as the castings. The subheat used for the test samples shall be produced using the same practices and additions as used for the castings.

4.4.3 Test specimens may be taken from castings or from coupons cast either integrally with the castings, in the same molds as the castings, or in separate molds.

4.4.4 Separately cast specimens for tension testing shall be cast in molds of the same type and material as those used for the castings, as shown in Figs. 1–4 and Table 2, except when Supplementary Requirement S26 is specified. The test coupon in Fig. 4 shall be employed only for austenitic alloy castings with cross sections less than 2½ in.

5. Chemical Composition

5.1 Chemical Analysis — Chemical analysis of materials covered by this specification shall be in accordance with Test Methods, Practices, and Terminology A 751.

5.2 Heat Analysis — An analysis of samples obtained in accordance with 4.4 or Supplementary Requirement S27 as appropriate, shall be made by the manufacturer to determine the percentages of the elements specified for the grade being poured. When drillings are used, they shall be taken not less than ⅛ in. [1.6 mm] beneath the surface. The chemical composition thus determined shall be reported to the purchaser, or his representative, and shall conform to

the requirements in the individual specification for the grade being poured.

5.3 Product Analysis — A product analysis may be made by the purchaser from material representing each master heat, subheat, lot, or casting. The analysis shall be made on representative material. Samples for carbon analysis shall be taken no closer than ⅛ in. [1.6 mm] to a cast surface except that castings too thin for this shall be analyzed on representative material. The chemical composition thus determined shall meet the requirements specified in the applicable specification for the grade involved, or shall be subject to rejection by the purchaser, except that the chemical composition determined for carbon and low-alloy steel castings may vary from the specified limits by the amounts shown in Table 1. The product analysis tolerances of Table 1 are not applicable as acceptance criteria for heat analysis by the casting manufacturer. When comparing product and heat analysis for other than carbon and low alloy steels, the reproducibility data R2, in Test Methods E 353 or E 354, as applicable, shall be taken into consideration.

5.4 Unspecified Elements — When chemical analysis for elements not specified for the grade ordered is desired, Supplementary Requirement S1 may be specified.

NOTE 1 — All commercial metals contain small amounts of various elements in addition to those which are specified. It is neither practical nor necessary to specify limits for every unspecified element that might be present, despite the fact that the presence of many of these elements often is determined routinely by the producer.

5.5 The substitution of a grade or composition different from that specified by the purchaser is prohibited.

6. Mechanical Test Methods

6.1 All mechanical tests shall be conducted in accordance with Test Methods and Definitions A 370.

7. Tensile Requirements

7.1 Sampling for tension testing shall be in accordance with 4.4 or with Supplementary Requirement S28 as appropriate.

7.2 The coupon from which the test specimen is taken shall be heat treated in production furnaces to the same procedure as the castings it represents.

7.3 If any specimen shows defective machining or develops flaws, it may be discarded and another substituted from the same heat.

7.4 To determine accordance with the tension test requirements, an observed value or calculated value shall be rounded off in accordance with Practice E 29 to the

nearest 500 psi [51 MPa] for yield and tensile strength and to the nearest 1% for elongation and reduction of area.

8. Repair by Welding

8.1 Repair by welding shall be in accordance with the requirements of individual specifications using procedures and welders qualified in accordance with Practice A 488/A 488M.

9. Flanges

9.1 When a flange from a flanged casting is removed to make a weld-end casting, discontinuities may be observed that would not have been detrimental in a flanged casting. The disposition of the casting shall be subject to agreement between the purchaser and manufacturer.

10. Quality

10.1 The surface of the casting shall be free of adhering ceramic, scale, cracks, and hot tears as determined by visual examination. Other surface discontinuities shall meet the visual acceptance standards specified in the order. Unacceptable visual surface discontinuities shall be removed and their removal verified by visual examination of the resultant cavities.

10.2 The castings shall not be peened, plugged, or impregnated to stop leaks.

10.3 When additional inspection is desired, Supplementary Requirements S4, S5, S7, or S10 may be specified.

11. Hydrostatic Tests

11.1 Each casting shall be tested after machining to the hydrostatic shell test pressures prescribed in ANSI B16.5 for the applicable steel rating for which the casting is designed. The casting shall not show any leaks. Castings ordered for working pressures other than those in the standard ANSI ratings, or those listed for which test pressures are not specified by ANSI B16.5, shall be tested at a pressure agreed upon between the manufacturer and purchaser.

11.2 It is realized that the foundry may be unable to perform the hydrostatic test prior to shipment, or that the purchaser may wish to defer testing until additional work or machining has been performed on the casting. Castings ordered in the rough state for final machining by the purchaser may be tested hydrostatically prior to shipment by the manufacturer at pressures to be agreed upon with the purchaser. The foundry, however, is responsible for the satisfactory performance of the casting under the final test required in 11.1.

12. Workmanship, Finish, and Appearance

12.1 All castings shall be made in a workmanlike manner and shall conform to the dimensions on drawings furnished by the purchaser. When the pattern is supplied by the purchaser or is produced using a die supplied by the purchaser, the dimensions of the casting shall be as predicated by the pattern or die, unless otherwise agreed upon.

12.2 Machined welding ends shall be suitably protected against damage during shipping.

13. Retests

13.1 If the results of the mechanical tests do not conform to the requirements specified, retests are permitted as outlined in Test Methods and Definitions A 370. At the manufacturer's option, castings may be reheat treated and retested. Testing after reheat treatment shall consist of the full number of specimens taken from locations complying with the specification or order.

14. Inspection

14.1 The manufacturer shall afford the purchaser's inspector all reasonable facilities necessary to satisfy that the material is being produced and furnished in accordance with the applicable specification. Foundry inspection by the purchaser shall not interfere unnecessarily with the manufacturer's operations. All tests and inspections, with the exception of product analysis (5.2), are the responsibility of the manufacturer.

15. Rejection and Rehearing

15.1 Any rejection based on test reports shall be reported to the manufacturer within 30 days from the receipt of the test reports by the purchaser.

15.2 Material that shows unacceptable discontinuities as determined by the acceptance standards specified in the order subsequent to its acceptance at the manufacturer's works will be rejected, and the manufacturer shall be notified within 30 days after discovery of the rejectable condition.

15.3 Samples that represent rejected material shall be preserved for two weeks from the date of transmission of the test report. In case of dissatisfaction with the results of the tests, the manufacturer may make claim for a rehearing with that time.

16. Certification

16.1 The manufacturer's certification shall be furnished to the purchaser stating that the material was manufactured,

sampled, tested, and inspected in accordance with the material specification (including year of issue) and was found to meet the requirements.

16.2 As applicable, the certification also shall include:

16.2.1 Material specification and grade,

16.2.2 Pattern or part number,

16.2.3 Master heat number or serial number traceable to the master heat number,

16.2.4 Chemical analysis results required by the specification and supplementary requirements specified in the purchase order,

16.2.5 Mechanical property results required by the specification and supplementary requirements specified in the purchase order,

16.2.6 Statement of satisfactory inspection, visual, and nondestructive testing specified in the purchase order,

16.2.7 Manufacturer's name, and

16.2.8 Additional purchase order requirements.

16.3 A signature is not required on the certification; however, the document shall identify clearly the organization submitting the certification. Notwithstanding the absence of a signature, the organization submitting the certification is responsible for its content.

17. Product Marking

17.1 Castings shall be marked for material identification with the grade symbols (WCB, WC9, CF8M, and so forth). In addition, master heat numbers, or serial numbers that are traceable to master heat numbers, shall be marked on all pressure-containing casting individually weighing 50 lb [25 kg] or more. Pressure-containing castings weighing less than 50 lb [25 kg] shall be marked with either the master heat number or a lot number that will identify the casting as to the month in which it was poured. Marking shall be in such position as not to injure the usefulness of the casting.

17.2 On casting for which impact property requirements are specified, stamped markings using low-stress stamps shall be on a raised pad when such pad can be made a part of the castings.

17.3 Castings shall be marked with the manufacturer's identification or symbols except when other provisions have been made between the manufacturer and purchaser.

18. Keywords

18.1 casting; investment casting; master heat; pressure containing; steel casting; subheat

Vanadium (V)	up to 0.25%	$0.23 \times \% V_L + 0.004$
	above 0.25%	0.06%
Tungsten (W)	up to 0.10%	$0.08 \times \% W_L + 0.02$
	above 0.10%	0.02%
Copper (Cu)	up to 0.15%	$0.18 \times \% Cu_L + 0.02$
	above 0.15%	0.05%
Aluminum (Al)	up to 0.10%	$0.08 \times \% Al_L + 0.02$
	above 0.10%	0.03%

^A The range denotes the composition limits up to which the tolerances are computed by the equation, and above which the tolerances are given by a constant.

^B The subscript _L for the elements in each equation indicates that the limits of the element specified by the applicable specification are to be inserted into the equation to calculate the tolerance for the upper limit and the lower limit, if applicable, respectively. Examples of computing tolerances are presented in the footnote C.

^C To compute the tolerances, consider the manganese limits 0.50 – 0.80% of Grade WC4 of Specification A 217/A 217M.

According to Table 1, the maximum permissible deviation of a product analysis below the lower limit 0.50 is $0.05\% = (0.08 \times 0.50 + 0.01)$. The lowest acceptable product analysis of Grade WC4, therefore, is 0.45%. Similarly, the maximum permissible deviation above the upper limit of 0.80% is $0.074\% = (0.08 \times 0.08 + 0.01)$. The highest acceptable product analysis of Grade WC4, therefore, is 0.874. For Grade WCC of Specification A 216/A 216M, the maximum manganese content is 1.40% if the carbon content is 0.20%. In this case, the highest acceptable product analysis is $1.49 = (1.40 + 0.09)$.

TABLE 2
DETAILS OF TEST COUPON DESIGN FOR CASTING (SEE FIG. 2)

Leg Design [125 mm]		Riser Design	
1. L (length)	A 5 in. [125 mm] minimum length will be used. This length may be increased at the option of the foundry to accommodate additional test bars (see Note 1).	1. L (length)	The length of the riser at the base will be the same as the top length of the leg. The length of the riser at the top therefore depends on the amount of taper added to the riser.
2. End taper	Use of and size of end taper is at the option of the foundry.	2. Width	The width of the riser at the base of a multiple-leg coupon shall be $n, 2\frac{1}{4}$ [57 mm] — $\frac{5}{8}$ [16 mm] where n equals the number of legs attached to the coupon. The width of the riser at the top is therefore dependent on the amount of taper added to the riser.
3. Height	$1\frac{1}{4}$ in. [32 mm]	3. T (riser taper)	Use of and size is at the option of the foundry.
4. Width (at top)	$1\frac{1}{4}$ in. [32 mm] (see Note 1).		
5. Radius (at bottom)	$\frac{1}{2}$ in. [13 mm], max	4. Height	The minimum height of the riser shall be 2 in. [51 mm]. The maximum height is at the option of the foundry for the following reasons: (a) Many risers are cast open, (b) different compositions may require variation in risering for soundness, (c) different pouring temperatures may require variation in risering for soundness.
6. Spacing between legs	A $\frac{1}{2}$ in. [13 mm] radius will be used between the legs.		
7. Location of test bars	The tensile, bend, and impact bars will be taken from the lower portion of the leg (see Note 2).		
8. Number of legs	The number of legs attached to the coupon is at the option of the foundry providing they are equispaced according to item 6.		
9. R_s	Radius from 0 to approximately $\frac{1}{16}$ in. [2 mm].		

NOTE 1 — *Test Coupons for Large and Heavy Steel Castings:* The test coupons in Fig. 2 are to be used for large and heavy steel castings. However, at the option of the foundry the cross-sectional area and length of the standard coupon may be increased as desired.

NOTE 2 — *Bend Bar:* If a bend bar is required, an alternate design (as shown by dotted lines in Fig. 2) is indicated.

SUPPLEMENTARY REQUIREMENTS

The following standardized supplementary requirements are for use when desired by the purchaser and when allowed by and listed in the individual specifications. They shall not apply unless specified in the order, in which event the specified tests shall be made by the manufacturer before shipment of the castings.

S1. Unspecified Elements

S1.1 Limits may be established for elements not specified for the grade ordered by agreement between the manufacturer and purchaser. The results of the analysis for the agreed upon elements shall be reported.

S2. Destruction Tests

S2.1 Purchaser may select representative castings from each heat and cut up and etch, or otherwise prepare, the sections for examination for internal defects. Should injurious defects be found that evidence unsound steel or faulty foundry technique, all of the castings made from that particular pattern, heat, and heat treatment charge may be rejected. All other rejected castings, including those cut up, shall be replaced by the manufacturer without charge.

S3. Bend Test

S3.1 One bend test shall be made from a test coupon from each master heat in accordance with Test Methods and Definitions A 370, and shall be machined to 1 by $\frac{1}{2}$ in. [25 by 13 mm] section with corners rounded to a radius not over $\frac{1}{16}$ in. [1.6 mm].

S3.2 The specimen shall withstand being bent longitudinally at room temperature through an angle of 90° about a pin, the diameter of which shall be the specimen thickness for carbon steels, and 1 in. [25 mm] for other steels. The specimen shall show no cracks on the outside of the bent portion of the specimen.

S3.3 Bend test specimens may be cut from heat-treated castings instead of from test bars when agreed upon between manufacturer and purchaser.

S3.4 If any test specimen shows defective machining or develops flaws, it may be discarded and another specimen substituted from the same heat.

S4. Magnetic Particle Inspection

S4.1 Castings shall be examined for surface and near-surface discontinuities by magnetic particle inspection. The examination shall be in accordance with Guide E 709, and types and degrees of discontinuities considered shall be

judged by the Reference Photographs E 125. Extent of examination, time of examination, and basis for acceptance shall be agreed upon between the manufacturer and purchaser. Specification, which may be used as a basis for such agreement, are Specifications A 903/A 903M and MSS SP 53.

S4.2 Personnel performing the examination shall be qualified in accordance with an acceptable written practice.

S5. Radiographic Inspection

S5.1 Castings shall be examined for internal defects by means of X rays or gamma rays. The procedure shall be in accordance with Guide E 94 and types and degrees of discontinuities considered shall be judged by Reference Radiographs E 186, E 192, E 280, or E 446. Extent of examination and basis for acceptance shall be agreed upon between the manufacturer and purchaser. A specification that may be used as a basis for such agreement is MSS SP 54.

S5.2 Radiographic examination of castings may be performed before or after any heat treatment.

S5.3 Personnel performing the examination shall be qualified in accordance with an acceptable written practice.

S6. Liquid Penetrant Inspection

S6.1 Castings shall be examined for surface discontinuities by means of liquid penetrant inspection. The examination shall be in accordance with Test Method E 165. Areas to be inspected, time of inspection, methods and types of liquid penetrants to be used, developing procedure, and basis for acceptance shall be agreed upon between the manufacturer and purchaser. A specification, which may be used as a basis for such agreement, is A 903/A 903M.

S6.2 Personnel performing the examination shall be qualified in accordance with an acceptable written practice.

S7. Ultrasonic Inspection

S7.1 Castings shall be examined for internal defects by means of ultrasonic inspection. The inspection procedure shall be in accordance with Practice A 609/A 609M.

Extent of examination methods of testing and basis for acceptance shall be agreed upon between the manufacturer and purchaser.

S7.2 Ultrasonic examination of casting of carbon and low-alloy steels shall be performed after at least one heat treatment above the transformation temperature range but need not be repeated after subsequent heat treatment.

S7.3 Personnel performing the examination shall be qualified in accordance with an acceptable written practice.

S8. Charpy Impact Test

S8.1 Charpy impact test properties shall be determined on each master heat from a set of three Charpy V-notch specimens made from a test coupon in accordance with Test Methods and Definitions A 370, and tested at a test temperature agreed upon by the manufacturer and purchaser. The sampling requirements shall be agreed upon between the manufacturer and purchaser (see 4.4). The acceptance requirements shall be energy absorbed, lateral expansion, percent shear area or any combination thereof, and shall be agreed upon by the manufacturer and purchaser. Test specimens shall be prepared as Type A and tested in accordance with Test Methods and Definitions A 370.

S8.2 *Absorbed Energy* — Average energy value of three specimens shall not be less than specified, with not more than one value permitted to fall below the minimum specified and no value permitted below the minimum specified for a single specimen.

S8.3 *Lateral Expansion* — Lateral expansion value shall be agreed upon by the manufacturer and purchaser.

S8.4 *Percent Shear Area* — Percent shear area shall be agreed upon by the manufacturer and purchaser.

S9. Drop Weight Tests

S9.1 Drop weight test properties shall be determined from each heat by preparing and testing either Type P1, P2, or P3 specimens in accordance with Test Methods E 208. The crack starter weld shall be deposited on the surface of the specimen that was nearest to the casting surface. Each test shall consist of at least two specimens tested at a temperature agreed upon by the manufacturer and purchaser. Each specimen shall exhibit “no break” performance.

S10. Examination of Weld Preparation

S10.1 Magnetic particle or liquid penetrant examination of cavities prepared for welding shall be performed to verify removal of those discontinuities found unacceptable by the inspection method specified for the casting. The method of performing magnetic particle or liquid penetrant

examination shall be in accordance with either Guide E 709 or Test Method E 165. Unless other degrees of shrinkage or types of discontinuities found in the cavities are specified, Type II, Internal Shrinkage of Reference Photographs E 125, of Degree 2 in sections up to 2 in. [50 mm] thick, and of Degree 3 in sections over 2 in. [50 mm] thick shall be acceptable.

S11. Prior Approval of Major Weld Repairs

S11.1 Major weld repairs shall be subject to the prior approval of the purchaser.

S12. Hardness Test

S12.1 A hardness test shall be made in accordance with Test Methods and Definitions A 370. The test location and the hardness requirements shall be agreed upon between the manufacturer and the purchaser.

S14. Tension Test From Each Heat and Heat Treatment Charge

S14.1 One tension test shall be made for each master heat and heat-treatment charge combination.

S15. Quench and Temper Heat Treatment

S15.1 The castings shall be quenched and tempered. Castings so treated shall be marked QT.

S17. Tension Test From Castings

S17.1 In addition to the tensile test required in Section 6, test material shall be cut from heat treated castings. The mechanical properties and location for the test material shall be agreed upon by the manufacturer and purchaser.

S20. Weld Repair Charts

S20.1 Weld repairs made to correct leakage on hydrostatic testing, weld repairs for which the depth of the cavity required for welding exceeds 20% of the actual wall thickness or 1 in. [25 mm], whichever is smaller, or weld repairs for which the area of the cavity required for welding exceeds approximately 10 in.² [65 mm²] shall be documented.

S20.2 Weld repairs requiring documentation shall be documented on sketches or photographs, or both. The sketches or photographs shall show the location and major dimensions of cavities prepared for weld repair. The weld repair documentation shall be submitted to the purchaser at the completion of the order.

S21. Heat-Treatment Furnace Record

S21.1 A heat-treatment chart showing time and temperature shall be prepared and be available for inspection by the purchaser.

S22. Heat Treatment

S22.1 Test specimens shall be heat treated together with the castings they represent. Heat-treated specimens shall be tested and shall meet the tensile and impact properties specified.

S22.2 The remaining test specimens from Supplementary Requirement S22.1 representing the casting shall be treated thermally after the final (foundry) heat treatment to simulate heat treatments below the transformation temperature, which the casting may receive during fabrication, and then tested for mechanical properties. Time, temperature, and cooling rate shall be as stated in the order. In the case of postweld heat treatment, the total time at temperature or temperatures for the test material shall be at least 80% of the total time at temperature or temperatures during actual postweld heat treatment of the fabrication of which the casting or castings are a part. The total time at temperature or temperatures for the test material may be performed in a single cycle. When this Supplementary Requirement is specified, the welding qualification test metal must be processed in the same manner.

S23. Macroetch Test

S23.1 Apply Supplementary Requirement S1 for the spectrographic determination and reporting of the total residual aluminum content of all heats of ferritic and martensitic steels subjected to this macroetch test.

S23.2 When the heat analysis indicates a total residual aluminum content in excess of 0.08%, the manufacturer shall etch a cross section of the casting with the heaviest section for which this supplementary requirement is invoked, or a coupon attached to that heaviest section or an area directly under a riser (see Note S23.1). Cross sections, from a separately cast test block from the same heat and a thickness representative of the heaviest section of castings purchased under this supplementary requirement, also may be used for macroetch testing. The etching shall be performed on the selected section after its heat treatment, that is, after annealing, normalizing, or quenching and tempering following the initial cooling of the steel below the transformation range.

NOTE S23.1 — High-strength martensitic castings, in particular, may be damaged beyond use if the etch is applied directly to the casting.

S23.3 The preparation of the surface and the macroetching procedure with solution No. 1 (1:1 HCl) of Table 5

in Test Method E 340 shall be followed. The resulting etched surface shall be compared and rated with the reference photographs in Fig. S23.1 depicting ten levels of severity of intergranular network structures indicative of the presence of aluminum nitride, or other constituents prone toward precipitating at grain boundaries during solidification and subsequent cooling. Table S23.1 relates the severity levels shown in these photographs with specific delineation widths and percent of boundary outlining in the etched structures.

S23.4 Castings represented by etched structures exhibiting a network rating in excess of Severity Level 4 shall be considered unacceptable until further evaluations are completed. The acceptability of individual castings may be determined by etching sections of each casting to ascertain the network severity level. Disposition of unacceptable castings shall be a matter of agreement between the manufacturer and purchaser. Those castings exhibiting etched severity levels greater than four may be further evaluated by any of the following agreed upon methods.

S23.4.1 Fracture testing to determine the amount of “rock candy” structure.

S23.4.2 Mechanical testing (bend, tensile, and so forth) to determine the ductility characteristics.

S23.4.3 Weld testing to determine crack susceptibility in the heat-affected zone of a circular groove welded with cellulose coated electrodes.

S23.5 Alternatively, by agreement, it is permissible to subject castings from an unacceptable heat to a high temperature solution treatment prior to the normal production heat-treatment and subsequently macroetch test each casting.

S24. Specified Ferrite Content Range

S24.1 The chemical composition of the heat shall be controlled such that the ferrite content, as determined by the chemical composition procedure of Practice A 800/A 800M, shall be in accordance with the specified ferrite content range.

S24.2 The specified ferrite content range shall be as agreed upon between the manufacturer and the purchaser. The minimum specified ferrite content range shall be 10% with the minimum ferrite content being no lower than the percent necessary to achieve the minimum mechanical properties required for the alloy.

S24.3 Should the purchaser wish to have the ferrite content determined by either magnetic response or metallographic methods, the purchaser should impose Supplementary Requirement S1 or S2 of Practice A 800/A 800M.

S25. Heat-Treatment Certification

S25.1 Heat-treatment temperature and cycle times shall be shown on the certification report.

S26. Alternative Tension Test Coupons and Specimen Locations for Castings (In-Lieu of Test Bars Poured from Special Blocks)

S26.1 Test blocks may be cast integrally with the castings or as separate blocks. Test blocks shall be heat treated together with the castings they represent.

S26.2 The casting thickness, T , is the maximum thickness of the pressure containing wall of the casting exclusive of padding added for directional solidification, flanges, appendages, and sections designated by the designer as noncritical. The order, inquiry, and drawing shall designate what the test dimension, T , is for the casting.

S26.3 One of the following shall apply:

S26.3.1 The longitudinal centerline of the test specimen shall be taken at least $\frac{1}{4}T$ from the T dimension surface and all of the gage length must be at least $1T$ from any other heat-treated surface, exclusive of the surface opposite the T dimension surface (see Fig. S26.1 (a)). For cylindrical castings, the longitudinal centerline of the specimens shall be taken at least $\frac{1}{4}T$ from the outside or inside and all of the gage length must be at least T from the as-heat treated end (see Fig. S26.1 (b)).

S26.3.2 For ferritic and martensitic castings, partial severing of test blocks prior to final heat treatment is permitted.

S26.3.3 Where separately cast test coupons are used, the dimensions shall not be less than $3T$ by $3T$ by T and each specimen shall meet the requirements of S26.3.1, except that when T exceeds 5 in. [125 mm], the dimension may be 15 by 15 by 5 in. [375 by 375 by 125 mm], by agreement between the manufacturer and the purchaser. The test coupon shall be of the same heat of steel and shall receive substantially the same casting practices as the production casting it represents (see Fig. S26.2).

S26.3.4 When agreed upon between the manufacturer and the purchaser, castings that are cast or machined to essentially the finished configuration prior to heat treatment, shall have test specimens removed from a prolongation or other stock on the casting at a location below the nearest heat-treated surface indicated on the order. The specimen location shall be at a distance below the nearest heat-treated surface equivalent to at least the greatest distance that the indicated high-tensile stress surface will be from the nearest heat-treated surface and a minimum of twice this distance from a second heat-treated surface, except that the test specimens shall be no nearer than $\frac{3}{4}$ in. [19 mm] to a heat-treated surface and $1\frac{1}{2}$ in. [33 mm] from a second heat-treated surface (see Fig. S26.3).

S26.3.5 Where specimens are to be removed from the body of quenched and tempered castings, either the requirements of S26.3.1 shall be met or a steel thermal buffer pad or thermal insulation or other thermal barriers shall be used during heat treatment. Steel thermal buffer pads shall be a minimum of T by T by $3T$ in length and shall be joined to the casting surface by a partial penetration weld completely sealing the buffered surface. Test specimens shall be removed from the casting in a location adjacent to the center third of the buffer pad. They shall be located at a minimum distance of $\frac{1}{2}$ in. [13 mm] from the buffered surface and $\frac{1}{4}T$ from other heat-treated surfaces (see Fig. S26.4). When thermal insulation is used, it shall be applied adjacent to the casting surface where the test specimens are to be removed. The producer shall demonstrate that the cooling rate of the test specimen location is no faster than that of specimens taken by the method described in S26.3.1.

S27. Increased Testing Frequency—Chemical Analysis

S27.1 Frequency of chemical analysis shall be as agreed upon between the purchaser and manufacturer.

S28. Increased Testing Frequency—Tensile Testing

S28.1 Frequency of tension tests shall be as agreed upon between the purchaser and manufacturer.

S29. Decarburization

S29.1 A representative casting or coupon shall be evaluated for total or complete decarburization, or both, in accordance with ARP 1341.

S29.2 The basis for acceptance shall be agreed upon between the purchaser and manufacturer. An example of an acceptance specification is zero total decarburization and no more than 0.020 in. partial decarburization.

S30. Metallurgical Cleanliness

S30.1 After polishing, each casting shall be visually inspected for nonmetallic inclusions and porosity.

S30.2 The details of the method for inspection and the basis for acceptance shall be agreed upon between the purchaser and manufacturer.

S30.3 It is realized that the foundry may be unable to perform the inspection for metallurgical cleanliness prior to shipment, or that the purchaser may wish to defer inspection until after additional work or machining has been performed on the casting. The foundry, however, is responsible for the satisfactory performance of the castings under the final inspection required in S30.1.

FIG. S23.1 REFERENCE PHOTOGRAPHS OF MACROETCHED CAST STEEL

NOTE—The 10 levels of severity of intergranular network structures shown are indicative of the presence of aluminum nitride precipitation in the primary austenitic grain boundaries.

FIG. S26.1 SPECIMEN FROM CASTING

Minimum length of the base — Specimen gage length + $2xT$ + $2x$ the thickness added due to the taper.

Minimum width of the base — $T + 2x$ the thickness added due to the taper.

Minimum height — $T + NxD + W_{TOT}$.

The taper is to be selected by the producer for ease of drawing the pattern from the mold.
where:

N = number of specimens to be cut from one side of the coupon,

D = diameter of the specimens, and

W_{TOT} = total width of metal required to remove the coupon from the casting, and to machine specimens from the coupon.

NOTE—Longitudinal axis and gage length of test specimen must be within shaded zone.

FIG. S26.2 SEPARATELY CAST BLOCK

NOTE — Longitudinal axis and gage length of test specimen must be within cross-hatched zone.

FIG. S26.3 PROLONGATION TEST SPECIMEN

NOTE — Longitudinal axis and gage length of test specimen must be within cross-hatched zone.

FIG. S26.4 THERMAL BUFFER PADS

NOTE — Longitudinal axis and gage length of test specimen must be within cross-hatched zone.

TABLE S23.1
DESCRIPTIVE DATA APPLICABLE TO NETWORK
STRUCTURES SHOWN IN FIG. S23.1

Rating	Delineation Width, in.	Boundary Outline, %
1	Fine-0.001	20
2	Fine-0.001	40
3	Fine-0.001	60
4	Fine-0.002	80
5	Fine-0.002	100
6	Medium-0.005	100
7	Heavy-0.010	100
8	0.020	100
9	$\frac{1}{32}$	100
10	$\frac{1}{16}$	100

NOTE 1 — These ratings are based on the physical width and continuity of the precipitate pattern developed by the acid etchant on the primary austenitic grain boundaries of the cast steel. Supplementary testing is normally conducted to determine the final disposition of castings with ratings of 5 or greater.

APPENDIX

(Nonmandatory Information)

X1. ALLOY DESIGNATIONS FOR CAST STAINLESS STEELS

X1.1 Cast stainless steels usually are specified on the basis of composition using the alloys designation system established by the Alloy Casting Institute (ACI). The ACI designations, for example, CF8M, have been adopted by ASTM and are preferred for cast alloys over the designations used by the American Iron and Steel Institute for similar wrought steels.

X1.2 This nomenclature system has served successfully to accommodate changes in old alloys and to designate new ones.

X1.2.1 Service Classification Letter — The first letter of the cast stainless steel designation system identifies the intended service application of the alloy. The letter *C* indicates corrosion-resistant service, and the letter *H* indicates

the heat-resistant service at and above 1200°F [650°C].

X1.2.2 Ternary Diagram Location Letter — The second letter indicates the approximate location of the nickel and chromium contents of the alloy grade on the FeCrNi ternary diagram shown in Fig. X1.1.

X1.2.3 Carbon Content Number — For *C* service classifications, this single or dual digit numeral represents the maximum carbon content in units of 0.01%. For *H* service classifications, this number represents the midpoint of the range of carbon content in terms of 0.01% with a $\pm 0.05\%$ limit.

X1.2.4 Special Elements Letters — Additional letters following the numeral represents special chemical elements in the alloy grade, such as M for molybdenum, C for columbium, Cu for copper, and W for tungsten. There are two exceptions. The letter A indicates “Controlled Ferrite,” and the letter F indicates “Free Machining.”

X1.3 In Fig. X1.1, unlettered NiCr ranges are associated with the nearest lettered location. They may be the result of differences between corrosion and heat-resistance types or because of the influence of additional elements, for example, the precipitation hardening grade CB-7 Cu.

FIG. X1.1 LETTERS ASSIGNED TO CHROMIUM AND NICKEL RANGES IN ACI DESIGNATION SYSTEM

NOTE—The approximate areas of microstructures to be expected at room temperature are indicated as follows:

- I—Martensite
- II—Martensite and untransformed austenite
- III—Ferrite plus martensite and untransformed austenite
- IV—Ferrite
- V—Ferrite plus austenite
- VI—Ferrite plus austenite plus sigma
- VII—Austenite

Carbides also may be present depending on carbon content and thermal history.

SPECIFICATION FOR CASTINGS, AUSTENITIC-FERRITIC (DUPLEX) STAINLESS STEEL, FOR PRESSURE-CONTAINING PARTS

SA-995

[Identical with ASTM Specification A 995-98(R07).]

1. Scope

1.1 This specification covers austenitic-ferritic (duplex) stainless steel castings for valves, flanges, fittings, and other pressure-containing parts.

1.2 The duplex stainless steels offer a combination of enhanced mechanical properties and corrosion resistance when properly balanced in composition and properly heat treated. Ferrite levels are not specified, but these grades will develop a range of approximately 30 to 60% ferrite with the balance austenite. It is the responsibility of the purchaser to determine which grade shall be furnished depending on design and service conditions, mechanical properties, and corrosion-resistant characteristics.

NOTE 1 — Because of the possibility of precipitation of embrittling phases, the grades included in this specification are not recommended for service at temperatures above 600°F [315°C].

1.3 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification.

2. Referenced Documents

2.1 ASTM Standards:

- A 488/A 488M Practice for Steel Castings, Welding, Qualification of Procedures and Personnel
- A 703/A 703M Specification for Steel Castings, General Requirements, for Pressure-Containing Parts
- E 125 Reference Photographs for Magnetic Particle Indications on Ferrous Castings
- E 165 Test Method for Liquid Penetrant Examination

E 562 Test Method for Determining Volume Fraction by Systematic Manual Point Count

3. Terminology

3.1 Definitions of Terms Specific to This Standard:

3.1.1 duplex stainless steel — an iron-chromium-nickel-molybdenum alloy which when properly heat treated consists of approximately 30 to 60% ferrite with the balance austenite.

4. General Conditions for Delivery

4.1 Material furnished to this specification shall conform to the applicable requirements of Specification A 703/A 703M, including the supplementary requirements that are indicated on the purchase order. Failure to comply with the general requirements of Specification A 703/A 703M constitutes nonconformance with this specification. In case of conflict between the requirements of the specification and Specification A 703/A 703M, this specification shall prevail.

5. Ordering Information

5.1 It is the responsibility of the purchaser to specify all requirements that are necessary for material ordered under this specification. Such requirements may include, but are not limited to, the following:

5.1.1 A description of the casting by pattern number or drawing (dimensional tolerances shall be included on the casting drawing),

5.1.2 Quantity (weight and number of castings),

5.1.3 Specification designation and date of issue,

5.1.4 Grade of steel,

5.1.5 Supplementary requirements including acceptance criteria,

5.1.6 Additional requirements.

6. Process

6.1 The steel shall be made by the electric furnace process with or without separate refining.

7. Heat Treatment

7.1 All castings shall be heat treated in accordance with Table 1.

8. Chemical Composition

8.1 The steel shall conform to the requirements as to chemical composition prescribed in Table 2.

9. Tensile Properties

9.1 One tension test shall be made from each heat and shall conform to the requirements as to tensile properties prescribed in Table 3.

10. Quality

10.1 When additional inspection is desired, Supplementary Requirements S5, S6, and S10 may be ordered.

11. Repair by Welding

11.1 Repairs shall be made using procedures and welders qualified under Practice A 488/A 488M.

11.2 The composition of the deposited weld metal may be similar to that of the casting or may be suitably alloyed to achieve the desired corrosion resistance and mechanical properties.

11.3 Weld repairs shall be subject to the same quality standards as used to inspect the castings.

11.4 When postweld heat treatment is believed necessary for adequate corrosion resistance or impact toughness, Supplementary Requirement S11, Post Weld Heat Treatment, shall be included in the purchase order.

12. Post Weld Heat Treatment After Major Weld Repair

12.1 Weld repairs shall be considered major in the case of a casting that has leaked on hydrostatic testing, or when the depth of the cavity after preparation for repair exceeds 20% of the actual wall thickness or 1 in. [25 mm], whichever is smaller, or when the extent of the cavity exceeds approximately 10 in.² [65 cm²]. All other weld repairs shall be considered minor.

12.2 Castings shall be heat-treated after major weld repairs. Heat treatment after minor weld repairs is not required except upon agreement between the manufacturer and the purchaser.

12.3 Post weld heat treatment shall be in accordance with Table 1.

13. Keywords

13.1 austenitic-ferritic; duplex stainless steel; pressure-containing; steel castings

TABLE 1
HEAT TREATMENT REQUIREMENTS

Grade	Heat Treatment
1B	Heat to 1900°F [1040°C] minimum, hold for sufficient time to heat casting uniformly to temperature, quench in water or rapid cool by other means.
2A	Heat to 2050°F [1120°C] minimum, hold for sufficient time to heat casting uniformly to temperature, quench in water or rapid cool by other means.
3A	Heat to 1950°F [1070°C] minimum, hold for sufficient time to heat casting uniformly to temperature, quench in water or rapid cool by other means.
4A	Heat to 2050°F [1120°C] minimum for sufficient time to heat casting uniformly to temperature and water quench, or the casting may be furnace cooled to 1850°F [1010°C] minimum, hold for 15 min minimum and then water quench. A rapid cool by other means may be employed in lieu of water quench.
5A	Heat to 2050°F [1120°C] minimum, hold for sufficient time to heat casting to temperature, furnace cool to 1910° F [1045°C] minimum, quench in water or rapid cool by other means.
6A	Heat to 2010°F [1100°C] minimum, hold for sufficient time to heat casting uniformly to temperature, quench in water or cool rapidly by other means.

⁴ When ICI test bars are used in tensile testing as provided for in this specification, the gage length to reduced section diameter ratio shall be 4:1.

SUPPLEMENTARY REQUIREMENTS

The following supplementary requirements shall not apply unless specified in the purchase order. A list of standardized supplementary requirements for use at the option of the purchaser is included in Specification A 703/A 703M. Those which are ordinarily considered suitable for use with this specification are given below. Others enumerated in Specification A 703/A 703M may be used with this specification upon agreement between the manufacturer and purchaser.

S1. Unspecified Elements

S2. Destruction Tests

S5. Radiographic Inspection

S6. Liquid Penetrant Inspection

S8. Charpy Impact Test

S10. Examination of Weld Preparation

S10.1 Liquid penetrant examination of cavities prepared for welding shall be performed to verify removal of those discontinuities found unacceptable by the inspection method specified for the casting. The method of performing liquid penetrant examination shall be in accordance with Practice E 165. Unless other degrees of shrinkage or types of discontinuities found in the cavities are specified, Type II, Internal Shrinkage, of Reference Photographs E 125, of Degree 2 in sections up to 2 in. [50 mm] thick and of Degree 3 in sections over 2 in. [50 mm] thick shall be acceptable.

S11. Post Weld Heat Treatment

S11.1 Castings shall be given a post weld solution heat treatment in accordance with Table 1.

S12. Prior Approval of Major Weld Repairs

Other supplementary requirements considered suitable for use with this specification are:

S50. Estimating Ferrite Content

S50.1 Ferrite contents shall be determined by point count (Practice E 562), by other quantitative metallographic methods such as image analysis, by measurement of magnetic response, or by other methods upon agreement between the manufacturer and the purchaser. Frequency of testing and location of tests shall be by agreement between the manufacturer and the purchaser.

S51. Prior Approval of Weld Material

S51.1 The purchaser must give approval of all weld filler materials to be used prior to any weld repairs.

SPECIFICATION FOR GENERAL REQUIREMENTS FOR ALLOY AND STAINLESS STEEL PIPE

**SA-999/SA-999M**

(Identical with ASTM Specification A 999/A 999M-04a)

1. Scope

1.1 This specification covers a group of general requirements that, unless otherwise specified in an individual specification, shall apply to the ASTM product specifications noted below.

1.2 In the case of conflict between a requirement of a product specification and a requirement of this specification, the product specification shall prevail. In the case of conflict between a requirement of the product specification or a requirement of this specification and a more stringent requirement of the purchase order, the purchase order shall prevail.

Title of Specification	ASTM Designation
Seamless and Welded Austenitic Stainless Steel Pipe	A 312/A 312M
Seamless and Welded Steel Pipe for Low-Temperature Service	A 333/A 333M
Seamless Ferritic Alloy-Steel Pipe for High-Temperature Service	A 335/A 335M
Electric-Fusion-Welded Austenitic Chromium-Nickel Alloy Steel Pipe for High-Temperature Service	A 358/A 358M
Carbon and Ferritic Alloy Steel Forged and Bored Pipe for High-Temperature Service	A 369/A 369M
Seamless Austenitic Steel Pipe for Use With High Temperature Central-Station Service	A 376/A 376M
Welded Large Diameter Austenitic Steel Pipe for Corrosive or High-Temperature Service	A 409/A 409M
Welded, Unannealed Austenitic Stainless Steel Tubular Products	A 778
Seamless and Welded Ferritic/Austenitic Stainless Steel Pipe	A 790/A 790M
Single- or Double-Welded Austenitic Stainless Steel Pipe	A 813/A 813M
Cold-Worked Welded Austenitic Stainless Steel Pipe	A 814/A 814M

Title of Specification	ASTM Designation
Ferritic/Austenitic (Duplex) Stainless Steel Pipe Electric Fusion Welded with Addition of Filler Metal	A 928/A 928M
Spray-Formed Seamless Austenitic Stainless Steel Pipe	A 943/A 943M
Spray-Formed Seamless Ferritic/Austenitic Stainless Steel Pipe	A 949/A 949M
Austenitic Chromium-Nickel-Silicon Alloy Steel Seamless and Welded Pipe	A 954

1.3 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore each system is to be used independently of the other without combining values in any way. The inch-pound units apply unless the “M” designation (SI) of the product specification is specified in the order.

NOTE 1 — The dimensionless designator NPS (nominal pipe size) is used in this standard for such traditional terms as “nominal diameter,” “size,” “nominal bore,” and “nominal size”.

1.4 The following precautionary statement pertains only to the test method portion, Section 22, of this specification: *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

3. Materials and Manufacture

3.1 The steel shall be made by a suitable steelmaking process.

3.2 If secondary melting, such as electroslag remelting or vacuum remelting, is used, the heat shall be defined as all of the ingots remelted from a single primary heat.

3.3 If steels of different grades are sequentially strand cast, the resultant transition material shall be removed using an established procedure that positively separates the grades.

3.4 If a specific type of melting is required by the purchaser, it shall be specified in the purchase order.

4. Terminology

4.1 Definitions:

4.1.1 The definitions in Terminology A 941, except as modified in this specification or in its referenced product specifications, are applicable to this specification.

5. Ordering Information

5.1 It is the responsibility of the purchaser to specify all requirements that are necessary for products ordered under the applicable product specification and this general requirements specification. Such requirements to be considered include, but are not limited to, the following:

- 5.1.1 ASTM product specification and year-date,
- 5.1.2 Name of product (for example, stainless steel pipe),
- 5.1.3 Quantity (feet, metres, or number of pieces),
- 5.1.4 Method of manufacture, where applicable (seamless or welded),
- 5.1.5 Specific type of melting, if required (see 3.4),
- 5.1.6 Grade or UNS number,
- 5.1.7 Size (NPS and outside diameter and schedule number, average (nominal) wall thickness (see 9.1 and 10.1), or minimum wall thickness (see 9.2 and 10.1.1), or minimum inside diameter (see 11.1)),
- 5.1.8 Length (specific or random),
- 5.1.9 End finish,
- 5.1.10 Optional requirements,
- 5.1.11 Certification (see Section 25),
- 5.1.12 Specification designation and year of issue, and
- 5.1.13 Special requirements or any supplementary requirements, or both.

6. Chemical Composition

6.1 Chemical Analysis – Samples for chemical analysis and method of analysis shall be in accordance with Test Methods, Practices, and Terminology A 751.

6.2 Heat Analysis – An analysis of each heat of steel shall be made by the steel manufacturer to determine the percentages of the specified elements. If secondary melting processes are employed, the heat analysis shall be obtained from one remelted ingot or the product of one remelted ingot of each primary melt. The chemical composition thus determined, or that determined from a product analysis made by the tubular product manufacturer shall conform to the requirements specified.

6.2.1 For steels ordered under product specifications referencing this specification of general requirements, the steel shall not contain an unspecified element, other than nitrogen for stainless steels, for the ordered grade to the extent that the steel conforms to the requirements of another grade for which that element is a specified element having a required minimum content. For this requirement, a grade is defined as an alloy described individually and identified by its own UNS designation in a table of chemical requirements within any specification listed within the scope as being covered by this specification.

6.3 Product Analysis – Product analysis requirements and options, if any, shall be as contained in the applicable product specification.

7. Mechanical Properties

7.1 Method of Mechanical Tests – The specimens and mechanical tests required shall be in accordance with Test Methods and Definitions A 370, especially Annex A2 thereof.

7.2 Specimens shall be tested at room temperature.

7.3 Small or subsize specimens as described in Test Methods and Definitions A 370 may be used only when there is insufficient material to prepare one of the standard specimens. When using small or subsize specimens, the largest one possible shall be used.

8. Tensile Requirements

8.1 The material shall conform to the requirements as to tensile properties in the applicable product specification.

8.2 The yield strength, if specified, shall be determined corresponding to a permanent offset of 0.2% of the gage length or to a total extension of 0.5% of the gage length under load.

8.3 If the percentage of elongation of any test specimen is less than that specified and any part of the fracture is more than $\frac{3}{4}$ in. [19.0 mm] from the center of the gage length, as indicated by scribe marks on the specimen before testing, a retest shall be allowed.

9. Permissible Variation in Mass for Seamless Pipe

9.1 Except as allowed by 9.2, the mass of any length of seamless pipe in sizes NPS 12 and smaller shall not vary more than 10% over or more than 3.5% under that specified. For pipe in sizes larger than NPS 12, the mass of any length of pipe shall not vary more than 10% over or more than 5% under that specified. Unless otherwise specified, the mass of lengths of pipe in sizes NPS 4 and smaller shall be determined separately or in convenient lots; the mass of lengths of pipe in sizes larger than NPS 4 shall be determined separately.

9.2 Minimum Wall – If the wall thickness of the pipe is specified as minimum wall in the purchase order, the mass of any length of seamless pipe shall not vary more than 16% over that calculated in accordance with 14.3. Unless otherwise specified, the mass of pipe in sizes NPS 4 and smaller shall be determined separately or in convenient lots; the mass of pipe in sizes larger than NPS 4 shall be determined separately.

9.3 The specified mass of pipe shall be determined by multiplying its specified or calculated mass per unit length (see 14.3) by its measured length.

10. Permissible Variations in Wall Thickness

10.1 Seamless and Welded – Except as required by 10.1.1, the minimum wall thickness at any point shall not be more than 12.5% under the nominal wall thickness specified. The minimum wall thickness on inspection is shown in Table X1.1.

10.1.1 Minimum Wall – If the wall thickness of the pipe is specified as minimum wall in the purchase order, there shall be no variation under the specified wall thickness.

10.2 Forged and Bored – The wall thickness shall not vary over that specified by more than $\frac{1}{8}$ in. [3.2 mm]. There shall be no variation under the specified wall thickness.

10.3 Cast – The wall thickness shall not vary over that specified by more than $\frac{1}{16}$ in. [1.6 mm]. There shall be no variation under the specified wall thickness.

11. Permissible Variations in Inside Diameter

11.1 Forged and Bored, and Cast – The inside diameter shall not vary under that specified by more than $\frac{1}{16}$ in. [1.6 mm]. There shall be no variation over the specified inside diameter.

12. Permissible Variation in Outside Diameter

12.1 Variations in outside diameter, unless otherwise agreed upon, shall not exceed the limits given in Table 1. The tolerances for outside diameter include ovality, except as provided for in 12.2 and 12.2.1. (See Note 2.)

12.2 For thin-wall pipe, defined as pipe having a wall thickness of 3% or less of the specified outside diameter, the diameter tolerance of Table 1 is applicable only to the mean of the extreme (maximum and minimum) outside diameter readings in any one cross-section.

12.2.1 For thin-wall pipe, the difference in extreme outside readings (ovality) in any one cross-section shall not exceed 1.5% of the specified outside diameter.

NOTE 2 — Thin-wall pipe usually develops significant ovality (out-of-roundness) during final annealing, straightening, or both. The diameter tolerances given in Table 1 are usually not sufficient to provide for additional ovality expected in thin-wall pipe.

13. Permissible Variations in Length

13.1 Seamless and Welded (No Filler Metal Added) – If specific cut lengths of 24 ft [7.3 m] or less are ordered, no length of pipe shall be under the length specified or more than $\frac{1}{4}$ in. [6 mm] over that specified.

13.1.1 Permissible variations in length for lengths greater than 24 ft [7.3 m] shall be subject to agreement between the manufacturer and purchaser.

13.2 Forged and Bored, Cast, and Cast Cold-Wrought – If specific cut lengths are ordered, no length of pipe shall be under the length specified or more than $\frac{1}{8}$ in. [3 mm] over that specified.

13.3 For pipe ordered to random lengths, the lengths and variations shall be agreed upon between the manufacturer and purchaser.

13.4 No girth welds are permitted unless agreed upon by the manufacturer and purchaser.

14. Mass per Unit Length

14.1 A system of standard pipe sizes has been approved by the American National Standards Institute as ANSI B36.10 and B36.19. The standard sizes do not prohibit the production and use of other sizes of pipe produced to the various product specifications referenced in 1.1. (See Note 3.)

14.2 For nonstandard sizes of pipe, the calculated mass per unit length shall be determined using the following equation:

$$M = C (D-t) t \quad (1)$$

where:

$C = 10.69$ [0.02466]

$M =$ mass per unit length, lb_m/ft [kg/m]

$D =$ specified or calculated (from specified inside diameter and wall thickness) outside diameter, in. [mm], and

$t =$ specified wall thickness, in. (to 3 decimal places) [mm to 2 decimal places]

14.3 When minimum wall thickness is specified in the purchase order, the calculated mass per unit length shall be determined using eq. 1, obtaining from Table X1.1 the nominal wall thickness, t , corresponding to that minimum wall.

NOTE 3 — The mass per unit length values given in the American National Standards and the calculated masses per unit length determined using Eq. 1 are based upon carbon steel pipe. The mass per unit length of pipe made of ferritic stainless steels may be up to about 5% less, and that made of austenitic stainless steel up to about 2% greater, than the values given.

15. Ends

15.1 Unless otherwise specified, the pipe shall be furnished with plain ends. All burrs at the ends of the pipe shall be removed.

16. Straightness

16.1 The finished pipe shall be reasonably straight.

16.2 For metal-arc welded pipe, the maximum deviation from a 10 ft [3.0 m] straightedge placed so that both

ends are in contact with the pipe shall be $\frac{1}{8}$ in. [3.2 mm]. For metal-arc welded pipe with lengths shorter than 10 ft [3.0 m], this maximum deviation shall be prorated with respect to the ratio of the actual length to 10 ft [3.0 m].

17. Repair by Welding

17.1 Repair by welding of defects in seamless pipe (including centrifugally cast pipe and forged and bored pipe) and of plate defects in welded pipe and, if specifically stated by the applicable product specification, weld seam defects in welded pipe shall be permitted subject to the approval of the purchaser and with the further understanding that the composition of the deposited filler metal shall be suitable for the composition being welded. Defects shall be thoroughly chipped or ground out before welding and each repaired length shall be reheat treated or stress relieved as required by the applicable product specification. Each length of repaired pipe shall be nondestructively tested as required by the applicable product specification.

17.2 Repair welding shall be performed using procedures and welders or welding operators that have been qualified in accordance with the ASME Boiler and Pressure Vessel Code, Section IX.

18. Retests

18.1 If the results of the qualification tests of any lot do not conform to the requirements specified in the applicable product specification, retests are permitted on additional lengths of pipe of double the original number from the same lot, each of which shall conform to the requirements specified. Only one retest of any lot is permitted. Nonconformance of the retest is cause for the rejection of the lot.

18.2 Any individual length of pipe that meets the test requirements is acceptable. It is permitted to retest individual lengths that do not conform to the test requirements, provided that the reason for nonconformance is established and the nonconforming portion is removed.

19. Retreatment

19.1 If individual lengths of pipe selected to represent any lot fail to conform to the test requirements, the lot represented may be reheat treated and resubmitted for test. The manufacturer may reheat treat the pipe, but not more than twice, except with the approval of the purchaser.

20. Test Specimens

20.1 Test specimens shall be taken from the ends of finished pipe prior to any forming operations, or being cut to length.

20.2 Specimens cut either longitudinally or transversely shall be acceptable for the tension test.

20.3 If any test specimen shows flaws or defective machining, the specimen may be discarded and another substituted.

21. Flattening Test Requirements

21.1 *Seamless and Centrifugally Cast Pipe* – A section of pipe not less than $2\frac{1}{2}$ in. [60 mm] in length shall be flattened cold between parallel plates in two steps. During the first step, which is a test for ductility, no cracks or breaks on the inside, outside, or end surfaces, except as allowed by 21.3.4, shall occur before the distance between the plates is less than the value of H calculated as follows:

$$H = (1+e) t/(e+t/D) \quad (2)$$

where:

H = distance between flattening plates, in. [mm],

t = specified wall thickness, in. [mm]

D = specified outside diameter, outside diameter corresponding to specified ANSI pipe size, or outside diameter calculated by adding $2t$ (as defined above) to the specified inside diameter in. [mm], and

e = deformation per unit length (constant for a given grade of steel, 0.07 for medium carbon steel (maximum specified carbon 0.19% or greater), 0.08 for ferritic alloy steel, 0.09 for austenitic steel, and 0.09 for low-carbon steel (maximum specified carbon 0.18% or less))

During the second step, which is a test for soundness, the flattening shall be continued until the specimen breaks or the opposite walls of the specimen meet.

21.2 *Welded Pipe* – A section of welded pipe not less than 4 in. [100 mm] in length shall be flattened cold between parallel plates in two steps. The weld shall be placed at 90° from the direction of the applied force (at the point of maximum bending). During the first step, which is a test for ductility, no cracks or breaks on the inside or outside surfaces, except as provided for in 21.3.4, shall occur before the distance between the plates is less than the value of H calculated by eq. 2. During the second step, which is a test for soundness, the flattening shall be continued until the specimen breaks or the opposite walls of the specimen meet.

21.3 *Seamless, Centrifugally Cast, and Welded Pipe:*

21.3.1 Evidence of laminated or defective material or weld that is revealed at any time during the entire flattening test shall be cause for rejection.

21.3.2 Surface imperfections not evident in the test specimen before flattening, but revealed during the first

step of the flattening test, shall be judged in accordance with the finish requirements.

21.3.3 Superficial ruptures resulting from surface imperfections shall not be a cause for rejection.

21.3.4 When low D -to- t ratio tubular products are tested, because the strain imposed due to geometry is unreasonably high on the inside surface at the six and twelve o'clock locations, cracks at these locations shall not be cause for rejection if the D -to- t ratio is less than 10.

22. Nondestructive Test Requirements

22.1 If required by the applicable product specification or the purchase order, the pipe shall be tested by the hydrostatic test (see 22.2) or by the nondestructive electric test (see 22.3).

22.2 Hydrostatic Test:

22.2.1 Except as allowed by 22.2.2 and 22.2.3, each length of pipe shall be tested by the manufacturer to a hydrostatic pressure that will produce in the pipe wall a stress not less than 60% of the specified minimum yield strength for ferritic alloy steel and stainless steel pipe, or 50% of the specified minimum yield strength for austenitic alloy and stainless steel pipe and for ferritic/austenitic stainless steel pipe. The test pressure or stress shall be determined using the following equation:

$$P = 2St/D \text{ or } S = PD/2t \quad (3)$$

where:

P = hydrostatic test pressure in psi [MPa]

S = pipe wall stress in psi or [MPa]

t = specified wall thickness, nominal wall thickness according to specified ANSI schedule number, or 1.143 times the specified minimum wall thickness, in. [mm], and

D = specified outside diameter, outside diameter corresponding to specified ANSI pipe size, or outside diameter calculated by adding $2t$ (as defined above) to the specified inside diameter, in. [mm]

22.2.1.1 The hydrostatic test pressure determined by eq. 3 shall be rounded to the nearest 50 psi [0.5 MPa] for pressures below 1000 psi [7 MPa], and to the nearest 100 psi [1 MPa] for pressures 1000 psi [7 MPa] and above. The hydrostatic test may be performed prior to cutting to final length, or prior to upsetting, swaging, expanding, bending, or other forming operations.

22.2.2 Regardless of pipe-wall stress-level determined by Eq. 3, the minimum hydrostatic test pressure required to satisfy these requirements need not exceed 2500 psi [17.0 MPa] for outside diameters (see D in 22.2) of 3.5 in. [88.9 mm] or less, or 2800 psi [19.0 MPa] for outside diameters over 3.5 in. [88.9 mm]. This does not

prohibit testing at higher pressures at the option of the manufacturer or as allowed by 22.2.3.

22.2.3 With concurrence of the manufacturer, a minimum hydrostatic test pressure in excess of the requirements of 22.1 or 22.2, or both, may be stated in the purchase order.

22.2.4 The test pressure shall be held for a minimum of 5 s. For welded pipe, the test pressure shall be held for a time sufficient to permit the entire length of the welded seam to be inspected.

22.2.5 The hydrostatic test may not be capable of testing the end portion of the pipe. The length of pipe that cannot be tested shall be determined by the manufacturer and, if specified in the purchase order, reported to the purchaser.

22.3 Nondestructive Electric Test:

22.3.1 Each pipe shall be examined with a nondestructive test in accordance with Practices E 213, E 309, E 426, or E 570. Unless specifically called out by the purchaser, the selection of the nondestructive electric test shall be at the option of the manufacturer. Upon agreement between the purchaser and the manufacturer, Practice E 273 shall be employed in addition to one of the full periphery tests. The range of pipe sizes that may be examined by each method shall be subject to the limitations in the scope of the respective practices.

22.3.2 The following information is for the benefit of the user of this specification:

22.3.2.1 The reference discontinuities defined in 22.3.8.2 – 22.3.8.7 are convenient standards for the standardization of nondestructive testing equipment. The dimensions of such reference discontinuities should not be construed as the minimum size imperfection detectable by such equipment.

22.3.2.2 The ultrasonic testing (UT) can be performed to detect both longitudinally and circumferentially oriented imperfections. It should be recognized that different techniques should be used to detect differently oriented imperfections. The examination may not detect short deep imperfections.

22.3.2.3 The eddy-current testing (ET) referenced in this specification, (see Practices E 426 and E 309), has the capability of detecting significant imperfections, especially of the short abrupt type. The sensitivity of this test decreases with wall thickness over 0.250 in. (6.4 mm).

22.3.2.4 The flux leakage examination referred to in this specification is capable of detecting the presence and location of significant longitudinally or transversely oriented imperfections; however, sensitivity of the test to various types of imperfections is affected by the calibration, and different techniques should be employed to detect differently oriented imperfections.

22.3.2.5 A purchaser interested in ascertaining the nature (type, size, location, and orientation) of imperfections that can be detected in the specific application of these examinations should discuss this with the manufacturer of the tubular product.

22.3.3 Time of Examination:

22.3.3.1 Nondestructive testing for specification acceptance shall be performed after all mechanical processing, heat treatments, and straightening operations. This requirement does not preclude additional testing at earlier stages in the processing.

22.3.4 Surface Condition:

22.3.4.1 All surfaces shall be free of scale, dirt, grease, paint, and other foreign material that could interfere with interpretation of test results. The methods used for cleaning and preparing the surfaces for examination shall not be detrimental to the base metal or the surface finish.

22.3.4.2 Excessive surface roughness or deep scratches can produce signals that interfere with the test.

22.3.5 Extent of Examination:

22.3.5.1 The relative motion of the pipe and the transducer(s), coil(s), or sensor(s) shall be such that the entire pipe surface is scanned, except as allowed by 22.3.5.2.

22.3.5.2 The existence of end effects is recognized, and the extent of such effects shall be determined by the manufacturer, and, if requested, shall be reported to the purchaser. Other nondestructive tests may be applied to the end areas, subject to agreement between the purchaser and the manufacturer.

22.3.6 Operator Qualifications:

22.3.6.1 The test unit operator shall be qualified in accordance with SNT-TC-1A, or an equivalent recognized and documented standard.

22.3.7 Test Conditions:

22.3.7.1 For eddy-current testing, the excitation coil frequency shall be chosen to ensure adequate penetration yet provide a good signal-to-noise ratio.

22.3.7.2 The eddy-current coil frequency used shall not exceed the following:

- On specified walls up to 0.050 in. [1.3 mm] – 100 kHz
- On specified walls up to 0.150 in. [3.8 mm] – 50 kHz
- On specified walls equal to or greater than 0.150 in. [3.8 mm] – 10 kHz

22.3.7.3 Ultrasonic – For examination by the ultrasonic method, the nominal transducer frequency shall be 2.00 MHz or more and the nominal transducer size shall be 1.5 in [38 mm] or less.

22.3.7.4 If the equipment contains a reject notice filter setting, this shall remain off during calibration and testing unless linearity can be demonstrated at the setting.

22.3.8 Reference Standards:

22.3.8.1 Reference standards of convenient length shall be prepared from a length of pipe of the same grade, size (NPS, or outside diameter and schedule or wall thickness), surface finish, and heat treatment conditions as the pipe to be examined.

22.3.8.2 For Ultrasonic Testing, the reference ID and OD notches shall be any one of the three common notch shapes shown in Practice E 213, at the option of the manufacturer. The depth of each notch shall not exceed 12.5% of the specified wall thickness of the pipe or 0.004 in. [0.1 mm], whichever is the greater. The width of the notch shall not exceed twice the depth. Notches shall be placed on both the OD and ID surfaces.

22.3.8.3 For Eddy-Current Testing, the reference standard shall contain, at the option of the manufacturer, any one of the following reference discontinuities:

22.3.8.4 Drilled Hole – The reference standard shall contain three or more holes, equally spaced circumferentially around the pipe and longitudinally separated by a sufficient distance to allow distinct identification of the signal from each hole. The holes shall be drilled radially and completely through the pipe wall, with care being taken to avoid distortion of the pipe while drilling. One hole shall be drilled in the weld, if visible. Alternatively, the manufacturer of welded pipe is permitted to drill one hole in the weld and run the calibration standard through the test coils three times, with the weld turned at 120° on each pass. The hole diameter shall not exceed the following:

NPS Designator	Hole Diameter
$\frac{1}{2}$	0.039 in. [1 mm]
above $\frac{1}{2}$ to $1\frac{1}{4}$	0.055 in. [1.4 mm]
above $1\frac{1}{4}$ to 2	0.071 in. [1.8 mm]
above 2 to 5	0.087 in. [2.2 mm]
above 5	0.106 in. [2.7 mm]

22.3.8.5 Transverse Tangential Notch – Using a round tool or a file with a $\frac{1}{4}$ in. [6.4 mm] diameter, a notch shall be filed or milled tangential to the surface and transverse to the longitudinal axis of the pipe. Such a notch shall have a depth not exceeding 12.5% of the specified wall thickness of the pipe or 0.004 in. [0.10 mm], whichever is the greater.

22.3.8.6 Longitudinal Notch – A notch of 0.031 in. [0.8 mm] or less in width shall be machined in a radial plane parallel to the pipe axis on the outside surface of the pipe, to have a depth not exceeding 12.5% of the specified wall thickness of the pipe or 0.004 in. [0.10 mm], whichever is the greater.

22.3.8.7 More or smaller reference discontinuities, or both, may be used by agreement between the purchaser and the manufacturer.

22.3.9 Standardization Procedure:

22.3.9.1 The test apparatus shall be standardized at the beginning and end of each series of pipes of the same size (NPS or diameter and schedule or wall thickness), grade and heat treatment condition, and at intervals not exceeding 4 h. More frequent standardization may be performed at the manufacturer's option and may be required upon agreement between the purchaser and the manufacturer.

22.3.9.2 The test apparatus shall also be standardized after any change in test system settings, change of operator, equipment repair, or interruption due to power loss, process shutdown, or when a problem is suspected.

22.3.9.3 The reference standard shall be passed through the test apparatus at the same speed and test system settings as the pipe to be tested.

22.3.9.4 The signal-to-noise ratio for the reference standard shall be $2\frac{1}{2}$ to 1 or greater. Extraneous signals caused by identifiable causes such as dings, scratches, dents, straightener marks, etc., shall not be considered noise. The rejection amplitude shall be adjusted to be at least 50% of full scale of the readout display.

22.3.9.5 If upon any standardization, the rejection amplitude has decreased by at least 29% (3 dB) of peak height from the last standardization, the pipe tested since the last calibration shall be rejected or retested for acceptance after the test apparatus settings have been changed, or the transducer(s), coil(s), or sensor(s) have been adjusted, and the test apparatus has been restandardized.

22.3.10 Evaluation of Imperfections:

22.3.10.1 Pipes producing a signal equal to or greater than the lowest signal produced by the reference discontinuities shall be identified and separated from the acceptable pipes. The area producing the signal may be reexamined.

22.3.10.2 Such pipes shall be rejected if the test signals were produced by imperfections that cannot be identified or were produced by cracks or crack-life imperfections. Such pipes may be repaired if such repair is permitted by the applicable product specification. To be accepted, a repaired pipe shall pass the same nondestructive test by which it was rejected, and it shall meet the minimum wall thickness requirements of the applicable product specification.

22.3.10.3 If the test signals were produced by visual imperfections such as scratches, surface roughness, dings, straightener marks, cutting chips, steel die stamps, stop marks, or pipe reducer ripple, the pipe is permitted to be accepted based upon visual examination provided that the depth of the imperfection is less than 0.004 in. [0.1 mm] or 12.5% of the specified wall thickness, whichever is the greater.

22.3.10.4 Rejected pipe may be reconditioned and retested, provided that the wall thickness is not decreased to less than that required by the applicable product specification. The outside diameter at the point of grinding may be reduced by the amount so removed. To be accepted, retested pipe shall meet the test requirement.

22.3.10.5 If the imperfection is explored to the extent that it can be identified as non-rejectable, the pipe may be accepted without further test provided that the imperfection does not encroach on the minimum required wall thickness.

23. Inspection

23.1 The inspector representing the purchaser shall have entry at all times work on the contract of the purchaser is being performed, to all parts of the manufacturer's facilities that concern the manufacture of the product ordered. The manufacturer shall afford the inspector all reasonable facilities to be satisfied that the product is being furnished in accordance with this specification. All required tests and inspection shall be made at the place of manufacture prior to shipment, unless otherwise specified, and shall be conducted so as not to interfere unnecessarily with the manufacturer's operations.

24. Rejection

24.1 Each length of pipe received from the manufacturer may be inspected by the purchaser and, if it does not meet the requirements of the specification based upon the inspection and test method as outlined in the applicable product specification, the length may be rejected and the manufacturer shall be notified. Disposition of rejected pipe shall be a matter of agreement between the manufacturer and the purchaser.

24.2 Pipe that fails in any of the forming operations or in the process of installation and is found to be defective shall be set aside and the manufacturer shall be notified for mutual evaluation of the suitability of the pipe. Disposition of such pipe shall be matter for agreement.

25. Certification

25.1 If specified in the purchase order or contract, the manufacturer or supplier shall furnish to the purchaser a certificate of compliance stating that the product was manufactured, sampled, tested, and inspected in accordance with the specification, including year-date, the supplementary requirements, and any other requirements designated in the purchase order or contract, and has been found to meet such requirements. A signature or notarization is not required; however, the document shall be dated and shall clearly identify the organization submitting it.

25.1.1 Notwithstanding the absence of a signature or notarization, the certifying organization is responsible for the contents of the document.

25.2 In addition, if specified in the purchase order or contract, the manufacturer or supplier shall furnish to the purchaser a test report that includes the following information and test results, as applicable:

25.2.1 Heat number,

25.2.2 Heat analysis,

25.2.3 Product analysis if specified or required,

25.2.4 Tensile properties,

25.2.5 Width in the gage length, if longitudinal strip tension test specimens were used,

25.2.6 Bend test acceptable,

25.2.7 Flattening test acceptable,

25.2.8 Hydrostatic test pressure,

25.2.9 Nondestructive electric test method,

25.2.10 Impact test results, and

25.2.11 Other test results or information required to be reported by the applicable product specification.

25.3 Test results or information required to be reported by supplementary requirements, or other requirements designated in the purchase order or contract shall be reported but may be reported in a separate document.

25.4 The test report shall include a statement of explanation for the letter added to the specification number marked on the tubes (see 26.5) if all of the requirements of the specification have not been completed. The purchaser must certify that all requirements of the specification have been completed before the removal of the letter (that is, X, Y, or Z).

25.5 A test report, certificate of compliance, or similar document printed from or used in electronic form from an electronic data interchange (EDI) shall be regarded as having the same validity as a counterpart printed in the certifying organization's facility. The content of the EDI transmitted document shall meet the requirements of the invoked ASTM standard(s) and conform to any existing EDI agreement between the purchaser and the supplier. Notwithstanding the absence of a signature, the organization submitting the EDI transmission is responsible for its content.

26. Product Marking

26.1 Each length of pipe shall be legibly marked with the manufacturer's name or brand, the specification number (year of issue not required) and grade. Marking shall begin approximately 12 in. [300 mm] from the end of each length

of pipe. For pipe less than NPS 2 and pipe under 3 ft [1 m] in length, the required information may be marked on a tag securely attached to the bundle or box in which the pipes are shipped.

26.2 When pipe marked as specified is rejected, the ASTM designation shall be canceled.

26.3 For austenitic steel pipe, the marking paint or ink shall not contain detrimental amounts of harmful metals, or metal salts, such as zinc, lead, or copper, which cause corrosive attack on heating.

26.4 Pipes that have been weld repaired in accordance with 17.1 shall be marked WR.

26.5 When it is specified that certain requirements of a specification adopted by the ASME Boiler and Pressure Vessel Committee are to be completed by the purchaser upon receipt of the material, the manufacturer shall indicate that all requirements of the specification have not been completed by a letter such as X, Y, or Z, immediately following the specification number. This letter may be removed after completion of all requirements in accordance with the specification. An explanation of specification requirements to be completed is provided in 25.1.

27. Packaging, Marking, and Loading

27.1 If specified in the purchase order, packaging, marking, and loading for shipment shall be in accordance with the procedures of Practices A 700.

28. Government Procurement

28.1 If specified in the contract or purchase order, the following requirements shall be considered in the inquiry, contract, or order for agencies of the U.S. Government where scale-free pipe is required. Such requirements shall take precedence if there is a conflict between these requirements and those of the applicable product specification.

28.2 Pipe shall be ordered to nominal pipe size (NPS) and schedule. Nominal pipe shall be as specified in ANSI B36.10 or B36.19.

28.3 Responsibility for Inspection – Unless otherwise specified in the contract or purchase order, the manufacturer is responsible for the performance of all inspection and test requirements specified. The absence of any inspection requirements in the specification shall not relieve the contractor of the responsibility for ensuring that all products or supplies submitted to the government for acceptance comply with all requirements of the contract or purchase order. Sampling inspection, as part of the manufacturing operations, is an acceptable practice to ascertain conformance to requirements; however, this does not authorize

submission of known defective material, either indicated or actual, nor does it commit the government to accept the material. Except as otherwise specified in the contract or purchase order, the manufacturer may use its own or any other suitable facilities for the performance of the inspection and test requirements unless disapproved by the purchaser at the time the order is placed. The purchaser shall have the right to perform any of the inspections and tests set forth if such inspections and tests are deemed necessary to ensure that the products conform to the prescribed requirements.

28.4 Sampling for Flattening and Flaring Test and for Visual and Dimensional Examination – Minimum sampling for flattening and flaring tests and visual and dimensional examination shall be as follows:

Lot Size (Pieces per Lot)	Sample Size
2 to 8	Entire Lot
9 to 90	18
91 to 150	12
151 to 280	19
281 to 500	21
501 to 1200	27
1201 to 3200	35
3201 to 10 000	38
10 001 to 35 000	46

In all cases, the acceptance number is zero and the rejection number is one. Rejected lots may be screened and resubmitted for visual and dimensional examination. All defective items shall be replaced with acceptable items prior to lot acceptance.

28.5 Sampling for Chemical Analysis – One sample for chemical analysis shall be selected from each two pipes chosen from each lot. A lot shall be all material poured from one heat.

28.6 Sampling for Tension and Bend Test – One sample shall be taken from each lot. A lot shall consist of all pipe of the same outside diameter and wall thickness manufactured during an 8 h shift from the same heat of steel, and heat treated under the same conditions of temperature and time in a single charge in a batch-type furnace, or heat treated under the same condition in a continuous furnace, and presented for inspection at the same time.

28.7 Hydrostatic and Ultrasonic Tests – Each pipe shall be tested by the ultrasonic (if specified) and hydrostatic tests.

28.8 Pipe shall be free from heavy oxide or scale. The internal surface of hot finished ferritic steel pipe shall be

pickled or blast cleaned to a free of scale condition equivalent to the CSa2 visual standard in SSPC-SP6. Cleaning shall be performed in accordance with a written procedure that has been shown to be effective. This procedure shall be available for audit.

28.9 In addition to the marking required by this specification, each length of pipe NPS $\frac{1}{4}$ or larger shall be marked, in accordance with FED-STD-183 and MIL-STD-792, with the nominal pipe size, schedule number, length, and heat number or lot identification number.

28.10 Pipe shall be straight to within the tolerance given in Table 2.

28.11 If specified, each pipe shall be ultrasonically examined in accordance with MIL-STD-271, except that the notch depth in the reference standard shall be 5% of the wall thickness or 0.005 in. [0.1 mm], whichever is the greater. Any pipe that produces an indication equal to or greater than 100% of the indication from the reference discontinuity shall be rejected.

28.12 The pipe shall be free from repair welds, welded joints, laps, laminations, seams, visible cracks, tears, grooves, slivers, pits, and other imperfections detrimental to the pipe as determined by visual and ultrasonic examination, or alternate tests, as specified.

28.13 Pipe shall be uniform in quality and condition and have a finish conforming to the best practice for standard quality pipe. Surface imperfections such as handling marks, straightening marks, light mandrel and die marks, shallow pits, and scale pattern will not be considered defects if the imperfections are removable within the tolerances specified for wall thickness or 0.005 in. [0.1 mm], whichever is the greater. The bottom of imperfections shall be visible and the profile shall be rounded and faired-in.

28.14 No weld repair by the manufacturer is permitted.

28.15 Preservation shall be level A or commercial, and packing shall be level A, B, or commercial, as specified. Level A preservation and level A or B packing shall be in accordance with MIL-STD-163 and commercial preservation and packing shall be in accordance with Practice A 700 or Practice D 3951.

ANNEX

(Mandatory Information)

A1. REQUIREMENTS FOR THE INTRODUCTION OF NEW MATERIALS

A1.1 New materials may be proposed for inclusion in product specifications referencing this general requirements specification subject to the following conditions:

A1.1.1 Application for the addition of a new grade to a specification shall be made to the chairman of the subcommittee that has jurisdiction over that specification.

A1.1.2 The application shall be accompanied by a statement from at least one user indicating that there is a

need for the new grade to be included in the applicable specification.

A1.1.3 The application shall be accompanied by test data as required by the applicable product specification. Test data from a minimum of three test lots, as defined by the applicable product specification, each from a different heat, shall be furnished.

A1.1.4 The application shall provide recommendations for all requirements appearing in the applicable product specification.

A1.1.5 The application shall state whether the new grade is covered by patent.

NOTE 1 — The following equation, upon which this table is based, may be applied to calculate minimum wall thickness from nominal (average) wall thickness:

$$t_n \times 0.875 = t_m$$

where:

t_n = nominal (average) wall thickness, in. [mm], and

t_m = minimum wall thickness, in. [mm].

The wall thickness in inch pound units is rounded to three decimal places in accordance with the rounding method of Practice E 29. The wall thickness in SI units is rounded to one decimal place in accordance with the rounding method of Practice E 29.

NOTE 2 — This table is a master table covering wall thicknesses available in the purchase of different classifications of pipe, but it is not meant to imply that all of the walls listed herein are necessarily obtainable for the applicable product specification.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR STEEL, SHEET, COLD-ROLLED, CARBON, STRUCTURAL, HIGH-STRENGTH LOW-ALLOY AND HIGH-STRENGTH LOW-ALLOY WITH IMPROVED FORMABILITY

SA-1008/SA-1008M

(Identical with ASTM Specification A 1008/A 1008M-01a except for the addition of 8.1.1.1 on mechanical properties for pressure vessel design.)

1. Scope

1.1 This specification covers cold rolled structural, high-strength low-alloy, and high-strength low-alloy with improved formability steel sheet, in coils and cut lengths.

1.2 Cold rolled steel sheet is available in the designations as listed in 4.1.

1.3 This specification does not apply to steel strip as described in Specification A 109.

1.4 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other.

2. Referenced Documents

2.1 ASTM Standards:

- A 109 Specification for Steel, Strip, Carbon, Cold Rolled
- A 366/A 366M Specification for Commercial Steel (CS), Sheet, Carbon (0.15 Maximum Percentage), Cold-Rolled
- A 370 Test Methods and Definitions for Mechanical Testing of Steel Products
- A 568/A 568M Specification for Steel, Sheet, Carbon, and High-Strength, Low-Alloy, Hot-Rolled and Cold-Rolled, General Requirements for
- A 620/A 620M Specification for Drawing Steel (DS), Sheet, Carbon, Cold-Rolled
- A 941 Terminology Relating to Steel, Stainless Steel, Related Alloys, and Ferroalloys
- E 517 Test Method for Plastic Strain Ratio r for Sheet Metal
- E 646 Test Method for Tensile Strain-Hardening Exponents (n -Values) of Metallic Sheet Materials

3. Terminology

3.1 Definitions:

3.1.1 For definitions of other terms used in this specification, refer to Terminology A 941.

3.1.2 *stabilization* — the addition of one or more nitride or carbide forming elements, or both, such as titanium and columbium, to control the level of the interstitial elements of carbon and nitrogen in the steel.

3.1.2.1 *Discussion* — Stabilizing improves formability and increases resistance to aging.

3.1.3 *vacuum degassing* — a process of refining liquid steel in which the liquid is exposed to a vacuum as part of a special technique for removing impurities or for decarburizing the steel.

3.2 Definitions of Terms Specific to This Standard:

3.2.1 *aging* — loss of ductility with an increase in hardness, yield strength, and tensile strength that occurs when steel that has been slightly cold worked (such as by temper rolling) is stored for some time.

3.2.1.1 *Discussion* — Aging increases the tendency of a steel to exhibit stretcher strains and fluting.

4. Classification

4.1 Cold-rolled steel sheet is available in the following designations:

4.1.1 Commercial Steel (CS Types A, B, and C),

4.1.2 Drawing Steel (DS Types A and B),

NOTE 1 — CS Type B and DS Type B describe the most common product previously included, respectively, in Specifications A 366/A 366M and A 620/A 620M.

4.1.3 Deep Drawing Steel (DDS),

4.1.4 Extra Deep Drawing Steel (EDDS),

4.1.5 Structural Steel (SS grades 25[170], 30[205], 33[230] Types 1 and 2, 40[275] Types 1 and 2, and 80[550]),

4.1.6 High-Strength Low-Alloy Steel (HSLAS, in classes 1 and 2, in grades 45[310], 50[340], 55[380], 60[410], 65[450], and 70[480] in Classes 1 and 2), and

4.1.7 High-Strength Low-Alloy Steel with Improved Formability (HSLAS-F grades 50 [340], 60 [410], 70 [480], and 80 [550]).

4.1.7.1 HSLAS-F steel has improved formability when compared to HSLAS. The steel is fully deoxidized, made to fine grain practice and includes microalloying elements such as columbium, vanadium, zirconium, etc. The steel may be treated to achieve inclusion control.

4.2 Cold-rolled steel sheet is supplied for either exposed or unexposed applications. Within the latter category, cold-rolled sheet is specified either “temper rolled” or “annealed last.” For details on processing, attributes and limitations, and inspection standards, refer to Specification A 568/A 568M.

5. Ordering Information

5.1 It is the purchaser’s responsibility to specify in the purchase order all ordering information necessary to describe the required material. Examples of such information include, but are not limited to, the following:

5.1.1 ASTM specification number and year of issue,

5.1.2 Name of material and designation (cold-rolled steel sheet) (include grade, type, and class, as appropriate, for CS, DS, DDS, EDDS, SS, HSLAS, or HSLAS-F) (see 4.1),

5.1.2.1 When a type is not specified for CS or DS, Type B will be furnished (see 4.1),

5.1.2.2 When a class is not specified for HSLAS, Class 1 will be furnished (see 4.1),

5.1.2.3 When a type is not specified for SS33 [230] and SS40 [275], Type 1 will be furnished (see 4.1),

5.1.3 Classification (either exposed, unexposed, temper rolled, or annealed last) (see 4.2),

5.1.4 Finish (see 9.1),

5.1.5 Oiled or not oiled, as required (see 9.2),

5.1.6 Dimensions (thickness, thickness tolerance table (see 5.1.6.1), width, and whether cut lengths or coils),

5.1.6.1 As agreed upon between the purchaser and the producer, material ordered to this specification will be supplied to meet the applicable thickness tolerance table shown in Specification A 568/A 568M,

NOTE 2 — Not all producers are capable of meeting all the limitations of the thickness tolerance tables in Specification A 568/A 568M. The purchaser should contact the producer regarding possible limitations prior to placing an order.

5.1.7 Coil size (must include inside diameter, outside diameter, and maximum weight),

5.1.8 Copper bearing steel (if required),

5.1.9 Quantity,

5.1.10 Application (part identification and description),

5.1.11 Special requirements (if required), or supplementary requirement S1 for HSLAS, and

5.1.12 A report of heat analysis will be supplied, if requested, for CS, DS, DDS, and EDDS. For materials with required mechanical properties, SS, HSLAS, and HSLAS-F, a report is required of heat analysis and mechanical properties as determined by the tension test.

NOTE 3 — A typical ordering description is as follows: ASTM A 1008-XX, cold rolled steel sheet, CS Type A, exposed, matte finish, oiled, 0.035 by 30 in. by coil, ID 24 in., OD 48 in., max weight 15 000 lbs, thickness tolerance Table 18 of Specification A 568/A 568M, 100 000 lb, for part No. 4560, Door Panel.

or:

ASTM A 1008M-XX, cold-rolled steel sheet, SS grade 275, unexposed, matte finish, oiled, 0.88 mm by 760 mm by 2440 mm, thickness tolerance Table A1.15 of Specification A 568/A 568M, 10 000 kg, for shelf bracket.

6. General Requirements for Delivery

6.1 Material furnished under this specification shall conform to the applicable requirements of the current edition of Specification A 568/A 568M unless otherwise provided herein.

7. Chemical Composition

7.1 The heat analysis of the steel shall conform to the chemical composition requirements of the appropriate designation shown in Table 1 for CS, DS, DDS, and EDDS and in Table 2 for SS, HSLAS, and HSLAS-F.

7.2 Each of the elements listed in Table 1 and Table 2 shall be included in the report of the heat analysis. When the amount of copper, nickel, chromium, or molybdenum is less than 0.02%, the analysis may be reported as < 0.02%. When the amount of vanadium, columbium, or titanium is less than 0.008%, the analysis may be reported as < 0.008%.

7.3 Sheet steel grades defined by this specification are suitable for welding if appropriate welding conditions are selected. For certain welding processes, more restrictive composition limits may be desirable and should be requested at the time of inquiry and ordering.

8. Mechanical Properties

8.1 CS, DS, DDS, and EDDS:

8.1.1 Typical nonmandatory mechanical properties for CS, DS, DDS and EDDS are shown in Table 3.

8.1.1.1 For the purposes of pressure vessel design, the following minimum tensile properties may be assumed, 20 ksi [140 MPa] yield strength and 40 ksi [275 MPa] tensile strength.

8.1.2 The material shall be capable of being bent, at room temperature, in any direction through 180° flat on itself without cracking on the outside of the bent portion (see Section 14 of Test Methods and Definitions A 370).

8.1.3 Sheet of these designations except for EDDS may be subject to aging dependent upon processing factors such as the method of annealing (continuous annealing or box annealing), and chemical composition. For additional information on aging, see Appendix X1 of Specification A 568/A 568M.

8.1.4 EDDS steel is stabilized to be nonaging and so is not subject to stretcher strains and fluting. Other steels may be processed to be nonaging; please consult your supplier.

8.2 SS, HSLAS and HSLAS-F:

8.2.1 The available strength grades for SS, HSLAS and HSLAS-F are shown in Table 4.

8.2.2 Tension Tests:

8.2.2.1 Requirements — Material as represented by the test specimen shall conform to the mechanical property requirements specified in Table 4. These requirements do not apply to the uncropped ends of unprocessed coils.

8.2.2.2 Number of Tests — Two tension tests shall be made from each heat or from each 50 tons [45 000 kg]. When the amount of finished material from a heat is less than 50 tons [45 000 kg], one test shall be made. When material rolled from heat differs 0.050 in. [1.27 mm] or more in thickness, one tension test shall be made from the thickest and thinnest material regardless of the weight represented.

8.2.2.3 Tension test specimens shall be taken at a point immediately adjacent to the material to be qualified.

8.2.2.4 Tension test specimens shall be taken from the full thickness of the sheet.

8.2.2.5 Tension test specimens shall be taken from a location approximately halfway between the center of the sheet and the edge of the material as rolled.

8.2.2.6 Tension test samples shall be taken with the lengthwise axis of the test specimen parallel to the rolling direction (longitudinal test).

8.2.2.7 Test Method — Yield strength shall be determined by either the 0.2% offset method or the 0.5% extension under load method unless otherwise specified.

8.2.3 Bending Properties:

8.2.3.1 The suggested minimum inside radii for cold bending are listed in Appendix X1 and is discussed in more detail in Specification A 568/A 568M (Section 6). Where a tighter bend radius is required, where curved or offset bends are involved, or where stretching or drawing are also a consideration, the producer should be consulted.

9. Finish and Appearance

9.1 Surface Finish:

9.1.1 Unless otherwise specified, the sheet shall have a matte finish. When required, a controlled surface texture and condition may be specified.

For additional information see “Finish and Condition” section of Specification A 568/A 568M.

9.2 Oiling:

9.2.1 Unless otherwise specified, the sheet shall be oiled.

9.2.2 When required, the sheet may be specified to be furnished not oiled (dry).

10. Retests and Resamples

10.1 Retests — If the results on an original tension test specimen are within 2 ksi [14 MPa] of the required tensile strength, within 1 ksi [7 MPa] of the required yield point, or within two percentage points of the required elongation, a retest shall be permitted for which one test specimen selected at random shall be tested. If the results of this retest specimen satisfy the specified mechanical properties and all other requirements of the applicable specification are satisfied, the material shall be accepted. Retests are permitted in accordance with Specification A 568/A 568M.

10.2 Resamples — Resamples are permitted in accordance with Specification A 568/A 568M.

11. Certification

11.1 A report of heat analysis shall be supplied, if requested, for CS, DS, DDS, and EDDS steels. For material with required mechanical properties, SS, HSLAS, and HSLAS-F, a report is required of heat analysis and mechanical properties as determined by the tension test.

11.2 The report shall include the purchase order number, the ASTM designation number and year date, product designation, grade, type or class, as applicable, the heat number, and as required, heat analysis and mechanical properties as indicated by the tension test.

11.3 A signature is not required on the test report. However, the document shall clearly identify the organization submitting the report. Notwithstanding the absence of a signature, the organization submitting the report is responsible for the content of the report.

11.4 A Material Test Report, Certificate of Inspection, or similar document printed from or used in electronic form from an electronic data interchange (EDI) transmission shall be regarded as having the same validity as a counterpart printed in the certifier's facility. The content of the EDI transmitted document must meet the requirements of the invoked ASTM standard(s) and conform to any existing EDI agreement between the purchaser and the supplier. Notwithstanding the absence of a signature, the organization submitting the EDI transmission is responsible for the content of the report.

12. Product Marking

12.1 In addition to the requirements of Specification A 568/A 568M, each lift or coil shall be marked with the designation shown on the order {CS (Type A, B, or C), DS (Type A or B), DDS, EDDS, SS, HSLAS, or HSLAS-F}. The designation shall be legibly stenciled on the top of each lift or shown on a tag attached to each coil or shipping unit.

13. Keywords

13.1 carbon steel sheet; cold-rolled steel sheet; steel sheet; commercial steel; drawing steel; deep drawing steel; extra deep drawing steel; high-strength low-alloy steel; high-strength low-alloy steel with improved formability; structural steel

TABLE 1 CHEMICAL COMPOSITION^A

^A Where an ellipsis (...) appears in the table, there is no requirement, but the analysis result shall be reported.

^B The sum of copper, nickel, chromium, and molybdenum shall not exceed 0.50% on heat analysis. When one or more of these elements is specified by the purchaser, the sum does not apply, in which case only the individual limits on the remaining elements shall apply.

^C Chromium is permitted, at the producer's option, to 0.25% maximum when the carbon content is less than or equal to 0.05%. In such case the limit on the sum of the four elements in Footnote B does not apply.

^D When an aluminum deoxidized steel is required for the application, Commercial Steel (CS) may be ordered to a minimum of 0.01% total aluminum.

^E Specify Type B to avoid carbon levels below 0.02%.

^F May be furnished as a vacuum degassed or chemically stabilized steel, or both, at the producer's option.

^G For carbon levels less than or equal to 0.02%, columbium or titanium, or both, may be used as stabilizing elements at the producer's option. In such cases, the applicable limit for columbium shall be 0.10% max. and the limit on titanium shall be 0.15% max.

^H When copper steel is specified, the copper limit is a minimum requirement. When copper steel is not specified, the copper limit is a maximum requirement.

^I Except for EDDS, titanium is permitted, at producer's option, to 0.025% provided the ratio of % titanium to % nitrogen does not exceed 3.4.

^J DS Type A may be furnished as a vacuum degassed steel, at the producers option.

^K Shall be furnished as a vacuum degassed and stabilized steel.

^A Where an ellipsis (...) appears in the table, there is no requirement but, the analysis shall be reported.

^B The sum of copper, nickel, chromium, and molybdenum shall not exceed 0.50%. When one or more of these elements are specified by the purchaser, the sum does not apply, in which case, only the individual limits on the remaining unspecified elements will apply.

^C When copper is specified, the copper limit is a minimum requirement. When copper steel is not specified, the copper limit is a maximum requirement.

^D For HSLAS steels, columbium and vanadium may be added singly or in combination.

^E These steels shall also contain one or more of the following elements: vanadium, titanium, and columbium. Other alloying elements may be present, but are not required.

TABLE 3
TYPICAL RANGES OF MECHANICAL PROPERTIES^A (NONMANDATORY)^B
FOR COLD ROLLED STEEL SHEET DESIGNATIONS CS, DS, DDS, AND EDDS

Designation	Yield Strength ^C		Elongation in 2 in. [50 mm] % ^C	r_m Value ^D	n -Value ^E
	ksi	MPa			
CS Types A, B, and C	20 to 40	[140 to 275]	≥ 30	^F	^F
DS Types A and B	22 to 35	[150 to 240]	≥ 36	1.3 to 1.7	0.17 to 0.22
DDS	17 to 29	[115 to 200]	≥ 38	1.4 to 1.8	0.20 to 0.25
EDDS	15 to 25	[105 to 170]	≥ 40	1.7 to 2.1	0.23 to 0.27

^A These typical mechanical properties apply to the full range of steel sheet thicknesses. The yield strength tends to increase, the elongation decreases, and some of the formability values tend to decrease as the sheet thickness decreases.

^B The typical mechanical property values presented here are nonmandatory. They are provided to assist the purchaser in specifying a suitable steel for a given application. Values outside of these ranges are to be expected.

^C Yield Strength and elongation are measured in the longitudinal direction in accordance with Test Methods A 370.

^D Average plastic strain ratio (r_m value) as determined by Test Method E 517.

^E The strain hardening exponent (n -value) as determined by Test Method E 646.

^F No typical properties have been established.

TABLE 4
MECHANICAL PROPERTY REQUIREMENTS^A
FOR COLD ROLLED STEEL SHEET DESIGNATIONS SS, HSLAS, AND HSLAS-F

Designation	Yield Strength, min.		Tensile Strength, min.		Elongation in 2 in. or 50 mm, min., %

^A For coil products, testing by the producer is limited to the end of the coil. Mechanical properties throughout the coil shall comply with the minimum values specified.

^B On this full-hard product, the yield strength approaches the tensile strength, and since there is no halt in the gage or drop in the beam, the yield point shall be taken as the yield stress at 0.5% extension under load.

^C There is no requirement for elongation in 2 in. for SS Grade 80.

SUPPLEMENTARY REQUIREMENTS FOR COLD ROLLED HSLAS STEEL SHEET

The following supplementary requirements shall apply when specified in the order or contract:

S1. Elements

S1.1 When a purchaser prefers to designate the specific elements (columbium, vanadium, nitrogen, or combinations thereof), one of the types listed below shall be specified. The type, in addition to the grade, must be shown on the order:

Type 1 — Columbium

Type 2 — Vanadium

Type 3 — Columbium and Vanadium

Type 4 — Vanadium and Nitrogen

S1.2 The composition limits of Section 7 shall apply for any of these elements.

APPENDIX

(Nonmandatory Information)

X1. BENDING PROPERTIES

TABLE X1.1
SUGGESTED MINIMUM INSIDE RADIUS FOR COLD BENDING

Product	Grade	Minimum Inside Radius for Cold Bending	
Structural Steel	25[170]	$\frac{1}{2} t$	
	30[205]	1 t	
	33[230]	$1\frac{1}{2} t$	
	40[275]	2 t	
	80[550]	not applicable	
High-Strength Low-Alloy Steel		Class 1	Class 2
	45[310]	$1\frac{1}{2} t$	$1\frac{1}{2} t$
	50[340]	2 t	$1\frac{1}{2} t$
	55[380]	2 t	2 t
	60[410]	$2\frac{1}{2} t$	2 t
	65[450]	3 t	$2\frac{1}{2} t$
	70[480]	$3\frac{1}{2} t$	3 t
High-Strength Low-Alloy Steel with Improved Formability	50[340]	1 t	
	60[410]	$1\frac{1}{2} t$	
	70[480]	2 t	
	80[550]	2 t	

NOTE 1 — (t) Equals a radius equivalent to the steel thickness.

NOTE 2 — The suggested radius should be used as a minimum for 90° bends in actual shop practice.

NOTE 3 — Material which does not perform satisfactorily, when fabricated in accordance with the requirements, may be subject to rejection pending negotiation with the steel supplier.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR HIGHER-STRENGTH MARTENSITIC STAINLESS STEEL PLATE, SHEET, AND STRIP

SA-1010/SA-1010M

[Identical with ASTM Specification A 1010/A 1010M-01^{e1}(R09) except for an editorial correction to a column heading in Table 2.]

1. Scope

1.1 This specification covers martensitic stainless steels for various structural, architectural, pressure vessel, and heat-resisting applications. The mechanical properties of these steels are customarily, but not necessarily, developed by a suitable heat treatment generally referred to as tempering.

1.2 Steel products under this specification are available in two grades:

Grade	Yield Strength, min, ksi [MPa]
40 [275]	40 [275]
50 [350]	50 [350]

1.3 The maximum thickness of plates is limited only by the capacity of the composition to meet the specified mechanical property requirements; however, current practice normally limits the maximum thickness of plates furnished under this specification to 1 in. [25 mm].

1.4 The values stated in inch-pound or SI units are to be regarded separately as the standard. Within the text, SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification. The inch-pound units shall apply unless the “M” designation of this specification is specified in the purchase order.

2. Referenced Documents

2.1 ASTM Standards:

A 480/A 480M Specification for General Requirements for Flat-Rolled Stainless and Heat-Resisting Steel Plate, Sheet, and Strip

A 673/A 673M Specification for Sampling Procedure for Impact Testing of Structural Steel

E 527 Practice for Numbering Metals and Alloys (UNS)

2.2 Other Document:

SAE J 1086 Recommended Practice for Numbering Metals and Alloys

3. General Requirements

3.1 The following requirements for orders for material furnished under this specification shall conform to the applicable requirements of the current edition of Specification A 480/A 480M.

- 3.1.1** Terminology,
- 3.1.2** Ordering Information,
- 3.1.3** Process,
- 3.1.4** Heat Analysis,
- 3.1.5** Product Analysis,
- 3.1.6** Finish for Sheet,
- 3.1.7** Finish for Strip,
- 3.1.8** Finish for Plates,
- 3.1.9** Test Specimens,
- 3.1.10** Number of Tests,
- 3.1.11** Test Methods,
- 3.1.12** Retests and Retreatment,
- 3.1.13** Dimensions and Permissible Variations,
- 3.1.14** Workmanship,
- 3.1.15** Packaging, Marking, and Loading,
- 3.1.16** Inspection,
- 3.1.17** Rejection and Rehearing, and
- 3.1.18** Material Test Report and Certification.

4. Chemical Composition

4.1 The steel shall conform to the requirements as to chemical composition specified in Table 1, and shall conform to applicable requirements specified in the current edition of Specification A 480/A 480M.

5. Heat Treatment

5.1 The material shall be heat-treated by tempering to meet the requirements of this specification. The tempering temperature shall not exceed 1400°F [760°C]. Prior to

tempering, the steel shall be in the as-rolled, normalized or quenched condition.

6. Mechanical Properties

6.1 The material shall conform to the mechanical properties specified in Table 2.

7. Keywords

7.1 architectural steel; martensitic; plate; stainless steel; steel; structural steel; tempered

TABLE 2
MECHANICAL TEST REQUIREMENTS

Grade	Yield Strength, min, ksi, [MPa]	Tensile Strength, min, ksi, [MPa]	Elongation in 2 in. [50 mm], min %	Brinell Hardness, max	Cold Bend
40	40 [275]	66 [455]	18	223	not required
50	50 [350]	70 [485]	18	223	not required

SUPPLEMENTARY REQUIREMENTS

Supplementary requirements shall not apply unless specified on the purchase order. Requirements other than those shown in this section may be specified subject to agreement between the supplier and the purchaser. The following supplementary requirements are suitable for use with this specification.

S1. Charpy V-Notch Impact Test

S1.1 Charpy V-notch impact tests shall be conducted in accordance with Specification A 673/A 673M.

S1.2 The frequency of testing, the test temperature to be used, and the absorbed energy requirements shall be as specified on the order.

S2. Ultrasonic Examination

S2.1 The material shall be ultrasonically examined in accordance with the requirements specified on the order.

SPECIFICATION FOR STEEL, SHEET AND STRIP, HOT-ROLLED, CARBON, STRUCTURAL, HIGH-STRENGTH LOW-ALLOY, HIGH-STRENGTH LOW-ALLOY WITH IMPROVED FORMABILITY, AND ULTRA-HIGH STRENGTH

SA-1011/SA-1011M

(Identical with ASTM Specification A 1011/A 1011M-06b.)

1. Scope

1.1 This specification covers hot-rolled, carbon, structural, high-strength low-alloy, high-strength low-alloy with improved formability, and ultra-high strength steel sheet and strip, in coils and cut lengths.

1.2 Hot rolled steel sheet and strip is available in the designations as listed in 4.1.

1.3 This specification is not applicable to the steel covered by Specification A 635/A 635M.

1.4 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other.

A 941 Terminology Relating to Steel, Stainless Steel, Related Alloys, and Ferroalloys

E 18 Test Methods for Rockwell Hardness of Metallic Materials

3. Terminology

3.1 Definitions — For definitions of other terms used in this specification refer to Terminology A 941.

3.2 Definitions of Terms Specific to This Standard:

3.2.1 aging — loss of ductility with an increase in hardness, yield strength, and tensile strength that occurs when steel, which has been slightly cold worked (such as by temper rolling) is stored for some time.

3.2.1.1 Discussion — Aging also increases the tendency toward stretcher strains and fluting.

3.2.2 stabilization — addition of one or more nitride or carbide forming elements, or both, such as titanium and columbium, to control the level of the interstitial elements carbon and nitrogen in the steel.

3.2.2.1 Discussion — Stabilization improves formability and increases resistance to aging.

3.2.3 vacuum degassing — process of refining liquid steel in which the liquid is exposed to a vacuum as part

of a special technique for removing impurities or for decarburizing the steel.

4. Classification

4.1 Hot-rolled steel sheet and steel strip is available in the following designations:

4.1.1 Commercial Steel (CS Types A, B, C, and D),

4.1.2 Drawing Steel (DS Types A and B),

NOTE 1 — CS Type B and DS Type B describe the most common product previously included, respectively, in Specifications A 569/A 569M and A 622/A 622M.

4.1.3 Structural Steel (SS grades 30[205], 33[230], 36[250] Types 1 and 2, 40[275], 45[310], 50[340], 55[380], 60[410], 70[480], and 80[550]),

4.1.4 High-Strength Low-Alloy Steel (HSLAS, classes 1 and 2, in grades 45[310], 50[340], 55[380], 60[410], 65[450], and 70[480]).

4.1.5 High-Strength Low-Alloy Steel with Improved Formability (HSLAS-F grades 50[340], 60[410], 70[480], and 80[550]).

4.1.5.1 HSLAS-F steel has improved formability when compared to HSLAS. The steel is fully deoxidized, made to a fine grain practice, and includes microalloying elements such as columbium, vanadium, and zirconium. The steel shall be treated to achieve inclusion control.

4.1.6 Ultra-High Strength (UHSS Types 1 and 2, in Grades 90 [620] and 100 [690]).

4.1.6.1 UHSS steel has increased strength compared with HSLAS-F. The steel is killed and made to a fine ferritic grain practice, and includes microalloying elements such as columbium (niobium), titanium, vanadium, molybdenum, and so forth. The steel shall be treated to achieve inclusion control. The material is intended for miscellaneous applications where higher strength, savings in weight, and weldability are important. Atmospheric corrosion resistance of these steels is equivalent to plain carbon steels. With copper specified, the atmospheric corrosion resistance is somewhat enhanced.

4.1.7 When required for HSLAS, HSLAS-F, and UHSS steels, limitations on the use of one or more of the microalloy elements shall be specified on the order.

5. Ordering Information

5.1 It is the purchaser's responsibility to specify in the purchase order all ordering information necessary to describe the required material. Examples of such information include, but are not limited to, the following:

5.1.1 ASTM specification number and year of issue,

5.1.2 Name of material and designation (hot-rolled steel sheet) (include grade, type and class, as appropriate, for CS, DS, SS, HSLAS, HSLAS-F, and UHSS) (see 4.1),

5.1.2.1 When a type is not specified for CS or DS, Type B will be furnished (see 4.1),

5.1.2.2 When a class is not specified for HSLAS, Class 1 will be furnished (see 4.1),

5.1.2.3 When a type is not specified for SS Grade 36, Type 1 will be furnished (see 4.1),

5.1.2.4 When a type is not specified for UHSS, Type 1 shall be furnished (see 4.1).

5.1.3 Finish (see 9.1)

5.1.4 Type of edge (see 9.3),

5.1.5 Oiled or not oiled, as required (see 9.2),

5.1.6 Dimensions (thickness, thickness tolerance table (see 5.1.6.1), width, and whether cut lengths or coils),

5.1.6.1 As agreed upon between the purchaser and the producer, material ordered to this specification will be supplied to meet the appropriate thickness tolerance table shown in Specifications A 568/A 568M for sheet and A 749/A 749M for strip.

NOTE 2 — Not all producers are capable of meeting all the limitations of the thickness tolerance tables in Specifications A 568/A 568M and A 749/A 749M. The purchaser should contact the producer prior to placing an order.

5.1.7 Coil size (inside diameter, outside diameter, and maximum weight),

5.1.8 Copper bearing steel (if required),

5.1.9 Quantity,

5.1.10 Application (part identification and description),

5.1.11 Special requirements (if required), and

5.1.12 A report of heat analysis will be supplied, if requested, for CS and DS. For materials with required mechanical properties, SS, HSLAS, HSLAS-F, and UHSS, a report is required of heat analysis and mechanical properties as determined by the tension test.

NOTE 3 — A typical ordering description is as follows: ASTM A 1011-XX, hot rolled steel sheet, CS Type A, pickled and oiled, cut edge, 0.075 by 36 by 96 in., thickness tolerance Table 4 of Specification A 568/A 568M, 100 000 lb, for part no. 6310, for shelf bracket.

or:

ASTM A 1011M-XX, hot rolled steel sheet, CS Type B, pickled and oiled, cut edge, 3.7 by 117 mm by coil, ID 600 mm, OD 1500 mm, max weight 10 000 kg, thickness tolerance Table A1.1 of Specification A 568/A 568M, 50 000 kg, for upper control arm.

6. General Requirements for Delivery

6.1 Material furnished under this specification shall conform to the applicable requirements of the current edition of Specification A 568/A 568M for sheets and Specification A 749/A 749M for strip, unless otherwise provided for herein.

7. Chemical Composition

7.1 The heat analysis of the steel shall conform to the chemical composition requirements of the appropriate designation shown in Table 1 for CS and DS and Table 2 for SS, HSLAS, HSLAS-F, and UHSS.

7.2 Each of the elements listed in Tables 1 and 2 shall be included in the report of the heat analysis. When the amount of copper, nickel, chromium, or molybdenum is less than 0.02%, report the analysis as <0.02% or the actual determined value. When the amount of vanadium, columbium, or titanium is less than 0.008%, report the analysis as <0.008% or the actual determined value. When the amount of boron is less than 0.0005%, report the analysis as <0.0005 % or the actual determined value.

7.3 Sheet steel grades defined by this specification are suitable for welding if appropriate welding conditions are selected. For certain welding processes, if more restrictive composition limits are desirable, they shall be specified at the time of inquiry and confirmed at the time of ordering.

8. Mechanical Properties

8.1 CS and DS:

8.1.1 Typical, nonmandatory mechanical properties for CS and DS are found in Table 3.

8.1.2 The material shall be capable of being bent at room temperature in any direction through 180° flat on itself without cracking on the outside of the bent portion (see the section on bend test in Test Methods and Definitions A 370).

8.2 SS, HSLAS, HSLAS-F, and UHSS:

8.2.1 The available grades and corresponding mechanical properties for SS, HSLAS, HSLAS-F, and UHSS are shown in Table 4.

8.2.2 Tension Tests:

8.2.2.1 Requirements — Material as represented by the test specimen shall conform to the mechanical property requirements specified in Table 4. These requirements do not apply to the uncropped ends of unprocessed coils.

8.2.2.2 Number of Tests — Two tension tests shall be made from each heat or from each 50 tons [45 000 kg]. When the amount of finished material from a heat is less than 50 tons [45 000 kg], one tension test shall be made.

When material rolled from one heat differs 0.050 in. [1.27 mm] or more in thickness, one tension test shall be made from the thickest and thinnest material regardless of the weight represented.

8.2.2.3 Tension test specimens shall be taken at a point immediately adjacent to the material to be qualified.

8.2.2.4 Tension test specimens shall be taken from the full thickness of the sheet as-rolled.

8.2.2.5 Tension test specimens shall be taken from a location approximately halfway between the center of sheet and the edge of the material as-rolled.

8.2.2.6 Tension test specimens shall be taken with the lengthwise axis of the test specimen parallel to the rolling direction (longitudinal test)

8.2.2.7 Test Method — Yield strength shall be determined by either the 0.2 % offset method or the 0.5% extension under load method unless otherwise specified.

8.2.3 Bending Properties:

8.2.3.1 The suggested minimum inside radii for cold bending are listed in Appendix X1 and is discussed in more detail in Specifications A 568/A 568M (6.6) and A 749/A 749M (7.6). Where a tighter bend radius is required, where curved or offset bends are involved, or where stretching or drawing are also a consideration, the producer shall be consulted.

9. Finish and Appearance

9.1 Surface Finish:

9.1.1 Unless otherwise specified, the material shall be furnished as rolled, that is, without removing the hot-rolled oxide or scale.

9.1.2 When required, it is permissible to specify that the material be pickled or blast cleaned (descaled).

9.2 Oiling:

9.2.1 Unless otherwise specified, as-rolled material shall be furnished not oiled (that is, dry), and pickled or blast cleaned material shall be furnished oiled.

9.3 Edges:

9.3.1 Steel sheet is available with mill edge or cut edge.

9.3.2 Steel strip is available with mill edge or cut edge.

10. Retests and Disposition of Non-Conforming Material

10.1 Retests, conducted in accordance with the requirements of Section 11.1 of Specification A 568/A 568M, are permitted when an unsatisfactorily test result is suspected

to be the consequence of the test method procedure.

10.2 Disposition of non-conforming material shall be subject to the requirements of Section 11.2 of Specification A 568/A 568M.

11. Certification

11.1 A report of heat analysis shall be supplied, if requested, for CS and DS steels. For material with required mechanical properties, SS, HSLAS, HSLAS-F, and UHSS a report is required of heat analysis and mechanical properties as determined by the tension test.

11.2 The report shall include the purchase order number; the ASTM designation number and year date; product designation; grade; type or class, as applicable; the heat number; and as required, heat analysis and mechanical properties as indicated by the tension test.

11.3 A signature is not required on the test report. However, the document shall clearly identify the organization submitting the report. Notwithstanding the absence of a signature, the organization submitting the report is responsible for the content of the report.

11.4 A Material Test Report, Certificate of Inspection, or similar document printed from or used in electronic form from an electronic data interchange (EDI) transmission shall be regarded as having the same validity as a

counterpart printed in the certifier's facility. The content of the EDI transmitted document must meet the requirements of the invoked ASTM standard and the purchaser and the supplier. Notwithstanding the absence of a signature, the organization submitting the EDI transmission is responsible for the content of the report.

12. Product Marking

12.1 In addition to the requirements of Specification A 568/A 568M for sheet and Specification A 749/A 749M for strip, each lift or coil shall be marked with the designation shown on the order {CS (Type A, B, or C), DS (Type A or B), SS (Grade and for SS36, Type), HSLAS (Grade and Class), HSLAS-F (Grade), or UHSS (Type and Grade)}. The designation shall be legibly stenciled on the top of each lift or shown on a tag attached to each coil or shipping unit.

13. Keywords

13.1 carbon steel sheet; carbon steel strip; commercial steel; drawing steel; high strength-low alloy steel; high strength-low alloy steel with improved formability; hot-rolled steel sheet; hot-rolled steel strip; steel sheet; steel strip; structural steel; ultra-high strength steel

^A Where an ellipsis (. . .) appears in the table, there is no specified limit, but the analysis shall be reported.

^B Chromium is permitted, at the producer's option, to 0.25% maximum when the carbon content is less than or equal to 0.05%.

^C For steels containing more than 0.02% carbon, titanium is permitted at the producer's options, to the lesser of 3.4N + 1.5S or 0.025%, for the purpose of stabilization.

^D Specify Type B to avoid carbon levels below 0.02%.

^E For carbon levels less than or equal to 0.02%, it is permissible to use vanadium, columbium, or titanium, or combinations thereof, as stabilizing elements at the producer's option. In such case, the limits for these elements are 0.10% for vanadium or columbium and 0.15% for titanium.

^F When an aluminum deoxidized steel is required, it is permissible to order to a minimum of 0.01% total aluminum.

^G It is permissible to furnish as a vacuum degassed or chemically stabilized steel, or both, at producer's option.

^H When copper steel is specified, the copper limit is a minimum requirement. When copper steel is not specified, the copper limit is a maximum requirement.

^A Where an ellipsis (. . .) appears in the table, there is no requirement but the analysis shall be reported.

^B When copper is specified, a minimum of 0.20% is required. When copper steel is not specified, the copper limit is a maximum requirement.

^C Titanium is permitted for SS designations, at the producer's option, to the lesser of 3.4N + 1.5S or 0.025%, for the purpose of stabilization.

^D For each reduction of 0.01% below the specified carbon maximum, an increase of 0.06% manganese above the specified maximum will be permitted up to a maximum of 1.50%.

^E HSLAS, HSLAS-F, and UHSS steels contain the strengthening elements columbium (niobium), vanadium, titanium, and molybdenum added singly or in combination. The minimum requirements only apply to the microalloy elements selected for strengthening of the steel.

^F The purchaser has the option of restricting the nitrogen content. It should be noted that, depending on the microalloying scheme (for example, use of vanadium) of the producer, nitrogen may be a deliberate addition. Consideration should be made for the use of nitrogen binding elements (for example, vanadium, titanium).

TABLE 3
TYPICAL RANGES OF MECHANICAL PROPERTIES^A
(NONMANDATORY)^B FOR HOT-ROLLED STEEL SHEET
AND STRIP DESIGNATIONS CS AND DS

Designation	Yield Strength ^C		Elongation in 2 in. [50 mm] % ^C
	ksi	MPa	
CS Types A, B, C, and D	30 to 50	[205 to 340]	≥ 25
DS Types A and B	30 to 45	[205 to 310]	≥ 28

^A The yield strength tends to increase and the elongation tends to decrease as the sheet thickness decreases. These properties represent those typical of material in the thickness range of 0.100 to 0.150 in. [2.5 to 3.5 mm] for CS Types A, B, and DS Types A and B and in the thickness ranges of 0.060 to 0.075 in. [1.5 to 1.9 mm] for CS Type D.

^B The typical mechanical property values presented here are non-mandatory. They are provided to assist the purchaser in specifying a suitable steel for a given application. Values outside these ranges are to be expected.

^C Yield strength and elongation are measured in the longitudinal direction in accordance with Test Methods and Definitions A 370.

TABLE 4
MECHANICAL PROPERTY REQUIREMENTS^A
FOR HOT ROLLED STEEL SHEET AND STRIP DESIGNATIONS SS, HSLAS, HSLAS-F, AND UHSS

Designation	Yield Strength ksi [MPa] min	Tensile Strength ^B ksi [MPa] min	Elongation in 2 in. [50 mm] min, % for Thicknesses:			Elongation in

^A For coil products, testing by the producer is limited to the end of the coil. Mechanical properties throughout the coil shall comply with the minimum values specified.

^B A minimum and maximum tensile strength has been specified for SS36 Type 2.

APPENDIXES

(Nonmandatory Information)

X1. BENDING PROPERTIES**X2. RELATED ISO STANDARDS**

The ISO standards listed below may be reviewed for comparison with this ASTM standard. The relationship between the standards may only be approximate; therefore, the respective standards should be consulted for actual requirements. Those who use these documents must determine which specifications address their needs.

ISO 3573 Hot-rolled Carbon Steel Sheet of Commercial and Drawing Qualities

ISO 4995 Hot-rolled Steel Sheet of Structural Quality

ISO 4996 Hot-rolled Steel Sheet of High Yield Stress Structural Quality

ISO 5951 Hot-rolled Steel Sheet of Higher Yield Strength with Improved Formability

ISO 6316 Hot-rolled Carbon Steel Strip of Structural Quality

ISO 6317 Hot-rolled Carbon Steel Strip of Commercial and Drawing Qualities

X3. HARDNESS PROPERTIES

X3.1 Table X3.1 lists the typical hardness values.

TABLE X1.1
SUGGESTED MINIMUM INSIDE RADIUS FOR COLD BENDING

Designation	Grade	Minimum Inside Radius for Cold Bending	
Structural Steel	30 [205]	1 t	
	33 [230]	1 t	
	36 [250] Type 1	1½ t	
	36 [250] Type 2	2 t	
	40 [275]	2 t	
	45 [310]	2 t	
	50 [340]	2½ t	
	55 [380]	3 t	
	60 [410]	3½ t	
	70 [480]	4 t	
High-Strength Low-Alloy Steel	80 [550]	4 t	
		<u>Class 1</u>	<u>Class 2</u>
	45 [310]	1½ t	1½ t
	50 [340]	2 t	1½ t
	55 [380]	2 t	2 t
	60 [410]	2½ t	2 t
	65 [450]	3 t	2½ t
	70 [480]	3½ t	3 t
High-Strength Low-Alloy Steel with Improved Formability	50 [340]	1 t	
	60 [410]	1½ t	
	70 [480]	2 t	
	80 [550]	2 t	
Ultra-High Strength Steel Types 1 and 2	90 [620]	2½ t	
	100 [690]	2½ t	

NOTE 1 — (t) Equals a radius equivalent to the steel thickness.

NOTE 2 — The suggested radius should be used as a minimum for 90° bends in actual shop practice.

NOTE 3 — Material which does not perform satisfactorily, when fabricated in accordance with the above requirements, may be subject to rejection pending negotiation with the steel supplier.

TABLE X3.1
TYPICAL HARDNESS VALUES

Designation	Hardness-Rockwell B Scale
CS Type A	75 or less
CS Type B	75 or less
CS Type C	75 or less
DS	65 or less

NOTE 1 — The hardness values shown are at the time of shipment.

NOTE 2 — Tests for hardness shall be conducted in accordance with the requirements of Test Methods E 18.

NOTE 3 — The hardness values are Rockwell B scale as measured or converted from the appropriate Rockwell scales.

NOTE 4 — The typical hardness values apply to the full range of steel sheet thickness. Hardness tends to increase as the steel sheet thickness decreases.

NOTE 5 — Hardness testing is commonly used to assess the relative formability of various designations of uncoated steel sheet. This assessment done by many users is recognized to be only an approximation of the relative formability and therefore cannot be used as a specification requirement.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR GENERAL REQUIREMENTS FOR FERRITIC ALLOY STEEL, AUSTENITIC ALLOY STEEL, AND STAINLESS STEEL TUBES

**SA-1016/SA-1016M**

(Identical with ASTM Specification A 1016/A 1016M-04a except for corrections to paragraph references in 25.2.5 and 25.5.1.)

1. Scope

1.1 This specification covers a group of requirements that, unless otherwise specified in an individual specification, shall apply to the ASTM product specifications noted below.

Title of Specification	ASTM Designation ^A
Seamless Carbon-Molybdenum Alloy-Steel Boiler and Superheater Tubes	A 209/A 209M
Seamless Ferritic and Austenitic Alloy-Steel Boiler, Superheater, and Heat-Exchanger Tubes	A 213/A 213M
Welded Austenitic Steel Boiler, Superheater, Heat-Exchanger, and Condenser Tubes	A 249/A 249M
Electric-Resistance-Welded Ferritic Alloy-Steel Boiler and Superheater Tubes	A 250/A 250M
Seamless and Welded Ferritic and Martensitic Stainless Steel Tubing for General Service	A 268/A 268M
Seamless and Welded Austenitic Stainless Steel Tubing for General Service	A 269
Seamless and Welded Austenitic Stainless Steel Sanitary Tubing	A 270
Seamless and Welded Carbon and Alloy-Steel Tubes for Low-Temperature Service	A 334/A 334M
Welded Austenitic Stainless Steel Feedwater Heater Tubes	A 688/A 688M
Austenitic Stainless Steel Tubing for Breeder Reactor Core Components	A 771/A 771M
Seamless and Welded Ferritic/Austenitic Stainless Steel Tubing for General Service	A 789/A 789M
Welded Ferritic Stainless Steel Feedwater Heater Tubes	A 803/A 803M
Austenitic and Ferritic Stainless Steel Duct Tubes for Breeder Reactor Core Components	A 826

Title of Specification	ASTM Designation ^A
High-Frequency Induction Welded, Unannealed Austenitic Steel Condenser Tubes	A 851

^A These designations refer to the latest issue of the respective specifications.

1.2 In the case of conflict between a requirement of a product specification and a requirement of this general requirements specification, the product specification shall prevail. In the case of conflict between a requirement of the product specification or a requirement of this general requirements specification and a more stringent requirement of the purchase order, the purchase order shall prevail.

1.3 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other. Combining values from the two systems may result in nonconformance with the specification. The inch-pound units shall apply unless the “M” designation (SI) of the product specification is specified in the order.

3. Terminology

3.1 Definitions:

3.1.1 The definitions in Test Methods and Definitions A 370, Test Methods, Practices and Terminology A 751, and Terminology A 941 are applicable to this specification and to those listed in 1.1.

3.1.2 *heat, n* — in secondary melting, all of the ingots remelted from a single primary heat.

3.1.3 *imperfection, n* — any discontinuity or irregularity found in a tube.

4. Manufacture

4.1 The steel shall be made by any process.

4.2 The primary melting is permitted to incorporate separate degassing or refining and is permitted to be followed by secondary melting, such as electroslog remelting or vacuum-arc remelting.

4.3 When steel of different grades is sequentially strand cast, the resultant transition material shall be removed using an established procedure that positively separates the grades.

5. Ordering Information

5.1 It is the responsibility of the purchaser to specify all requirements that are necessary for product ordered under the product specification. Such requirements to be considered include, but are not limited to, the following:

5.1.1 Quantity (feet, metres, or number of pieces),

5.1.2 Name of material (stainless steel tubing),

5.1.3 Method of manufacture, when applicable [seamless (SML), welded (WLD), or heavily cold-worked (HCW)],

5.1.4 Grade or UNS number,

5.1.5 Size (outside diameter and average or minimum wall thickness),

5.1.6 Length (specific or random),

5.1.7 End finish if required,

5.1.8 Optional requirements,

5.1.9 Specific type of melting, if required,

5.1.10 Test report requirements,

5.1.11 Specification designation and year of issue, and

5.1.12 Special requirements or any supplementary requirements, or both.

6. Chemical Composition

6.1 Chemical Analysis — Samples for chemical analysis, and method of analysis, shall be in accordance with Test Methods, Practices, and Terminology A 751.

6.2 Heat Analysis — An analysis of each heat of steel shall be made by the steel manufacturer to determine the percentages of the elements specified. If secondary melting processes are employed, the heat analysis shall be obtained from one remelted ingot or the product of one remelted ingot of each primary melt. The chemical composition thus determined, or that determined from a product analysis made by the tubular product manufacturer, shall conform to the requirements specified in the product specification.

6.2.1 For steels ordered under product specifications referencing this specification of general requirements, the steel shall not contain an unspecified element, other than nitrogen for stainless steels, for the ordered grade to the extent that the steel conform to the requirements of another grade for which that element is a specified element having a required minimum content. For this requirement, a grade is defined as an alloy described individually and identified by its own UNS designation in table of chemical requirements within any specification listed within the scope as being covered by this specification.

6.3 Product Analysis — Product analysis requirements and options, if any, shall be as contained in the product specification.

7. Tensile Properties

7.1 The material shall conform to the tensile property requirements prescribed in the individual product specification.

7.2 The yield strength, when specified, shall be determined corresponding to a permanent offset of 0.2% of the gage length or to a total extension of 0.5% of the gage length under load.

7.3 If the percentage of elongation of any test specimen is less than that specified and any part of the fracture is more than $\frac{3}{4}$ in. [19.0 mm] from the center of the gage length, as indicated by scribe marks on the specimen before testing, a retest shall be allowed.

8. Standard Mass per Unit Length

8.1 The calculated mass per foot, based upon a specified minimum wall thickness, shall be determined by the following equation (see Note 1):

$$W = C(D - t)t \quad (1)$$

where:

$C = 10.69$ [0.0246615],

$W =$ mass per unit length, lb/ft [kg/m],

$D =$ specified outside diameter, in. [mm], and

$t =$ specified minimum wall thickness, in. [mm].

NOTE 1 — The calculated masses given by eq. (1) are based on the masses for carbon steel tubing. The mass of tubing made of ferritic stainless steels may be up to about 5% less, and that made of austenitic stainless steel up to about 2% greater than the values given. Mass of ferritic/austenitic (duplex) stainless steel will be intermediate to the mass of fully austenitic and fully ferritic stainless steel tubing.

8.2 The permitted variations from the calculated mass per foot [kilogram per meter] shall be as prescribed in Table 1.

9. Permitted Variations in Wall Thickness

9.1 Variations from the specified minimum wall thickness shall not exceed the amounts prescribed in Table 2.

9.2 For tubes 2 in. [50 mm] and over in outside diameter and 0.220 in. [5.6 mm] and over in thickness, the variation in wall thickness in any one cross section of any one tube shall not exceed the following percentage of the actual mean wall at the section. The actual mean wall is defined as the average of the thickest and thinnest wall in that section.

Seamless tubes $\pm 10\%$

Welded tubes $\pm 5\%$

9.3 When cold-finished tubes as ordered require wall thicknesses $\frac{3}{4}$ in. [19.1 mm] or over, or an inside diameter 60% or less of the outside diameter, the permitted variations in wall thickness for hot-finished tubes shall apply.

10. Permitted Variations in Outside Diameter

10.1 Except as provided in 10.2.1, 10.3, and 25.10.4, variations from the specified outside diameter shall not exceed the amounts prescribed in Table 3.

10.2 Thin-wall tubes usually develop significant ovality (out-of-roundness) during final annealing, or straightening, or both. Thin-wall tubes are defined as those with a specified wall 3% or less than the specified OD, or with a wall specified as 0.020 in. [0.5 mm] or less.

10.2.1 The diameter tolerances of Table 3 are not sufficient to provide for additional ovality expected in thin-wall tubes, and, for such tubes, are applicable only to the mean of the extreme (maximum and minimum) outside diameter readings in any one cross section. However, for thin wall tubes the difference in extreme outside diameter readings (ovality) in any one cross section shall not exceed the following ovality allowances:

Outside Diameter, in. [mm]	Ovality Allowance
1 [25.4] and under	0.020 [0.5]
Over 1 [25.4]	2.0% of specified outside diameter

10.3 For cold-finished seamless austenitic and ferritic/austenitic tubes, an ovality allowance is necessary for all sizes less than 2 in. [50.8 mm] outside diameter, because they are likely to become out of round during their final heat treatment. For such tubes, the maximum and minimum outside diameter at any cross section shall not deviate from the nominal diameter by more than ± 0.010 in. [± 0.25 mm]. However, the mean diameter at that cross section must still be within the given permitted variation given in Table 3. In the event of conflict between the provisions of 10.2.1 and those of 10.3, the larger value of ovality tolerance shall apply.

10.4 When the specified wall is 2% or less of the specified OD, the method of measurement is per agreement between purchaser and manufacturer (see Note 2).

NOTE 2 — Very thin wall tubing may not be stiff enough for the outside diameter to be accurately measured with a point contact method, such as with the use of a micrometer or caliper. When very thin walls are specified, “go” — “no go” ring gages are commonly used to measure diameters of $1\frac{1}{2}$ in. [38.1 mm] or less. A 0.002 in. [0.05 mm] additional tolerance is usually added on the “go” ring gage to allow clearance for sliding. On large diameters, measurement is commonly performed with a pi tape. Other methods, such as optical methods may also be considered.

11. Permitted Variations in Length

11.1 Variations from the specified length shall not exceed the amounts prescribed in Table 4.

12. Permitted Variations in Height of Flash on Electric-Resistance-Welded Tubes

12.1 For tubes over 2 in. [50.8 mm] in outside diameter, or over 0.135 in. [3.44 mm] in wall thickness, the flash on

the inside of the tubes shall be mechanically removed by cutting to a maximum height of 0.010 in. [0.25 mm] at any point on the tube.

12.2 For tubes 2 in. [50.8 mm] and under in outside diameter and 0.135 in. [3.44 mm] and under in wall thickness, the flash on the inside of the tube shall be mechanically removed by cutting to a maximum height of 0.006 in. [0.15 mm] at any point on the tube.

13. Straightness and Finish

13.1 Finished tubes shall be reasonably straight and have smooth ends free of burrs. They shall have a workmanlike finish. It is permitted to remove surface imperfections by grinding, provided that a smooth curved surface is maintained, and the wall thickness is not decreased to less than that permitted by this or the product specification, or the purchase order. The outside diameter at the point of grinding may be reduced by the amount so removed.

14. Repair by Welding

14.1 Repair welding of base metal defects in tubing is permitted only with the approval of the purchaser and with the further understanding that the tube shall be marked “WR” and the composition of the deposited filler metal shall be suitable for the composition being welded. Defects shall be thoroughly chipped or ground out before welding and each repaired length shall be reheat treated or stress relieved as required by the applicable specification. Each length of repaired tube shall be examined by a nondestructive test as required by the product specification.

14.2 Repair welding shall be performed using procedures and welders or welding operators that have been qualified in accordance with ASME Boiler and Pressure Vessel Code, Section IX.

15. Retests

15.1 If the results of the mechanical tests of any group or lot do not conform to the requirements specified in the individual specification, retests may be made on additional tubes of double the original number from the same group or lot, each of which shall conform to the requirements specified.

16. Reheat Treatment

16.1 If the individual tubes or the tubes selected to represent any group or lot fail to conform to the test requirements, the individual tubes or the group or lot represented may be reheat treated and resubmitted for test. Not more than two reheat treatments shall be permitted.

17. Test Specimens

17.1 Test specimens shall be taken from the ends of finished tubes prior to upsetting, swaging, expanding, or other forming operations, or being cut to length. They shall be smooth on the ends and free of burrs and flaws.

17.2 If any test specimen shows flaws or defective machining, it may be discarded and another specimen substituted.

18. Method of Mechanical Testing

18.1 The specimens and mechanical tests required shall be made in accordance with Test Methods and Definitions A 370.

18.2 Specimens shall be tested at room temperature.

18.3 Small or subsize specimens as described in Test Methods and Definitions A 370 may be used only when there is insufficient material to prepare one of the standard specimens. When using small or subsize specimens, the largest one possible shall be used.

19. Flattening Test

19.1 A section of tube not less than $2\frac{1}{2}$ in. [60 mm] in length for seamless tubes and not less than 4 in. [100 mm] in length for welded tubes and for heavily cold-worked tubes shall be flattened cold between parallel plates in two steps. For welded tubes, the weld shall be placed 90° from the direction of the applied force (at a point of maximum bending). During the first step, which is a test for ductility, no cracks or breaks, except as provided for in 19.4, on the inside, outside, or end surfaces shall occur in seamless tubes, or on the inside or outside surfaces of welded tubes and heavily cold-worked tubes, until the distance between the plates is less than the value of H calculated by the following equation:

$$H = \frac{(1 + e)t}{e + t/D} \quad (2)$$

where:

H = distance between flattening plates, in. [mm]

t = specified wall thickness of the tube, in. [mm]

D = specified outside diameter of the tube, in. [mm] and

e = deformation per unit length (constant for a given grade of steel: 0.07 for medium-carbon steel (maximum specified carbon 0.19% or greater), 0.08 for ferritic alloy steel, 0.09 for austenitic steel, and 0.09 for low-carbon steel (maximum specified carbon 0.18% or less))

During the second step, which is a test for soundness, the flattening shall be continued until the specimen breaks

or the opposite walls of the specimen meet. Evidence of laminated or unsound material, or of incomplete weld that is revealed during the entire flattening test shall be cause for rejection.

19.2 Surface imperfections in the test specimens before flattening, but revealed during the first step of the flattening test, shall be judged in accordance with the finish requirements.

19.3 Superficial ruptures resulting from surface imperfections shall not be cause for rejection.

19.4 When low D -to- t ratio tubular products are tested, because the strain imposed due to geometry is unreasonably high on the inside surface at the six and twelve o'clock locations, cracks at these locations shall not be cause for rejection if the D -to- t ratio is less than 10.

20. Reverse Flattening Test

20.1 A section 4 in. [100 mm] in length of finished welded tubing in sizes down to and including $\frac{1}{2}$ in. [12.7 mm] in outside diameter shall be split longitudinally 90° on each side of the weld and the sample opened and flattened with the weld at the point of maximum bend. There shall be no evidence of cracks or lack of penetration or overlaps resulting from flash removal in the weld.

21. Reverse Bend Test

21.1 A section 4 in. [100 mm] minimum in length shall be split longitudinally 90° on each side of the weld. The sample shall then be opened and bent around a mandrel with a maximum thickness of four times the wall thickness, with the mandrel parallel to the weld and against the original outside surface of the tube. The weld shall be at the point of maximum bend. There shall be no evidence of cracks or of overlaps resulting from the reduction in thickness of the weld area by cold working. When the geometry or size of the tubing make it difficult to test the sample as a single piece, the sample may be sectioned into smaller pieces provided a minimum of 4 in. of weld is subjected to reverse bending.

21.2 The reverse bend tests is not applicable when the wall is 10% or more of the specified outside diameter, or the wall thickness is 0.134 in. [3.4 mm] or greater, or the outside diameter is less than 0.375 in. [9.5 mm]. Under these conditions, the reverse flattening test shall apply.

22. Flaring Test

22.1 A section of tube approximately 4 in. [100 mm] in length shall stand being flared with a tool having a 60° included angle until the tube at the mouth of the flare has

been expanded to the percentages specified in Table 5 without cracking or showing imperfections rejectable under the provisions of the product specification.

23. Flange Test

23.1 A section of tube shall be capable of having a flange turned over at a right angle to the body of the tube without cracking or showing imperfections rejectable under the provisions of the product specification. The width of the flange for carbon and alloy steels shall be not less than the percentages specified in Table 6. For the austenitic grades, the width of the flange for all sizes listed in Table 6 shall be not less than 15%.

24. Hardness Test

24.1 For tubes with wall thickness 0.200 in. [5.1 mm] or over, either the Brinell or Rockwell hardness test shall be used. When Brinell hardness testing is used, a 10 mm ball with 3,000, 1,500, or 500 kg load, or a 5 mm ball with 750 kg load shall be used, at the option of the manufacturer.

24.2 For tubes with wall thickness 0.065 in. [1.7 mm] or over but less than 0.200 in. [5.1 mm], the Rockwell hardness test shall be used.

24.3 For tubes with wall thickness less than 0.065 in. [1.7 mm], the hardness test shall not be required.

24.4 The Brinell hardness test shall, at the option of the manufacturer, be made on the outside of the tube near the end, on the outside of a specimen cut from the tube, or on the wall cross section of a specimen cut from the tube. This test shall be made so that the distance from the center of the impression to the edge of the specimen is at least 2.5 times the diameter of the impression.

24.5 The Rockwell hardness test shall, at the option of the manufacturer, be made on the inside surface, on the wall cross section, or on a flat on the outside surface.

24.6 For tubes furnished with upset, swaged, or otherwise formed ends, the hardness test shall be made as prescribed in 24.1 and 24.2 on the outside of the tube near the end after the forming operation and heat treatment.

24.7 For welded or brazed tubes, the hardness test shall be made away from the joints.

24.8 When the product specification provides for Vickers hardness, such testing shall be in accordance with Test Method E 92.

25. Nondestructive Examination

25.1 Except as provided in 26.1, each tube shall be examined by a nondestructive examination method in

accordance with Practice E 213, Practice E 309 (for ferromagnetic materials), Practice E 426 (for non-magnetic materials), or Practice E 570. Upon agreement, Practice E 273 shall be employed in addition to one of the full periphery tests. The range of tube sizes that may be examined by each method shall be subject to the limitations in the scope of that practice. In case of conflict between these methods and practices and this specification, the requirements of this specification shall prevail.

25.2 The following information is for the benefit of the user of this specification.

25.2.1 Calibration standards for the nondestructive electric test are convenient standards for calibration of nondestructive testing equipment only. For several reasons, including shape, orientation, width, and so forth, the correlation between the signal produced in the electric test from an imperfection and from calibration standards is only approximate. A purchaser interested in ascertaining the nature (type, size, location, and orientation) of discontinuities that can be detected in the specific application of these examinations should discuss this with the manufacturer of the tubular product.

25.2.2 The ultrasonic examination referred to in this specification is intended to detect longitudinal discontinuities having a reflective area similar to or larger than the calibration reference notches specified in 25.8. The examination may not detect circumferentially oriented imperfections or short, deep defects.

25.2.3 The eddy current examination referenced in this specification has the capability of detecting significant discontinuities, especially of the short abrupt type. Practices E 309 and E 426 contain additional information regarding the capabilities and limitations of eddy-current examination.

25.2.4 The flux leakage examination referred to in this specification is capable of detecting the presence and location of significant longitudinally or transversely oriented discontinuities. The provisions of this specification only provide for longitudinal calibration for flux leakage. It should be recognized that different techniques should be employed to detect differently oriented imperfections.

25.2.5 The hydrostatic test referred to in Section 26 is a test method provided for in many product specifications. This test has the capability of finding defects of a size permitting the test fluid to leak through the tube wall and may be either visually seen or detected by a loss of pressure. This test may not detect very tight, through-the-wall defects or defects that extend an appreciable distance into the wall without complete penetration.

25.2.6 A purchaser interested in ascertaining the nature (type, size, location, and orientation) of discontinuities that can be detected in the specific application of these

examinations should discuss this with the manufacturer of the tubular products.

25.3 Time of Examination — Nondestructive examination for specification acceptance shall be performed after all deformation processing, heat treating, welding, and straightening operations. This requirement does not preclude additional testing at earlier stages in the processing.

25.4 Surface Condition:

25.4.1 All surfaces shall be free of scale, dirt, grease, paint, or other foreign material that could interfere with interpretation of test results. The methods used for cleaning and preparing the surfaces for examination shall not be detrimental to the base metal or the surface finish.

25.4.2 Excessive surface roughness or deep scratches can produce signals that interfere with the test.

25.5 Extent of Examination:

25.5.1 The relative motion of the tube and the transducer(s), coil(s), or sensor(s) shall be such that the entire tube surface is scanned, except for end effects as noted in 25.5.2.

25.5.2 The existence of end effects is recognized, and the extent of such effects shall be determined by the manufacturer, and, if requested, shall be reported to the purchaser. Other nondestructive tests may be applied to the end areas, subject to agreement between the purchaser and the manufacturer.

25.6 Operator Qualifications:

25.6.1 The test unit operator shall be certified in accordance with SNT TC-1-A, or an equivalent documented standard agreeable to both purchaser and manufacturer.

25.7 Test Conditions:

25.7.1 For examination by the ultrasonic method, the minimum nominal transducer frequency shall be 2.0 MHz, and the maximum transducer size shall be 1.5 in. [38 mm].

25.7.2 For eddy current testing, the excitation coil frequency shall be chosen to ensure adequate penetration, yet provide good signal-to-noise ratio.

25.7.2.1 The maximum coil frequency shall be:

Specified Wall Thickness, in. [mm]	Maximum Frequency, kHz
<0.050 [1.25]	100
0.050 to 0.150 [1.25 to 3.80]	50
>0.150 [3.80]	10

25.8 Reference Standards:

25.8.1 Reference standards of convenient length shall be prepared from a length of tube of the same grade, specified size (outside diameter and wall thickness), surface

finish, and heat treatment condition as the tubing to be examined.

25.8.2 For eddy current testing, the reference standard shall contain, at the option of the manufacturer, any one of the following discontinuities:

25.8.2.1 Drilled Hole — The reference standard shall contain three or more holes, equally spaced circumferentially around the tube and longitudinally separated by a sufficient distance to allow distinct identification of the signal from each hole. The holes shall be drilled radially and completely through the tube wall, with care being taken to avoid distortion of the tube while drilling. The holes shall not be larger than 0.031 in. [0.8 mm] in diameter. As an alternative, the producer may choose to drill one hole and run the calibration standard through the test coil three times, rotating the tube approximately 120° each time. More passes with smaller angular increments may be used, provided testing of the full 360° of the coil is obtained. For welded tubing, if the weld is visible, one of the multiple holes or the single hole shall be drilled in the weld.

25.8.2.2 Transverse Tangential Notch — Using a round tool or file with a ¼ in. [6.4 mm] diameter, a notch shall be milled or filed tangential to the surface and transverse to the longitudinal axis of the tube. Said notch shall have a depth not exceeding 12.5% of the specified wall thickness of the tube or 0.004 in. [0.1 mm], whichever is greater.

25.8.2.3 Longitudinal Notch — A notch 0.031 in. [0.8 mm] or less in width shall be machined in a radial plane parallel to the tube axis on the outside surface of the tube, to have a depth not exceeding 12.5% of the specified wall thickness of the tube or 0.004 in. [0.1 mm], whichever is greater. The length of the notch shall be compatible with the testing method.

25.8.3 For Ultrasonic Testing. The reference ID and OD notches shall be any one of the three common notch shapes shown in Practice E 213, at the option of the manufacturer. The depth of the notches shall not exceed 12.5% of the specified wall thickness of the tube or 0.004 in. [0.1 mm], whichever is greater. The width of the notch shall not exceed two times the depth. For welded tubing, the notches shall be placed in the weld, if the weld is visible.

25.8.4 For Flux Leakage Testing. The longitudinal reference notches shall be straight-sided notches machined in a radial plane parallel to the tube axis on the inside and outside surfaces of the tube. Notch depth shall not exceed 12.5% of the specified wall thickness or 0.004 in. [0.1 mm], whichever is greater. Notch length shall not exceed 1 in. [25.4 mm], and the width shall not exceed the depth. Outside and inside notches shall have sufficient separation to allow distinct identification of the signal from each notch.

25.8.5 More or smaller reference discontinuities, or both, may be used by agreement between the purchaser and the manufacturer.

25.9 Standardization Procedure:

25.9.1 The test apparatus shall be standardized at the beginning and end of each series of tubes of the same specified size (diameter and wall thickness), grade and heat treatment condition, and at intervals not exceeding 4 h during the examination of such tubing. More frequent standardizations may be performed at the manufacturer's option or may be required upon agreement between the purchaser and the manufacturer.

25.9.2 The test apparatus shall also be standardized after any change in test system settings, change of operator, equipment repair, or interruption due to power loss or shutdown.

25.9.3 The reference standard shall be passed through the test apparatus at the same speed and test system settings as the tube to be tested, except that, at the manufacturer's discretion, the tubes may be tested at a higher sensitivity.

25.9.4 The signal-to-noise ratio for the reference standard shall be 2.5:1 or greater, and the reference signal amplitude for each discontinuity shall be at least 50% of full scale of the display. In establishing the noise level, extraneous signals from identifiable surface imperfections on the reference standard may be ignored. When reject filtering is used during UT testing, linearity must be demonstrated.

25.9.5 If, upon any standardization, the reference signal amplitude has decreased by at least 29% (3.0 dB), the test apparatus shall be considered out of standardization. The test system settings may be changed, or the transducer(s), coil(s), or sensor(s) adjusted, and the unit restandardized, but all tubes tested since the last acceptable standardization must be retested.

25.10 Evaluation of Imperfections:

25.10.1 Tubing producing a test signal equal to or greater than the lowest signal produced by the reference standard shall be designated suspect, shall be clearly marked or identified, and shall be separated from the acceptable tubing.

25.10.2 Such suspect tubing shall be subject to one of the following three dispositions:

25.10.2.1 The tubes shall be rejected without further examination, at the discretion of the manufacturer.

25.10.2.2 If the test signal was produced by imperfections such as scratches, surface roughness, dings, straightener marks, loose ID bead and cutting chips, steel die stamps, stop marks, tube reducer ripple, or chattered flash trim, the tubing shall be accepted or rejected

depending on visual observation of the severity of the imperfection, the type of signal it produces on the testing equipment used, or both.

25.10.2.3 If the test signal was produced by imperfections that cannot be identified, or was produced by cracks or crack-like imperfections, the tubing shall be rejected.

25.10.3 Any tubes with imperfections of the types in 25.10.2.2 and 25.10.2.3, exceeding 0.004 in. [0.1 mm] or 12.5% of the specified minimum wall thickness (whichever is greater) in depth shall be rejected.

25.10.4 Rejected tubes may be reconditioned and retested providing the wall thickness is not decreased to less than that required by this or the product specification. If grinding is performed, the outside diameter in the area of grinding may be reduced by the amount so removed. To be accepted, reconditioned tubes must pass the nondestructive examination by which they were originally rejected.

26. Hydrostatic Test

26.1 In lieu of nondestructive electric examination, and when specified by the purchaser, and, except as provided in 26.2 and 26.3, each tube shall be tested by the manufacturer to a minimum hydrostatic test pressure determined by the following equation:

$$\text{Inch—Pound Units: } P = 32000 \, t/D \quad (3)$$

$$\text{SI Units: } P = 220.6 \, t/D$$

where:

P = hydrostatic test pressure, psi or MPa

t = specified wall thickness, in. or mm, and

D = specified outside diameter, in. or mm

26.1.1 The hydrostatic test pressure determined by Eq. (3) shall be rounded to the nearest 50 psi [0.5 MPa] for pressure below 1000 psi [7 MPa], and to the nearest 100 psi [1 MPa] for pressures 1000 psi [7 MPa] and above. The hydrostatic test may be performed prior to cutting to final length, or prior to upsetting, swaging, expanding, bending or other forming operations, or both.

26.2 Regardless of the determination made by eq. (3), the minimum hydrostatic test pressure required to satisfy these requirements need not exceed 1000 psi [7 MPa]. This does not prohibit testing at higher pressures at manufacturer's option or as provided in 26.3.

26.3 With concurrence of the manufacturer, a minimum hydrostatic test pressure in excess of the requirements of 26.2 or 26.1, or both, may be stated on the order. The tube wall stress shall be determined by the following equation:

$$S = PD/2t \quad (4)$$

where:

S = tube wall stress, psi or MPa, and all other symbols as defined in 24.1

26.4 The test pressure shall be held for a minimum of 5 s.

26.5 If any tube shows leaks during the hydrostatic test, it shall be rejected.

26.6 The hydrostatic test may not be capable of testing the end portion of the pipe. The lengths of pipe that cannot be tested shall be determined by the manufacturer and, when specified in the purchase order, reported to the purchaser.

27. Air Underwater Pressure Test

27.1 When this test is required, each tube, with internal surface clean and dry, shall be internally pressurized to 150 psi [1000 kPa] minimum with clean and dry compressed air while being submerged in clear water. The tube shall be well lighted, preferably by underwater illumination. Any evidence of air leakage of the pneumatic couplings shall be corrected prior to testing. Inspection shall be made of the entire external surface of the tube after holding the pressure for not less than 5 s after the surface of the water has become calm. If any tube shows leakage during the air underwater test, it shall be rejected. Any leaking areas may be cut out and the tube retested.

28. Certification and Test Reports

28.1 The producer or supplier shall furnish a certificate of compliance stating that the material was manufactured, sampled, tested, and inspected in accordance with the Specification, including year date, the Supplementary Requirements, and any other requirements designated in the purchase order or contract, and the results met the requirements of that Specification, the Supplementary Requirements and the other requirements. A signature or notarization is not required on the certificate of compliance, but the document shall be dated and shall clearly identify the organization submitting the Report. Notwithstanding the absence of a signature or notarization, the certifying organization is responsible for the contents of the document.

28.2 In addition to the certificate of compliance, the manufacturer shall furnish test reports that include the following information and test results, where applicable:

- 28.2.1** Heat number,
- 28.2.2** Heat analysis,
- 28.2.3** Product analysis, when specified,
- 28.2.4** Tensile properties,

28.2.5 Width of the gage length, when longitudinal strip tension test specimens are used,

28.2.6 Flattening test acceptable,

28.2.7 Reverse flattening test acceptable,

28.2.8 Flaring test acceptable,

28.2.9 Flange test acceptable,

28.2.10 Hardness test values,

28.2.11 Hydrostatic test pressure,

28.2.12 Nondestructive electric test method,

28.2.13 Impact test results, and

28.2.14 Any other test results or information required to be reported by the product specification or the purchase order or contract.

28.3 The manufacturer shall report, along with the test report or in a separate document, any other information that is required to be reported by the product specification or the purchase order or contract.

28.4 The certificate of compliance shall include a statement of explanation for the letter added to the specification number marked on the tubes (see 30.3) when all of the requirements of the specification have not been completed. The purchaser must certify that all requirements of the specification have been completed before the removal of the letter (that is, X, Y, or Z).

28.5 A test report, certificate of compliance, or similar document printed from or used in electronic form from an electronic data interchange (EDI) transmission shall be regarded as having the same validity as a counterpart printed in the certifier's facility. The content of the EDI transmitted document shall meet the requirements of the invoked ASTM standard(s) and conform to any existing EDI agreement between the purchaser and supplier. Notwithstanding the absence of a signature, the organization submitting the EDI transmission is responsible for the content of the report.

29. Inspection

29.1 The manufacturer shall afford the purchaser's inspector all reasonable facilities necessary to be satisfied that the product is being produced and furnished in accordance with the ordered product specification. Mill inspection by the purchaser shall not interfere with the manufacturer's operations.

30. Rejection

30.1 Each length of tubing received from the manufacturer may be inspected by the purchaser and, if it does not meet the requirements of the ordered product specification

based on the inspection and test method as outlined in the ordered product specification, the length shall be rejected and the manufacturer shall be notified. Disposition of rejected tubing shall be a matter of agreement between the manufacturer and the purchaser.

30.2 Material that fails in any of the forming operations or in the process of installation and is found to be defective shall be set aside and the manufacturer shall be notified for mutual evaluation of the material's suitability. Disposition of such material shall be a matter for agreement.

31. Product Marking

31.1 Each length of tube shall be legibly stenciled with the manufacturer's name or brand, the specification number, and grade. The marking need not include the year of issue of the specification. For tubes less than 1¼ in. [31.8 mm] in diameter and tubes under 3 ft [1 m] in length, the required information may be marked on a tag securely attached to the bundle or box in which the tubes are shipped.

31.2 For austenitic steel pipe, the marking paint or ink shall not contain detrimental amounts of harmful metals, or metal salts, such as zinc, lead, or copper, which cause corrosive attack on heating.

31.3 When it is specified that certain requirements of a specification adopted by the ASME Boiler and Pressure Vessel Committee are to be completed by the purchaser upon receipt of the material, the manufacturer shall indicate that all requirements of the specification have not been completed by a letter such as X, Y, or Z, immediately following the specification number. This letter may be removed after completion of all requirements in accordance with the specification. An explanation of specification requirements to be completed is provided in 28.4.

31.4 Bar Coding —In addition to the requirements in 31.1–31.3, the manufacturer shall have the option of using bar coding as a supplementary identification method. Bar coding should be consistent with the (AIAG) standard prepared by the Primary Metals Subcommittee of the AIAG Bar Code Project Team.

32. Packaging, Marking, and Loading

32.1 When specified on the purchase order, packaging, marking, and loading for shipment shall be in accordance with the procedures of Practices A 700.

33. Government Procurement

33.1 Scale Free Tube:

33.1.1 When specified in the contract or order, the following requirements shall be considered in the inquiry

contract or order, for agencies of the U.S. Government where scale-free tube is required. These requirements shall take precedence if there is a conflict between these requirements and the product specification.

33.1.2 Tube shall be ordered to outside diameter (OD) and wall thickness.

33.1.3 Responsibility for Inspection —Unless otherwise specified in the contract or purchase order, the manufacturer is responsible for the performance of all inspection and test requirements specified. The absence of any inspection requirements in the specification shall not relieve the contractor of the responsibility for ensuring that all products or supplies submitted to the government for acceptance comply with all requirements of the contract. Sampling inspection, as part of the manufacturing operations, is an acceptable practice to ascertain conformance to requirements, however, this does not authorize submission of known defective material, either indicated or actual, nor does it commit the government to accept the material. Except as otherwise specified in the contract or purchase order, the manufacturer may use his own or any other suitable facilities for the performance of the inspection and test requirements unless disapproved by the purchaser at the time the order is placed. The purchaser shall have the right to perform any of the inspections and tests set forth when such inspections and tests are deemed necessary to ensure that the material conforms to the prescribed requirements.

33.1.4 Sampling for Flattening and Flaring Test and for Visual and Dimensional Examination — Minimum sampling for flattening and flaring tests and visual and dimensional examination shall be as follows:

Lot Size (pieces per lot)	Sample Size
2 to 8	Entire lot
9 to 90	8
91 to 150	12
151 to 280	19
281 to 500	21
501 to 1,200	27
1,201 to 3,200	35
3,201 to 10,000	38
10,001 to 35,000	46

In all cases, the acceptance number is zero and the rejection number is one. Rejected lots may be screened and resubmitted for visual and dimensional examination. All defective items shall be replaced with acceptable items prior to lot acceptance.

33.1.5 Sampling for Chemical Analysis —One sample for chemical analysis shall be selected from each of two tubes chosen from each lot. A lot shall be all material poured from one heat.

33.1.6 Sampling for Tension and Bend Test —One sample shall be taken from each lot. A lot shall consist of all tube of the same outside diameter and wall thickness manufactured during an 8 h shift from the same heat of steel, and heat treated under the same conditions of temperature and time in a single charge in a batch type furnace, or heat treated under the same condition in a continuous furnace, and presented for inspection at the same time.

33.1.7 Hydrostatic and Ultrasonic Tests — Each tube shall be tested by the ultrasonic (when specified) and hydrostatic tests.

33.1.8 Tube shall be free from heavy oxide or scale. The internal surface of hot finished ferritic steel tube shall be pickled or blast cleaned to a free of scale condition equivalent to the CSa2 visual standard listed in SSPC-SP6. Cleaning shall be performed in accordance with a written procedure that has been shown to be effective. This procedure shall be available for audit.

33.1.9 In addition to the marking in Specification A 530/A 530M, each length of tube $\frac{1}{4}$ in. outside diameter and larger shall be marked with the following listed information. Marking shall be in accordance with FED-STD-183 and MIL-STD-792: (a) Outside diameter, wall thickness, and length (b) Heat or lot identification number.

33.1.10 Tube shall be straight to within the tolerances specified in Table 7.

33.1.11 When specified, each tube shall be ultrasonically examined in accordance with MIL-STD-271, except that the notch depth in the calibration standard shall be 5% of the wall thickness or 0.005 in., whichever is greater. Any tube that produces an indication equal to or greater

than 100% of the indication from the calibration standard shall be rejected.

33.1.12 The tube shall be free from repair welds, welded joints, laps, laminations, seams, visible cracks, tears, grooves, slivers, pits, and other imperfections detrimental to the tube as determined by visual and ultrasonic examination, or alternate tests, as specified.

33.1.13 Tube shall be uniform in quality and condition and have a finish conforming to the best practice for standard quality tubing. Surface imperfections such as handling marks, straightening marks, light mandrel and die marks, shallow pits, and scale pattern will not be considered injurious if the imperfections are removable within the tolerances specified for wall thickness or 0.005 in. [0.1 mm], whichever is greater. The bottom of imperfections shall be visible and the profile shall be rounded and faired-in.

33.1.14 No weld repair by the manufacturer is permitted.

33.1.15 Preservation shall be level A or commercial, and packing shall be level A, B, or commercial, as specified. Level A preservation and level A or B packing shall be in accordance with MIL-STD-163 and commercial preservation and packing shall be in accordance with Practice A 700 or Practice D 3951.

34. Keywords

34.1 alloy steel tube; austenitic stainless steel; duplex stainless steel; ferritic stainless steel; ferritic/austenitic stainless steel; heavily cold-worked steel tube; seamless steel tube; stainless steel tube; steel tube; welded steel tube

TABLE 1
PERMITTED VARIATIONS IN MASS PER FOOT^A

Method of Manufacture	Permitted Variation in Mass Per Foot, %	
	Over	Under
Seamless, hot-finished	16	0
Seamless, cold-finished:		
$1\frac{1}{2}$ in. [38 mm] and under OD	12	0
Over $1\frac{1}{2}$ in. [38 mm] OD	13	0
Welded	10	0

NOTE:

^A These permitted variations in mass apply to lots of 50 tubes or more in sizes 4 in. [101.6 mm] and under in outside diameter, and to lots of 20 tubes or more in sizes over 4 in. [101.6 mm] in outside diameter.

TABLE 2
PERMITTED VARIATIONS IN WALL THICKNESS⁴

Outside Diameter, in. [mm]	Wall Thickness, %							
	Over 0.095 to 0.150				Over 0.150 to 0.180			
	0.095 [2.4] and Under		[2.4 to 3.8], Incl.		[3.8 to 4.6], Incl.		Over 0.180, [4.6]	
	Over	Under	Over	Under	Over	Under	Over	Under
Seamless, Hot-Finished Tubes								
4 [100] and under	40	0	35	0	33	0	28	0
Over 4 [100]	...	...	35	0	33	0	28	0
Seamless, Cold-Finished Tubes								
	Over				Under			
1½ [38.1] and under	20				0			
Over 1½ [38.1]	22				0			
Welded Tubes								
All sizes	18				0			

NOTE:

⁴ These permitted variations in wall thickness apply only to tubes, except internal-upset tubes, as rolled or cold-finished, and before swaging, expanding, bending, polishing, or other fabricating operations.

TABLE 3
PERMITTED VARIATIONS IN OUTSIDE DIAMETER⁴

Specified Outside Diameter, in. [mm]	Permitted Variations, in. [mm]	
	Over	Under
Hot-Finished Seamless Tubes		
4 [100] or under	1/64 [0.4]	1/32 [0.8]
Over 4 to 7½ [100 to 200], incl.	1/64 [0.4]	3/64 [1.2]
Over 7½ to 9 [200 to 225], incl.	1/64 [0.4]	1/16 [1.6]
Welded Tubes and Cold-Finished Seamless Tubes		
Under 1 [25]	0.004 [0.1]	0.004 [0.11]
1 to 1½ [25 to 40], incl.	0.006 [0.15]	0.006 [0.15]
Over 1½ to 2 [40 to 50], excl.	0.008 [0.2]	0.008 [0.2]
2 to 2½ [50 to 65], excl.	0.010 [0.25]	0.010 [0.25]
2½ to 3 [65 to 75], excl.	0.012 [0.3]	0.012 [0.3]
3 to 4 [75 to 100], incl.	0.015 [0.38]	0.015 [0.38]
Over 4 to 7½ [100 to 200], incl.	0.015 [0.38]	0.025 [0.64]
Over 7½ to 9 [200 to 225], incl.	0.015 [0.38]	0.045 [1.14]

NOTE:

⁴ Except as provided in 10.2 and 10.3, these permitted variations include out-of-roundness. These permitted variations in outside diameter apply to hot-finished seamless, welded and cold-finished seamless tubes before other fabricating operations such as upsetting, swaging, expanding, bending, or polishing.

TABLE 4
PERMITTED VARIATIONS IN LENGTH⁴

Method of Manufacture	Specified Outside Diameter, in. [mm]	Cut Length, in. [mm]	
		Over	Under
Seamless, hot-finished	All sizes	3/16 [5]	0 [0]
Seamless, cold-finished	Under 2 [50.8]	1/8 [3]	0 [0]
	2 [50.8] and over	3/16 [5]	0 [0]
Welded	Under 2 [50.8]	1/8 [3]	0 [0]
	2 [50.8] and over	3/16 [5]	0 [0]

NOTE:

⁴ These permitted variations in length apply to tubes before bending. They apply to cut lengths up to and including 24 ft [7.3 m]. For lengths greater than 24 ft [7.3 m], the above over-tolerances shall be increased by 1/8 in. [3 mm] for each 10 ft [3 m] or fraction thereof over 24 ft or 1/2 in. [13 mm], whichever is lesser.

TABLE 5
FLARING TEST REQUIREMENTS

Ratio of Inside Diameter to Specified Outside Diameter ⁴	Minimum Expansion of Inside Diameter, %	
	Carbon, Carbon-Molybdenum, and Other Ferritic Alloy Steels	Austenitic Steels
0.9	21	15
0.8	22	17
0.7	25	19
0.6	30	23
0.5	39	28
0.4	51	38
0.3	68	50

NOTE:

⁴ In determining the ratio of inside diameter to specified outside diameter, the inside diameter shall be defined as the actual mean inside diameter of the material tested.

TABLE 6
FLANGE REQUIREMENTS

Specified Outside Diameter of Tube, in. [mm]	Width of Flange
To 2½ [63.5], incl.	15% of specified Outside Diameter
Over 2½ to 3¾ [63.5 to 95.2], incl.	12½% of specified Outside Diameter
Over 3¾ to 8 [95.2 to 203.2], incl.	10% of specified Outside Diameter

TABLE 7
STRAIGHTNESS TOLERANCES

Specified OD (in.)	Specified Wall Thickness (in.)	Maximum Curvature in Any 3 ft (in.)	Maximum Curvature in Total Length (in.)
Up to 5.0, incl.	Over 3% OD to 0.5, incl.	0.030	0.010 × length, ft
Over 5.0 to 8.0, incl.	Over 4% OD to 0.75, incl.	0.045	0.015 × length, ft
Over 8.0 to 12.75, incl.	Over 4% OD to 1.0, incl.	0.060	0.020 × length, ft

ANNEXES

(Mandatory Information)

A1. REQUIREMENTS FOR THE INTRODUCTION OF NEW MATERIALS

A1.1 New materials may be proposed for inclusion in specifications referencing this Specification of General Requirements subject to the following conditions:

A1.1.1 Application for the addition of a new grade to a specification shall be made to the chairman of the subcommittee that has jurisdiction over that specification.

A1.1.2 The application shall be accompanied by a statement from at least one user indicating that there is a

need for the new grade to be included in the applicable specification.

A1.1.3 The application shall be accompanied by test data as required by the applicable specification. Test data from a minimum of three test lots, as defined by the specification, each from a different heat, shall be furnished.

A1.1.4 The application shall provide recommendations for all requirements appearing in the applicable specification.

A1.1.5 The application shall state whether the new grade is covered by patent.

SUMMARY OF CHANGES

The Committee has identified the location of selected changes to this specification since the last issue that may impact the use of this specification.

- (1) Added 6.2.1 to provide a limitation on grade substitution for alloy steels and stainless steels.
- (2) Removed A 423/A 423M from Scope and Referenced Documents.
- (3) Added heavily cold-working tubing to Ordering Information, Flattening Test, and Keywords.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR PRESSURE VESSEL PLATES, ALLOY STEEL, CHROMIUM-MOLYBDENUM- TUNGSTEN

SA-1017/SA-1017M

(Identical with ASTM Specification A 1017/A 1017M-07.)

1. Scope

1.1 This specification covers Chromium-Molybdenum-Tungsten alloy steel plates intended primarily for welded boilers and pressure vessels designed for elevated temperature service.

1.2 Plates are available under this specification in three grades having different alloy contents as follows:

Grade	Nominal Chromium Content, %	Nominal Molybdenum Content, %	Nominal Tungsten Content, %
23	2.25	0.20	1.60
911	9.00	1.00	1.00
122	12.00	0.40	2.00

1.3 The maximum thickness of plates is limited only by the capacity of the composition to meet the specified mechanical property requirements.

1.4 The specification is expressed in both inch-pound units and in SI units. However, unless the order specifies the applicable “M” specification designation (SI units), the material shall be furnished to inch-pound units.

1.5 The values stated in either inch-pound units or SI units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system are not exact equivalents; therefore, each system must be used independently of the other.

2. Referenced Documents

- 2.1 ASTM Standards:**
A 20/A 20M Specification for General Requirements for Steel Plates for Pressure Vessels
A 435/A 435M Specification for Straight-Beam Ultrasonic Examination of Steel Plates

A 577/A 577M Specification for Ultrasonic Angle-Beam Examination of Steel Plates

3. General Requirements

3.1 Material supplied to this material specification shall conform to Specification A 20/A 20M. Such requirements outline the testing and retesting methods and procedures, permissible variations in dimensions and weight [mass], quality and repair of defects, marking, loading, and so forth.

3.2 Specification A 20/A 20M also establishes the rules for the ordering information that should be complied with when purchasing material to this specification.

3.3 In addition to the basic requirements of this specification, certain supplementary requirements are available when additional control, testing, or examination is required to meet end use requirements. The purchaser is referred to the listed supplementary requirements in this specification and to the detailed requirements in Specification A 20/A 20M.

3.4 If the requirements of this specification are in conflict with the requirements of Specification A 20/A 20M, the requirements of this specification shall prevail.

4. Materials and Manufacture

4.1 Steelmaking Practice — The steel shall be killed.

5. Heat Treatment

5.1 Except as allowed by 5.2 and 5.3, all plates shall be normalized at 1900 to 1975°F [1040 to 1080°C]. Plates for Grades 23 and 122 shall be tempered at 1350 to 1470°F [730 to 800°C]. Grade 911 plates shall be tempered at 1365 to 1435°F [740 to 780°C].

5.2 If permitted by the purchaser, plates for Grades 23 and 122 may be austenitized at 1900 to 1975°F [1040 to 1080°C], subjected to accelerated cooling from the austenitizing temperature by air blasting or liquid quenching, and then tempered at 1350 to 1470°F [730 to 800°C].

5.3 Plates ordered without the heat treatment required by either 5.1 or 5.2 shall be furnished in either the stress-relieved or annealed condition, and the purchaser shall be responsible for the heat treatment of such plates to conform to either 5.1 or 5.2.

6. Chemical Composition

6.1 The steel shall conform to the requirements for chemical composition given in Table 1.

7. Mechanical Properties

7.1 Tension Test:

7.1.1 The material as represented by the tension test specimens shall conform to the applicable requirements given in Table 2.

7.2 Hardness Test:

7.2.1 Grade 23 plates shall have a hardness not exceeding 220 HB [97HRB].

7.2.2 Grade 122 plates shall have a hardness not exceeding 250 HB [25HRC].

8. Marking

8.1 In addition to the marking required in Specification A 20/A 20M, each plate shall be legibly stamped or stenciled, dependent upon the ordered thickness, with the letter “N” for normalized and tempered, “Q” for accelerated cooled and tempered, “S” for stress relieved, or “A” for annealed, whichever is applicable.

9. Keywords

9.1 alloy steel; alloy steel plate; pressure containing parts; pressure vessel steels; steel plates; steel plates for pressure vessels

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR CARBON AND ALLOY STEEL EXTERNALLY THREADED METRIC FASTENERS

SF-568M

(Identical with ASTM Specification F 568M-98)

1. Scope

1.1 This specification covers chemical and mechanical requirements for nine property classes of carbon and alloy steel externally threaded metric fasteners in nominal thread diameters M1.6 through M100 suited for use in general engineering applications.

1.2 This specification does not cover dimensional requirements for fasteners of any property class. When referencing this specification for procurement purposes, it is mandatory that size, type, style, and any special dimensions of the product be additionally specified.

1.2.1 In case of any conflict in requirements, the requirements of the individual product specification shall take precedence over those of this general specification.

1.2.2 The purchaser may specify additional requirements which do not negate any of the provisions of this general specification or of the individual product specification. Such additional requirements, the acceptance of which are subject to negotiation with the supplier, must be included in the order information (see Section 3).

1.3 Requirements for seven of the nine property classes, 4.6, 4.8, 5.8, 8.8, 9.8, 10.9, and 12.9, are essentially identical with requirements given for these classes in ISO 898/I. The other two, 8.8.3 and 10.9.3, are not recognized in ISO standards.

1.4 Classes 8.8.3 and 10.9.3 bolts, screws, and studs have atmospheric corrosion resistance and weathering characteristics comparable to those of the steels covered in Specification A 588. The atmospheric corrosion resistance of these steels is substantially better than that of carbon steel with or without copper addition. See 5.2. When properly exposed to the atmosphere, these steels can be used bare (uncoated) for many applications.

1.5 When agreed on by the purchaser, Class 5.8 fasteners may be supplied when either Classes 4.6 or 4.8 are

ordered; Class 4.8 may be supplied when Class 4.6 is ordered; Class 8.8.3 may be supplied when Class 8.8 is ordered; and Class 10.9.3 may be supplied when Class 10.9 is ordered.

1.6 The product size range for which each property class is applicable is given in Table 1 and Table 2 on chemical composition requirements, and the mechanical requirements table (see Table 3).

1.7 Appendix X1 gives conversion guidance to assist designers and purchasers in the selection of a suitable property class.

1.8 Appendix X2 explains the significance of the property class designation numerals.

2.4 ANSI/ASME Standard:

B18.5.2.2M Metric Round Head Square Neck Bolts

3. Ordering Information

3.1 Orders for products referencing this specification shall include the following:

3.1.1 Quantity (number of pieces),

3.1.2 Name of product (that is, type and style of bolt, screw, or stud),

3.1.3 Dimensions, including nominal thread diameter, thread pitch, and length,

3.1.4 Property class,

3.1.5 *Zinc Coating*—Specify the zinc coating process required, for example, hot dip, mechanically deposited, or no preference (see 4.5),

3.1.6 *Other Finishes*—Specify other protective finish, if required,

3.1.7 ASTM designation and year of issue, and

3.1.8 Any special requirements (for example, mechanical requirements, see Table 3, or proof load testing, see Table 4; stud marking, see 12.2.3; additional testing, see 8.3).

3.2 *Government Provisioning* — Government procurement and design selection criteria shall be specified in

accordance with ANSI (or ANSI/ASME) B18.2.3.1M, B18.2.3.2M, B18.2.3.3M, B18.2.3.4M, B18.2.3.5M, B18.2.3.6M, B18.5.2.1M, or B18.5.2.2M, as appropriate.

4. Materials and Manufacture

4.1 Steel for bolts, screws, and studs shall be made by the open-hearth, basic-oxygen, or electric-furnace process.

4.2 Heading Practice:

4.2.1 Methods other than upsetting or extrusion, or both, are permitted only by special agreement between purchaser and producer.

4.2.2 Class 4.6 may be hot or cold headed at the option of the manufacturer.

4.2.3 Classes 4.8, 5.8, 8.8, 8.8.3, 9.8, 10.9, 10.9.3, and 12.9 bolts and screws in nominal thread diameters up to M20 inclusive with lengths up to 10 times the nominal product size or 150 mm, whichever is shorter, shall be cold headed, except that they may be hot headed by special agreement with the purchaser. Larger diameters and longer lengths may be cold or hot headed at the option of the manufacturer.

4.3 Threading Practice:

4.3.1 Threads on Class 4.6 bolts and screws and on all classes of studs may be cut, rolled, or ground at the option of the manufacturer.

4.3.2 Threads on Classes 4.8, 5.8, 8.8, 8.8.3, 9.8, 10.9, 10.9.3, and 12.9 bolts and screws in nominal thread diameters up to M20 inclusive, and product lengths up to 150 mm inclusive, shall be roll threaded, except by special agreement with the purchaser. Threads of these classes on bolts and screws larger than M20 or longer than 150 mm or both, may be rolled, cut, or ground at the option of the manufacturer.

4.4 Heat Treatment:

4.4.1 Class 4.6 bolts and screws and Classes 4.6, 4.8, and 5.8 studs need not be heat treated.

4.4.2 Classes 4.8 and 5.8 bolts and screws shall be stress relieved if necessary to assure the soundness of the head to shank junction. When stress relieving is specified by the purchaser, Class 5.8 bolts and screws shall be stress relieved at a minimum stress-relief temperature of 470°C. Where higher stress-relief temperatures are necessary to relieve stresses in severely upset heads, mechanical requirements shall be agreed upon between the purchaser and producer.

4.4.3 Classes 8.8, 8.8.3, and 9.8 bolts, screws, and studs shall be heat treated by quenching in a liquid medium from above the transformation temperature and reheating to the tempering temperature given in Table 1.

4.4.4 Classes 10.9, 10.9.3, and 12.9 bolts, screws, and studs shall be heat treated by quenching in oil from above the transformation temperature and reheating to the tempering temperature given in Table 1.

4.4.5 Tempering-Temperature-Audit Test— This test is a means for checking whether products were tempered at the specified temperature. The hardness (mean hardness of three hardness readings) of a bolt, screw, or stud as manufactured shall be measured. The product shall then be retempered for a minimum of 30 min per 25 mm of nominal diameter, but not less than 30 min, at a temperature 10°C less than the minimum tempering temperature specified for the property class and material in Table 1. The hardness of the retempered product shall then be measured. The difference between the hardness of the product before and after retempering shall not exceed 20 HV points.

4.5 Zinc Coatings, Hot-Dip, and Mechanically Deposited:

4.5.1 When zinc-coated fasteners are required, the purchaser shall specify the zinc coating process, for example, hot dip, mechanically deposited, or no preference.

4.5.2 When hot-dip is specified, the fasteners shall be zinc coated by the hot-dip process in accordance with the requirements of Class C of Specification A 153.

4.5.3 When mechanically deposited is specified, the fasteners shall be zinc coated by the mechanical deposition process in accordance with the requirements of Class 50 of Specification B 695.

4.5.4 When no preference is specified, the supplier may furnish either a hot dip zinc coating in accordance with Specification A 153, Class C, or a mechanically deposited zinc coating in accordance with Specification B 695, Class 50. All components of mating fasteners (for example, bolts, nuts, and washers) shall be coated by the same zinc coating process, and the suppliers option is limited to one process per item with no mixed processes in a lot.

4.6 Bolts, screws, and studs of Classes 10.9 and 12.9 should not be hot-dip zinc-coated.

NOTE 1 — Research conducted on bolts with properties equivalent to Class 10.9 indicated that hydrogen-stress corrosion cracking may occur in hot-dip zinc-coated fasteners of Classes 10.9 and 12.9.

5. Chemical Composition

5.1 For all classes except 8.8.3 and 10.9.3, the bolts, screws, and studs shall conform to the chemical composition specified in Table 1.

5.2 Classes 8.8.3 and 10.9.3:

5.2.1 Sizes M20 and smaller shall conform to any one of the compositions (A, B, C, D, E, or F) specified in Table 2, at the suppliers option.

5.2.2 Sizes larger than M20 shall conform to Compositions A or B specified in Table 2, at the suppliers option.

5.2.3 See Guide G 101 for methods of estimation corrosion resistance of low alloy steels.

5.3 Material analyses may be made by the purchaser from finished products representing each lot. The chemical composition thus determined shall conform to the requirements specified for the product analysis in Table 1 and Table 2.

5.4 Use of heats of steel to which bismuth, selenium, tellurium, or lead has been intentionally added shall not be permitted.

5.5 Chemical analyses shall be performed in accordance with Test Methods A 751.

6. Mechanical Properties

6.1 Bolts, screws, and studs shall be tested in accordance with the mechanical testing requirements for the applicable type, property class, size, and length of product as specified in Table 4, and shall meet the mechanical requirements specified for that product in Tables 3-5.

6.2 For products on which both hardness and tension tests are performed, acceptance based on tensile requirements shall take precedence over low readings of hardness tests.

7. Workmanship

7.1 Surface discontinuity limits shall be in accordance with Specification F 788/F 788M.

8. Number of Tests and Retests

8.1 The requirements of this specification shall be met in continuous mass production for stock; the manufacturer shall inspect to ensure that the product conforms to the specified requirements. Additional tests of individual shipments of product are not ordinarily required. Individual heats of steel are not identified in the finished product.

8.2 When specified in the order, the manufacturer shall furnish a test report certified to be the last completed set of mechanical tests for each stock size in each shipment.

8.3 When testing of a specific lot is specified on the purchase order, a lot, for purposes of selecting test samples, shall consist of all products of one type, that is, bolts, screws, or studs having the same nominal diameter, length, and property class, offered for inspection at one time. Unless otherwise specified, the number of tests for each specified property shall be as follows:

Number of Pieces in Lot	Number of Samples
800 and less	1
over 800 to 8 000, incl	2
over 8 000 to 22 000, incl	3
over 22 000	5

8.4 If any test specimen shows defective machining, it may be discarded and another specimen substituted.

9. Test Methods

9.1 Bolts, screws, and studs shall be tested in accordance with the methods described in Test Methods F 606M, with tension test wedge angles as specified in Table 6.

10. Inspection

10.1 If the inspection described in 10.2 is required by the purchaser, it shall be specified in the inquiry, order, or contract.

10.2 The inspector representing the purchaser shall have free entry to all parts of the manufacturer's works that concern the manufacture of the material ordered. The manufacturer shall afford the inspector all reasonable facilities to satisfy the inspector that the material is being furnished in accordance with this specification. All tests and inspection shall be made prior to shipment, and shall be so conducted as not to interfere unnecessarily with the operation of the work.

11. Responsibility

11.1 The party responsible for the fastener shall be the organization that supplies the fastener to the purchaser and certifies that the fastener was manufactured, sampled, tested and inspected in accordance with this specification and meets all of its requirements.

12. Product Marking

12.1 Bolts and Screws:

12.1.1 Bolts and screws of nominal thread diameters smaller than M5 need not be marked. Additionally, slotted and recessed screws of nominal thread diameters M5 and larger need not be marked.

12.1.2 Bolts and screws, except those covered in 12.1.1, shall be marked permanently and clearly to identify the property class and the manufacturer. The property class symbols shall be as given in Table 7. The manufacturer's identification symbol shall be of his design.

12.1.3 For Classes 8.8.3 and 10.9.3, the manufacturer may add other distinguishing marks indicating that the

bolt or screw is atmospheric corrosion resistant and of a weathering grade of steel.

12.1.4 Markings shall be located on the top of the head with the base of the property class symbols positioned toward the closest periphery of the head. Markings may be either raised or depressed at the option of the manufacturer. Alternatively, for hex head products, the markings may be indented on the side of the head with the base of the property class symbols positioned toward the bearing surface.

12.1.5 Metric bolts and screws shall not be marked with radial line symbols.

12.2 Studs:

12.2.1 Studs shall be marked permanently and clearly to identify the property class. The property class symbols and sizes to be marked shall be as given in Table 7.

12.2.2 Markings shall be located on the extreme end of the stud and may be raised or depressed at the option of the manufacturer. For studs with an interference-fit thread, the markings shall be located on the nut end.

12.2.3 When ordered by the purchaser, studs shall be marked on both ends.

13. Packaging and Package Marking

13.1 Packaging:

13.1.1 Unless otherwise specified, packaging shall be in accordance with Practice D 3951.

13.1.2 When special packaging requirements are required, they shall be defined at the time of the inquiry and order.

13.2 Package Marking:

13.2.1 Each shipping unit shall include or be plainly marked with the following information:

13.2.1.1 ASTM designation and type,

13.2.1.2 Size,

13.2.1.3 Name and brand or trademark of the manufacturer,

13.2.1.4 Number of pieces,

13.2.1.5 Purchase order number, and

13.2.1.6 Country of origin.

14. Keywords

14.1 alloy steel; bolts; carbon steel; metric; screws; steel; structural; weathering steel

^A For studs only, sulfur content may be 0.33%, max.

^B At the manufacturer's option, medium-carbon-alloy steel may be used for nominal thread diameters over M24.

^C For studs only, sulfur content may be 0.13%, max.

^D Products made using this material shall be specially identified as specified in Section 12.

^E Steel for Classes 10.9, 10.9.3, and 12.9 products shall be fine grain and have a hardenability that will achieve a structure of approximately 90% martensite at the center of a transverse section one diameter from the threaded end of the product after oil quenching.

^F Carbon steel may be used at the option of the manufacturer for products of nominal thread diameters M12 and smaller. When approved by the purchaser, carbon steel may be used for products of diameters larger than M12 through M20, inclusive.

^G Alloy steel shall be used. Steel is considered to be alloy by the American Iron and Steel Institute when the maximum of the range given for the content of alloying elements exceeds one or more of the following limits: manganese, 1.65%; silicon, 0.60%; copper, 0.60%; or in which a definite range or a definite minimum quantity of any of the following elements is specified or required within the limits of the recognized field of constructional alloy steels: aluminum, chromium up to 3.99%, cobalt, columbium, molybdenum, nickel, titanium, tungsten, vanadium, zirconium, or any other alloying elements added to obtain a desired alloying effect.

^A A, B, C, D, E, and F are types of material used for Property Classes 8.8.3 and 10.9.3 bolts, screws, and studs. Selection of composition shall be at the option of the product manufacturer except that sizes M20 and larger shall conform to Composition A or B only.

TABLE 3
MECHANICAL REQUIREMENTS FOR BOLTS, SCREWS, AND STUDS

Property Class	Nominal Diameter of Product	Full Size Bolts, Screws, and Studs			Machined Test Specimens of Bolts, Screws, and Studs							Product Hardness			
		Proof Load ^A			Yield Strength, MPa ^B	Tensile Strength, MPa	Elongation, %	Reduction of Area, %	Surface Hardness		Rockwell		Vickers

8.8.3	M20–M36	600	660	830	660	830	12	35	53	C23	C34	255	336		
9.8	M1.6–M16	650	720	900	720	900	10	35	56	C27	C36	280	360		
10.9	M5–M100	830	940	1040	940	1040	9	35	59	C33	C39	327	382		
10.9.3	M16–M36	830	940	1040	940	1040	9	35	59	C33	C39	327	382		
12.9 ^E	M1.6–M100	970	1100	1220	1100	1220	8	35	63	C38	C44	372	434		

^A Proof load and tensile strength values for full size products of each property class are given in Table 5.

^B Yield strength is stress at which a permanent set of 0.2% of gage length occurs.

^C Yield point shall apply instead of yield strength at 0.2% offset for Class 4.6 products.

^D Class 5.8 applies only to bolts and screws with lengths 150 mm and shorter and to studs of all lengths.

^E Caution is advised when considering the use of Class 12.9 bolts, screws, and studs. Capability of the bolt manufacturer, as well as the anticipated in-use environment, should be considered. High-strength products of Class 12.9 require rigid control of heat-treating operations and careful monitoring of as-quenched hardness, surface discontinuities, depth of partial decarburization, and freedom from carburization. Some environments may cause stress corrosion cracking of nonplated as well as electroplated products.

TABLE 4
MECHANICAL TESTING REQUIREMENTS FOR BOLTS, SCREWS, AND STUDS^A

Item	Product	Property Class	Specified Min Tensile Strength of Product (See Table 5) kN	Length of Product ^B	Product Hardness		Surface Hardness ^C max	Tests Conducted Using Full-Size Products			Tests Conducted Using Machined Test Specimens

			over 450	over 8D or 200 mm, whichever is greater x and longer	●	...	●	○	A	...	B	B	B	B
Tests to be conducted in accordance with the following paragraph of Method F 606:					3.1			3.2.1	3.5	3.4	3.6			

^A ● denotes a mandatory test. For each product all mandatory tests (●) shall be performed. In addition, either all tests denoted A (which apply to full-size products) or all tests denoted B (which apply to machined test specimens) shall be performed. ○ denotes tests to be performed when specifically required in the original inquiry and purchase order. In case arbitration is necessary, A tests and proof load test shall be performed. Leaders (.) indicate tests that are not required.

^B D equals nominal diameter of product. x equals the minimum length of product subject to tensile testing. Values of x are as follows:

Nominal Product Diameter	x, mm
M5	12
M6	14
M8	20
M10	25
M12	30
M14	35
M16	40
M20	45
M24 and larger	30

^C Surface hardness requirements apply only to Property Classes 8.8, 8.8.3, 9.8, 10.9, 10.9.3, and 12.9.

^D Tensile test wedge angles are specified in Table 6.

^E Special head bolts and screws are those with special configurations or with drilled heads which are weaker than the threaded section.

TABLE 5

^A Proof loads and tensile strengths are computed by multiplying the stresses given in Table 3 by the stress area of the thread.

^B Stress area, mm² = 0.7854 ($D - 0.9382 P$)², where D = nominal product size, mm, and P = thread pitch, mm.

^C Proof load, Method 1, is the length measurement method as described in 3.2.3 of Test Methods F 606. Proof load, Method 2, is the yield strength method as described in 3.2.5 of Test Methods F 606.

^D For Classes 8.8 and 8.8.3 sizes M16 and smaller are not covered by Specification F 568M. Class 9.8 may be suitable for applications requiring sizes M16 and smaller after consideration of design parameters, application and service environment.

^E M22 and M27 are standard sizes for high-strength structural bolts only as covered in Specifications A 325M and A 490M.

TABLE 6
TENSION TEST WEDGE ANGLE

Product	Property Class	Nominal Product Diameter, (<i>D</i>)	Wedge Angle,*
Hex bolts and screws threaded 1 <i>D</i> or closer to underside of head	4.6, 4.8, 5.8	through M24	10
		over M24	6
	8.8, 8.8.3, 9.8, 10.9, 10.9.3	through M20	6
		over M20	4
Hex bolts and screws with unthreaded length greater than 1 <i>D</i>	4.6, 4.8, 5.8, 8.8, 8.8.3, 9.8, 10.9, 10.9.3	through M24	10
		over M24	6
Hex bolts and screws threaded 2 <i>D</i> or closer to underside of head	12.9	all	4
Hex bolts and screws with unthreaded length greater than 2 <i>D</i>	12.9	through M20	6
		over M20	4
Hex flange screws	5.8, 9.8, 10.9	all	6
Studs	all	through M20	6

^A Not applicable.

^B Products made of low-carbon martensite steel shall be additionally marked by underlining the property class symbol.

APPENDIXES

(Nonmandatory Information)

X1 CONVERSION GUIDANCE

X1.1 For guidance purposes only, to assist designers and purchasers in the selection of a property class, the following conversion guidance is provided:

X1.1.1 Class 4.6 mechanical properties are approximately equivalent to those of Specification A 307, Grade A.

X1.1.2 Class 8.8 mechanical properties are approximately equivalent to those of Specification A 449, and Specification A 325, Types 1 and 2.

X1.1.3 Class 8.8.3 mechanical properties are approximately equivalent to those of Specification A 325, Type 3.

X1.1.4 Class 9.8 mechanical properties are approximately 9% higher than those of Specification A 449.

X1.1.5 Class 10.9 mechanical properties are approximately equivalent to those of Specification A 354, Grade BD and Specification A 490, Types 1 and 2.

X1.1.6 Class 10.9.3 mechanical properties are approximately equivalent to those of Specification A 490, Type 3.

X1.1.7 Class 12.9 mechanical properties are approximately equal to those of Specification A 574.

X1.2 Class 9.8 is applicable to fasteners of nominal thread diameters M16 and smaller; Class 8.8 is applicable

to fasteners larger than M16, except for Specification A 325M bolts where M16 and larger bolt diameters are Class 8.8.

X2. SIGNIFICANCE OF PROPERTY CLASS DESIGNATION

X2.1 Property classes are designated by numbers where increasing numbers generally represent increasing tensile strengths. The designation symbol has the following significance:

X2.1.1 The one or two numerals preceding the first decimal point approximates 1/1000 of the minimum tensile strength in MPa.

X2.1.2 The numeral following the first decimal point approximates 1/10 of the ratio, expressed as a percentage, between minimum yield stress and minimum tensile strength.

X2.1.3 The numeral 3, following the second decimal point, is an indicator that the material has atmospheric corrosion resistance and weathering characteristics comparable to steels covered in Specification A 588/A 588M.

SPECIFICATION FOR STEEL PLATES FOR PRESSURE EQUIPMENT

SA/AS 1548

(Identical with AS 1548-1995, with the additional requirements listed on this cover sheet. No other Edition is approved for ASME use.)

1. Additional Requirements

1.1 Marking:

In addition to the marking requirements of this specification, the prefix, SA/, shall be added ahead of the marking on all products required to be marked by this specification,

and to the material identification used on all documentation required by the specification.

2. Source

2.1 See Nonmandatory Appendix A for ordering information.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR STRUCTURAL QUALITY STEELS

SA/CSA-G40.21

(Identical with CAN/CSA-G40.21-04, with the additional requirements listed on this cover sheet. No other Edition is approved for ASME use.)

1. Additional Requirements

1.1 Marking:

In addition to the marking requirements of this specification, all products are to be identified by this SA/CSA specification designation.

2. Source

2.1 See Nonmandatory Appendix A for ordering information.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR FLAT PRODUCTS MADE OF STEELS FOR PRESSURE PURPOSES

Part 2: Non-Alloy and Alloy Steels With Specified Elevated Temperature Properties

SA/EN 10028-2

(Identical with EN 10028-2:2003, with the additional requirements listed on this cover sheet.)

1. Additional Requirements

1.1 Marking

In addition to the marking requirements of this specification, all products required to be marked and material identification used on all documentation required by this specification are to be identified by this SA/EN specification designation.

Plates that have been given the full heat treatment required by para. 8.2.1 or 8.2.2 shall be marked by the party performing the heat treatment with the letters designating the applicable heat treatment condition in Table 3 of EN 10028-2 following the stamped steel name or number.

Plates that are not heat treated but are qualified on the basis of heat treated specimens per para. 8.2.3 shall be stamped with letter "G" following the stamped specification designation.

1.2 Tension Tests

For quenched and tempered plates one tension test shall be taken from each end of the heat treated plate. The gage length of the tension test specimens shall be taken at least 1T from any heat treated edge, where T is the thickness of the plate, and shall be at least $\frac{1}{2}$ in. (12.5 mm) from flame cut or heat-affected-zone surfaces.

1.3 Quality

All surface imperfections, the removal of which will reduce the plate thickness below its permissible minimum, shall be cause for rejection of the plate; however by agreement with the purchaser, the metal so removed may be replaced with weld metal.

Preparation for repair welding shall include inspection to assure complete removal of the defect.

Repairs shall be made utilizing welding procedures qualified in accordance with ASME Section IX and repair welding shall be done by welders or welding operators meeting the qualification requirements of ASME Section IX.

2. National Parts

2.1 The National Foreword and the National Annexes, if any, do not apply for SA/EN 10028-2.

3. Source

3.1 See Nonmandatory Appendix A for ordering information to obtain an English language copy of EN 10028-2 and its references.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR FLAT PRODUCTS MADE OF STEELS FOR PRESSURE PURPOSES

Part 3: Weldable Fine Grain Steels, Normalized

SA/EN 10028-3

(Identical with EN 10028-3:2003, with the additional requirements listed on this cover sheet.)

(10)

1. Additional Requirements

1.1 Marking

In addition to the marking requirements of this specification, all products required to be marked and material identification used on all documentation required by this specification are to be identified by this SA/EN specification designation.

Plates that have been given the full heat treatment required by para. 8.2.1 or 8.2.2 shall be marked by the party performing the heat treatment with the letters designating the applicable heat treatment condition in Table 4 of EN 10028-3 following the stamped steel name or number.

Plates that are not heat treated but are qualified on the basis of heat treated specimens per para. 8.2.3 shall be stamped with letter "G" following the stamped specification designation.

1.2 Quality

All surface imperfections, the removal of which will reduce the plate thickness below its permissible minimum, shall be cause for rejection of the plate; however by

agreement with the purchaser, the metal so removed may be replaced with weld metal.

Preparation for repair welding shall include inspection to assure complete removal of the defect.

Repairs shall be made utilizing welding procedures qualified in accordance with ASME Section IX and repair welding shall be done by welders or welding operators meeting the qualification requirements of ASME Section IX.

2. National Parts

2.1 The National Foreword and the National Annexes, if any, do not apply for SA/EN 10028-3.

3. Source

3.1 See Nonmandatory Appendix A for ordering information to obtain an English language copy of EN 10028-3 and its references.

SPECIFICATION FOR FLAT PRODUCTS MADE OF STEELS FOR PRESSURE PURPOSES Part 7: Stainless Steels

SA/EN 10028-7

(Identical with EN 10028-7:2007, with the additional requirements listed on this cover sheet.)

1. Additional Requirements

1.1 Marking

In addition to the marking requirements of this specification, all products required to be marked and material identification used on all documentation required by this specification are to be identified by this SA/EN specification designation.

2. National Parts

2.1 The National Foreword and the National Annexes, if any, do not apply for SA/EN 10028-7.

3. Source

3.1 See Nonmandatory Appendix A for ordering information to obtain an English language copy of EN 10028-7 and its references.

SPECIFICATION FOR STEEL PLATES FOR PRESSURE VESSELS

SA/GB 6654

(Identical with GB 6654-1996, with the additional requirements listed on this cover sheet.)

1. Additional Requirements

1.1 Chemical Composition

In addition to the chemical composition requirements of Table 3 and para. 5.1.2 of this specification, the limits on elements listed in SA-20/SA-20M, Table 1 shall be observed.

1.2 Marking

In addition to the marking requirements of this specifica-

tion, all products are to be identified by this SA/GB specification designation.

2. Source

2.1 See Nonmandatory Appendix A for ordering information to obtain an English language copy of GB 6654 and its references.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR CARBON STEEL PLATES FOR PRESSURE VESSELS FOR INTERMEDIATE AND MODERATE TEMPERATURE SERVICE

SA/JIS G3118

(Identical with JIS G3118-2000, as translated and published in the English language by the Japanese Standards Association, with the additional requirements listed on this cover sheet. No other Edition is approved for ASME use.)

1. Additional Requirements

1.1 Marking:

In addition to the marking requirements of this specification in para. 11, all products are to be identified by this SA/JIS specification designation.

2. Mechanical Properties

2.1 Tension testing is mandatory. Metric symbol materials (Table 1-2) shall use the values in Table 3-2 only.

3. Repair Welding

3.1 Weld repairs may be performed when permitted by the purchaser. The requirements of SA-20 shall apply.

4. Annex

4.1 The annex, supplementary quality requirements, does not apply for SA/JIS G3118.

5. Source

5.1 See Nonmandatory Appendix A for ordering information.

INTENTIONALLY LEFT BLANK

SPECIFICATION FOR STAINLESS STEEL BARS

SA/JIS G4303

(Identical with JIS G4303-1998, as translated and published in the English language by the Japanese Standards Association, with the additional requirements listed on this cover sheet. No other Edition is approved for ASME use.)

1. Additional Requirements

1.1 *Marking:*

In addition to the marking requirements of this specification in para. 13, all products are to be identified by this SA/JIS specification designation.

3. Source

3.1 See Nonmandatory Appendix A for ordering information to obtain an English language copy of JIS G4303 and its references.

2. Mechanical Testing

2.1 Tensile testing is a mandatory requirement of this specification.

2010 ASME Boiler and Pressure Vessel Code

AN INTERNATIONAL CODE

The ASME Boiler and Pressure Vessel Code (BPVC) is "An International Historic Mechanical Engineering Landmark," widely recognized as a model for codes and standards worldwide. Its development process remains open and transparent throughout, yielding "living documents" that have improved public safety and facilitated trade across global markets and jurisdictions for nearly a century.

ASME also provides BPVC users with integrated suites of related offerings:

- referenced standards
- related standards and guidelines
- conformity assessment programs
- training courses
- ASME press books and journals
- conferences and proceedings

You gain unrivalled insight direct from the BPVC source, along with the professional quality and real-world solutions you have come to expect from ASME.
